The revenue is in a large measure derived from the gold-mines, of which in 1891 the output was valued at £2,924,305, and in 1898 at £16,240,630. In 1898 the revenue was £3,983,560, and the expenditure £3,971,473; while the public debt amounted to only £2,660,400. Coal is found near the goldfields, the annual output being over 1,600,000 tons. There are also deposits of silver with copper and lead, of iron, coal, cobalt, and other metals and minerals. The country is rich in corn and pasture-land. The gold has been the principal export; the imports had before the war an annual value of from £10,000,000 to £14,000,000. The climate is, as a rule, healthy, and in some parts exceptionally bracing. The population was estimated in 1898 at 1,094,156, of whom 345,397 were whites and 748,759 coloured people, including Kaffirs and Indian and Chinese coolies. In 1899 only 30 per cent. of the whites were Boers, the others being mostly British born or colonial, with immigrants from other European countries and from America. The Boers belong to the several divisions of the Dutch Reformed Church. The natural seaports of the Transvaal are Delagoa Bay and Durban, Pretoria being distant 348 miles from the former and 441 miles from the latter. From Delagoa Bay, Durban, and the Cape Colony ports lines of railway extend to Johannesburg and Pretoria (since 1892-95). Pretoria (pop. 15,000) is the seat of government; Johannesburg, the great centre of mining and finance, has within a radius of three miles a population of 105,000.

See J. Nixon, *The Complete Story of the Transvaal* (1885); Mather's *Golden South Africa* (new ed. 1889); C. J. Alford, *Geological Features of the Transvaal* (1891); W. L. Distant, *A Naturalist in the Transvaal* (1892); Hatch and Chalmers, *The Gold-mines of the Rand* (1895); G. M. Theal, *History of South Africa* (1887-93, including a *History of the Boers* as vol. v.); C. G. Thomas, *Johannesburg in Arms* (1896); J. J. Regan, *Boer and Uitlander* (1896); W. E. Fisher, *The Transvaal and the Boers* (1896). The war of 1899-1901 produced a large literature, including the *Times* history, that by Mr Cunliffe, Fitzpatrick's *Transvaal from Within* (hostile to the Boers), Voigt's *Fifty Years of the Republic in South Africa* (hostile to Britain), A. H. Keane's *Boer States*, Conan Doyle's *Great Boer War*, &c.

Transylvania, now the easternmost part of Hungary, fenced N., E., and S. by the Carpathians, is mainly a plateau crossed by numerous mountain-chains, and drained by the tributaries of the Theiss and the Pruth. The soil is fertile; and salt, gold, silver, copper, quicksilver, iron, and lead are wrought. Of the population (2,084,048 in 1880, and 2,247,049 in 1890) 55 per cent. are cattle-breeding Roumanians or Wallachians of the Greek Church. More important are the Hungarians, 29 per cent., farmers and Roman Catholics or Unitarians; the Szeklers retain many characteristics of the old Magyars. The Germans or Saxons, 10 per cent., farm, grow fruit and wine, and are mostly Protestants. There are nearly 50,000 Gypsies, some of them settled; 20,000 Jews, petty dealers and brandy distillers; Greeks and Armenians, the mercantile class; and Slavs. Kronstadt, Klausenburg, and Hermannstadt are the principal towns. Transylvania, the Roman Dacia (q.v.), was successively overrun by Ostrogoths, Gepidæ, Petchenegs, and Magyars (11th century). The 13th century brought German colonists to mix with Romano-Dacians and Magyars (Szeklers). From the land being divided into seven administrative divisions it acquired the name of *Siebenbürgen*—the Seven Strong Towns. In the 16th century the woiwode of Transylvania, John Zapolya (see HUNGARY), asserted his independence of the emperor; and till the end of the 17th century the princes of Transylvania even regarded the sultan as their suzerain. During the first half of the 19th century the Hungarian elements of the population strove to promote a closer union with Hungary, and at the same time stoutly asserted the ancient rights of which the people of Transylvania (except the Roumanians) had been gradually deprived by the imperial governors. The Roumanians, too, petitioned very earnestly for the same political rights as the Magyars, Szeklers, and Saxons enjoyed. These various conflicting claims resulted in 1848 in a fierce racial war, in which General Bem, acting in conjunction with the Hungarians, for some time successfully withstood the forces of the emperor (the Austrians), the Russians, and the Roumanian levies. After hostilities had ceased in 1849 Transylvania was made a crown-land of the Austrian empire, its ancient rights being restored to it eleven years later. But in 1867-68 the Hungarian party effected the complete union of the country with Hungary, and since then it has been 'Magyarised' apace.

See E. Gerard, *The Land beyond the Forest* (1888); C. Boner, *Transylvania* (1865); Josef Haltrich, *Zur Volkskunde der Siebenbürger Sachsen* (ed. J. Wolf, Vienna, 1885); and *Siebenbürgisch-Deutsche Volksbücher* (3 vols. 1885), by Fr. Müller, Haltrich, and Fr. Fronius.

Trap (Sw. *trappa*, 'a stair'). Under this term were formerly included various crystalline igneous rocks, most of which are basic in character. These frequently enter more or less conspicuously into the formation of certain hills and mountains—the igneous rocks being often arranged in horizontal or approximately horizontal beds, separated by intervening layers of some more yielding material, such as tuff, shale, sandstone, &c. Under the influence of denudation the relatively hard crystalline rocks come to stand out like huge steps on hill-faces and mountain-slopes, which thus acquire a step-like contour. The term is now disused. Most of the trap-rocks are varieties of Basalt (q.v.), while under the same head were formerly included certain diorites and porphyrites (see IGNEOUS ROCKS).

Trapa, a genus of plants of the natural order Onagrariæ, and named from the resemblance of the fruit to a Caltrop (q.v.; Low Lat. *calcitrapa*). The genus comprises only two or three species, all aquatic and natives of central and southern Europe, India, China, and Japan. The seeds of all abound in starch, and are much used for food. The more familiar is the *T. natans*, or Water Chestnut (French *Marron d'Eau*). *T. bispinosa*, the Singhara Nut, affords a great part of the food of the inhabitants of Cashmere.

Trapani (anc. *Drepănum*), a seaport of Sicily, and capital of a province in the north-west of the

island, stands on a tongue of land 40 miles W. of Palermo, but fully thrice (141 m.) that distance by rail. It has a trade in wheat, wine, olives, sumach, salt, tunny fishes, sponges, and coral. Since 1860 it has been transformed: most of its fortifications have been removed to make room for promenades, gardens, new streets, and monuments; a suburb 2 miles long has been built; and the place is now noticeably clean, and plentifully supplied (since 1891) with good water brought 60 miles. Pop. 32,020. The ancient *Drepanum* was probably founded by the Carthaginians; and here they utterly defeated the Romans in a celebrated naval engagement in 249 B.C.

Trapezium. Euclid defined a trapezium as any quadrilateral except a square, an oblong, a rhombus, and a rhomboid. Later Greek geometers seem to have used the word in the more restricted sense of a quadrilateral with one pair of parallel sides; and the word trapezoid was introduced to describe a quadrilateral which had no two sides parallel. On the Continent the words are so distinguished to this day. By English geometers and writers on mensuration the words got interchanged as regards their significance, so that with us a trapezoid is generally defined as a quadrilateral with two parallel sides. Thus English writers have retained trapezium in the broader sense, and have used trapezoid in the restricted sense of a Euclidean trapezium with two sides parallel. The continental custom is historically and etymologically the better. There is, however, hardly a necessity for both words, since the word quadrilateral is now invariably used by modern geometers for a four-sided figure which is not a parallelogram.

Trappists, a religious order, celebrated for its extraordinary austerities, is so called from an abbey of the Cistercian order, founded in the middle of the 12th century, in the narrow valley of La Trappe, near Mortagne, in the Norman department of Orne—called 'the trap' because of its inaccessibility. The discipline of this monastery, in common with many others of the more wealthy monastic bodies, especially of those which were held *in commendam*, had become very much relaxed. In the first half of the 17th century the abbey of La Trappe fell, with other ecclesiastical preferments, to Dominique Armand-Jean le Bouthillier de Rancé (1626–1700), originally an accomplished but worldly courtier, who suddenly underwent a great change and turned his back on the vanities of the world. He undertook a reform of his monastery, and in the end established what was equivalent to a new religious order. It was in 1662 that he commenced his reforms. At first he encountered violent opposition from the brethren; but his firmness overcame it all. He himself entered upon a fresh novitiate in 1663, made anew the solemn profession, and was reinstalled as abbot. From this time may be dated the introduction of the new austerities which characterised the order. The monks were forbidden the use of meat, fish, wine, and eggs. All intercourse with externs was cut off, and the old monastic habit of manual labour was revived. The reform of De Rancé is founded on the principle of perpetual prayer and entire self-abnegation. By the Trappist rule the monks are obliged to rise at two o'clock A.M. for matins in the church, which last till half-past three; and after an interval occupied in private devotion they go at half-past five to the offices of prime, which is followed by a lecture. At seven they engage in their several daily tasks, indoors or out, according to the weather. At half-past nine they return to the choir for the successive offices of terce, sext, and none; at the close of which they dine on vegetables dressed without butter or oil, or on vegetable soup, and a little fruit. Milk and cheese are used save in time of fast; the sick are allowed eggs. The dietary is not the same in all the houses of the order. In some light beer or wine is sparingly allowed. The principal meal is succeeded by manual labour for two hours, after which each monk occupies an hour in private prayer or reading in his own cell until four o'clock, when they again assemble in the choir for vespers. The supper consists of bread and water, and after a short interval of repose is followed by a lecture. At six o'clock they recite compline in choir, and at the end spend half an hour in meditation, retiring to rest at eight o'clock. The bed is a hard straw mattress, with a coarse coverlet; and the Trappist never lays aside his habit, even in case of sickness, unless it should prove extreme. Perpetual silence is prescribed, save in cases of necessity, and at certain stated times; only the abbot and the guest-master are allowed to speak to strangers. But conversation by means of manual and other signs is practised. The minor practices and observances are devised so as to remind the monk at every turn of the shortness of life and the rigour of judgment; and the last scene of life is made signal in its austerity by the dying man being laid during his death-agony upon a few handfuls of straw, that he may, as it were, lay aside upon the very brink of the grave even the last fragment of earthly comfort to which the necessities of nature had till then compelled him to cling.

The reformed order of La Trappe scarcely extended beyond France in the first period of its institution. The inmates of La Trappe shared, at the Revolution, the common fate of all the religious houses of France: they were compelled to quit their monastery; but a considerable number of them found a shelter at Valsainte, in the canton of Fribourg in Switzerland. In the vicissitudes of the revolutionary war they were driven from this house; and a community numbering about 250, together with a large number of nuns who had been established for purposes of education, found refuge at Constance, at Augsburg, at Munich, and even in Russia. Later in the course of the war small communities obtained a certain footing in Italy, Spain, America, England, and, notwithstanding the prohibitory law, even in France, at Mont Genèvre. After the Restoration they resumed, by purchase (1817), possession of their old home at La Trappe, which continued to be the head monastery of the order. During the course of the next fifty years they formed many establishments in France, the house of La Meilleraye being one of the most famous abbeys. When in 1880 1450 brethren of the order were expelled from France only a comparatively small number were left. In England the Cistercian house of St Bernard in Leicestershire is Trappist; so is the convent at Stapehill in Dorset. In Ireland the order has houses at Mount Melleray, near Cappoquin, in Waterford, and at Roscrea in Tipperary. America has houses at Gethsemane in Kentucky, at New Melleray, near Dubuque, Iowa, at Tracadie in Nova Scotia, and at Oka, on the Ottawa River, 36 miles from Montreal; there are houses in Germany, Algiers, Italy, and Belgium; there is even one (of German brethren) in Turkey.

Trasimene Lake, a shallow Italian lake lying between the towns of Cortona and Perugia. Surrounded on all sides by hills, it is about 10 miles in length by 8 in breadth. There is no

outlet, and the flat and reedy margins are of late planted with eucalyptus trees. In 1896 a canal was begun to regulate and partially drain the lake, which is memorable for the great victory obtained by Hannibal (q.v.) in 217 B.C. over the Romans.

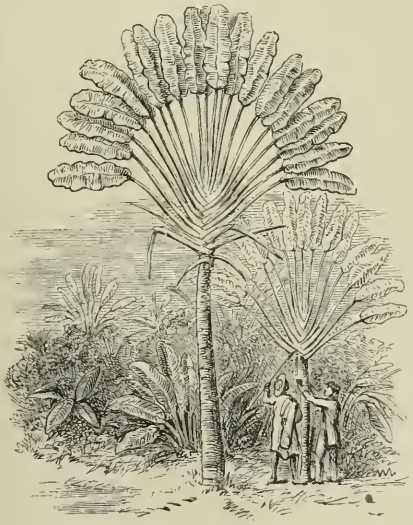
Travancore (*Tiruránkod*), a protected state in the extreme south of India, bounded on the N. by Cochin, on the E. by British territory, and on the W. by the Indian Ocean. The state pays a yearly tribute of £80,000 to Britain, and is politically connected with the province of Madras. Area, 6730 sq. m.; pop. (1881) 2,401,158; (1891) 2,557,840, mainly Hindus, belonging to 420 castes, from Brahmans to Negroid hill-men. Nairs are over a fourth of the total, Mohammedans only 7 per cent. There are many native Christians of the Syrian rite (see THOMAS, CHRISTIANS OF ST), and some black Jews. At the southern extremity of the state is Cape Comorin; the Western Ghâts run along the eastern side. The physical appearance of the higher part of the country, which is varied and picturesque, is described at GHÂTS. Westward of the hill-foots is a level belt, 10 miles wide, covered with cocoa-nut and areca palms. On the elevations the soil is light and gravelly; in the valleys it is in general a deep black mould. The lagoons or backwaters along the coast, which Travancore shares with Cochin, are explained at COCHIN. The chief produce is copra, coir, tobacco, nut-oil, areca-nut, ginger, pepper, cardamoms, beeswax, coffee, and timber. The rajahs are intelligent, have been faithful to the English alliance, cherish education, and govern well. The capital is Trivandrum; other principal places are Aulapolai and Quilon. See Mateer, *Native Life in Travancore* (1883).

Travellers. See COMMERCIAL TRAVELLERS, CARRIERS, INN.

Traveller's Joy. See CLEMATIS.

Traveller's Tree (*Ravenala madagascariensis*, or *Urania speciosa*), a remarkable plant of the natural order Scitamineæ, a native of Madagascar,



Traveller's Tree (*Ravenala madagascariensis*).

and forming a characteristic feature of the scenery of many parts of that island. The stem resembles that of the plantain-tree, but sends out leaves only on two opposite sides, like a great expanded fan. The lower leaves drop off as the stem grows, and in an old tree the lowest leaves are sometimes 30 feet from the ground. A tree often has twenty or twenty-four leaves, the stalk of each leaf being 6 or 8 feet long, and the blade 4 or 6 feet more. The blade of the leaf is oblong, bright green, and shining. The fruit is woody, capsular three-celled, the seeds are arranged in two rows in each cell, and are surrounded by a pulpy blue aril. Forty or fifty fruits grow in a bunch, and three or four bunches may be seen at once on the tree. The leaves are much used for thatch, and for many other purposes, and the leaf-stalks for the partitions, and often even for the walls of houses. It received its popular name, *Arbre des voyageurs*, first from the French on account of the stores of pure water found in the large cup-like sheaths of its leaf-stalks, and which is readily obtained by tapping the sheaths at the base. There is a similar tree called 'Traveller's Fountain' in the Malay Peninsula.

Travemünde. See LÜBECK.

Travertin, the Italian name for limestone formed by springs holding lime in solution. See CALCAREOUS TUFA.

Travnik, a town of Bosnia, once its capital, stands on the Lasva River, 45 miles NW. of Bosna-Serai by rail. Pop. 5933.

Trawling. See FISHERIES.

Traz-os-Montes ('Beyond the Mountains'), a province forming the north-east corner of Portugal, bordering on Spain and bounded S. by the Douro, now falls into the two districts of Braganza and Villa Real, with a collective area of 4300 sq. m., and a population of 417,380. It is a coldish plateau, with bare mountain masses, broken through by deep romantic ravines; but the port-wine district known as the *Alto-Douro* is fertile. Wine is the chief product, but the mountains are also rich in unutilised metallic wealth.

Treacle, the dark, viscous, uncrystallisable syrup obtained in refining sugar; also the drainings of crude sugar, properly distinguished from treacle as molasses. The etymology and the original meaning of the word are explained in Theriaca (q.v.). See SUGAR, SYRUP.—For the *Treacle Bible*, see BIBLE, Vol. II. p. 127.

Treacle Mustard, a popular name for the genus of cruciferous plants described at ERYSIMUM. Alliaria is another name that used to be given to the genus.

Tread-wheel, an apparatus used in the prisons of Great Britain for enforcing a portion of the sentences of imprisonment with hard labour. Sir W. Cubitt about 1818 devised the construction by which this form of employment was first practically carried into effect. The Prison Act, 1865, requires that every male adult prisoner over sixteen years of age sentenced to hard labour shall during at least three months of his sentence be employed on labour of the first class, namely, crank, capstan, tread-wheel, stone-breaking, or other like kind of bodily labour. The minimum period was by the Prisons Act, 1877, reduced to one month.

The tread-wheel consists of a hollow cylinder of wood on an iron frame, and revolving on an iron axle. The cylinder is usually about 5 to 6 feet in diameter, and on its outer circumference are steps about 7½ inches apart. The weight of the prisoners coming on these steps in succession causes the wheel to revolve. By means of suitable gearing this power may be transferred and utilised for grinding corn, pumping water, and other purposes. The speed of the wheel must be regulated by some

sort of brake which may be applied by means of a 'governor.' According to the present practice, the speed is such that the prisoner ascends at the rate of 32 feet per minute. They are kept at this work for 6 hours in each day, divided into two periods of three hours each; and during each of these periods they are on the wheel for spells of 15 minutes, and then resting for 5 minutes. A prisoner, therefore, ascends 8640 feet per diem. In order to prevent intercourse between prisoners, wooden partitions are placed so that each of them works in a separate compartment, and each compartment has a handrail by which the prisoner steadies and partly supports himself while the wheel is moving, and while mounting or getting off it.

The crank is sometimes substituted for the tread-wheel as a means of enforcing hard labour. It has the advantage that the prisoner can work it in his cell. The prisoner turns a handle as in raising a bucket from a well, the handle causes a wheel to revolve, and the resistance to be overcome may be derived from a brake fitted on the wheel, or from mill machinery applied to grinding corn, pumping water, turning saws, or other purposes. The crank, when applied to overcome the friction of a brake, is liable to the disadvantage that the pressure may vary excessively from the heat evolved in the friction, which causes the surfaces to swell and increase the friction, and various forms of crank have been devised to counterbalance this, the most successful being that of Mr Appold. The present practice is to limit the pressure to 12 lb.; and the prisoner is required to make in 6 hours 8000 or 10,000 revolutions, according to his strength, the number of revolutions being recorded on a dial. Before a prisoner is put to tread-wheel or crank labour, he is examined carefully by the medical officer to ensure his fitness for such employment.

Treason may be defined in general terms as an attempt to overturn the government established by law. In early times it was regarded entirely as an offence against the monarch in whom that government was personified, and this view is still apparent in the present state of the law. The foundation of the English legislation on the subject is the Statute of Treasons (25 Ed. III. sect. 5), 1352. Previous to that the law was vague. Murder, highway robbery, piracy, even charging the king wrongfully, were sometimes punished as treason. What was termed 'accroaching'—i.e. assuming or trespassing on royal power—also fell under this designation. The Statute of Treasons was passed to declare the law on the subject. It enumerated various acts which constitute the crime. These were compassing the king or queen's death, or that of the heir; seducing his wife or eldest daughter, or the wife of his heir; levying war against the king, or assisting his enemies; killing the judges whilst in the execution of their duty. A later age found this, as other mediæval acts, alike redundant and defective. There has never been any prosecution under some of its provisions, and many varieties of attacks on the state or its ruler did not come within its plain meaning. The judges gave a forced construction to the clauses, and thus widened their application; yet there was much fresh legislation. Under Henry VII. (1494) it was enacted that obedience to the king *de facto* but not *de jure* was not treason. Under Henry VIII. there were nine acts passed creating fresh treasons, but these were all swept away in the first year of his successor. Again, acts on the subject were passed under the Stuarts, and were in turn superseded by laws passed after the Revolution.

The provisions of the Statute of Treasons above mentioned still remain in force. It is to be noted that the offence consists in *imagining* the sovereign's death, and that it is proved by such overt acts as display the intention. As to levying war, this includes an attempt by force 'to compel the sovereign to change his measures or counsels, or to intimidate or overawe both Houses or either House of Parliament,' or an attempt 'by an insurrection of any kind to effect any general public object,' as, for instance, to pull down dissenting meeting-houses generally. Although the speaking of words expressing and imagining the king's death is not of itself an overt act, yet if written or accompanied by words of advice or command they constitute such an act. In treason every accessory is a principal traitor.

An act of 1848 provides a maximum punishment of penal servitude for life for those who shall be guilty of the treason felony of attempting to deprive the Queen of any of her dominions, or of making war against her. A previous act (1842) punishes by imprisonment and whipping those who shall strike or threaten the Queen. Insulting the sovereign, attempting to seduce soldiers, illegal drilling, and assisting at royal marriages to which the sovereign has not given consent are offences akin to treason. Offences against the state are called *high*-treason. It is distinguished from *petty*-treason—the murder of a husband by his wife, a master by his servant, or an ecclesiastical superior by his inferior. These crimes are now treated as other murders; and the term petty-treason was abolished in 1828. Formerly the trials for these were similar in many respects to those for the graver offence. Misprision of treason is knowledge of the principal crime and concealment thereof. It is still punishable with forfeiture of goods as well as imprisonment for life. Sedition (q.v.) is cognate to treason; Coining (q.v.) used to be dealt with as treason. See also Præmunire.

At common law but one witness was required, but by an act of Edward VI. two witnesses were necessary, though they may speak to different overt acts of the same kind. This was often evaded in later practice before the Revolution. At the trial of Algernon Sidney (q.v.) in 1683 the want of one witness was supplied by a pamphlet found in the prisoner's study, affirming that the king was subject to parliament, and that 'we may therefore change or take away kings.' The accused must, before his trial, be furnished with a copy of the indictment, a list of witnesses and jury. For two centuries he has been allowed the assistance of counsel, a privilege not granted to those accused of felony till very recent times. Also the trial must take place within three years of the commission of the alleged offence, unless it be the attempted assassination of the king, in which case the prisoner shall be tried in the same manner as if charged with murder.

The punishment for high-treason has always been death. In its old savage form, first inflicted in 1284 on the Welsh prince David, and on Sir William Wallace a few years later, and in force till 1870, the sentence provided that the criminal should be drawn on a hurdle to the place of execution, be hanged but not till he is dead, be cut down and have his entrails torn out and burned before his eyes, and then be beheaded and quartered, his remains to be disposed of as the king should think fit (see Drawing and Quartering). That sentence was last passed (though not carried out) in 1867 on the Fenians Burke and O'Brien. Women were burned alive, though the sentence might be commuted by the king to beheading, as in the case of Lady Alicia Lisle (q.v.). The punishment is now execution by hanging. The Act of 1870 prevented forfeiture of property on conviction for treason;

but it is thought the Act of 1868, abolishing public executions, does not apply to those convicted of this crime. See Stephen's *Digest*, p. 45.

Law of Treason in Scotland.—After the Union (1707) an act (7 Anne, c. 21) was passed making the Scots law of treason the same as the English. Thus the prosecution is not at the instance of the Lord Advocate but on the presentment of a grand jury, and there is a petty jury of twelve who determine the guilt or innocence of the prisoner. Trial in absence or after death was also abolished. The traitor's property is still forfeited, as the Act of 1870 does not apply to Scotland.

In the United States, where the people as a community, and not any one individual, is sovereign, treason is necessarily confined to levying war against the state, or adhering to and giving aid and comfort to its enemies. It implies the assembling of a body of men for the purpose of overturning or resisting the government by force; but an assembly for deliberative purposes alone does not fall under the head of treason, since the law distinguishes between deliberation and—what is a distinct step beyond it—any act of war, even though the latter be the direct outcome of the former.

See Chitty, *On the Criminal Law*; Stephen, *Digest and History of the Criminal Law; State Trials;* Macdonald, *Treatise on the Criminal Law of Scotland.*

Treasure-trove is the finding of hidden treasure in the earth; the word treasure meaning coin, gold or silver plate, or bullion. According to Roman law, treasure found by a man in his own land belonged to the finder; if found in the land of another, half was given to the owner of the land and half to the finder. By the law of England he who finds such things hidden in the earth is not entitled to them, but they belong to the crown. This is an exception to the general rule, that he who first finds a thing, whose owner is unknown, is entitled to keep it; and accordingly the exception is construed strictly, so that if the coin, &c. is not hidden in and covered by the earth the finder, and not the crown, is entitled to it. If it is treasure-trove in the strict sense above described, then it is the duty of the finder to give notice to the crown; and to conceal it or appropriate it is an indictable offence, punishable by fine and imprisonment. In Scotland the rule is the same, and the finder is bound to inform the sheriff of the finding. It is not so generally known as it ought to be that the crown is in the practice of paying to the finder the value of the property, on its being delivered up; from misapprehension of this matter it is believed that many curious relics are lost by their finders consigning them to the melting-pot. In 1886 the Home Office gave notice that finders of treasure would be permitted to retain articles not required for any national institution, subject to a deduction of 10 per cent.; articles required for museums, &c. are paid for at their antiquarian value, less 20 per cent. In the United States treasure usually belongs to the state in which it is found; Louisiana adopts the rule of Roman law as stated in the French civil code.

Treasury, the central department of the British executive government. After the Norman Conquest a separate board was appointed for revenue matters on the model of the Exchequer of Normandy, and a royal treasurer was appointed. Odo, Earl of Kent and Bishop of Bayeux, was the first holder of the office, and the early treasurers were for the most part churchmen. The office was sometimes held along with that of Justiciar. The Lord High Treasurer was one of the great officers of state. So great was his political influence that James I. in 1612 thought it prudent to put the office into commission—i.e. to entrust it to a board of Lords Commissioners; since the death of Queen Anne no Lord High Treasurer has been appointed; the office has been always in commission. Similar offices existed in Scotland and Ireland. The Treasury Board now consists of four Lords Commissioners and the 'Chancellor of the Exchequer,' an officer originally appointed to check the accounts of the Treasurer (see EXCHEQUER, CABINET). The First Lord (the lord whose name stands first in the commission) is a political officer of the highest rank; he has no departmental duties to perform, and his office is therefore usually assigned to the prime-minister. Since 1806 the head of the administration has always presided over the Treasury; but in 1886 Lord Salisbury undertook the department of Foreign Affairs, the leader of the House of Commons acting as First Lord of the Treasury. The three junior lords perform such duties as it may be convenient to assign to them; they are usually members of the House of Commons, and it is customary to appoint an Englishman, a Scotsman, and an Irishman. The Treasury Board is now no more than a name; formal documents run in the name of 'my lords,' but the working head of the department is the Chancellor of the Exchequer, who holds under a distinct patent the office of Under-treasurer. There are two secretaries, both of whom are usually members of parliament; the Financial Secretary is specially responsible for the civil service estimates; the Patronage Secretary conducts correspondence relating to appointments, and acts as chief whip of the ministerial party in the House of Commons. The permanent officials of the Treasury enjoy a high reputation for ability, and the traditions of the office are not to be disregarded even by the most enterprising Chancellor of the Exchequer. When the First Lord of the Treasury is himself Chancellor of the Exchequer he receives only half the salary of the latter office.

Since the Restoration it has been the established practice to keep the receipt of revenue separate from the expenditure of public money; but the Treasury exercises a general control. By an arrangement sanctioned by parliament in 1834, all public revenue is paid into the Bank of England to the credit of the Comptroller-general; this officer is in fact the pivot of the whole system; he checks all receipts and payments, and reports independently to the House of Commons. The Boards of Customs and Inland Revenue, the office of Woods and Forests, and the Post-office are under the authority of the Treasury. Estimates of expenditure in all the public departments are submitted to and revised by the Chancellor of the Exchequer, who is thus enabled to take a comprehensive survey of the resources and liabilities of the nation. Towards the end of the financial year he opens his budget in committee of the House of Commons, estimates the total expenditure of the coming year, and indicates the ways and means by which the required sum may be raised. Payments on account of the army, navy, civil service, &c. are made by the Paymaster-general on the authority of the Treasury. Under various statutes the Treasury regulates the salaries of newly-created officers in other departments, and fixes the number of officers employed in new departments. The duties of the Treasury also comprise the examination of the expenses of legal establishments, sheriffs, county courts, and criminal prosecutions. The Solicitor to the Treasury is a permanent official of great importance; his office is now combined with those of the Public Prosecutor and the Queen's Proctor. For a full account of the law relating to this subject, see Todd's *Parliamentary Government in England.*

Treaty, in Public International Law, is an agreement or contract between two or more separate states, by means of which the jural relations subsisting between them are defined. As treaties are merely contracts, the rules for their negotiation, from a jural point of view, do not differ from those regulating the constitution of valid contracts in any other department of jurisprudence. Thus, in order to the validity of a treaty, the parties to it must be capable of contracting—a condition which renders void contracts entered into by protected states or members of a confederation when such contracts are in excess of the powers retained by these states; the agents employed must be duly empowered to contract on behalf of their respective states; the situation of the parties must be such that their consent may be regarded as having been freely given; and the objects of the agreement must be, physically and morally, possible and generally in conformity with law. No special form is prescribed by international usage as necessary for treaties. From the moment that consent on both sides is clearly established an obligatory treaty exists; but generally of course international contracts are, as a matter of prudence, consigned to writing. Sometimes treaties take the form of a specific agreement signed by both parties; but more frequently they take the form of a joint declaration or of an exchange of diplomatic notes. In practice the word treaty is commonly used for the larger political or commercial contracts, the term convention being applied to agreements on points of minor importance. When, as is usually the case, a treaty is entered into through the agency of official plenipotentiaries, it is necessary to its validity that it be ratified, either expressly or tacitly, by the supreme treaty-making power of the state. The constitution of each particular state determines in whom resides this supreme power of contracting treaties with foreign powers. In monarchies, whether absolute or constitutional, it is usually vested in the sovereign. In Great Britain the exercise of this power is subject to parliamentary censure; and ministers who advise the conclusion of any treaty which shall afterwards be judged derogatory to the honour or disadvantageous to the welfare of the nation are liable to impeachment, a proceeding of which English history affords numerous instances. In republics the chief magistrate, senate, or executive council is usually entrusted with the sovereign power. By the constitution of the United States the president prepares treaties; he discusses the conditions with foreign governments, and signs the treaty; but, over and above this, a sitting of the senate is required to approve the treaty, and no less than a majority of two-thirds in order to ratify it.

Concerning treaties, considered as sources of international law, there is a wide difference of opinion. Many Continental publicists regard treaties, or a certain class of them, as forming a sort of international jurisprudence; while on the other hand most British and American writers are disposed to lay small stress on them. Treaties assented to by all or nearly all civilised states, and avowedly making changes in the law, or laying down new rules, are important in proportion to the number of states which sign them. If they are accepted by all civilised states, or if, without this formal acceptance, the rules contained in them are tacitly adopted by many states, the treaties undoubtedly are sources of international law. Such treaties are rare, the Declaration of Paris in 1856 and the Geneva Convention of 1864 being the most conspicuous examples. Another class of treaties which form an important source of international law are those which are expressly declaratory of that law as understood by the contracting parties: e.g. the Protocol signed at the Conference of London in 1871 and the Three Rules of the Treaty of Washington in the same year. On the other hand, treaties signed by two or three states only, and stipulating for a new rule or rules as between the contracting parties, are evidence of what international law is not rather than of what it is. If, however, the new rule works well, and is gradually adopted by other states, it may win its way into the international code. Far the most numerous class of treaties are those merely settling some matter of dispute between the parties to them; these contain no rules of international conduct, and do not in any way affect international law.

Performance of the stipulations contained in a treaty used frequently to be secured by the taking of hostages. This is now in disuse, the treaty of Aix-la-Chapelle in 1748 being the last occasion upon which hostages were given, except in military conventions. The occupation of territory and the mortgaging of revenue have also often been used as modes of taking security. The most common means of securing the execution of a treaty is now through a treaty of guarantee by a third power. Treaties are interpreted according to practically the same rules as the contracts of private individuals. Collections of treaties are either general or national. The former class are made up of selections from the treaties of all nations; the latter include only the treaties to which a particular country was a party. The chief national collection of British treaties is that of L. Hertslet, librarian of the Foreign Office, continued by his son and successor, Sir Edward Hertslet.

Trebbia (anc. *Trebia*), a southern tributary of the Po, which rises in the Ligurian Apennines. Here Hannibal (q.v.) decisively defeated the Roman consul Sempronius, 218 B.C.

Trebelli, Zelia, opera-singer, was born of German parents called Gilbert at Paris in 1838, and made her début at Madrid under the name of Trebelli (? Gillebert transposed) in 1859. The next year she entered on a series of triumphs at Berlin, and in 1862 passed to London, where her success was also immediate. In the years that followed, marked by tours in Scandinavia, Russia, and the United States (1884), she held the position which she had at once assumed of the greatest mezzo-soprano of her day, winning applause equally on the stage or in the concert-room for her rich, brilliant voice and wonderful executive power, and for the marvellous range of expression that touched at one extremity an 'almost manly vigour' and at the other the most perfect womanly tenderness and delicacy. She died 18th August 1892.

Trebizond (Old Gr. *Trapezous;* mediæval Lat. *Trebisonda;* Turk. *Tarabzûn*) is the capital of a province in the extreme NE. of Asia Minor. The city is a flourishing seaport on the Black Sea coast, between the sea and the mountains; its importance being due to the fact that it stands on the great overland trade-route between Europe and Persia over the tableland of Armenia, though this trade has been much injured by the Batoum-Tiflis railway. It is surrounded by walls of great extent, which have numerous picturesque forts and enclose numerous gardens as well as the town itself. Outside the walls are various suburbs, where most of the Christian inhabitants reside, and in which the principal bazaars and khans have been established. The harbour is but a roadstead, not protected on the north-east, and vessels cannot come close inshore; but there is regular communication with Constantinople, the mouth of the Danube, and some Mediterranean ports. The pop. (50,000) comprises Turks, Armenians, Greeks, and Persians.

The city is noted for its silk manufactures, which, however, are fast decaying. The old Greek city dates from 700 B.C., and was founded by a colony from Sinope. Conquered from Mithridates by the Romans, it rapidly rose in importance, became a free city, and was made by Trajan the capital of Pontus Cappadocius. On the capture of Constantinople by the Crusaders in 1204 one of the imperial Byzantine family, Alexis, established himself at Trebizond, where he had previously exercised the functions of governor, and founded a state known as the *Empire of Trebizond*, which stretched from the Phasis to the Halys, and maintained its independence against the Turks till 1462.—George of Trebizond (1396–1486), descended of parents from Trebizond, was born in Crete, but settled in Italy in 1420 as a teacher of rhetoric, Greek grammar, and philosophy.

Treble, the highest part in harmonised music, which in general contains the melody, and is sung by a Soprano (q.v.) voice. For the treble or G clef, see CLEF.

Trede'gar, a market-town on the north-west border of Monmouthshire, 12 miles WSW. of Abergavenny and 7 ENE. of Merthyr-Tydvil. Grown from a mere village since 1800, it stands in the midst of a district rich in coal and ironstone; but its iron and steel works are a thing of the past. Pop. (1851) 8305; (1881) 18,771: (1891) 17,484.

Tredgold, THOMAS, architect and engineer, was born at Brandon, near Durham, 22d August 1788. While apprenticed to a cabinetmaker, and while working as a carpenter in Scotland, he devoted his leisure time to the study of the principles of architecture and kindred subjects. From 1813 to 1823 he worked with his relative Mr Atkinson, architect to the Ordnance Board, and next commenced business on his own account as a civil engineer. He died 28th January 1829. Tredgold's scientific contributions to periodicals and also to the *Encyclopædia Britannica* range over a wide field; but his most valuable works are *The Elementary Principles of Carpentry* (4to, 1820; revised ed. by Hurst, 1871; and Tarn, 1886) and the *Strength of Cast Iron* (1821).

Tree, any woody plant of perennial duration, the natural habit of which is to rise from the ground with a distinct trunk, in contradistinction to Shrub, which naturally produces several stems more or less directly rising from the root. The terms are, however, somewhat arbitrary in their application. Trees are found in all climates except the coldest, but the number of species, as well as the luxuriance of the forests, is greatest in the tropics. As we advance towards the polar regions, or ascend high mountains, trees disappear before other forms of vegetation. The different characters of trees affect very much the landscape of the countries in which they grow; some countries, and particularly in northern parts of the world, being covered with sombre pine forests, whilst others abound in ash, beech, and similar trees of verdant foliage. Every kind of tree has its peculiar character, not only in its foliage, but in its general form and its mode of branching. An ash is as easily distinguished from an elm by a practised eye in winter when destitute of leaves as in the full foliage of summer. No acotyledonous plant assumes the character of a tree, except a few ferns known as Tree-ferns. See also ARBORICULTURE, GARDENING, TIMBER, TRANSPLANTING, WOOD; and for tree-worship, see PLANTS, p. 224.

In Law, trees and shrubs are fixtures, and on sale pass with the land to the purchaser. Except in nursery gardens, shrubs are reserved to the landlord. Even a lease of land with woods gives only the right of thinning plantations, cutting copsewood, and of cutting wood for repairing or building houses upon the ground, but not of selling wood. Injuries to trees are punishable at common law as malicious mischief.

Tree-fern, the common name for ferns with arborescent trunks, of which there are many species, all natives of tropical and subtropical countries. Their stems are formed of the consolidated bases of the fronds, surrounding a central column of soft tissue, in which the circulation takes place. In the landscape their columnar trunks, surmounted by graceful crowns of spreading fronds, have a similar

Tree-fern (*Cyathea dealbata*).

effect to the palms. The height to which they attain varies from 2 or 3 feet to 80 feet, according to the species. The Alsophilas and Cyatheas are the giants of the tribe. *A. excelsa*, a native of Norfolk Island, is stated by Captain King to grow to the height of 80 feet. Preserved in the British Museum is a trunk of *A. brunoniana*, an Indian species, which measures 45 feet. The pith or soft cellular matter in the centre of the stem of *A. excelsa* and *A. medularis*, the latter a native of New Zealand, is greedily eaten by swine, and when cooked resembles inferior turnips in taste and texture. Numerous species of tree-fern are cultivated in British conservatories.

Tree-frog (*Hylidæ*), a family of Amphibians, more closely related in structure to the Toads than

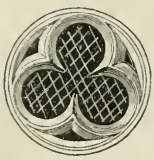
Tree-frog (*Hyla arborea*).

to the Frogs proper. The family is a large one, the typical genus Hyla alone including ninety-five species. Of these by far the greater number are peculiar to America; about twenty species are

found in Australia and two in Asia, while only one (*H. arborea*) occurs in Europe. The tree-frogs show various interesting adaptations to their arboreal life. The last joint of each toe bears a claw, on which is supported a disc or sucker, by means of which the animal can cling to a perfectly perpendicular surface. Most of them also exhibit in a greater or less degree the power of colour-change. This power is seen most perfectly in *H. versicolor*, where the colour varies from a dark brown to a lichen-like gray or a brilliant green. The name tree-frog is often extended to Hylodes, a genus of the family Cystignathidæ, and to various species of Ranidæ, which are arboreal in habit, and are furnished with suckers like those of the true tree-frogs. In the male of the common tree-frog the skin of the throat may be distended into a resonant bladder, which greatly increases the sound of the creature's voice.

Tree-nettle. See NETTLE-TREE.

Trefoil, a name given to many herbaceous plants with leaves of three leaflets, as Clover (q.v.), Lotus (q.v.), Medick (q.v.), Buckbean (q.v.), &c. The term is used also in Architecture (for a three-lobed aperture in tracery) and in Heraldry.



Trefoil in Architecture.

Tregelles, SAMUEL PRIDEAUX, New Testament critic, was born at Falmouth, January 30, 1813. He was educated at Falmouth grammar-school, and spent some years as a private teacher, but from an early age gave himself to the study of the New Testament text, and at twenty-five formed the plan of a Greek New Testament on the principles which he afterwards carried out. In preparing for his *magnum opus* he visited the Continent three times in search of MSS., and spent five months in Rome, where he was allowed to see, but not to collate, the *Codex Vaticanus*. The first part appeared in 1857; the sixth, completing the text, in 1872. The seventh part, containing the *prolegomena*, appeared in 1879, edited by Dr Hort and A. W. Streane. Other works of this laborious scholar were the *Codex Zacynthius* (1861), and *Canon Muratorianus* (1868); an *Account of the Printed Text of the Greek New Testament* (1854), and *Remarks on the Prophetic Visions of Daniel* (1847). Besides these he edited *The Englishman's Greek Concordance*, and *The Englishman's Hebrew Concordance*, and translated Gesenius' *Hebrew Lexicon* (1847). Tregelles received a pension of £100 in 1862, which was doubled in 1870. In 1861 and again in 1870 he was stricken by paralysis, yet persevered in his labours with a noble fortitude. He was invited to join the New Testament Revision Committee in 1870, but was prevented from attending by ill-health. An earlier honour was the LL.D. degree from St Andrews (1850). Tregelles was of Quaker parentage, but in early life joined the Plymouth Brethren, from whom in later years he separated. He died on the 24th of April 1875.

Trégnier, a small port of 2763 inhabitants in the department of Côtes-du-Nord, Brittany, the birthplace of Renan.

Treinta y Tres, an eastern department of Urugnay (q.v.), washed by the Lagoa Mirim. The name was given to commemorate the *thirty and three* patriots who on 19th April 1825, after revolutionary meetings in Buenos Ayres, crossed the Plate and proclaimed a revolt against Brazil.

Trelawney, EDWARD JOHN, a venturesome Cornishman whose name is strangely linked with the names of Shelley and Byron, sprang from a famous and ancient family, was born in 1792, and entered the navy at eleven. Harsh treatment, together with a native spirit of insubordination, made him desert, and he is said next to have joined a privateer, and to have lived a life of desperate enterprises in the Indian and Malay Seas. In January 1822 he made the acquaintance of Shelley at Pisa, and it was he who took the chief part in the burning of the poet's body in August on the shore near Via Reggio. Next year he accompanied Byron to Greece, and there remained some time after Byron's death, attached to the fortunes of the chief Odysseus, who came to be more or less in open opposition to the government. Once while sheltering in the cave of Odysseus a treacherous Englishman shattered Trelawney's jaw with a bullet; but he, with characteristic magnanimity and though himself expecting death, saved the wretch from the vengeance of his men and sent him away in safety. Trelawney next travelled in North and South America, lived awhile in Italy, and spent his last years in Monmouthshire or Sussex, dying at his residence at Sompting near Worthing, 13th August 1881. His body was cremated, and the ashes carried to Rome and laid beside the graves of Shelley and Keats. Trelawney was a man of indomitable courage and generous to a fault, but restless, impatient, and completely impracticable. He had scarcely ever had an illness, to the last wore neither overcoat nor underclothing, took scarce any animal food, and was almost abstemious throughout his life. Remarkably handsome in youth, in old age his presence was no less striking. He sat for the old Arctic voyager in Millais's well-known picture, 'The North-west Passage.' Trelawney published two books, *The Adventures of a Younger Son* (1830; new ed. 1890), a vivid though ill-constructed story, based on the adventures of his own youth; and *Recollections of the Last Days of Shelley and Byron* (1858), re-issued in 1878 with considerable changes as *Records of Shelley, Byron, and the Author*. The importance of the latter is of course almost altogether relative; it reveals considerable power of insight into character, and betrays, as might have been expected, much greater sympathy for Shelley than for Byron.

Trelawney, Sir JONATHAN, from Westminster passed in 1663 to Christ Church, Oxford, and became bishop in turn of Bristol (1685), Exeter (1688), and Winchester (1707); he was one of the Seven Bishops (q.v.) tried under James II., and is the hero of R. S. Hawker's well-known ballad, 'And shall Trelawney die.' This was based on a contemporary refrain, the strong feeling aroused among the Cornishmen due rather to Trelawney's being head of an ancient Cornish house than to his being a bishop or even a martyr in a good cause. Trelawney died in 1721.

Tremad'oc Slates. See CAMBRIAN SYSTEM.

Trematodes, a class of flat-worms whose members are parasitic in or on a great variety of animals. The body is unsegmented, leaf-like, or more or less cylindrical, and provided with adhesive suckers. In one set, mostly cetoparasitic, the embryo develops directly into the adult sexual forms; of this 'monogenetic' life-history Polystomum (e.g. in the frog), Deplozoon (on minnows), Gyrodactylus (on various fresh-water fishes), Calicotyle (on rays), Aspidogaster (in the fresh-water mussel) are illustrative types. In another set, mostly endoparasitic in vertebrates, the embryo gives rise to one or more generations of non-sexual forms; of this 'digenetic' life-history the liver-fluke (Distomum), Monostomum, and Bilharzia are illustrative. All are hermaphrodite except Bilharzia, and self-impregnation is common. See FLUKE, BILHARZIA, &c.

Tremella, a genus of Fungi, of the division Hymenomycetes, soft and gelatinous, mostly growing on decaying wood. In some places they receive such popular names as Witches' Meat, and an imaginary medicinal value has been ascribed to them.

Tremolite, one of the amphibole group of minerals. It is composed of silica, magnesia, and lime, and has a hardness of 5·5 to 6, and a specific gravity of 2·9 to 3. It occurs usually in long prisms, white or gray, vitreous, and translucent to opaque, but frequently appears as fibrous asbestos-like aggregates with a silky lustre. Tremolite is usually associated with crystalline schistose rocks, often occurring in the granular limestones, and sometimes forming the chief material of the so-called tremolite-schists.

Trench. See SIEGE.

Trench, RICHARD CHENEVIX, Archbishop of Dublin, belonged to an Anglo-Irish family of Galway, the Trenches of Woodlawn, and was born at Dublin, 9th September 1807. He passed from Harrow in 1825 to Trinity College, Cambridge, where he graduated in 1829. After a journey to Spain (its object to fight in the cause of liberty) and his ordination he was curate at Hadleigh, incumbent of Curdridge in Hampshire, and then for four years curate to Samuel Wilberforce, afterwards Bishop of Winchester; and during 1835–46 he published six volumes of poetry, which were favourably received, and which were re-issued as *Poems Collected and Arranged anew* (1865); the first of them was *The Story of Justin Martyr*. In 1845 Trench was presented to the rectory of Itchenstoke; in 1847 he became Theological Professor in King's College, London; in 1856 Dean of Westminster; and in 1864 Archbishop of Dublin, an office which he resigned in 1884. He died 29th March 1886, and was buried in the nave of Westminster Abbey. Trench's poetry was marked by sensibility and refinement, but not by genius. His theological writings laid his contemporaries under deep debt of gratitude, more for their tone and spirit than for originality or critical insight. And in the field of philology, while his interest was not in scientific problems for their own sake, he took pains to secure accuracy in his facts, and contrived to fascinate his readers with the 'fossil poetry and fossil history imbedded in language.' His principal works are *Notes on the Miracles* (1846; 12th ed. 1884), *Notes on the Parables* (1841; 15th ed. 1886), *The Lessons in Proverbs* (1853), *Hulsean Lectures* (1845; 5th ed. 1880), *The Sermon on the Mount illustrated from St Augustine* (1844), *Sacred Latin Poetry* (1849), *St Augustine as an Interpreter of Scripture* (1851), *Synonyms of the New Testament* (1854), *English Past and Present* (1855; 11th ed. 1881), *An Essay on the Life and Genius of Calderon* (1856), *Deficiencies in our English Dictionaries*, *Select Glossary of English Words* (1859), *The Study of Words* (1851; 15th ed. 1888), a memoir of his mother (1862), *Studies on the Gospels* (1867), and *Lectures on Mediæval Church History* (1877). See his *Letters and Memorials* (2 vols. 1886).

Trenck, THE BARONS. The cousins Franz and Friedrich, Freiherren (or Barons) von der Trenck, soldiers and adventurers, were descended from an ancient house of East Prussia. The elder, Freiherr Franz, was born at Reggio, in Calabria, on 1st January 1711, where his father was an Austrian general. When he was seventeen he received a commission as a cavalry officer, but he fought duels and indulged in such adventures that he had to flee in consequence, and went to Russia, where he was made a captain of hussars. Cashiered and imprisoned for insubordination, he returned to settle on his estates in Slavonia. At the outbreak of the Austrian war of succession (1740) he obtained from Maria Theresa permission to raise at his own cost a body of 1000 Pandours (q.v.), who, increased to 5000, formed the advanced guard of the imperial army in Silesia. But Trenck and his Pandours were even more distinguished for outrageous cruelty than for reckless daring; there had been no such monster, says Carlyle, since Attila and Genghiz. On the 7th of September 1742 he attacked Cham, a town in neutral territory, this act being, of course, in defiance of all law and discipline; and he completely annihilated it. After the battle of Sohr, in September 1745, he offered to capture Frederick the Great and bring him a prisoner to the Austrian camp. He failed in the enterprise, with great loss of men, but he secured the king's tent and much valuable booty. Suspicions were, however, entertained that he had allowed the king to escape, or even that he was in communication with the enemy, and he was tried by court-martial. He was imprisoned at Vienna, but made his escape with the assistance of a lady of rank; he was however captured, and condemned to life-long imprisonment in the Spielberg at Brünn, where he poisoned himself, 14th October 1749.

See his Autobiography (1748; new ed. 1807); the Life by Hübner (1788); a monograph, *Freiherr Franz von der Trenck* (3d ed. Celle, 1868); and Carlyle's *Frederick the Great*.

Freiherr Friedrich was born at Königsberg, 16th February 1726, the son of a Prussian major-general, and distinguished himself at the university. At sixteen he became a cornet in the guards; and two years afterwards he attempted some kind of intrigue with the Princess Amalia, and fell into disfavour. The discovery of a correspondence (itself innocent enough) with his Austrian cousin led to his imprisonment at Glatz, whence in 1747 he escaped to take service in the Austrian army at Vienna. Having returned to Prussian territory on family business, he was clapped in prison by Frederick the Great, and on his attempting to escape from the fortress of Magdeburg was heavily ironed—hands, feet, and waist. He was released on 24th December 1763, and afterwards settled at Aix-la-Chapelle, where he married the burgomaster's daughter, and went into business as a wine-merchant. He published his Memoirs in 1787. The book was translated into all languages, and Trenck became more famous than his famous cousin; several plays founded on his adventures were brought out on the French stage. In 1774–77 he had travelled in England and France, and the restless man received again his confiscated Prussian estate. But having gone to Paris during the Revolution, he was imprisoned by Robespierre as a secret political agent, and guillotined near the Barrière du Trône, 25th July 1794.

See Carlyle's *Frederick the Great;* Trenck's Autobiography (full of exaggerations, 1787); the Life by Wahrmann (1837); and the monograph, *Freiherr Friedrich von der Trenck* (3d ed. Celle, 1868). A complete edition of Trenck's collected works, containing his poems, was published in 8 vols. in 1786.

Trendelenburg, FRIEDRICH ADOLF, philosopher, was born at Eutin, 30th November 1802, and was for nearly forty years professor at Berlin, and a member of the Academy; he also sat as a Conservative in the Prussian Second Chamber. He died 24th January 1872. His principal works are *Elementa Logices Aristotelicæ* (1837; 8th ed. 1878; trans. as *Elements of Logic*, 1881); *Logische Untersuchungen* (1840; 3d ed. 1870); *Historische Beiträge zur Philosophie* (1846–67); and *Naturrecht* (1860). See the Memoir by Bratuschek (1873), and a work by Orphal (1891).

Trent, a river of central England, the third in length, rising on Biddulph Moor on the north-west border of Staffordshire, and flowing south-east through Staffordshire, then north-east through the counties of Derby, Leicester, Nottingham, and Lincoln, till it unites with the Ouse to form the Humber, about 15 miles W. of Hull. It receives on the right the Sow, Tame, Soar, and Devon, and on the left the Blythe, Dove, and Derwent; passes the towns of Burton, Nottingham, Newark, and Gainsborough; and is about 150 miles long—navigable for barges to Burton (117 miles), for vessels of 200 tons to Gainsborough (25 miles). By canals it is widely connected with many of the great Midland manufacturing towns. See *The Rivers of England* (Cassell, 1889).

Trent, a small lake flowing by the Trent River into Lake Ontario. By this valley it has been proposed to connect the Georgian Bay of Lake Huron with Lake Ontario. The total length of the canal would be 197 miles; but the longer part of the course would consist of lakes and rivers.

Trent (Ital. *Trento*, Ger. *Trient*, Lat. *Tridentum*), a town of Austria, in the southern part of Tyrol, on the left bank of the Adige, in a beautiful and fertile valley, surrounded by high limestone hills, 145 miles by rail SSW. of Innsbruck and 59 N. of Verona. In its general aspect and architecture Trent is quite an Italian town; and with its spires and towers, ruined castles and ancient embattled walls, it presents an imposing appearance from a distance. It is surrounded by modern detached forts. The *Piazza Grande* is adorned with a splendid fountain of red marble, surmounted by a colossal statue of Neptune with his trident. The cathedral, begun in 1212, is a beautiful specimen of Lombard Romanesque, with a few features suggestive of the contemporary German style. The church of Santa Maria Maggiore (15th century) was the meeting-place of the famous Council. Among other public buildings are the seminarial church (formerly the Jesuits' church), ornamented with the richest foreign marbles; the theatre; the town-hall; some noble private mansions; and the Palazzo Buonconsiglio adjoining the town, a noble specimen of the feudal architecture of North Italy, now occupied as a barrack. Trent manufactures silks, wine, pottery, confections, and sugar, and has a brisk transit trade. Pop. (1880) 19,585; (1890) 21,653.

The ancient *Tridentum* or *Tridente* derived its name from the Tridentini, an Alpine tribe, whose capital it was. In 1027 its prince-bishops obtained the temporal rule of the valley of the Adige, and under them Trent rose to great prosperity. It became Austrian in 1803, and after much fighting was Italian from 1809 to 1813, when it was restored to Austria. It is still the see of a prince-bishop. The inhabitants are quite Italian in language and habits; and the restoration to Italy of Trent and the *Trentino* (district of Trent) is, with that of Trieste, the chief aim of the *Italia Irredenta* agitation in Italy.

The Council of Trent, generally reckoned as the eighteenth œcumenical council of the church, assembled at Trent, and sat with certain interruptions from December 13, 1545, until December 4, 1563. From the first outbreak of the Reformation a council of some sort had been called for by both Catholics and Protestants. Luther and his friends thought of one in which all Christians should be represented and the Scriptures accepted as the sole rule of faith. The emperor and many Catholic princes desired a council mainly for the reformation of abuses in ecclesiastical government and discipline, a reform, as the phrase went, 'in the head and members,' and to obtain certain concessions in doctrine and ritual, in the hope of conciliating Protestants and restoring to Europe religious peace. The pope and the Roman court, on the other hand, recognised in general the need of reform, and made sundry efforts in that direction, but for some time regarded the convocation of a council with undisguised aversion, from a well-grounded fear lest the emperor should dictate the subjects of debate and usurp the functions of the holy see, and partly lest the council itself should, in the spirit of some recent synods, presume to declare itself superior to the pope, and initiate reforms unacceptable to the Roman curia. It was the object of the popes, with or without a council, to more clearly define Catholic doctrine, pronounce the condemnation of the new heresies, strengthen the bonds of ecclesiastical unity, and consolidate the papal power. These conflicting aims and interests supply the key to the intricate negotiations which led first to the long delay in the meeting of the council, and subsequently to its several prorogations and suspensions, covering in all a period of more than forty years. Clement VII., who for ten years had resisted the pressure put upon him by Germany, at length, after an interview with the Emperor Charles V. in 1533, consented to call a council at Mantua or some Italian city. The Protestants now in their turn made difficulties, and insisted upon a freedom of debate and a reopening of closed questions which were incompatible with the traditions and principles of the Roman Church. Meanwhile England was lost to the pope, and Paul III. (December 1534), recognising that a council was inevitable, set himself earnestly to overcome all practical difficulties, indicted the council first at Mantua for May 1536, then at Vicenza, and again, without success, at Trent in 1542, until finally the council actually opened at the latter place, as has been said, December 13, 1545, the twelfth year of the pontificate of Paul, with four archbishops, twenty-two bishops, five generals of orders, and two ambassadors, under the presidency of three papal legates, the cardinals Del Monte (afterwards Julius III.), Cervini, and the Englishman Reginald Pole.

It was at once apparent that, though considerable freedom of speech was tolerated in the course of debate, the procedure of the council and its final decrees were under the immediate control and direction of the pope. Matters for deliberation could only be proposed by the legates, though this was a source of frequent complaint and contention; and the legates on all questions of difficulty awaited the pope's decision. The pope had desired that matters of doctrine should be dealt with first, while the emperor demanded that the council should begin with practical reforms. It was finally agreed that doctrine and discipline should be treated simultaneously in every session. The decrees were prepared in particular congregations, or select committees, afterwards more fully discussed and voted upon in general congregations, and finally proclaimed in public sessions. The position which the council was to take up with regard to the principles of the Reformation was soon made clear. In the fourth session, held April 8, 1546, sacred tradition, or the unwritten Word of God, was put on a par with Scripture, all the books contained in the Vulgate, including the so-called Apocrypha, were declared to be canonical, and the Vulgate version was pronounced 'authentic.' The important doctrine of Justification, which some of the bishops admitted to be comparatively new and to raise questions which the Schoolmen had not fully treated, was after much discussion laid down (sixth session, January 13, 1547) in terms which involved the emphatic condemnation of the

Lutheran teaching, as well as of certain moderate views in that direction which had recently found favour within the Roman Church, and had been advocated by Cardinal Pole, who in the preceding October had resigned his legation on the plea of health. Discussions followed on original sin and the sacraments; but while the new heresies were explicitly condemned, care was taken not to close, without grave reason, any questions which divided the Thomists and Scotists or the orthodox schools of Catholic theology. Many ancient subjects of dispute, as, for example, the Immaculate Conception, were thus designedly left unsettled. One of the most prolonged of the party struggles which agitated the council arose at the earliest stage of its proceedings out of a discussion on the laws regarding episcopal residence. The Spanish bishops, who formed a strong minority, and who were at times supported by the French, were eager to strengthen the authority of bishops, and wished the council to define that episcopal jurisdiction was derived immediately from Christ and not through the pope. The Italians, supported by the legates in the interests of papal centralisation, were opposed to any such definition. It was not till towards the close of the council in 1563 that a decree, so worded as to leave the point in ambiguity, was accepted as satisfactory. Meanwhile the legates, seeing the emperor irritated by the action of the council, and his power much increased by the recent course of political affairs, had become anxious to transfer the council to a spot less open to his influence. An epidemic at Trent afforded a sufficient pretext for removing in March 1547 to Bologna. Certain bishops in the imperial interest remained at Trent, and for a time there was risk of a schism. The fathers at Bologna, however, abstained from publishing any decrees; and the few sessions there held related only to successive prorogations until in September 1547 the council was suspended *sine die*.

In February 1550 Julius III. succeeded to the papacy, and in the following year, May 1551, reopened the eleventh session of the Council at Trent under the presidency of Cardinal Crescenzio. It now sat for about twelve months, but in April 1552 the military successes of Maurice of Saxony led to another suspension. Meanwhile, in this second period of the council, the fathers had proceeded with the doctrine of the sacraments, and transubstantiation was defined. Certain Protestants now desired to be heard, and a safe conduct was accorded to their deputies, who were received in a general congregation; but their demands were considered impracticable, and the negotiations came to nothing.

Many years now passed, with little thought or opportunity of renewing the council. Meanwhile, the Emperor Charles V. had abdicated. Julius was succeeded by Cardinal Cervini, Marcellus II., and he in turn by the stern reformer Paul IV. (1555–59), who occupied himself mainly with the organisation and extension of the Inquisition. To Pius IV. (1560–66) belongs the credit of renewing the council, and, by his energy and tact, bringing it to a successful conclusion. This third period, in many respects the most important, begins with the seventeenth session, held in May 1562. Disciplinary decrees were passed regarding episcopal duties, the religious orders, the education of the priesthood, and the censorship of books. Clandestine marriages were by a new law made invalid. The odious office of questors of alms was abolished. Doctrinal decrees were issued on the mass, purgatory, the veneration due to saints, and the doctrine of indulgences.

During these last sessions (seventeenth to twenty-fifth) there were present at one time or another, besides ambassadors and theologians, 270 prelates, of whom 187 were Italians, 31 Spaniards, and 26 Frenchmen. The decrees of the entire council were confirmed, January 26, 1564, by Pius IV., who in the same year published the Profession of the Tridentine Faith, a brief summary of doctrines, generally known as the Creed of Pius IV. (see Vol. III. p. 555).

Several important works, recommended or initiated by the council, but which the fathers could not effectually carry out, were handed over to the pope for completion. Thus, the revision of the Vulgate, ordered at Trent in 1546, was finally completed under Clement VIII. in 1592. Pius V. founded the Congregation of the Index to carry out the work attempted but left unfinished by the council. The same pope also undertook the revision of the Breviary, and in 1566 published the *Catechism of the Council of Trent* (see Vol. III. p. 3).

The first important history of the council was written in a very hostile spirit by a Servite friar of Venice, Paul Sarpi (q.v.), whose book was published in Italian under a feigned name at London in 1619, and afterwards translated into English by Brent in 1640. The Jesuit, Cardinal Pallavicini, who had access to Vatican archives, wrote a refutation of Sarpi in his *Istoria del Concilio* (2 vols. fol., Roma, 1656). Le Plat, in his *Monumenta Concilii* (Louvain, 1781), printed a large collection of documents; to which must be added the *Acta Genuina*, printed by Theiner (1874) from the diary of Massarelli, the secretary of the council, and the *Sammlung von Urkunden* of Döllinger (1876). The best general history in English is that of the Rev. T. A. Buckley (Lond. 1852), who has also translated the *Canons and Decrees* (1851) and the *Catechism;* with which should be compared, on the Roman Catholic side, Waterworth's *Canons and Decrees*, &c. (1848). An interesting account of the debates within the council will be found in Mendham's *Memoirs* (1834), which includes the history of the synod under Pius IV. by Paleotto, the protonotary. See also Ranke's *History of the Popes;* Philippson, *La Contre-Révolution Religieuse au XVI^e Siècle* (1884); and Dejob, *De l'Influence du Concile de Trente sur la Littérature*, &c. (1884). And see Roman Catholic Church, Transubstantiation.

Trent Affair. In October 1861 Captain Charles Wilkes, U.S.N., intercepted at sea the British mail-steamer *Trent*, bound from Havana to St Thomas, and took off two Confederate commissioners accredited to France, senators Mason and Slidell, who were among her passengers. They were taken to Boston, and imprisoned in Fort Warren, but were released on January 1, 1862, on the demand of the British government, and suffered to proceed to Europe. The affair created intense excitement at the time, but Secretary Seward accepted Britain's demand as an adoption of the American doctrine which denied the 'right of search,' and on that ground replied that the prisoners would be 'cheerfully given up.'

Trente-un. See Rouge et Noir.

Trenton, the capital of New Jersey, is on the Delaware River, at the head of tide-water and of steam-navigation, 57 miles by rail from New York and 34 from Philadelphia. It is a handsome city, divided into Trenton and South Trenton by Assanpink Creek, and with wide, straight streets, in the residence portions delightfully shaded. The public buildings include a commodious state-house, federal buildings, a county court-house, city hall, and state lunatic asylum, arsenal, penitentiary, reform school, and normal school. The Delaware, which is crossed by two fine bridges, is largely utilised for water-power. The industry chiefly identified with Trenton is the production of crockery and pottery, of which it is the principal centre in the United States; but there are other manufactures of scarcely less importance, including iron, steel, and zinc, rubber goods, fire-bricks, &c. On December 26, 1776, Washington here surprised 1500 Hessians,

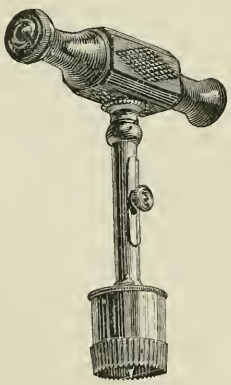
and captured nearly 1000, after crossing the Delaware during the night, amid blocks of floating ice and in the face of a fierce snow-storm. Pop. (1880) 29,910; (1890) 57,458.

Trenton Falls, a village of New York, on West Canada Creek, 17 miles by rail NW. of Utica, celebrated for its beautiful cascades (five, within a deep, narrow limestone ravine), with an aggregate fall of nearly 400 feet in 2 miles.

Trepan. See TREPHINE.

Trepang, the Malay name for species of Holothuria, principally *H. edulis* and *H. nigra*, much esteemed in China as a food delicacy. It passes also under the name of 'bêche de mer,' or sea-slug. The ordinary kind resembles a prickly cucumber; but they vary in colour when dried, being black, white, or red. There are no less than thirty-three different varieties enumerated by Chinese traders. It is gutted, boiled, split open, and smoke-dried. The average size is about 8 inches long, but some are found 2 feet in length. In the commercial form it is very hard and rigid, but when boiled down into a kind of gelatinous soup it is much esteemed. The fishing is carried on extensively on the northern coast of Australia, in India, Fiji, Tahiti, Macassar, Sumatra, and New Caledonia. Although there are so many varieties, only about five kinds have any great commercial value—viz. brown, large and small black, red, and white: these rank in importance in the order given. The average annual imports into China of trepang of late years are some 50,000 cwt., valued at about £250,000. It is only in China (where it is valued as an aphrodisiac) that this marine food-substance is appreciated; some is shipped annually from India to Hong-kong, and a little also from Japan.

Trephine. The instrument in its original form was like a carpenter's brace, and was called a *trepan*, from Gr. *trupaō*, allied to Lat. *tereo*, 'I bore.' The operation of trephining consists in the perforation of a bone, usually the skull, by means of a trephine, which is a small cylindrical or circular saw, with a centre-pin on which it works. It is practised on the skull in cases of fracture, chiefly when symptoms of compression or irritation of the brain are produced by depressed portions of bone, or by hæmorrhage beneath the skull; as a necessary preliminary to all operations on the brain—e.g. the evacuation of abscesses; for the removal of the focus of irritation in certain cases of epilepsy, &c., particularly where the disease has followed injury to the head; and even in rare cases for the removal of tumours. Trephining was known and practised in prehistoric times; some sixty skulls of the Stone Age that had been thus practised on are to be found in French archæological museums. Comparatively recently it was used almost as a routine treatment in severe head injuries; but it is now restricted to a very small proportion of such cases. The advance of knowledge of localisation of function in the brain, and the introduction of antiseptic methods in surgery have, however, extended its scope in other directions. It has recently been applied to the treatment of certain forms of idiocy and insanity, and in some cases with apparent benefit, at any rate for a time.



Trephine.

Trespass, in Law, is a physical interference with the person or property of another. However innocent the act, if it be voluntary, a legal wrong is done. Thus, if pursued by a wild beast you deliberately take refuge in another man's house, you commit a trespass; but if you rush there in mere blind fear, you do not. Again, if you drive in so careless a manner as to hurt any one, though unintentionally, this is a trespass. If animals or, indeed, any chattels are on a man's land doing damage, they may be seized and impounded till compensation be made. This remedy is called distress *damage feasant*. It is similar to distress at common law—e.g. there is no power of sale. If a dog worry cattle or sheep, the owner is liable since 1863. Formerly it was necessary to prove *scienter*—i.e. knowledge by the master of the animal's vicious disposition. *Scienter* must still be proved in other cases, and generally when animals, not savage by nature, do hurt—a legal doctrine quaintly parodied in the vulgar saying, that the dog is entitled to his first bite. Even in complete absence of real injury an action for trespass will lie, for, says Lord Denman, those rights are an extension of that protection which the law throws round the person. A verdict of a farthing damages is, however, the frequent and appropriate compensation for injury without damage (*injuria sine damno*).

As will be seen, there are various kinds of trespass: (1) trespass to goods, which consists in damaging them physically, as *asportation*—i.e. carrying them away; (2) trespass to the person, which is either battery, assault, or false imprisonment. Battery is an active attack on any one. Assault (q.v.) is an attempted battery; both are criminal offences as well as civil wrongs. False imprisonment is usually classed among the latter. It consists in depriving a man of his liberty without lawful excuse. Compelling any one to submit by the exhibition of superior force, though no actual violence be used, is a wrong of this nature. If a constable intervene, the question is, did he do so of his own initiative, or at the prompting of a third party? In the second case only, even if the arrest be illegal, can the third party be held liable for the false imprisonment. Trespass to the person may be justified on the ground that a man was acting in self-defence, that it was necessary to stop a breach of the peace, to apprehend a felon, or to assist police-officers in the execution of their duty, and that the person arrested was dangerous to himself and others. Various acts give power to arrest those found committing certain specified misdemeanours.

As regards trespass to land, since a plaintiff must succeed by the strength of his own, not by the weakness of his adversary's case, bare possession is a good title as against a wrong-doer; so the occupier may turn out an intruder, using, upon his refusal to depart peaceably, as much force as is necessary. If the possessor be forcibly turned out, he may forcibly re-enter, even though outer doors be broken open to effect the purpose. But this must be done immediately, otherwise the owner, though entitled to possession, will, if he use violence, render himself criminally liable under the statutes of Forcible Entry. In making a distraint for rent, or in levying an execution, but not in executing criminal legal process, it is a trespass to break open the outer door. Although the general rule is that any entry on another's land is a trespass, yet in certain cases of necessity an entry is excused—e.g. to abate a nuisance, or to prevent the spread of fire. A customary right of recreation or right of way will excuse what would otherwise be a trespass. Cut glass or spikes on a wall are allowable as a defence against intruders; but not man-traps

or spring-guns (except inside a dwelling-house), at least since 1827. Even before that a trespasser could recover for damages so done to him, unless he had notice of the existence of the engines in question. The mere act of trespassing on another's land is not a criminal offence, but by statute it is when in pursuit of game, on railways, on places where explosives are stored or animals afflicted with contagious disease are confined. Besides the remedies for trespass—viz. forcible expulsion and an action for damages—an injunction may be granted, even for a bare trespass, since the Judicature Act of 1873. The law of the United States is based on the English law.

The term trespass, in Scots law, is borrowed from that of England. It is restricted to trespass to land. The law on the subject is generally the same as in the rest of the United Kingdom. The Trespass Act, 1865, provides a summary form of punishment for those who camp upon open land, or lodge in premises or enclosures without leave. Against mere trespassers an interdict may be obtained. See RIGHT OF WAY, POACHING, GAME-LAWS.

Trevelyan, SIR CHARLES, was born on 2d April 1807, the fourth son of the Archdeacon of Taunton, and was educated at the Charterhouse and Haileybury College. He entered the East India Company's service, and became assistant-secretary to the Treasury (1840–59), governor of Madras (1859–60, being recalled for his protest against new taxes proposed), and Indian finance minister (1862–65). He was created a K.C.B. in 1848, and a baronet in 1874; published several works on educational and philanthropic subjects; and died on 19th June 1886.—His son, the Right Hon. Sir GEORGE OTTO TREVELYAN, by his first wife, Hannah, Lord Macaulay's sister, was born at Rothley Temple, Leicestershire, on 20th July 1838. He passed from Harrow to Trinity College, Cambridge, and graduated as second classic (1861). In 1865 he was returned for Tynemouth in the Liberal interest, in 1868 for the Border Burghs, and he became a Lord of the Admiralty (1868–70), parliamentary secretary to the Board of Admiralty (1880–82), Chief-secretary for Ireland, as Lord Frederick Cavendish's successor, and a member of the Privy-council (1882–84), chancellor of the duchy of Lancaster, with a seat in the Cabinet (1884–85), and Secretary for Scotland (1886). Defeated in the Borders at the general election (1886) as a Unionist, in August 1887 he regained admission to parliament for Bridgeton (Glasgow) as a Gladstonian, was re-elected in 1892, was Secretary for Scotland (1892–95), and was re-elected in 1895, but retired from public life in February 1897. K.C.B. and D.C.L., he is author of *Horace at the University of Athens* (1861) and *The Ladies in Parliament* (1869), two brilliant Aristophanic skits; *Letters of a Competition Wallah* (1864); *Cawnpore* (1865); the admirable *Life and Letters of Lord Macaulay* (2 vols. 1876); the *Early History of Charles James Fox* (1880); and *The American Revolution* (Part I. 1899).

Trèves (Ger. *Trier*), a city of Rhenish Prussia, lies on the right bank of the Moselle, in a valley between low vine-covered hills, 69 miles by rail SW. of Coblenz. The river is crossed here by an eight-arch bridge, 623 feet long, whose Roman piers date from 25 B.C. 'A quiet, old-fashioned town, Trèves,' Freeman says, 'has a body of Roman remains far more numerous and varied, if not individually more striking, than any other place north of the Alps can show.' These include the 'Porta Nigra,' 118 feet long, and 95 high, one probably of the five gates by which Trèves was entered in Constantine's time; the so-called Roman baths (more probably part of an imperial palace); and a basilica built of Roman brick by Constantine for a court of justice, but demolished in great measure to make room for an electoral palace in 1614. This, however, was removed, and the basilica fitted up for a Protestant church in 1856. Beyond the walls are the ruins of an amphitheatre that could seat 30,000 spectators; and 6 miles off is the 'Igelsäule' or 'Heidenthurm,' a monumental column, 71 feet high, sculptured with bas-reliefs of the 2d century. The cathedral of SS. Peter and Helena is an interesting structure of various antiquity, but chiefly in the early German Romanesque style of the 11th century. The most famous of its relics is the seamless or 'Holy Coat,' which consists of 'connected fragmentary particles of material.' Said to have been brought to Trèves by the Empress Helena, it is first referred to in 1106 by an anonymous monk, and was not a source of revenue till 1512. It was visited by nearly two million pilgrims in 1891, the first time of exhibition since 1844. A 'Holy Coat' is also shown at Argenteuil and in nineteen other places. Connected with the cathedral by a cloister is the beautiful Liebfrauenkirche (1243); and there is a library of over 100,000 volumes and many MSS., among them the 'Codex Aureus' of the Gospels, presented to the abbey of St Maximin by Charlemagne's sister, Ada. A university, founded in 1472, was suppressed in 1798. The industries comprise manufactures of woollens, cottons, and linens, besides a brisk trade in corn, timber, and Moselle wine. Pop. (1871) 21,442: (1891) 36,162; (1895) 40,026.

Trèves, which claims to be 1300 years older than Rome, derives its name from the *Treviri*, a Gallic or, more probably, a Belgic people, who in Cæsar's time inhabited a large district between the Meuse and the Rhine. Their capital, *Augusta Trevirorum*, seems to have become a Roman colony in the reign of Augustus, and ultimately was the headquarters of the Roman commanders on the Rhine, and a frequent residence of the emperors, especially Constantine. Sacked by Attila in 451, it passed to the Franks in 463, to Lorraine in 843, to Germany in 870, and back to Lorraine in 895, and was finally united to Germany by the Emperor Henry I. The Archbishop of Trèves was, as chancellor of Burgundy, one of the Electors of the Empire, a right which originated in the 12th or 13th century, and which continued till the French Revolution. The last elector removed to Coblenz in 1786; and Trèves was the capital of the French department of Sarre from 1794 till 1814, since which time it has belonged to Prussia.

See German works by Haupt (1822), Leonardy (1871), Wilmowski (1874–76), Hettner (1880), Steinbach (1883), and Beissel (1888); also Freeman's *Historical and Architectural Sketches* (1876), and Clarke's *Pilgrimage to the Holy Coat of Trèves* (1892).

Treviranus, GOTTFRIED REINHOLD (1776–1837), and his brother, LUDOLF CHRISTIAN (1779–1864), two names eminent in the history of biology. See EVOLUTION, p. 481, and BIOLOGY, p. 156.

Treviso, the capital of an Italian province, on the Sile, 17 miles N. of Venice by rail. It has a Duomo dating from the 15th century, with pictures by Titian and Pordenone, the older Gothic church of San Nicolo, a public library (30,000 vols.), and a fine theatre. Pop. 18,301.

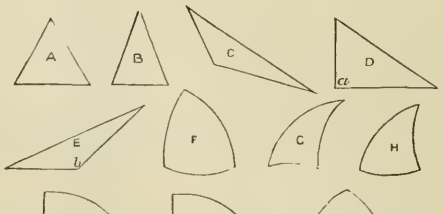
Trevithick, RICHARD (1771–1833), one of the pioneers of railway travelling. See RAILWAYS, p. 554, and the Life by Francis Trevithick (1872).

Trevor, SIR JOHN, born in 1633, in the parliament which met on 19th May 1685 was elected Speaker of the House of Commons. 'Trevor,' says Macaulay, 'had been bred half a pettifogger and half a gambler, had brought to political life sentiments

and principles worthy of both his callings, had become a parasite of Jeffreys, and could on occasion imitate not unsuccessfully the vituperative style of his patron. The minion of Jeffreys was, as might have been expected, preferred by James, was proposed by Middleton, and was chosen without opposition.' In the same year he was made Master of the Rolls. He contrived to maintain his political and judicial position after the revolution of 1688, and was re-elected Speaker in 1690, on an understanding with the government that he was to take the management of the bribery department. As first commissioner of the Court of Chancery, his integrity was greatly suspected; and though he was deficient neither in learning nor in parts, his greed and venality at length became notorious. In 1695 a committee of the House of Commons reported that in the preceding session Sir John Trevor had received 1000 guineas from the city of London for expediting a local bill. When it was moved in the House that the Speaker had been guilty of a high crime and misdemeanour, he had himself to put the question, and to declare that the 'Ayes' had it. A few days afterwards he was formally expelled. He still, however, retained the Mastership of the Rolls, 'to the great encouragement' says North, 'of prudent bribery for ever after.' He died 20th May 1717.

Trial. See CRIMINAL LAW, JURY. For Trial by Combat, see BATTLE (WAGER OF).

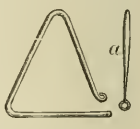
Triangle (*tres*, 'three,' *angulus*, 'a corner'), the most simple of closed geometrical figures, is a figure having three angles, and consequently three sides. It is, indeed, generally defined by geometers as a figure of three sides, and its property of being three-angled is put in the subordinate position of a necessary consequence. In plane geometry a triangle is bounded by three straight lines; and triangles are classed according to the relative length of their sides into *equilateral* (A), or equal-sided; *isosceles* (B), or having two sides equal; and *scalene* (C), or unequal-sided. Considered with reference to the size of its angles, a triangle is *right-angled* (D) when one of its angles (*a*) is a right angle (90°), *obtuse-angled* (E) when it has one angle (*b*) greater than a right angle,



Triangles.

and *acute-angled* (A or B) when it has no angle so great as a right angle. The triangle being the fundamental figure of plane geometry, through which the properties of all other figures have been arrived at, the investigation of its properties has always been held to be of primary importance. The simpler of these properties have of course long been known; but in modern times a whole system of geometry has grown up known as the geometry of the triangle, in which an endless number of remarkable properties are discussed. To the modern geometer the triangle connotes not merely the closed figure bounded by the sides, but the outside regions of space marked off by the sides produced to infinity. Of special importance also are those lines drawn through the angles which bisect these angles, or bisect or are perpendicular to the opposite sides. Then there are many interesting theorems connected with the inscribed, circumscribed, and escribed circles (see Casey's *Sequel to the First Six Books of Euclid*). The area of a triangle is half of that of a parallelogram which has the same base and altitude, and is thus equal to half the product of the base into the altitude. In the geometry of the sphere a triangle is a figure bounded by three arcs of circles (as F, G, H, K, L, and M). For triangulation, see ORDNANCE SURVEY, SURVEYING, TRIGONOMETRY; for triangular numbers, see FIGURATE NUMBERS.

Triangle, a musical instrument of percussion, formed of a steel rod bent in triangle-form, open at one angle, as shown in the figure. It is suspended by means of a string attached to the upper angle, and struck with a steel beater (*a* in figure). Many composers use it in their works as an adjunct to the drums, and it has a place in all military bands.



Triassic System. This forms the basement group of the Mesozoic or Secondary strata, and was formerly associated with the Permian System under the name of the New Red Sandstone. The term *trias* has reference to the threefold grouping of the system in Germany, where the strata are more fully developed than in Britain. In our area the system rests unconformably upon the upturned and denuded edges of the Permian and older Palæozoic strata. It is well developed in the central plains of England, whence a long belt extends north from Nottingham to the valley of the Tees, while another band stretches down the Severn valley into Devonshire. Small areas likewise occur in Dumfriesshire and near Elgin, and also in the north of Ireland. The system, however, assumes more importance in central Europe, where it occurs at the surface over a wide tract between the Thüringerwald in the east and the Vosges Mountains in the west, and between Basel in the south and Hanover in the north. North of that region it continues underneath overlying formations, but appears again and again at the surface where these latter are wanting. Trias is also met with in Heligoland and the south of Sweden. In all the regions now noted the strata appear to have been deposited in inland seas, and the following table gives the general succession of strata:

RHÆTIC.	Dark shales, red, green, and gray marls, thin gray limestones, sandstones, and bone-beds (Penarth Beds); and in Germany occasional thin coal-seams.
UPPER TRIAS or KEUPER.	Red, green, and gray marls and shales, and thin sandstones, with rock-salt and gypsum. Red sandstones and marls (England); gray sandstones, marls, and clays, with thin coal-seams (Germany).
MIDDLE TRIAS or MUSCHELKALK.	Limestones and dolomites, with associated beds of rock-salt, gypsum, and anhydrite. Not represented in England.
LOWER TRIAS or BUNTER.	Mottled red and green sandstones, marls, and conglomerates; with (in Germany) occasional beds of dolomite, rock-salt, and gypsum.

In the Alpine regions the Trias differs much from that of England and Germany. It attains a thickness of many thousand feet, and forms ranges of mountains. The lower division consists chiefly of fossiliferous limestones, the middle of shales, marls, limestones, and dolomites, while the Rhætic is built up mainly of limestones and dolomites. Thus in north-western and central Europe we have one well-defined type consisting of strata which have accumulated for the most part in inland seas, while in the Alpine regions the character of the

beds betokens more open water. In France isolated areas of Trias occur, some of which approximate in appearance to those of England, while others resemble those of Germany. In Spain and Portugal both the German and Alpine types are represented.

In North America the Trias is well developed, as in Nova Scotia, Prince Edward Island, the Connecticut valley; the west side of the Hudson River, and south-west through Pennsylvania into Virginia; North Carolina. Strata believed to be of the same age cover wide areas in the western territories, extending from the eastern borders of the Rocky Mountains into Alaska, British Columbia, and California. Brick-red sandstones and marls are a prominent feature in all those areas. Like the similar rocks of Europe they contain few fossils, but animal tracks and footprints are of frequent occurrence. On the whole the American strata above referred to resemble the English type of the Trias. But on the Pacific slope, in Northern California and Mexico, the strata yield a plentiful marine fauna, and resemble the type of the Alpine Trias. Rocks of Triassic age have been recognised in Spitzbergen, in the Himalayas, and again in South Africa, in New South Wales, Victoria, and Queensland, where the series contains coal-seams.

Life of the Period.—The predominant plants were cycads (Pterophyllum, Zamites, &c.), horsetails (Equiseta), ferns, and conifers, especially the cypress-like Voltzia. In the red beds of the Trias few fossils occur, our knowledge of the life of the period (more especially the invertebrate life) being derived from the Rhætic, the Muschelkalk, and the marine strata of the Alpine Trias. Foraminifera, sponges, star-corals, and echinoderms were tolerably numerous. One of the most beautiful fossils is the lily encrinite (*Encrinus liliiformis*) of the Muschelkalk. Amongst Lamellibranchs Myophoria, Avicula, Pecten, Cardium were common forms. A number of Palæozoic genera of Gasteropods (Loxonema, Murchisonia, &c.) appear, commingled with newer forms. The same is the case with the Cephalopods, such old genera as Orthoceras, Cyrtoceras, and Goniatites occurring along with Ceratites and other species of the great tribe of Ammonites. This remarkable association of Palæozoic and Mesozoic genera is most notable in the Alpine Trias. In the same strata occur the earliest traces of dibranchiate cephalopods, represented by the internal bone or shell (Belemnites). The Triassic fishes are ganoids and placoids—the latter represented by spines and palate teeth (Ceratodus). Labyrinthodonts abounded, and are known chiefly through their footprints, which are often plentiful in the red beds of the Trias. Some of these creatures attained a large size—the skull of one (*Mastodonsaurus*) measuring over 3 feet in length by 2 feet in breadth. Lizard-like reptiles (Telerpeton, Hyperodapedon) were numerous, while crocodiles (Stagonolepis) made their first appearance. The same is the case with the extinct group of Dinosaurs—terrestrial reptiles, some of which could walk on their hind-feet, which were often only three-toed—their front feet being four-toed. The footprints of these Dinosaurs are very numerous in some sandstones, and the three-toed impressions were at first supposed to be those of birds. They vary in size, the largest being nearly 2 feet long. Swimming reptiles (Nothosaurus) have also been recorded from the Trias. Another remarkable group of reptiles were represented by Dicynodon, which had a horny beak and carried two large tusk-like teeth in the upper jaw. The Trias is further remarkable for having yielded the earliest relics of mammalia. They seem to have been small marsupials (Microlestes, Dromatherium), with some affinities to the little Banded Ant-eater of Australia.

Physical Conditions.—The British Triassic strata afford evidence of having, for the most part, been deposited in a great inland sea or salt lake, from the waters of which sodium chloride (rock-salt), gypsum, and other chemically-formed materials were precipitated. This inland sea covered a large part of England, and extended north into southern Scotland and across what is now the area of the Irish Sea into the north-east of Ireland. It is possible also that the same sea stretched into northern France. Another but smaller lake is indicated by the red sandstones of Elgin. The lands surrounding these lakes were clothed with cypress-like evergreens, and their shores were haunted by labyrinthodonts and various reptiles. The briny waters were unfavourable to life, and we have consequently few traces of any aquatic fauna, which seems to have consisted chiefly of small phyllopods (Estheria) and fishes. Eventually the lacustrine areas became largely silted up, and then subsidence of the land took place, so that the sea occupied some of the shallow depressions. In these marine tracts the Rhætic beds were deposited.

On the Continent during a large part of the Triassic period an inland sea extended westwards from the Thüringerwald across the Vosges country into France, and stretched northwards from the confines of Switzerland over what are now the low grounds of Holland and North Germany. In this ancient sea the Harz Mountains formed an island. In the earlier stages of the period the conditions resembled those that obtained in Britain, but the thick Muschelkalk with its numerous marine forms seems to indicate an influx of water from the open sea. Afterwards, however, this connection was closed, and the subsequent accumulations point to increasing salinity, during which chemical formations (gypsum, rock-salt, &c.) took place, while the marine fauna disappeared. Towards the close of the period, after the great inland lake had been largely silted up, a partial influx of the sea introduced a fauna comparable to that of the English Rhætic. It seems highly probable that the lands surrounding the inland lakes of central and north-western Europe were more or less dry and sandy regions, like the great wastes of central Asia. Many of the sandstones in the Bunter series of England are made up of grains so completely worn and rounded that they exactly recall the appearance presented by the wind-blown sands of desert regions. Some geologists therefore infer that in the earlier stages of the Triassic period large tracts of Britain were sandy deserts before the inland sea attained its greatest development.

The Alpine Trias, which is mostly marine, shows that, while continental and lacustrine conditions obtained in central and north-western Europe, an open sea existed towards the south—a Mediterranean of much greater extent than the present. From the fact that Triassic rocks with characteristic fossils occur within the Arctic regions, it may be inferred that the climate of the period was generally genial or warm.

Tribe, an aggregate of stocks—a stock being an aggregate of persons considered to be kindred—or an aggregate of families, forming a community usually under the government of a chief. The chief is possessed of despotic power over the members of the tribe, which is one of the earliest forms of the community among all the races of men. The discussion of the origin of tribes will be found in the article FAMILY; see also MARRIAGE, CLAN, and the articles on peoples, such as the American Indians, whose organisation is tribal (cf. IROQUOIS).

Tribonianus, a very eminent Roman jurist of the 6th century, of Macedonian parentage, but born in Paphlagonia. He held under the Emperor Justinian the offices of quæstor, master of the imperial household, and consul. But he is famous chiefly through his labours in connection with the Code (q.v.) of Justinian (q.v.) and the Pandects. Tribonianus died in 545.

Tribune. See ROME, Vol. VIII. p. 787.

Trichiasis. See EYE, Vol. IV. p. 516.

Trichina (*Trichina spiralis*), a minute parasitic Nematode, occurring in man, pig, rat, and also in hedgehog, fox, marten, dog, cat, rabbit, ox, and horse. The sexual forms are found in the intestine—the female nearly $\frac{5}{6}$ of an inch in length, the male about half as long. After impregnation the female brings forth numerous embryos viviparously, sixty to eighty at a time, and altogether about 1500, which bore through the wall of the intestine into the body-cavity or blood-vessels, and work their way, especially through connective tissue, to the muscle fibres, within which they grow, coil themselves spirally, and become encysted with a sheath at first membranous and afterwards calcareous. In these cysts, which may be sometimes present in millions, the young Trichinæ remain passive unless the flesh of their host be eaten by another—as by a pig eating a rat, and a man eating the pig. In the alimentary canal of the new host the capsule is dissolved, the embryos are set free, and rapidly developing become reproductive and migratory. The migrations of the young forms from the food canal to other parts of the body of the host produce disorders which are often fatal.

Trichina lying coiled up in muscle (magnified).

TRICHINIASIS, or TRICHINOSIS, is the name of the diseased condition which is induced by the ingestion of food containing *Trichina spiralis* in large quantity. It was first recognised as a distinct disease by Zenker in 1860; since that time a few cases have been met with in England, many in the United States, but most in Germany (largely on account of the common custom of eating smoked ham and uncooked), where epidemics have been not infrequent. For about a week the symptoms are those merely of the feverish state; but about that time the muscles begin to be painful and tender to the touch, and are found to be hard and swollen. Movements of the affected muscles are painful or even impossible; so that the limbs and jaws may be fixed, and the breathing may become hurried and shallow. In severe cases diarrhœa often occurs. When death takes place it is usually in the fourth or fifth week, either from exhaustion, intestinal irritation, or pneumonia. In some epidemics one-fourth or one-fifth of the cases are said to have proved fatal. Convalescence is usually very slow; three or four months may elapse before the health is restored. No means is known of destroying the parasites when they have reached the muscles; but when the disease is suspected castor-oil or calomel should be administered to expel as many of the embryos as possible from the intestines. Glycerine is said to be fatal to them, and to have been administered with benefit. But even infected meat is rendered innocuous by thorough cooking.

Trichinopoli, the capital of a district in Madras Presidency, with an area of 3561 sq. m., on the right bank of the Kaveri, 56 miles from the sea. At least seventeen villages and hamlets are included in the municipal limits. The fort, which includes the old town, is dominated by a mass of gneiss 273 feet above the level of the street. There are two temples upon it. The walls of the fort, which are now demolished, had a circuit of two miles, and this area is inhabited by a dense population. The moat has been laid out as a boulevard, and the Nawab's palace, which was restored in 1873, has been utilised for courts and offices. Beyond the walls is St John's Church, containing the tomb of Bishop Heber, who was buried here in 1826. The troops are stationed $1\frac{1}{2}$ mile south of the fort. There are a market (1868), military hospitals, municipal hospitals, and an observatory. Cheroots are manufactured in large quantity, chiefly from excellent tobacco grown at Dindigal. Manufactures of hardware and jewellery, especially gold chains, are extensively carried on. A railway to Madras was opened in 1875, while there is connection south to Madura. It has two railway stations. It is the residence of a Roman Catholic bishop, with a Catholic college affiliated with Madras University; and the Lutherans, Wesleyans, and the Society for the Propagation of the Gospel have missions. Pop. (1881) 84,450; (1891) 90,730.

Tricolor. See FLAG, Vol. IV. p. 664.

Tricoupis, SPIRIDION, a modern Greek statesman and writer, was born at Missolonghi, 20th April 1788. He served as private secretary to Lord Guilford in the Ionian Isles, but took his place amongst the patriots on the outbreak of the war of independence. From 1821, except during the presidency of Capo d'Istria, he was continually employed in administrative and diplomatic business, was thrice sent to London as envoy-extraordinary, was minister of foreign affairs and of public instruction (1843), vice-president of the senate (1844–49), and envoy-extraordinary to Paris (1850). He died February 24, 1873. His speeches were collected at Paris (1836). Notable also are his poem on the Klephts (1821) and his *History of the Greek Revolution* (1853–57).

Tricuspid. See HEART.

Tricycle. See CYCLING.

Tridacna. See CLAM.

Trident, a three-pronged fork used by fishermen, is employed as the attribute of Poseidon (Neptune), and is frequent on coins of such Greek states as had Poseidon for patron deity. The conventional figure of Britannia bears a trident as the symbol of sovereignty over the sea.

Tridymite, a mineral composed of silica, which occurs in various acid igneous rocks in the form of thin transparent six-sided plates, several of which are usually grouped together. It is very brittle, has a hardness of 7, and specific gravity of 2·25 to 2·33. The mineral occurs in cavities in the trachytes of many regions, as in those of the Siebengebirge, Mont Dore, Hungary, Euganean Hills, Ireland, Iceland, Mexico, &c. It is also met with scattered through the ground-mass of trachytic rocks, as at Kosemütz in Silesia, Kaschau in Hungary, Hüttenberg in Carinthia, &c.

Triennial Acts. See PARLIAMENT, p. 776.

Trient. See TRENT.

Trier. See TRÈVES.

Trieste (Slav. *Têrst*), the most important seaport of Austro-Hungary, and the most considerable trading town on the Adriatic, stands at the head of the Gulf of Trieste, an arm of the Gulf of Venice, 370 miles by rail SSW. of Vienna. In 1849 it was constituted an imperial free city, and attached and belonging to it is a territory 36 sq. m. in extent. The city of Trieste, in which the population of the

district is almost wholly massed, consists of the old town, the new town, or Theresienstadt, and two suburbs, Josefstadt and Franzenstadt. The old town, built on the slope of a steep hill, crowned by a castle (1508–1680), is distinguished by its narrow streets and black walls. It contains the cathedral, a Byzantine edifice built between the 5th and 14th centuries, into the walls of which stones bearing Roman inscriptions and carving have been built, and the tower of which is said to rest on the foundation of a temple of Jupiter. The new town, with broad streets built in regular parallelograms and handsome houses, occupies the plain that fronts the sea. Between these two divisions runs the *Corso*, the chief thoroughfare. The *Tergesteo* (1840), in the new town, is a splendid modern edifice, containing an exchange and reading-rooms, and the offices of the Austrian Lloyd's (see Vol. VI. p. 675). Trieste, which from 1719 till 1st July 1891 was a free port, has a very fine new harbour (1868–83). In 1890 there entered 7873 vessels of 1,471,464 tons, and cleared 7856 of 1,457,174. The manufactures are very extensive, including shipbuilding, rope-making, and the manufacture of soap, rosoglio, white-lead, leather, &c. A great agricultural exhibition was held at Trieste in 1882. Pop. (1810) 29,908; (1880) 144,844; (1890) 158,344, nearly all Catholics, and mostly Italian-speaking.

Trieste, the ancient *Tergeste* or *Tergestum*, was of importance under the Romans, and first receives historical mention 51 B.C., when it was overrun and plundered by neighbouring tribes. In 1382 it passed finally into the hands of Austria. It owes its prosperity chiefly to the Emperor Charles VI., who constituted it a free port, and to Maria Theresa. Since the year 1816 Trieste has borne the title of the 'Most Loyal of Towns.' Charles Lever and Sir Richard Burton were consuls here.

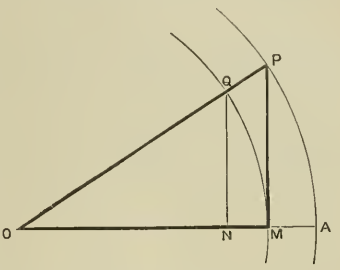
Trifolium. See CLOVER.

Triforium, the arcade over the arches of a church between the nave and side aisles. It is usually a dark gallery, being the wall-space against which the lean-to roof of the aisles rests. See GOTHIC ARCHITECTURE.

Triglyph. See ENTABLATURE.

Trigonocarpon. See CARPOLITES.

Trigonometry, originally the branch of geometry which had to do with the measurement of plane triangles. This gradually resolved itself into the investigation of the relations between the angles of the triangle, for the simple reason that all triangles having the same sets of angles are similar, so that if, in addition, one side is given the other two at once follow. It is easy to show from the Sixth Book of Euclid that, if we fix the values of the angles of a triangle, the ratio of the sides containing any one of these angles is the same whatever be the size of the triangle. This ratio is a definite function of the angles; and it is with the properties of such ratios that trigonometry has now to deal. The fundamental ratios are obtained from a right-angled triangle, of which one angle is the angle under consideration. It will suffice to show what these ratios are and how they have received their names. Let POM be the angle considered, PM being drawn perpendicular to OM. With centre O describe the two circles PA and MQ. The appropriate measure of the angle at O is the ratio of the subtended arc to the radius —i.e. either $\widehat{AP}/OP$ or $\widehat{MQ}/OM$ (see CIRCLE). This measure we shall adopt throughout, and shall represent it by the symbol θ. If QN is drawn perpendicular to OM, then the ratio of any pair of sides of the triangle OQN is equal to the ratio of the corresponding sides of triangle OPM. All the possible ratios which can be formed are the so-called trigonometrical or circular functions of the angle θ. Thus the ratio PM/OP or QN/OQ is the *sine* of θ. It is evidently half the chord of the angle 2θ; and its value is numerically less than θ, because PM being less than the chord PA is less than the arc PA. Again, the ratio PM/OM is the *tangent* of θ. MP is, in fact, the geometrical tangent drawn from the one extremity of the arc MQ till it meets the radius through the other extremity. For a similar reason the ratio OP/OM or OQ/ON is called the *secant* of the angle θ. In the same way the ratios OM/OP, OM/PM, OP/PM are respectively the *sine*, *tangent*, and *secant* of the angle OPM, which is the complement of the angle POM. Hence these ratios, regarded as functions of θ, are called the *cosine*, *cotangent*, and *cosecant* of θ. For any given angle there are, then, six trigonometrical functions. It is obvious that these functions are mutually dependent. Indeed, if any one is given the other five can at once be calculated. For instance, the well-known relation $OM^2 + MP^2 = OP^2$ gives at once by dividing by OP^2



$$(\sin.\ \theta)^2 + (\cos.\ \theta)^2 = 1,$$

or, as it is usually written,

$$\sin.^2\theta + \cos.^2\theta = 1.$$

Then, again, the *cosecant* is the reciprocal of the *sine*, and the *secant* of the *cosine*. The *tangent* is the ratio of the *sine* to the *cosine*; and the *cotangent* is the reciprocal of the *tangent*. The sine and cosine are never greater than unity, and the secant and cosecant are never less than unity. The tangent is less or greater than unity according as the angle POM is less or greater than half a right angle.

Suppose OP to rotate counter-clockwise. Then as the angle AOP increases from zero to a right angle the sine evidently grows from zero to unity; while at the same time the cosine diminishes from unity to zero. Continuing the increase so that AOP becomes an obtuse angle, we find that the sine begins to diminish, and that the cosine begins to increase numerically but towards the left of O. In other words, the cosine becomes negative, and continues so until OP has completed three right angles. In the same way, as AOP passes through the value of two right angles and becomes re-entrant, the sine becomes negative, being thenceforward measured downwards until OP has made one complete revolution. After one complete revolution both sine and cosine, and also secant and cosecant, begin to go through exactly the same cycle of changes in magnitude and sign as at first. They are therefore periodic functions (see PERIOD), and their period is 2π or four right angles. The tangent and cotangent, however, go through their cycle of changes in half this period or two right angles. All possible numerical values of the functions are obtained in the first quadrant. It is therefore sufficient in constructing tables of the trigonometrical functions to tabulate for angles from 0° to 90° inclusive. For example, the angle 130° (90° + 40°) has the same sine as the angle of 50° (90° − 40°); and its cosine differs only by being negative. Of greater practical importance than

the tables of the functions themselves are the tables of their logarithms. These are generally tabulated for every degree and minute of angle from 0° to 90°; and proportional parts are added by which is readily calculated the number corresponding to an angle involving seconds of arc.

The calculation of the functions and their logarithms is a sufficiently laborious task. It is generally effected by means of Series (q.v.), although the values for certain particular angles can be found by the simplest of arithmetical operations. Thus, the cosine of 60° is evidently $\frac{1}{2}$; sine 60° is therefore $\frac{1}{2}\sqrt{3}$; tangent 60° is $\sqrt{3}$; and so on. What might be called the fundamental series for the sine and cosine in terms of the arc are :

$$\sin.\ \theta = \theta - \frac{\theta^3}{1.2.3} + \frac{\theta^5}{1.2.3.4.5} - \frac{\theta^7}{1.2.3.4.5.6.7} + \ldots.$$

$$\cos.\ \theta = 1 - \frac{\theta^2}{1.2} + \frac{\theta^4}{1.2.3.4} - \frac{\theta^6}{1.2.3.4.5.6} + \ldots.$$

If we make all the signs in these two series positive we get two other functions of θ, which are called the hyperbolic sine and cosine of θ, and are written *sinh.* θ and *cosh.* θ respectively. Related to these functions there are the hyperbolic tangent, cotangent, secant, and cosecant; and they are connected by relations similar to, though not quite identical with, the ordinary circular functions. We may see, by adding the series with signs all positive, that the sum of the hyperbolic sine and cosine is the exponential of θ. Demoivre's theorem gives the corresponding equation for the circular sine and cosine (see DEMOIVRE, and QUATERNIONS). The reason for the names circular and hyperbolic may be partially indicated thus: The relation $\cos.^2\theta + \sin.^2\theta = 1$ may be put in the form $x^2 + y^2 = a^2$, which is the equation of a circle of radius a, referred to rectangular axes (see GEOMETRY). The equation of the rectangular Hyperbola (q.v.) is $x^2 - y^2 = a^2$, to which there corresponds the relation $\cosh.^2\theta - \sinh.^2\theta = 1$. The hyperbolic sines and cosines are really exponential functions, and are not periodic. They are of constant occurrence both in the higher analysis and in mathematical physics. To facilitate their use in calculation, tables have recently been constructed.

Besides the series given above, there are many others, some of which are particularly serviceable for calculating the values of the functions or the values of their logarithms. There are also the converse series, by which an angle is found in terms of one of its circular functions. One of the simplest, and at the same time most historically famous, of these is Gregory's series, which expresses an angle in ascending powers of its tangent. It is as follows :

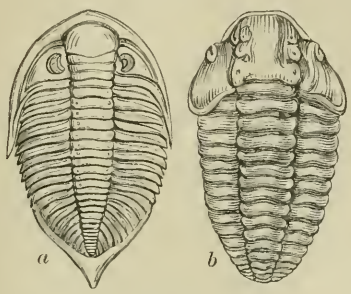
$$\theta = \tan.\theta - \tfrac{1}{3}\tan.^3\theta + \tfrac{1}{5}\tan.^5\theta - \tfrac{1}{7}\tan.^7\theta + \ldots.$$

Of great importance are the addition formulæ which express any required function of the sum or difference of two given angles in terms of the trigonometrical functions of these angles. They are readily established for the circular functions by application of the elementary theorems of orthogonal projection. Similar formulæ hold for the hyperbolic functions. As plane trigonometry has to do chiefly with the solution of plane triangles, so spherical trigonometry is devoted to the discussion of spherical triangles. In navigation, geodesy, and astronomy the formulæ of spherical trigonometry are in constant use. The ordinary text-books on trigonometry do little more than present the subject in its practical bearings. An introductory study of the general theorems in analysis which have sprung out of the development of trigonometry will be found in Chrystal's *Algebra* (part ii.). It is impossible to make any progress in the higher mathematics without a thorough knowledge of the properties of the trigonometrical functions.

Trikhala, a town of Greece, in Thessaly, 40 miles W. of Larissa, is built on the slope of a hill, manufactures cotton and woollen stuffs, and has a large transit trade. The neighbouring plains, which are watered by the Salambria (anc. *Peneus*), are rich in fruits. Pop. (1896) 21,149. Trikhala, the *Trikka* of Homer, was celebrated for its temple of Æsculapius. It was ceded to Greece in 1881.

Trilobita, an order of fossil crustacea entirely confined to the Palæozoic rocks. They make their first appearance in the Cambrian, attain a great development in the Silurian, occur sparingly in the Devonian and the Carboniferous, and disappear finally in the Permian system. The dorsal surface of the body was covered with a calcareous shell or crust, which is usually trilobed longitudinally—i.e. the lobes extend from head to tail. This trilobed crust consisted of a cephalic shield, a variable number of movable body rings or thoracic segments, and a tail or pygidium, composed of a number of segments more or less anchylosed. The eyes were invariably sessile and compound, consisting of an aggregation of facets, covered by a thin cornea. The lenses are frequently well preserved, and in some species can readily be seen with the naked eye. Although usually faceted, yet in certain forms the eyes are smooth; while a few species had no organs of sight. The number of facets varies considerably. Thus, while in some types there are not more than fourteen facets, in others there are as many as 15,000 in each eye. The thoracic segments, which vary in number in the different types, were capable of more or less movement, and this to such an extent in some species as to allow of the animal rolling itself up like a hedgehog. Specimens showing the under surface are very rare, but the few which have been found show that the margin of the dorsal crust was turned under in the form of a more or less narrow 'doublure.' In the centre of this doublure in the cephalic region is attached the lip-plate or 'hypostome,' with which, as shown in one specimen, buccal organs (maxillary palpi) seem to have been associated. Other specimens have shown that all the segments of the thorax and tail carried jointed limbs, and that branchial filaments were also present. More recently Mr Walcot, by making thin sections of rolled-up specimens of trilobites, has greatly increased our knowledge of their under surface. He shows (in the case of Calymene) that the mouth, behind the lip-plate, was bounded by four pairs of jointed appendages, the basal joints of which acted as jaws; while the thoracic and pygidial segments each carried a pair of slender jointed legs. To the thoracic segments were likewise attached spiral gills, one row on each side; and probably branchial appendages were also attached to the bases of the thoracic legs. The sexes are believed to be indicated by variations in the breadth of the cephalic shield, and in the length of the cephalic and pygidial spines. The members of the order varied greatly in size, some species being scarcely larger than a pin's head, while others, like *Asaphus gigas*, attained a length of 18 inches, and even sometimes of 2 feet. The eggs of trilobites appear to have been deposited in clusters, but very little is known as to the larval condition of these curious animals. It is possible, as some think, that the young in many species may have been naked, but the dorsal crusts of minute larval forms have been met with, and it is not improbable that many so-called species may be only larval or transition forms of others. Trilobites appear to have swarmed on the muddy bottoms of Cambrian and Silurian seas, although they lived also in

regions where only pure limestone was being accumulated. It is now believed that many of the peculiar markings seen upon the surfaces of Cambrian and Silurian strata, and some of which have been described as fossil plants, are really the tracks and trails of trilobites and probably other crustaceans. Some doubt exists as to the systematic position of Trilobita, but they are usually regarded by geologists as entomostracous crustaceans having relations to the phyllopods, but being more nearly allied to the Xiphosura (king-crabs). Hence some writers would include them under the Arachnida.



a, Phacops caudatus; *b*, Calymene blumenbachii.

Trilogy, the name given by the Greeks to a group of three tragedies, either connected by a common subject, or each representing a distinct story. A satyric drama was customarily added as a termination, whence the whole was sometimes termed a *tetralogy*. We possess only one perfect specimen of the classic trilogy—the *Oresteïa* of Æschylus (q.v.), which embraces the *Agamemnon*, the *Choëphoræ*, and the *Eumenides*. Schiller's *Wallenstein* is a trilogy, and so are Swinburne's *Chastelard*, *Bothwell*, and *Mary Stuart*.

Trim, the county town of Meath, on the Boyne, 30 miles NW. of Dublin by rail, with imposing ruins of a 12th-century castle, the Yellow Steeple (125 feet) on the site of an ancient abbey founded by St Patrick, and a column to Wellington, who had his first schooling here. Close by are the ruins of Newtown Abbey and the Priory of St John the Baptist, and 5 miles down the river are the noble ruins of Bective Abbey. Pop. 1586.

Trimethylamine, $N(CH_3)_3$, incorrectly called propylamine, is an organic base resembling ammonia in some of its properties, and having a strong herring-brine odour. It is obtained principally by distilling herring-brine with lime. It has been employed with success, in doses of 10 to 15 drops, in the treatment of acute rheumatism.

Trimmer, Mrs Sarah, was born at Ipswich on 6th January 1741. Her father was Joshua Kirby, a man of intelligence and piety, who in 1755 removed to London, and became tutor to the Prince of Wales, afterwards George III., in the science of perspective. Here his daughter met Dr Johnson, with whom she speedily became a favourite. In 1759 her father was appointed Clerk of the Works at Kew Palace; and here she became acquainted with Mr Trimmer (1738–92), who married her in 1762, and to whom she bore twelve children. It was not till 1780 that she came before the world as an authoress, by the publication of her *Easy Introduction to the Knowledge of Nature*—the first of nearly thirty volumes for the young, which, though now forgotten, with the exception of *The History of the Robins*, were excellently adapted for their purpose. She died quite suddenly on December 15, 1810. See her *Life and Writings* (2 vols. 1814).

Trimorphism. See Dimorphism.

Trimúrti (from the Sanskrit *tri*, 'three,' and *múrti*, 'form') is the name of the Hindu triad, or the gods *Brahman* (masculine), *Vishnu*, and *Siva*, when thought of as an inseparable unity, though three in form. When represented, the Trimúrti is one body with three heads—in the middle that of Brahman, at its right that of Vishnu, and at its left that of Siva. The symbol of the Trimúrti is the mystical syllable *Om* (q.v.)

Trinacria. See Sicily.

Trincomalee, a seaport, naval station, and magnificent harbour on the north-east coast of Ceylon, 110 miles NE. of Kandy. The town is built on a bold peninsula, which divides the inner and outward harbours. Here the Malabar invaders of Ceylon built the 'Temple of a Thousand Columns,' to which pilgrims flocked from all parts of India. This celebrated shrine was demolished in 1622 by the Portuguese, who fortified the heights with the materials derived from its destruction. It was next held by the Dutch, and subsequently by them and the French alternately, until the capture of Ceylon by the British in 1795. The modern town is in no way remarkable, and, with the exception of the official buildings (barracks, residences of civil, military, and naval authorities), makes a poor appearance, though there is a fine esplanade. The Bay of Trincomalee is landlocked, and presents a scene of tranquil beauty; the harbour is renowned for its extent and security; unlike every other in the Indian seas, it is accessible to every description of craft in every variation of weather, but unluckily it lies out of the course of trade, Colombo having in this respect a great advantage over it. There is an admiralty dockyard, and the fortifications have been strengthened. Pop. 10,180.

Tring, a market-town of Hertfordshire, on a spur of the Chilterns, 2 miles W. of Tring station, and 31 NW. of London. Situated near the Icknield Way and the Grand Junction Canal, it has a good church, and manufactures of silk, canvas, and straw-plait. Tring Park, built by Wren for Henry Guy (*c.* 1670), is the seat of Lord Rothschild. Pop. (1851) 3218; (1891) 4525.

Trinidad is the most southerly of the British West India Islands, being only 7 miles from the coast of Venezuela, the Gulf of Paria (an extremely safe anchorage) lying between. It is about 50 miles long, varying in breadth from 30 to 35 miles, and the area amounts to 1755 sq. m. Three ridges of mountains run east and west, one fringing the north coast and reaching an elevation of 3000 feet. The island has several tolerably large rivers. A remarkable phenomenon is a pitch lake near the village of La Brea, composed of bituminous matter floating on the surface of fresh water, about 3 miles in circumference, and 138 feet above the sea. The soil is very rich and productive. The climate is hot and moist, but not unhealthy; the mean maximum is 87·7°, and the mean minimum 70° F.; and the rainfall is about 74 inches. The chief town, Port of Spain, is one of the finest towns in the West Indies (pop. 33,782). There is another town called San Fernando (pop. 6335), with two or three pretty villages. The most important products are cocoa, sugar, rum, molasses, coffee, cocoa-nuts, tobacco, bitters, asphalt, and fruit (exported since 1889). The value of the exports reaches £2,310,000, and of the imports about the same figure. A third of the trade is with Britain, and a fourth with the United States. Pop. (1871) 109,638; (1881) 155,128; (1890) 208,030, mainly French (speaking a patois), with Spanish and English colonies, and many East Indian coolies. There are 54 miles of railway in the island, which with Tobago forms a crown colony, ruled by a governor, an executive council of four, and a legislative council of eighteen members. Trinidad

was discovered by Columbus in 1498, but no permanent establishment was founded there until 1532 by the Spaniards. It suffered at the hands of the English (Sir Walter Raleigh in 1595), the Dutch (1640), and the French (1677 and 1690). In 1797 it first fell into the hands of the British, who were confirmed in possession of it in 1802.

See works by Daniel Hort (1865), Wickham (1872), De Verteuil (new ed. 1884), Collins (2d ed. 1888), and Fraser (1894), with others cited at WEST INDIES.

Trinidad, a small island in the Atlantic, in 20° 30′ S. lat., and 700 miles E. of the coast of Brazil, to which it belongs. It has been reported to contain pirates' buried treasure. See Knight's *Cruise of the Alert* (1890).

Trinidad, capital of Las Animas county, Colorado, on the Purgatory River, 210 miles by rail S. by E. of Denver, with mills and a trade in wool. Coal is found close by. Pop. (1890) 5523.

Trinitarians, a religious order founded at Rome in 1198 to redeem Christian captives from the infidels (see SLAVERY). Their rule was a modification of that of St Augustine, and from the red cross on the right breast of their white serge garments they were known as *Red* or *Crutched* Friars. They were bound to devote one-third of their total revenues to the work of redeeming the captives; in the 17th century they claimed to have redeemed upwards of 30,000 Christian captives. At the Reformation there were eleven houses in England, five in Scotland, and one in Ireland. The remaining houses of the order in Spain were suppressed in the reign of Isabella II.

Trinity, THE DOCTRINE OF THE, is the highest and most mysterious doctrine of the Christian religion. It declares that there are three Persons in the Godhead, or divine nature—the Father, the Son, and the Holy Ghost, and that 'these three are one true, eternal God, the same in substance, equal in power and glory—although distinguished by their personal properties.' The most elaborate statement of the doctrine is to be found in the Athanasian Creed, which asserts that 'the Catholic faith is this: That we worship one God as Trinity, and Trinity in Unity—neither confounding the persons nor dividing the substance—for there is one person of the Father, another of the Son, and another of the Holy Ghost. But the Godhead of the Father, and of the Son, and of the Holy Ghost is all one; the glory equal; the majesty coeternal.'

It is admitted that the doctrine is not found in its fully-developed form in the Scriptures; but it is believed to be clearly revealed in its elements in the New Testament, and also to be indicated in many of the statements and revelations of the Old Testament. The form of expression in speaking of God in the Old Testament Scriptures—the plural *Elohim*, coupled with a singular verb; the apparent distinction recognised in the revelations to the Patriarchs and Moses between Jehovah and 'the Angel of Jehovah;' the mode in which 'the Spirit' and 'Word' of God, and 'Wisdom' (Proverbs viii.) are spoken of; and the gradual unfolding of the doctrine of a 'Messiah,' have all been regarded as indications from the earliest times of the truth of a plurality of persons in the Godhead. In the New Testament Scriptures the doctrine is represented as clearly taught in the Trinitarian formula of baptism, the general character of the claims and prerogatives of Jesus Christ, especially the ascription to Him of the designation 'the Son of God,' and in the functions attributed to the Holy Spirit. The evidence is held conclusive of the equal divine nature and yet distinct personality of the Son and the Spirit along with God the Father. It is generally conceded, however, that the Christians of the 2d and even of the 3d century were far from having a clearly understood and recognised doctrine on this high subject. They were content for the most part to use scriptural expressions in speaking of the Father, and the Son, and the Spirit, without defining articulately their relation to one another. It was not till the progress of opposing heresies sought, on the one hand, to degrade the divine dignity of Christ, or, on the other, to confound the personality of Christ with God the Father, that the church was led to define in its Creeds, Nicene (325 A.D.) and others, the relation of the Son to the Father; the Christological controversies which led to the ultimate definition are discussed at CHRIST. The Constantinopolitan Creed (381) affirmed also the deity of the Holy Spirit; but this church doctrine of a Trinity of Persons was not fully completed till the addition of the *Filioque* clause in the Western Church of the 6th century, which led to the separation of the Greek Church from the Latin (see GREEK CHURCH, CHURCH HISTORY, CREEDS). The Western or Latin Church had less genius for such speculations, and, in so far as it meddled with them, imparted to them a coarser and more contradictory aspect—witness the so-called Athanasian Creed (q.v.). Strenuous assertion of the doctrine of the Trinity occasionally led to what was denounced as tritheism, or doctrine of three gods (so Philoponus in the 6th century). Roscellin was charged with tritheism by Anselm. Scotus Erigena taught a Neoplatonic heretical view; the mystic Richard of St Victor emphasised his view of Trinity as founded on love more than any mediæval teacher.

The Reformers clung to the doctrine as already formulated. Jakob Boehme developed a strangely mystical doctrine. Socinus and modern Unitarians are the most outspoken in their rejection of the doctrine of the Trinity, which has always been specially obnoxious to Deists and advanced Rationalists, and is little insisted on by Broad Church thinkers. Some speculative theologians and philosophers have refined away the Trinity into aspects of God's action rather than *hypostases* or persons as formerly understood. Clarke and the semi-Arians of the 18th century were not trinitarian in the full sense.

Tripartite divisions have had a special charm for philosophers from Plato to Hegel; to some of these the term Trinity has been applied. The Trimúrti (q.v.) is called the Hindu Trinity.

See the articles ARIUS, ATHANASIUS, SOCINUS, SPIRIT (HOLY), UNITARIANISM; the handbooks of systematic theology and histories of dogma; Waterland, Bull, and Pearson of the older English systematists; and especially Dorner's great works.

Trinity, a river of Texas, is formed by the union of two forks near Dallas, and runs 500 miles SSE. to Galveston Bay. It is navigable for steamboats for over 300 miles, except in the dry season.

Trinity House. Five maritime societies bear the name Trinity House, and are situated in London, Hull, Newcastle-on-Tyne, Leith, and Dundee. Probably all, or most of them, were originally partly religious and partly secular establishments founded by seamen, their chief original objects being probably mutual assistance and the care of aged and infirm seamen. From the 14th century onwards various public duties and privileges were assigned to them by royal charters or acts of parliament, such as providing lighthouses, buoying channels, and licensing pilots; and powers were given to them to levy dues on shipping or cargoes. With one important exception, these duties and powers have been reduced or withdrawn. Dundee House is now only a benefit society. Leith retains its public duties as a pilotage authority,

as also do Newcastle and Hull, while the last also looks after the lighthouses and buoys of the Humber. All of them continue to give pensions, or homes and pensions, to members, and some assistance to destitute seafarers.

On the other hand, the London Trinity House, called the Corporation of Trinity House of Deptford Strond, is entrusted with the management of the general lighthouse and buoyage system of England and Wales, and with a supervising authority over local lights and buoys, and has besides a partial control over the lighting and buoyage systems of Scotland and Ireland. In 1514 this society was incorporated by royal charter of Henry VIII.; and its privileges were confirmed and extended by subsequent charters, particularly by that of James II. in 1685. In 1600 its first lighthouse was built at Caistow, after which date, as lighthouses increased in number, many of them fell into the hands of private individuals by lease, or patent, or act of parliament; but by 6, 7, William IV. chap. 79, private rights in lighthouses were compulsorily purchased by that Trinity House. After 1853 all light-duties, with those of the Scottish and Irish Lighthouse Boards, were paid to the paymaster-general, and went towards the formation of the Mercantile Marine Fund; and all disbursements for lighthouses were to be paid out of that fund after being approved by the Board of Trade. The Merchant Shipping Act of 1854 and subsequent acts laid upon the London Trinity House the additional duty of removing wrecks around the coast when dangerous to navigation. The power of the London Trinity House to appoint and license pilots was enlarged by the Merchant Shipping Act of 1854, and again in 1862. The Pilots' Fund and several special charities are administered by it.

The corporation of the London Trinity House consists of a master, a deputy-master, thirteen acting elder brethren, eleven honorary elder brethren, and an unlimited number of younger brethren. The master and honorary elder brethren are chosen on the ground of eminent social or official position. The younger brethren all belong either to the naval service or the mercantile marine, and are admitted by the court of elder brethren. The deputy-master and acting elder brethren are elected by the court of elder brethren from such of the younger brethren as are possessed of the qualifications of having obtained the rank of commander in the navy four years previously, or having served as master in the merchant service on foreign voyages for at least four years. The Board discharges its duties by means of committees and sub-committees for special purposes. Two elder brethren of Trinity House assist the Court of Admiralty at the hearing of every suit for collision, and occasionally in suits for salvage; but their duty is to guide the court by advice only.

Trinity Sunday, the Sunday immediately following Whitsunday, so called as being set aside for the special honour of the Blessed Trinity. The festival was not generally observed before the 12th century, though kept in Liége two centuries earlier; only in 1334 was it established by Pope John XXII. as a common festival of the whole Western Church. The mass and office peculiar to the day, however, are of greater antiquity.

Trinoda Necessitas, three species of contributions to which in Anglo-Saxon times all the lands of England, were subject—viz. *bricg-bot*, for keeping the bridges and highways in repair; *burh-bot*, for keeping the fortresses in repair; and *fyrd*, for maintaining the military and naval force.

Trio, in Music, a composition for three voices or for three instruments. The term is also applied to a movement in $\frac{3}{4}$ time in a different key, which follows a minuet or other movement, and leads back to the previous movement in the original key.

Tripe, parts of the compound stomach of a ruminant, especially of sheep or horned cattle, prepared as food. The parts used are the paunch or rumen (yielding plain tripe) and the smaller reticulum (yielding honeycomb tripe). See DIGESTION, Vol. III. p. 817.

Tripe de Roche, a name originally given to various species of lichens of the genera Gyrophora and Umbilicaria. They are nutritious, though bitter, nauseous, and purgative, and have been used as food by Canadian hunters and arctic explorers when better was not to be had.

Triple Alliance, the name by which various treaties are known: (1) A treaty concluded in 1668 at the Hague between England, Holland, and Sweden, having for its object the protection of the Spanish Netherlands and the checking of the conquests of Louis XIV. (2) An alliance concluded in 1717 between Britain, France, and Holland against Spain. (3) Between Britain, Russia, and Austria in 1795. (4) Between Germany, Austria, and Italy, formed and confirmed between 1883 and 1887. This superseded the 'alliance of the three emperors' (*Dreikaiserbund*) between William I. of Germany, Francis Joseph of Austria, and Alexander II. of Russia, 1872–84.

Tripoli (*Tarâbulus*), a province of the Ottoman empire, and the easternmost of the Barbary States of North Africa, stretching along the whole extent of both the greater and lesser Syrtes (the gulfs of Cabes and Sidra), is bounded on the W. by Tunis, on the S. (very vaguely) by the Libyan Desert and Fezzan, on the E.—if we include the plateau of Barca (q.v.)—by Egypt, and on the N. by the Mediterranean Sea. The area is roughly estimated at 399,000 sq. m.; the number of the population, which is very mixed, can only be guessed, but is believed to be over 1,000,000—Libyan Berbers, Moors, and a few Arabs—with 3000 Europeans, chiefly Maltese, and 24,000 Jews. Tripoli is less mountainous than the rest of Barbary, for the Atlas range terminates here in a couple of chains running parallel to the coast and never exceeding 4000 feet in height. There are no rivers, and rain seldom falls during the long hot summers, but the heavy dew supports vegetation in favoured spots. The climate is extremely uncertain. The coast region (about 1100 miles in length) is very fertile about Tripoli and Mesurata, where all sorts of tropical fruits, grain, wine, cotton, madder, &c. are produced; but further east, along the shores of the Gulf of Sidra, reigns sandy desolation. The interior yields senna, dates, and galls, and the carob and lotus are indigenous. Sheep and cattle are reared in great numbers, and there is a hardy breed of small but excellent horses, besides strong and beautiful mules. The commerce of the country consists in exporting, principally to Malta and the Levant, the products of the country and of the interior of Africa (gold-dust, ivory, natron, and ostrich feathers), which are brought hither in caravans across the desert. The imports (which consist chiefly of European manufactures) have been declining gradually of late years, owing partly to the new direction which the trade of Central Africa is assuming, and partly to the abolition of the slave-trade, which has stopped the demand for many of the commodities that supported the traffic. Nevertheless Tripoli is still an important mart of the caravan trade with the interior.

Tripoli is subdivided into four *livas* or provinces —Tripoli, Benghazi (Berenice), Mesurata, and Gadames. The governor-general has the title, rank, and authority of a pasha of the Ottoman

empire. He is appointed by the sultan, and in his turn appoints the *beys* or subordinate governors of the provinces; but many of the chief officers of state are nominated from Constantinople. The military force of the country consists of a body of Turkish soldiers, formerly about 3000, but increased in 1885 to 17,000 in number, whose business is to keep down insurrections, but who were formerly chiefly expert in creating them. The natives pay to the Turkish government, by way of tribute, a tenth of all the products of the soil; and there are, besides, the onerous special taxes on date-trees, &c. common to Mohammedan countries.

From the Phœnicians Tripoli passed into the hands of the rulers of Cyrenaica (Barca), from whom it was wrested by the Carthaginians. It next belonged to the Romans, who included it within the province of Africa, and gave it the name of *Regio Syrtica*. About the beginning of the 3d century A.D. it became known as the *Regio Tripolitana* (on account of its three principal cities, Œa, Sabrata, and Leptis, which were leagued together), and was probably raised to the rank of a separate province by Septimius Severus, who was a native of Leptis. Like the rest of North Africa, it was conquered by the Arabs early in the 8th century (see BARBARY), and the feeble Christianity of the natives was supplanted by a vigorous and fanatical Mohammedanism. In 1510 it was taken by Don Pedro Navarro for Spain, and in 1523 it was assigned to the Knights of St John, who had lately been expelled by the Ottoman Turks from their stronghold in the Island of Rhodes. The Knights kept it with some trouble till 1551, when they were compelled to surrender to the Turkish admiral Sinan (see Lane-Poole, *Barbary Corsairs*), and Tripoli henceforward joined in the general piracy which made the Barbary States the terror of maritime Christendom. In 1714 the ruling pasha, Ahmad Karamânlî, assumed the title of bey, and asserted a sort of semi-independence of the sultan, and this order of things continued under the rule of his descendants, accompanied by the most brazen piracy and blackmailing, until 1835, when the Porte took advantage of an intestinal struggle in Tripoli to reassert its authority. A new Turkish pasha, with viceregal powers, was appointed, and the state was made a vilâyet of the Ottoman empire, which it still remains. Several anti-Turkish rebellions have since taken place (notably in 1842 and 1844), but they have always been suppressed. The religious movement set on foot by the 'prophet' Senûsi in the middle of the 19th century is the most remarkable feature in the recent history of Tripoli. The first Senûsi died in 1860, and was succeeded by his son, who calls himself the Mahdi, and commands the devotion of a large following in northern Africa, much as did the better-known Mahdi in the Soudan (see SENUSSI). Of late Italy has sought to extend her interests in Tripoli.

Tripoli, probably the *Œa* of antiquity, called in Arabic *Tarâbulus*, or *Tarâbulus Gharb* ('Tripoli of the West'), is the capital of the foregoing province, and lies on the edge of the desert, on a point of rocky land projecting into the Mediterranean and forming a bay. It is a typical Moorish city irregularly built, surrounded by high bastioned walls and celebrated for its beautiful gardens. There are many mosques, besides several large churches. Pop. about 20,000. Though the majority of the inhabitants are Moslems, nearly all the trade is in the hands of Jews and Christians.

Tripoli (*Tarâbulus*, or *Atrâbulus*), a seaport of Syria, and capital of a province of the same name, is 40 miles NNE. of Beyrout, near the coast, and watered by a small stream, the Kadîsha. In and around the town are many remains of antiquity and traces of Saracenic architecture. Originally an important maritime city of Phœnicia, the ancient *Tripolis* was besieged and taken by the Crusaders in 1104, and retaken by the Mameluke Kalaûn in 1289. The old town having been laid in ruins by these sieges, a new one was built about 5 miles inland on a spur of the Lebanon range. It was famous in the middle ages for its fruit and gardens, its commerce and industries. The old harbour is small and shallow, and the trade has mostly shifted to Beyrout. Pop. 17,000.

Tripoli (Diatomite), a mineral substance employed in polishing metals, marble, glass, &c., so named because it was originally brought from Tripoli in Africa. It is a siliceous rock, composed of the siliceous frustules of Diatomaceæ. It is frequently soft, friable, and earthy, but now and then is rendered firmer and more solid, and even extremely hard, probably from impregnation with opal substance. The more dust-like varieties are called *Kieselguhr*, and are in much demand for the manufacture of Dynamite (q.v.). Kieselguhr has been met with in alluvial (generally lacustrine) deposits in many countries. It occurs in beds underneath peat in Britain, Norway, Germany, &c. Diatomaceous deposits are forming at the present day both in fresh water and in the sea: those which are worked for economic purposes ranging in age from Tertiary to recent times. Ehrenberg estimated that every cubic inch of Bilin Tripoli weighing 220 grains contained 41,000,000,000 of these minute water-weeds.

Tripolitza (officially Tripolis, 'three cities'), a town of Greece, under the Turkish rule capital of the Morea, 40 miles SW. of Corinth, in a plain 3000 feet above the sea. It is a comparatively modern place, and derives its name from being near the sites of the three ancient cities Tegea, Mantinea, and Pallantium. In 1821 it was stormed by the Greek insurgents, and in 1828 razed to the ground by the troops of Ibrahim Pasha. Pop. (1889) 10,698; (1896) 10,465.

Tripos. See CAMBRIDGE, Vol. II. p. 667.

Triptych (Gr. *tris*, 'thrice,' and *ptyssō*, 'I fold'), a set of tablets consisting of three leaves, each painted with a distinct subject, but joined together by hinges, and capable of being folded so as to present a new face. The general character of such tablets has been explained under DIPTYCH (q.v.), the difference of name 'triptych,' 'polyptych,' being taken from the number of the leaves. In ecclesiastical use the diptych has been already explained as commonly meaning rather the register of names inscribed on the tablets than the tablets themselves. The triptych, on the contrary, generally speaking, contained sacred pictorial representations rather than written registers or records, and is extended to canvas pictures in three compartments. Famous triptychs are an altarpiece of the Van Eycks (q.v.) and the 'Descent from the Cross' by Rubens.

Trireme (Lat. *triremis*; Gr. *triērēs*), an ancient galley—especially a war-galley—having three banks of oars. Originally boats with one bank, then with other two banks of oars, were used. In the Persian and Peloponnesian wars triremes were the largest vessels employed; but at the time of Alexander we find that galleys with four and five banks had gradually come into favour. In the Punic wars the Carthaginians employed quinqueremes; and thenceforth the Romans constructed their war-vessels after the model of the Carthaginian quinquereme. At Actium Antony had nine and ten banked galleys. Under the empire the police of the seas was managed by smaller vessels, *liburnæ*; great war-ships were hardly required.

The banks of oars were elevated above each

other, but not perpendicularly; the lowest rank of rowers having the shortest oars and easiest work. How the banks of rowers were arranged as to allow all to have a fair share of the work has never been satisfactorily explained. The trireme or quinquereme was also provided with a square sail, which was used when the wind was favourable for voyaging to relieve the labour of the rowers, but was not employed in action. In the earlier times victory depended more upon the number and valour of the soldiers on board than upon the skill of the seamen. Latterly the aim of each trireme was not as before to grapple with its opponent, but to dash with the greatest momentum possible with its beak against the enemy's vessel, and strike it amidship, or, at any rate, disable his banks of oars on one side. Fighting men were not so much wanted for these tactics. The crew then of an Athenian trireme consisted of about 200 men, of whom 20 might be sailors, nearly the same number marines, and the rest rowers. A contrivance for strengthening the prow of the trireme and increasing its efficiency as a ram gave the Syracusans their final victory over the Athenians in the harbour of Syracuse. The Romans preferred to grapple and fight hand to hand. See GALLEY.

Trisagion, or TRISHAGION (Gr. *tris*, 'thrice,' and *hagios*, 'holy'), one of the doxologies in use in the Greek Church which is repeated in the form of versicle and responses by the choir in certain parts of the liturgy. The words of the Trisagion are: 'O holy God, holy and mighty, holy and immortal, have mercy on us!' This doxology occurs in the Constantinopolitan and Syriac liturgies, in the Good Friday service of the 'adoration of the Cross,' and in the ferial prayers at Prime for penitential days.

Trismegistus (Gr., 'Thrice-greatest'), an epithet applied to the Egyptian Hermes; see HERMETIC BOOKS.

Trismus Nascentium. See TETANUS.

Tristan Da Cunha (often but erroneously *Tristan d'Acunha*), an island in the South Atlantic Ocean, with two smaller ones adjoining, lies midway between the coast of South America and the Cape of Good Hope, in 37° 6′ S. lat. It is about 21 miles in circumference, is rugged and precipitous, rising in a central conical mountain to 7640 feet. Discovered by the Portuguese in 1506, and named after the commander of the expedition, it was occupied by American sealers in 1790–1811. Formal possession was taken of the island in 1817 by a company of British artillery for the purpose of keeping a watch on Napoleon, at that time a prisoner in St Helena. On the death of Napoleon in 1821 the soldiers were withdrawn, with the exception of a corporal Glass and two companions, who, with some whaling men, were the founders of the present settlement. The colony flourished, and in 1829 numbered 27 souls; in 1873 there were 80, with 600 cattle and 600 sheep. In 1887 there were 97 persons, in 1895 only 61, the population having decreased through migrations to the Cape. The settlement is in a fertile tract to the north-west, and is called Edinburgh. Property is practically held in common, and there is no strong drink and no crime, while the natives are healthy and long-lived. Nearly all the able-bodied men were drowned in December 1885 while attempting to board a vessel; and a grant of stores and provisions was passed by parliament for the use of the survivors in 1886. The oldest inhabitant acts as governor. During the American war the *Shenandoah* landed forty Federal prisoners here without providing for them. There is parcel post from St Helena as opportunity offers; and a ship of war pays the island an annual visit. Inaccessible Island, 20 miles distant, harboured two Germans of the name of Stoltenhoff, who underwent a kind of Robinson Crusoe experience there (1871–73). Nightingale Island lies 10 miles from Inaccessible Island.

Tristrem, or TRISTAN, the hero of a Breton or Cornish romance, originally unconnected with the Round Table cycle, although later interwoven with it. Tristrem was the love-child of King Mark of Cornwall's sister and Roland of Ermonie, and at fifteen repaired to Cornwall, where he charmed the whole court by his minstrelsy. He slew Morannt in mortal combat, and lay ill three years of the wounds received, but was borne to Ireland, and there cured by Ysolt or Ysonde, daughter of the queen. On his return to Cornwall he told his uncle of the marvellous beauty of the Irish princess, and was sent to solicit her hand for him in marriage. Tristrem escorted Ysonde on her voyage to England; but both unwittingly drank of a love-potion intended for Mark, and from that day to the day of their death no man or woman could come between their loves. Ysonde was married to the king of Cornwall, but by the help of her clever maid, Brengwain, had many a secret interview with her lover. Tristrem was banished from Cornwall, but again brought to his uncle's court, and again their inevitable loves began anew. Next he wandered to Spain, Ermonie, Brittany, and here married another Ysonde—her with the white hand, daughter of Duke Florentine—but he could not forget his love for Ysonde of Ireland. Grievously wounded in battle, he sent a messenger to bring her to him. 'If you bring her with you,' he charged him, 'hoist a white sail; if you bring her not, let your sail be black.' Soon the ship is sighted, and Tristrem asks eagerly what is the colour of her sail. It was white; but Ysonde of Brittany, her heart filled with bitter jealousy, told Tristrem the sail was black, whereupon the heart-sick lover sank back and died. Ysonde of Ireland threw herself in passionate despair upon his body, and died heart-broken beside him. King Mark subsequently learned the story of the love-potion, and buried the twain in one grave, planting over Ysonde a rose-bush, and over Tristrem a vine, which grew up so inextricably intertwined that no man could ever separate them.

This romantic story is beyond a doubt of Celtic origin, but its intrinsic beauty early carried it widely across western Europe. It had very probably a mythological origin, and it recalls in more than one point the legend of Theseus. The oldest poem on the subject is that of *Béroul*, about 1150, extant only in a fragment. Several fragments of the story of the 12th and 13th centuries were edited by Francisque Michel (Lond. 1835). About the end of the 12th century Eilhard of Oberge composed his *Tristrant* (Strasb. 1877), the ultimate parent of many versions in later German *Volksbücher*. Gottfried of Strasburg's *Tristan und Isolde*, an unfinished poem of almost 20,000 lines, belongs to the first quarter of the 13th century. Soon after Gottfried's death his fine poem was feebly continued by Ulric of Türheim and Henry of Freiburg. The extant English poem, *Sir Tristrem*, dates from about the close of the 13th century. It was first edited by [Sir] Walter Scott in 1804; later by Eugen Kölbing (Heilbronn, 1882), and George P. M'Neill for the 'Scottish Text Society' (1886). Scott ascribed the authorship to Thomas of Ercildoune, and is followed by Mr M'Neill. In the 13th century also a Norse version was made, *Tristrams Saga ok Ísondar* (edited by Eugen Kölbing, Heilbronn, 1878). We find allusions enough to the story in French *fabliaux*, in Dante, Petrarch, Boiardo, and Ariosto, in Chaucer, Lydgate, and Gower; in 1469 a prose romance on the subject

of Tristan, son of King Meliadus of Leonnois was printed at Rouen, and was soon translated into German. The Spanish romance of *Don Tristan of Leonis* appeared at Seville in 1528; the Italian, *I due Tristani*, at Venice in 1555. It also became associated with the romances of the Round Table, and we find it in its place in Sir Thomas Malory's famous composition of these, the *Morte Darthur*. Hans Sachs worked the subject into a tragedy, and in 1588 a long poem on the love of Tristano and Madonna Isotta was printed at Venice. In 1841 appeared Karl Immermann's unfinished *Tristan and Isolde;* Wagner's operatic poem, which preserves all the essential points of the story, was first produced in 1859. A later work is the tragedy by Ludwig Schneegans (1865). In modern English poetry we have Matthew Arnold's poem, *Tristram and Iseult*, expressing exquisitely the pity of the story from the side of Iseult of Brittany; 'The Last Tournament' in Tennyson's *Idylls of the King*, closely based on Malory; and the *Tristram of Lyonesse* of Swinburne, a splendid poetic realisation of the theme.

See the Introductions to the editions of Eugen Kölbing and G. P. M'Neill; also Golther, *Die Sage von Tristan und Isolde* (Munich, 1887); vol. xxx. (1888) of the *Hist. littéraire de la France;* and *Romania*, vols. xv. and xvi.

Triticum. See WHEAT, and COUCH-GRASS.

Tritoma (*Flame Flower*), a genus of tufted herbaceous plants belonging to the natural order Liliaceæ. The leaves are all radical, long, narrow linear; the flowers are scarlet and yellow, very showy, densely racemose or spicate, the spikes in some species being ovoid, supported at the summit of a stout leafless scape. The perianth is tubular, six-parted, usually more or less depressed. The genus is best known in gardens by the name here given, but bears many synonyms, the earliest of which, Kniphofia, has recently been revived by botanists. There are about sixteen species, natives of South Africa and Madagascar. The species best known in British gardens is *T. aloides*, better known as *T. uvaria*, which is quite hardy in most parts of Britain, and is one of the most brilliant of border flowers in late summer and autumn. There are four or five other species in cultivation less hardy, but hardly less showy, where they may be successfully grown. Light, rich, well-drained soil suits them best; they are propagated by division of the crowns in spring as growth commences.

Triton, in Greek Mythology, a son of Poseidon and Amphitrite, who dwells with his parents in a golden palace at the bottom of the sea. He usually figures as an attendant on his father, a man in his upper parts with a dolphin's tail, and soothing the turbulent waves by blowing his shell-trumpet—his 'wreathed horn,' as Wordsworth calls it. The later poets speak of Tritons, in the plural, as a race of subordinate sea-deities, who are described by Pausanias as having sea-green hair and eyes, gills below the ears, human noses, broad mouths with the teeth of animals, scales on their bodies, and instead of feet a tail like that of a dolphin. Some have a dolphin's tail and horse's fore-feet (*Centauro-tritons*).—In zoology the name is given to the Newt, and to a genus of Gasteropods.

Triumph (Lat. *triumphus*) was the name given in ancient Rome to the public honour bestowed on a general who had been successful in war. It consisted in a solemn procession along the *Via Sacra* up to the Capitol, where sacrifice was offered to Jupiter. The victor stood in a chariot, drawn by four horses—his captives marching before, his troops following behind.

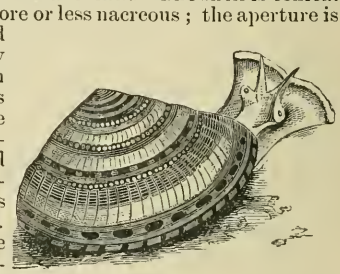
The *ovation* (from *ovare*, 'to shout,' 'exult'), or lesser triumph, differed from the greater chiefly in these respects, that the imperator entered the city on foot, clad in the simple *toga prætexta* of a magistrate, instead of with the *toga picta* and the *tunica palmata* of the more highly honoured commander, that he bore no sceptre, was not preceded by the senate and a flourish of trumpets, nor followed by his victorious troops, but only by the equites and the populace. The ovation was granted when the success, though considerable, did not fulfil the conditions specified for a triumph, or if the conqueror had not been in supreme command. For triumphal arch, see ARCH.

Triumvirate (Lat., 'a union composed of three men') is the name given in Roman history to the private league entered into between Pompey, Crassus, and Cæsar to carry out their own schemes of political aggrandisement, in spite of the opposition of the senate. The term is also applied to the division of government between Octavian (Augustus), Mark Antony, and Lepidus in the civil wars that followed the murder of Cæsar—an arrangement sanctioned, and therefore legalised by the senate. The former is usually called the *first*, the latter the *second* triumvirate. See ROME, and the articles on CÆSAR, POMPEY, and AUGUSTUS.

Trivium. See ARTS.

Trocar. See CANNULA.

Trochidæ, a family of gasteropodous molluscs of the order Pectinibranchiata. The shell is conical and spiral and more or less nacreous; the aperture is entire and closed by a thin horny operculum. In the genus Trochus the shells are top-shaped, and hence are popularly known as Top-shells. Many of the shells are extremely beautiful, and are used for adorning head-dresses, necklaces, &c., the outer layers being removed. There are a large number of British species, and a multitude of foreign and fossil forms. The Trochidæ are closely allied to the Turbinidæ.



Trochus.

Trochilus. See HUMMING-BIRD.

Trochu, LOUIS JULES, the defender of Paris, was born at Palais in Belle-Isle (Morbihan), 12th May 1815, and after the course at St Cyr entered the army at seventeen, and by his conduct and capacity rose rapidly in rank. He served as adjutant to Lamoricière, and to Bugeaud in Algeria; next to Saint-Arnaud and Canrobert in the Crimea, became in November 1854 general of brigade, and distinguished himself next year in the storming of the Malakoff. As general of division he fought at Solferino, and after the peace entered the Ministry of War, and was destined by Niel for his successor. But the unpalatable truths contained in his famous pamphlet, *L'armée Française en 1867*, in which he pointed out the rottenness of the imperial military system, and urged the adoption of Prussian methods, made him hateful to the court. At the outbreak of the 1870 war he received command of the 12th Territorial Division at Toulouse, and on the 17th August was named by the emperor governor of Paris, and after the proclamation of the republic became chief of the National Defence. He was cautious, timid, said the hotter spirits both within and without the circle of the doomed city; it is most probable that he saw only too well the hopelessness of his task. He laid down

his office as governor 22d Jan. 1871, but remained president of the National Defence till 1872, and died 7th Oct. 1896. Works in his own defence are *Pour la Vérité et pour la Justice* (1873) and *La Politique et le Siége de Paris* (1874). See his *Souvenirs Posthumes* (2 vols. 1896).

Troctolite (trout-stone), a variety of Gabbro (q.v.) composed almost entirely of white felspar (anorthite) and dark olivine. It is the 'Forellenstein' of the Germans.

Trœzen, a very ancient Greek city, capital of the south-east district of Argolis. It was the birthplace of Theseus (q.v.).

Troglodytes (Gr. *Trōglodytai*, 'cave-dwellers'), the name given by the ancient Greeks to various tribes or races of uncivilised men, who dwelt either in natural caverns or in holes which they had dug for themselves in the earth. They are mentioned by Strabo as existing as far west as Mauretania, and as far east as the Caucasus; but perhaps the best-known Troglodytes of ancient times were those of southern Egypt and Ethiopia. It was reported that they could not speak articulately, but shrieked or screamed like the lower animals. The chief occupation of the Troglodytes was herding cattle, though we also read that they were hunters and robbers. They are likewise mentioned as serving among the light troops in the army of Xerxes. Their habits of life were rude and debased; their drink was a mixture of milk and blood; they had a community of wives; and they killed the old men when unfit to tend cattle. Troglodytes are mentioned by Herodotus, Aristotle, and Diodorus, and seem to have been found also in Mœsia. The prehistoric cave-dwellers of Europe and more recent cave-dwelling peoples are noticed at CAVE.

Trogons (*Trogonidæ*), a family of birds of the order Picariæ, not very closely allied to any other group. They have the bill short, broad, notched or serrated, and with a wide gape; the feet small and weak, with the toes in pairs; but the first and second toes are turned backward, instead of the first and fourth—an arrangement unique among birds. The wings are short and somewhat pointed; and the tail is long and broad, often overhung by long tail-coverts. The plumage is soft, lax, and loosely attached to the very delicate skin; it is very beautifully coloured, some species being only excelled in brilliancy by the humming-birds. The females are less gorgeous than the males. The trogons inhabit the tropics of the old and new worlds; they are most numerous in South America, less so in the oriental region, and are represented in Africa by two species only. They are birds of moderate size, and sedentary and unsocial habits, inhabiting forests, where they sit motionless on branches, occasionally darting off to seize fruits or insects. They nestle in holes in decayed trees, laying two to four eggs, white or pale in colour. There are about fifty species, of which the most celebrated is the Quetzal, or Resplendent Trogon (*Pharomacrus mocinno* or *Calurus resplendens*), whose plumage is of a magnificent golden green, the centre tail-coverts of the male being nearly three feet long, though the bird is only of the size of a magpie. It inhabits Central America: Guatemala especially is the 'Land of the Quetzal.' See Gould's *Monograph of the Trogonidæ* (2d ed. 1875), and Brigham's *Guatemala* (1887).

The Quetzal (*Pharomacrus mocinno*).

Troilus and Cressida. See TROY.

Troitsk, a town of Russia, in the government of Orenburg, but on the Siberian side of the mountains, is 400 miles NE. of Orenburg, on the great road into Siberia. Pop. 18,497.

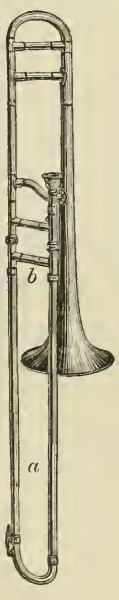
Troll. See DEMONOLOGY.

Trollope, the name of a family which has produced several eminent English authors.—MRS FRANCES TROLLOPE was a novelist and miscellaneous writer. Born in 1780, the daughter of the Rev. William Milton, vicar of Heckfield, Hants, in 1809 she was married to Mr Thomas Anthony Trollope, a barrister-at-law and fellow of New College. In 1829, her husband having fallen into straitened circumstances, she went to America; and during a three years' residence in the United States she amassed the materials of her first book, *Domestic Manners of the Americans*, published in 1832. This work attracted great attention, and the severity of certain of its strictures was much resented by Americans. From this time forward the literary activity of Mrs Trollope was nearly uninterrupted; novels of society and impressions of travel make up the sum of her works. Of her novels the most successful is, perhaps, *The Widow Barnaby* (1839), with its sequel, *The Widow Married* (1840), followed by *The Barnabys in America*. Mrs Trollope was a woman of strong talent, and her works are full of shrewd observation and true, if at times somewhat coarse, humour. They were popular in their day, and very well deserved their popularity; but already they are well-nigh forgotten. During the life of her husband Mrs Trollope resided chiefly at Harrow. Latterly much of her time was passed in Italy with her eldest son; she died at Florence, 6th October 1863. See Life by her daughter (1895).

Her son, THOMAS ADOLPHUS TROLLOPE (29th April 1810–13th November 1892), was educated at Winchester and Oxford, and in 1841 settled in Italy. He is favourably known by his *Girlhood of Catherine de' Medici*, *A Decade of Italian Women*, and a number of novels such as *La Beata*, *Marietta*, *Lindisfarn Chase*, *Gemma*, *The Garstangs*, *The Dream Numbers*. He has also written a *History of Florence*, the *Life of Pius IX.*, *Sketches of French History*, &c. His second wife, Mrs Frances Eleanor Trollope, is known as the author of *Aunt Margaret's Trouble* (1866), *Black Spirits and White* (1877), *That Unfortunate Marriage* (1888), and, with her husband, *The Homes and Haunts of the Italian Poets* (1881). See his autobiographical *What I Remember* (3 vols. 1887–89).

The third son, ANTHONY TROLLOPE, one of the most popular of recent novelists, was born 24th April 1815, and was educated at Winchester and Harrow. In 1841 he obtained a post as clerk to a surveyor of post-offices in Ireland. Here he acquired the fondness for hunting which never left him, married (1844), and began writing novels; and while filling more responsible official situations in the Post-office, he found, or made, leisure to amuse the public with a long series of novels, many of them of very remarkable merit. The *Kellys and the O'Kellys* (1848) was one of the first three novels he wrote, and like the other two fell dead from the press, although a graphic and accurate picture of the Irish life of the time. The first work which

decisively drew attention, *The Warden* (1855), was followed by a continuation, *Barchester Towers*, which remains, perhaps, the cleverest of all his books. In rapid succession to these came *Doctor Thorne*, *The Bertrams*, *The Three Clerks*, *Castle Richmond*, *Framley Parsonage* (originally published in the *Cornhill Magazine*), *Orley Farm*, *The Small House at Allington* (contributed to the *Cornhill Magazine*), *Rachel Ray*, *Miss Mackenzie*, *Can You Forgive Her? The Claverings*, and *The Last Chronicle of Barset* (1867)—one of his best novels—besides many others. He was a zealous and valuable servant of the Post-office, and resigned his position as a surveyor (1867) three or four years only before he would have been entitled to a retiring pension, because he felt that his increasing literary work made it impossible for him, even with his extraordinarily unflagging industry, to discharge his official duties with efficiency. He wrote much for the magazines, and was the first editor of *St Paul's;* he once stood for parliament and was defeated. Post-office work had taken him to the West Indies, Egypt, and the United States; latterly he travelled in Australia and South Africa; so that he acquired materials for books on all these countries. Novels continued to be produced with astonishing regularity and frequency, according to a business-like method he has described in his autobiography. Amongst novels written subsequent to his resignation were *Phineas Finn* (1869), *Ralph the Heir*, *The Golden Lion of Granpère*, *Phineas Redux*, *John Caldigate*, *Ayala's Angel*, *The Fixed Period*, and *An Old Man's Love* (1884). Other works were a sketch of Thackeray ('Men of Letters' series, 1879), a Life of Cicero (2 vols. 1880)—a task for which his powers were inadequate—and a short Life of Palmerston (in 'English Political Leaders,' 1882). Trollope died 6th December 1882, and in 1883 appeared his interesting *Autobiography* (edited by his son, H. M. Trollope, who has also published novels and other works). Trollope sketches the superficial aspects of society with a charming lightness, and his works are unfailingly agreeable and amusing. Many of the portraits in the extensive gallery he has left us, especially of the residents in the cathedral close, are permanently fixed in the memory of all readers of English literature.



Tenor Trombone.

Trombone, a brass musical wind-instrument, whose title, originally Italian, signifies the great tromba or Trumpet (q.v.), to which instrument it forms the natural complement. It consists of a tube bent twice on itself, ending in a trumpet-shaped bell, and sounded by means of a cupped mouthpiece. The centre section (*a* in fig.) is double, the outer tube sliding on an inner one so as to permit of its being stretched to nearly double its own length. The performer, while holding the mouthpiece with the left hand, moves the slide out and in with the right hand by means of the cross-piece, *b*. The bass form of the instrument is provided with a jointed handle to enable the performer to reach the end of the slide. The trombone is, like the violin, a perfect instrument, being capable by means of the slide of any gradation of tone. Its notes are not fixed like the valved instruments, but made by moving the slide to varying distances, and consequently requiring a very correct ear on the performer's part. It has the usual open harmonic notes of the tube (see HARMONICS), the slide giving the complete chromatic scale. One great advantage it has over keyed or valved instruments—viz. all its notes are of the same quality; the moving of the slide does not alter its form as in the valved instruments, where every valve opens an extra convolution for the air to go through. It is of ancient but uncertain date, some authorities tracing it back to nearly 700 B.C. Specimens made of bronze, with gold mouthpieces, were discovered at Pompeii in 1738. When first introduced into England it was called sackbut. It has been much used in orchestral composition, and as a military-band instrument is unrivalled. To partly get over its difficulties a form with valves instead of the slide has been introduced, but its brilliancy is thereby destroyed, and its use is consequently declining. It has been made in almost every key, but the two principally used are the tenor in B♭ and the bass in G; and the music for them is written in the tenor and bass clefs respectively.

Tromp, MARTIN HARPERTZOON, a famous Dutch admiral, was born at Briel in 1597, went to sea as a child with his father, a commander in the Dutch navy, was captured off the coast of Guinea by an English cruiser, and compelled to serve over two years as a cabin-boy. In 1624 we find him in command of a Dutch frigate; in 1637 he was created lieutenant-admiral, with command of a squadron of eleven ships, with which he defeated a vastly superior Spanish fleet off Gravelines in February 1639. In the following October he defeated another fleet off the Downs, and captured thirteen richly laden galleons. But it was his conduct in the struggle with England that was to make the name of Tromp immortal. On May 19, 1652, with over forty ships, he encountered an English fleet of fifteen under Blake, and was worsted, with the loss of two ships. Tromp was for a while superseded in command by Ruyter and De Witt, but he was soon afterwards reinstated. On November 30, with eighty ships and a convoy of 300 merchantmen, he again encountered Blake in the Strait of Dover, and this time success was decidedly with the Dutch. The English fleet drew off, but it more than probably is a mere romance that Tromp now sailed up the Channel with a broom at his masthead, to denote that he had swept the enemy from the seas. At any rate that enemy was not long in returning. On the 18th of February 1653 Blake, together with Monk and Deane, engaged Tromp near Portland, and defeated him, though only after a contest memorable for its obstinacy. It lasted three days, at the close of which Blake had taken or destroyed nine ships of war and thirty merchantmen. Tromp fought with desperate courage, and brought off in safety the remainder of his convoy of 200 merchantmen. On June 2 and 3 following another terrific battle between Tromp and Deane took place off North Foreland, in which six Dutch vessels were captured, eleven sunk, and the remainder driven into Calais Roads. The final struggle of the war was his desperate battle with Monk, 31st July 1653, off the coast of Holland. The Dutch lost thirty men-of-war, but their greatest loss was the heroic Admiral Tromp, the victor in thirty-three sea-fights, killed by a bullet through the heart. He was buried at Delft. —His second son, CORNELIUS TROMP, was born at Rotterdam, 9th September 1629. His first service was against the Algerine pirates. Next he served under Van Galen in the Mediterranean, and became rear-admiral after the battle off Leghorn in which Van Galen fell (13th March 1653). On June 3, 1665, he shared the disgrace of Opdam's defeat by the Duke of York at Solebay on the Suffolk coast, but next year had an ample share of the glory of

Ruyter's four days' fight (June 1–4) off the Downs. Two months later he was deprived of his command by Ruyter for a breach of duty, the result of his over-eagerness to pursue an advantage, but was reinstated in 1673 by the stadtholder William, and covered himself anew with glory in the bloody battles against the combined English and French fleets, 7th and 14th June. In 1675 he visited England, and was created a baron by Charles II. The year after he aided the Danes in their struggle with Sweden, and after his return home was appointed, in room of the dead Ruyter, lieutenant admiral-general of the United Provinces. He died at Amsterdam, 29th May 1691, and was laid at Delft in his father's grave. See Jacob de Liefde, *Great Dutch Admirals* (Eng. trans. 1873).

Trompe. See BLOWING-MACHINES.

Tromsö, a town of Norway, capital of the *amt* of Tromsö (the north-west part of the kingdom), on the eastern shore of the low, fertile island of Tromsö, which is nearly 5 miles long, and about 1½ mile broad. Pop. of island, 65,000; of town, 6000.

Tron or TRONE weight, the most ancient system of weight used in Scotland, the *trone* being a heavy beam or balance set up in the market-place, and employed for the weighing of heavy wares. The tron lb. contained 20 oz., but, from the custom of giving 'one in' to the score, was always reckoned at 21 oz.; this was the most general value; but it varied in the different market-towns between this and 28 oz. The later tron stone or standard weight contains 16 tron lb., each lb. 16 tron oz., and each tron oz. 16 drops; the tron lb. is estimated to be equivalent to 1·3747 lb. avoirdupois. The name survives in several Scottish churches.

Trondhjem (also *Throndhjem;* Ger. *Drontheim*), on the south side of the long and narrow Trondhjem fjord, at the mouth of the little Nid River, and 250 miles N. of Christiania by rail. It is built on undulating slopes, and has regular and broad streets, the houses being mostly of wood, though the building of new wooden houses is now forbidden by law. The (fortified) harbour is capacious, deep, and safe, but is difficult of entry. The most interesting building in the city is the venerable cathedral, a cruciform church dating partly from the 13th century, of English-Norman architecture, and unquestionably the most interesting ecclesiastical edifice in Norway. A great fire in 1530 destroyed most of the church except the richly adorned octagonal choir (late Gothic). The church, since 1818 the place of coronation of Norwegian kings, has been carefully restored since 1880. Portions of an old archiepiscopal palace (Kongsgaard) also survive. The town is the main emporium of a wide district of country, and has a large trade by sea and land; the exports include copper ore, herrings and other fish, train-oil, timber, &c. The ancient capital of Norway, originally called Nidaros, Trondhjem was founded in 996 by Olaf Trygvason, and became in 1152 the seat of an archbishop. Its decline dates from the Reformation. It was taken by the Swedes after a siege of nine weeks, and has often been nearly destroyed by fire. Pop. (1891) 25,051.

Troon, a seaport and watering-place of Ayrshire, 6 miles N. by W. of Ayr and 31 SW. of Glasgow. The harbour, begun in 1808, was completed at a cost of half a million. A fine new parish church was opened in 1893, and a new water-supply turned on in 1897. Golf-links were laid out in 1878; and Troon also has splendid sands and good sea-bathing. Pop. 2383. See Kirkwood's *Troon and Dundonald* (2d ed. Kilmarnock, 1881).

Troop, in Cavalry, a captain's command, consisting in the British army of two lieutenants, fifty-six mounted non-commissioned officers and troopers, and some twenty dismounted men when the regiment is at war strength. Two troops form a squadron, which is the manœuvring unit.

Troopial. See TROUPIAL.

Tropæ'olum, a genus of plants variously included by different botanists in the natural orders Tropæolaceæ and Geraniaceæ. It is numerous in species, all of which are natives of South America. They are annual or perennial herbs of trailing or climbing habit, having simple peltate leaves which are often peltately divided into several leaflets. The genus comprises the Great Indian Cress or Nasturtium (q.v.), *T. majus*, and the Small Indian Cress (*T. minus*), which are familiar in nearly every garden, along with the Canary-bird Flower or Canary Creeper (*T. peregrinum*), and many brilliant perennial species not so generally cultivated in Britain. The best known of the perennials is the Flame-flowered Nasturtium (*T. speciosum*), which, though introduced from its native country, Chili, so recently as 1846, is now one of the most frequent and brilliant ornaments of cottage walls throughout Scotland, particularly in the highland or northern districts, and also in North Wales. It is the envy of southern tourists, who carry roots of the plant home with them in the hope of establishing it in their own gardens, but rarely succeed. It requires peculiar atmospheric conditions to induce it to grow and flower freely; moderate exposure to light, such as would be afforded by a west aspect, high atmospheric humidity and cool nights, with deep moist but well-drained soil, are essential to its healthy growth. It is easily propagated by its creeping underground rhizomes. There are several other hardy and greenhouse perennials with tuberous roots in cultivation, all of a very ornamental character. The tubers of *T. tuberosum*, a native of Peru, are edible.

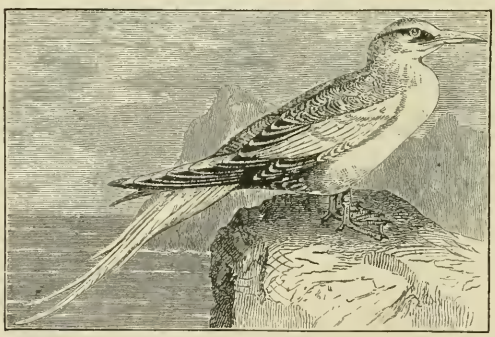
Canary Creeper (*Tropæolum peregrinum*).

Trophonius, in Greek legend, was the most skilful architect of his day, and was the son of Erginus, king of Orchomenus, or of Apollo. Along with his brother, Agamedes, he built the temple of Delphi and the treasury of King Hyrieus in Bœotia, which the two are said afterwards to have plundered. After his death he was worshipped as a hero, and had a celebrated oracle at Lebadeia (Livadia) in Bœotia. The votary who wished to enter the 'Cave of Trophonius,' in order to consult

the oracle, after preparing himself for several days previously by purification and sacrifice, lay prone on his back, and put his feet into the cave, when he was caught by some unseen force, and violently pulled inside. Don Quixote, it will be remembered, once thought himself to have got there.

Trophy (Lat. *tropæum;* Gr. *tropaion*, from *trepō*, 'I put to flight') was a memorial of victory erected on the spot where the enemy had turned to flight. Among the Greeks (with the exception of the Macedonians, who erected no trophies) one or two shields and helmets of the routed enemy, placed upon the trunk of a tree, served as the sign and memorial of victory. After a sea-fight the trophy consisted of the beaks and stern-ornaments of the captured vessels, set up on the nearest coast. It was considered wrong to destroy such a trophy, and equally wrong to repair it. In early times the Romans decorated the buildings at Rome with the spoils of the vanquished. Of this practice we have a familiar instance in the *rostra* or beaks set up in the forum. In later times pillars and triumphal arches were employed to commemorate victories. Besides these, in modern times, the humiliation of an enemy is rendered lasting by such devices as the naming of many streets in Paris (Austerlitz, Jena, Magenta, Solferino, &c.), the Waterloo Bridge in London, the Sedan-festival in Germany, the Russian cannon set up in English towns, &c.

Tropic-bird (*Phaëthon*), a genus of birds of the family Phaëthontidæ. The bill is strong, pointed, and almost arched; the head completely feathered; the tail short; the four toes united by a web. In general aspect and size they closely resemble gulls or terns. They often follow in the wake of ships, and are known to sailors as 'Boatswains.' The two very long tail-feathers are in one species red and in the two other species



Tropic-bird (*Phaëthon æthereus*).

white. Their flight is very unlike the usual flight of sea-birds, its chief peculiarity being the rapid and constant strokes of the wings, more like a duck than a gull. Three species are known, all tropical, and often seen very far from land. They breed in cracks of cliffs or ledges of rock, but make no nest. The Common Tropic-bird (*P. æthereus*) is about the size of a partridge, white, with curved lines of black on the back; some of the quill-feathers black, tipped with white. It is found in the Atlantic Ocean. In the Indian and Pacific Oceans another species, the Red-tailed Tropic-bird (*P. rubricauda* or *phœnicurus*) appears, which is larger in size, of a deep roseate tinge, with red bill and the retrices and long feathers of the tail red. The Yellow-billed Tropic-bird (*P. flavirostris* or *candidus*) is the smallest in size; it breeds in Bermuda, and occurs numerously in the South Atlantic, the Indian, and a great part of the Pacific Ocean.

Tropics (Gr., 'turning-points' or 'limits') are two parallels of latitude on the terrestrial globe, passing through the most northerly and southerly points on the earth's surface at which the sun is vertical. On the Armillary Sphere (q.v.), consequently, the ecliptic (the representation of the sun's path) touches but does not cross the tropics. The tropics include between them all those points on the earth's surface at which the sun is ever vertical. The tropic north of the equator is called the Tropic of Cancer, because the sun at the summer solstice (at which time he is vertically over that tropic) enters the constellation of Cancer; and the southern one is, for a similar reason, denominated the Tropic of Capricorn. Though usually said to be in $23\frac{1}{2}°$ N. and S. lat., the tropics are not absolutely fixed at a uniform distance from the equator, but the limits of their variation are extremely narrow (see Ecliptic). For 1st January 1882 the *Nautical Almanac* gave their position in 23° 27′ 16″·60 N. and S. respectively; and for 1st January 1892, 23° 27′ 11″·84 N. and S. The term subtropical is used somewhat loosely for a climate between tropical and temperate, and for the regions bordering on the tropics.

Troppau, the capital of Austrian Silesia, on the Oppa, a tributary of the Oder, 184 miles by rail NE. of Vienna. It has an old town-hall, a library of 35,000 volumes, and manufactures of cloth, beet-root sugar, &c. Pop. 20,562.

Trossachs, a wooded defile of Perthshire, 8 miles W. by S. of Callander, which Scott's *Lady of the Lake* has made one of the places of pilgrimage of the world. It extends 1 mile eastward between Lochs Katrine and Achray, and to the north has Ben A'an (1851 feet), to the south-west Benvenue (2393 feet).

Trotting. For more than half a century the trotting horse in America has been a distinctive type. Since this was recognised to be so the trotting strains have been much improved by careful breeding, while skilful training has greatly aided in the development of these useful horses. Indeed, it may be said that the trotter is the national horse of America, where it is considered the ideal animal for both business and pleasure. There are trotting strains elsewhere than in America—for instance, the Norfolk trotters in England and the Orloff trotters in Russia—but no other strain has attained the speed of the trotting-horse in America. The turf test of speed is the only one by which trotting strains can be judged, and trotting races are held in America for the purpose of applying this test, quite as much as to furnish sport to spectators. Compared with running races, even in America, trotting contests are not very popular. The trot and the amble or pace are kindred gaits, the latter being the faster. The trot is a diagonal and the pace a lateral gait. In the trot the order of movement is left fore-foot, right hind-foot, right fore-foot, left hind-foot. Thus the left fore-foot and right hind-foot move in unison, striking the ground together; then in turn the right fore and left hind foot complete the movement. In the pace two feet are also moved simultaneously, but the two feet moved at once are on the same side. From the same strains of blood there frequently come both natural trotters and pacers. Though pacing is the faster gait, it is not considered desirable, and pacers are often converted into trotters by the use of heavy toe weights on the forward feet. A competent trainer by the use of these weights can change an inveterate pacer into a trotter. As the horse becomes used to the trot the weights are gradually reduced. The gait of even natural trotters is oftener than not helped by the use of toe weights.

Copyright 1892 in U.S. by J. B. Lippincott Company.

The best strains of American trotters trace back to the thoroughbred gray stallion Messenger, imported from England in 1788 when he was eight years old. He was by Mambrino, first dam by Turk, second dam by Regulus, third dam by Starling, fourth dam by Fox, fifth dam by Bay Bolton, sixth dam by Duke of Newcastle's Turk, seventh dam by Byerly Turk, eighth dam by Taffolet Barb, and ninth dam by Place's White Turk. Though this record shows that Messenger's pedigree goes back to the very beginning of the thoroughbreds, it is generally thought that he himself was not, strictly speaking, a thoroughbred. The more frequent the Messenger cross is found in the pedigree of a trotter, the more valuable the strain is thought to be. Messenger begot Mambrino, Mambrino begot Abdallah, and Abdallah begot Rysdyk's Hambletonian. Rysdyk's Hambletonian, foaled in 1849, was out of the Charles Kent mare by Bellfounder, a horse imported from England, and said to come of the strain of Norfolk trotters, and with two crosses on the dam's side tracing back to Messenger. Rysdyk's Hambletonian is considered by breeders to be the father of the American trotters. Many experiments have been tried in breeding trotters for greater speed and endurance. Within the space of this article the various theories of breeding cannot even be stated, but recent performers, such as Maud S., Palo Alto, and Sunol, would seem to show that the Hambletonian blood on the side of the sire, with a rich infusion of thoroughbred blood on the side of the dam, is likely to produce faster trotters than any other crosses so far attempted.

The breeding of trotters has become in the United States and Canada a great industry. Yearlings from the trotting stock farms do not command as high prices as yearling thoroughbreds, but in maturity they appear to be more valuable. In 1886 two great breeding stables were sold—the Rancocas, in New Jersey, for breeding thoroughbreds, and the Glenview, in Kentucky, for breeding trotters. The Rancocas stallions sold at an average of $6370 each, and the brood-mares at $1422, or a general average of $1721. The Glenview stallions brought an average of $12,780, and the brood-mares $1678, and a general average of $2238. These were both breeding establishments of the first class. It is probable that a like comparative average would be maintained at lesser sales. Individual trotters have been sold for very high figures—many of the fastest of them to Mr Robert Bonner of New York. Although, through his not making public the prices paid by him, these cannot be stated with certainty, it is believed that he paid $35,000 for Dexter, $40,000 for Maud S., and $50,000 for Sunol. The young stallion Axtell was sold in 1889 for $105,000, and Nancy Hanks in 1891 for $75,000. These were all phenomenal trotters. Prices vary from these fancy figures down to $250.

The first trotting race in America of which there is a record was at Harlem, N.Y., in 1806, when Yankee did a mile in 2 minutes 50 seconds. Then there is a record of a match in Philadelphia in 1810, when a Boston horse trotted a mile in 2 minutes 48½ seconds. The next race was in 1818, when the time was 3 minutes. There was nothing very wonderful about these performances, for horses in England had before then done as well, if not better. In England, in 1800, Phenomenon trotted 17 miles in 56 minutes, and in the same month repeated the distance in 53 minutes. This was at the rate of 62 minutes 20 seconds for 20 miles. This English performance remained unbeaten until Messenger's great-grandson Trustee went the distance in 59 minutes 35½ seconds. Since then only six horses have equalled Trustee's performance. These long-distance trials are justly regarded as cruel and unprofitable. The reduction of the trotting record has been steady but not rapid. Here are some of the prominent records:

1844	Lady Suffolk	trotted a mile in	2	min.	28	sec.
1859	Flora Temple	" "	2	"	19¾	"
1867	Dexter	" "	2	"	19	"
1871	Goldsmith Maid	" "	2	"	17	"
1874	" "	" "	2	"	14	"
1878	Rarus	" "	2	"	13¼	"
1880	St Julien	" "	2	"	11¼	"
1881	Maud S.	" "	2	"	10¼	"
1884	Jay Eye See	" "	2	"	10	"
1884	Maud S.	" "	2	"	9¾	"
1885	"	" "	2	"	8¾	"
1891	Sunol	" "	2	"	8¼	"

Among the pacers the best records are those of Johnston, which paced a mile, in 1884, in 2 minutes 6¼ seconds, and Direct, which did the same distance, in 1891, in 2 minutes 6 seconds.

Troubadours. See PROVENÇAL.

Troupial (*Icterus icterus*), a bird of the family Icteridæ, Hang-nests (q.v.), famed for its exquisite song, which is considered to be even finer than the mellow whistle of the Baltimore oriole.

Trout, the popular name of many species of the genus Salmo, as characterised by Cuvier, some of which are referred by Valenciennes to his restricted genus Salmo, some to Fario, and some to Salar (see SALMON, BULL TROUT). The name is given to some of the silvery species migrating to the sea, which are noticed in the article SALMON, as well as to all the yellow species, which constantly inhabit fresh waters. The latter are found in almost all the lakes and rivers of the temperate and colder parts of the northern hemisphere. The Common Trout (*Salmo fario* or *Salar ausonii*) is widely diffused in the eastern hemisphere, abounding in almost all the lakes and rivers of the British Islands and the north of Europe. It is found in very small streams, ascending even to their mountain sources, but attains its largest size where there is considerable depth of water and abundance of food. A trout caught in a branch of the Avon at Salisbury weighed 25 lb., and one was caught in Loch Stenness in Orkney in 1888 which weighed 29 lb.; but such a size is very rare, and even in ponds where the trout are regularly fed they seldom exceed 10 lb. A trout of 1 lb. or 1½ lb. is reckoned by the angler a very fine fish, and many a stream swarming with trout produces none nearly so weighty. The head of the common trout is large; the eye large; the general form symmetrical, stouter than that of the salmon,

Fig. 1.—Common River Trout (*Salmo fario*).

the convexity of the outline of the back nearly similar to that of the belly; the tail is slightly forked, except in old fish, in which it becomes almost square, and sometimes even slightly convex. The teeth are numerous, strong, and curved, two rows of them extending along the whole length of the *vomer*, with no marked group at its front. The colour is more or less yellow, but the tint varies much in the trout of different waters, sometimes passing into greenish black or violet. The colour is brightest in the trout of clear streams.

On the back and upper part of the sides there are numerous spots of black and red; the belly is silvery white or yellow; the spots on the sides vary much. The fins are light brown; the dorsal fin and tail with numerous darker brown spots. The varieties which the common trout exhibits in tints and spots has led to attempts to distinguish several species; but these have not proved satisfactory to most naturalists. It is certain that the appearance of the trout is much affected by the character of the water in which it lives, and the food with which it is supplied. The trout of a river with a muddy bottom are very different from those of a clear gravelly stream, and those of a stream darkly coloured by moss are easily distinguished. The tint of the flesh varies as well as the external colours, being pink in some—the finest for the table—and white in others. Trout transferred from one locality to another soon change their tints, as they have a wonderful power of assimilating their colour to that of the medium in which they dwell.

The trout is very voracious, and readily devours almost any kind of animal food. Worms and slugs washed into rivers by rains are very acceptable to it. Small crustaceans are supposed to be the chief food of trout in some lakes and streams which are noted for the excellence of their produce. Small fresh-water shellfish, such as the fresh-water shrimp, are also a favourite food of trout; and the most beautiful trout in Scotland—those found in Loch Mulach Corry near Inchnadamph in Sutherlandshire—feed almost entirely on the fresh-water shrimp. Small fish of any kind which they can capture are their prey, and multitudes of salmon-fry thus perish. A gentleman well known to the writer of this article caught a large trout which had a very young viper in its mouth, bitten into three pieces. The leaping of trout for flies in a summer day or evening adds to the charm of many a rural scene. Small trout often throw themselves quite out of the water; the larger ones in general merely rise to take struggling flies from its surface. The angler adapts his lures to the season and the weather. In spring and summer, when the weather is fine, the artificial fly is very successful; bait, generally the worm, is used in wet weather, or when the streams are swollen by rains. The minnow is a good bait for large trout. No bait is more deadly than salmon roe, but the use of it is prohibited by law in Britain, for the sake of the salmon-fisheries (see ANGLING).

The trout generally spawns in the end of October and in November, when the lower jaw of the male becomes elongated, but not so much as in the salmon. The spawn is deposited in the same manner as that of the salmon, in gravelly beds, in running streams; and the lake-trout ascend streams for this purpose. Where trout have no access to proper spawning-ground recourse must be had to artificial means to increase the stock (see PISCICULTURE); but in some small streams their numbers seem incapable of being diminished by any amount of fair angling. The best feeding-grounds are often where there is no good spawning-ground within reach of the fish. The trout grows rapidly when it has abundant food. From instances of individuals kept in wells and ponds it is known to attain an age of thirty or even fifty years. Among the varieties of the common trout one called the Gillaroo Trout is found in Lough Neagh and other lakes of the north of Ireland. It attains a large size, is very thick in proportion to its length, and has much smaller teeth than the ordinary trout.

The Lochleven Trout (*Salmo levenensis* or *S. cæcifer*) is found in Lochleven in Scotland, where the common trout is also found, and is distinguished from it by the more pointed pectoral fins; the much longer rays of the tail-fin, which is also more pointed at its extremities; and particularly by the number of cæcal appendages, which are from forty-nine to eighty in the Lochleven trout,

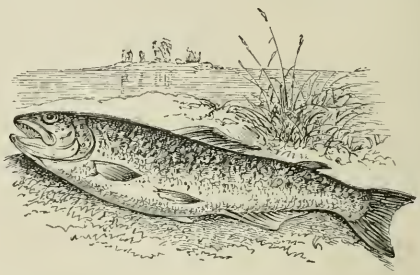


Fig. 2.—Lochleven Trout (*Salmo levenensis*).

whilst they do not exceed fifty in the common trout. The flesh of the Lochleven trout, which attains a large size, is a rich pink colour. Lochleven (q.v.), for its size, is probably the most productive trout-loch in the world. In 1888, the best year on record, 23,516 trout, weighing 21,073¾ lb., were captured by the rod; and in 1891 16,058, weighing 12,830 lb., were taken. There is an artificial hatchery in connection with Lochleven; and in 1891 nearly 300,000 healthy fry were deposited in spring in the feeders of the loch. With the exception of the lake species, all British trout are more or less migratory.

The Great Lake Trout (*Salmo ferox*) is the only other British species. It is found in some of the larger British and Irish lakes, and in the lakes of Scandinavia, seldom, if ever, ascending rivers, except for a short distance at the spawning season. It occasionally, but very rarely, attains a size of 30 lb., is a very powerful, active fish, and tries the skill of the angler in no small degree. It differs from the common trout in the longer muzzle, in the position of the fins, in having the tail square in all stages of growth, and in other characters. Its colour is generally deep purplish brown, passing into greenish or grayish yellow on the belly. The spots are large, and not numerous. The great lake trout feeds much on

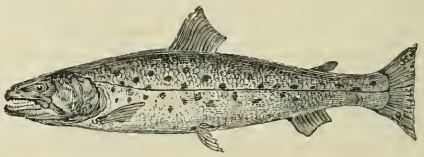

Fig. 3.—Great Lake Trout (*Salmo ferox*).

small fishes, and is as greedy as a pike. It is taken by night-lines, or by trolling with strong tackle and a small trout or other small fish (or artificial minnow) for bait. Young fish are taken with the artificial fly. The flesh of this species is inferior in quality to that of the common trout. Very different from it is the Lake Trout of the Lake of Geneva (*Salmo* or *Fario lemanus*), which is a fish of excellent quality, and nearly allied to the Salmon-trout (see SALMON). It ascends the rivers which fall into the lake, as the salmon-trout ascends rivers from the sea.

It should be stated that many persons, whose views are entitled to consideration, are of opinion that there is no specific difference between the *Salmo ferox* and the *Salmo fario*, and that the former is simply an overgrown specimen of the latter. The Loch Stenness trout of 29 lb. already mentioned tends rather to strengthen this opinion.

North America has numerous species of trout. One of them, the Common Brook Trout, or Speckled Trout (*Salmo fontinalis*), differs considerably from the common trout of Britain; in fact, strictly speaking, it is a char and not a trout. It abounds in the streams of eastern Canada, and in the northern and middle parts of the United States. In September 1867 Mr George S. Page caught at the outlet of Rangeley Lake, Franklin County, Maine, two male trout, one weighing 10 lb., the other 9½ lb.; and in June 1871 Mr T. L. Page caught a Fontinalis in Mooselue Maguntic Lake in the same county weighing 9¼ lb. The North American Lake Trout (*Salmo confinis*) inhabits the deepest waters of the great lakes, and sometimes attains a weight of 60 lb. It is dark-coloured, mottled with grayish spots. Its flesh is dirty yellow, and of very poor quality. It never takes the fly, but may be caught with the minnow, or a bait of fat pork. It is more sluggish than its congeners, and affords poor sport to the angler. There are several species of lake trout in North America. The finest in quality, as well as largest in size, is the Mackinaw Trout or Namaycush (*Salmo amethystus* or *namaycush*). It is not found in Lake Erie, nor in Lake Ontario, but in Lake Huron, Lake Superior, and the more northern lakes, even in those of the arctic regions. It inhabits the deepest parts of them, except in autumn, when it resorts to shallow water for spawning. The Siskiwit Trout (*Salmo* or *Salar siscowet*) of Lake Superior is of large size, stout, thick, and of rich flavour, but so fat as to be almost unfit for food. The Red-bellied Trout (*Salmo* or *Fario erythrogaster*) of the lakes of New York and Pennsylvania, sometimes 2½ feet in length, is deep greenish on the back, lighter on the sides, which are spotted with red, the belly orange-red. The north-west of America has its own peculiar species of trout, one of which, the Oregon Trout (*Salmo oregonensis*), is found in almost every stream from the snowy peaks of the Rocky Mountains to the sea, and is very similar to the common trout of Europe. British trout have been acclimatised in Tasmania.

In England there is a close time for trout and char, so that no trout or char of any kind can be sold in England or Wales under a penalty between the 2d of October and the 1st February. The penalties for the capture of any trout or char during close time are not exceeding £2 for the first offence, not less than £1, nor more than £2, for the second, not less than £2 for the third, and on each conviction forfeiture of all trout and char caught. In Ireland the close season for trout-fishing extends from 29th September to the end of February. Scotland has no close time for trout (except the Water of Leith within Edinburgh), and no gauge for immature fish. There certainly should be a close time or a gauge, or both. The best period for a close time would probably be from 15th October to 1st March. Illegal methods of taking trout are discussed at POACHING.

See works cited at ANGLING; also Livingstone Stone, *Domesticated Trout* (Charleston, 3d ed. 1877).

Trouvère, the name given in northern France to the same kind of courtly or polished poet who in southern France, &c. was called Troubadour (see etymology at PROVENÇAL). Like the latter, he was usually attended by a jongleur, whose business it was to furnish an instrumental accompaniment to the songs which his master composed and sung. But the distinction was far from absolute, for many *trouvères* performed their own works, and many *jongleurs* made and mended verses. See CHANSONS DE GESTES, JONGLEURS, FRANCE (LITERATURE), ROLAND.

Trouville, a popular French watering-place, in the dept. of Calvados, at the mouth of the Tongues, about 10 miles SW. of Honfleur. It was always famous for oysters, but on its fine sands and its nearness to Paris depends its modern importance. It was first brought to notice by Alexandre Dumas. Pop. (1886) 5749.

Trover, in the law of England, is an action brought to recover goods from a person to whom they do not belong, but who has in some way obtained possession of them. It was founded on the old fiction that the rightful owner had accidentally lost the goods, and the party in possession had found them, and would not give them up to such owner. It is practically an action to try the title to the goods, and therefore is of extensive application in the law of contracts, as well as other branches of law. The plaintiff, if successful, recovers the value of the goods as a satisfaction. The defendant is said to have illegally converted or appropriated the goods; it is by the conversion of the goods that the damage is done, and for this the remedy is given. See Bullen and Leake, *Precedents of Pleadings*.

Trowbridge, a market-town of Wiltshire, on a rocky hill above the small river Biss, 12½ miles by rail SE. of Bath and 12 SSW. of Chippenham. A Norman castle at Court Hill has vanished. The fine Perpendicular church of St James (1475) has a spire 159 feet high; Crabbe the poet was rector from 1814 to 1832, and is buried in the chancel. A new town-hall, presented by Mr W. R. Brown, was opened by the Duchess of Albany in 1889; and there are also a market-house, public gardens, (1884), cottage hospital (1886), water-works (1873), &c. Trowbridge has been a seat of the woollen manufacture since Henry VIII.'s reign; and superfine broadcloth and kerseymere are largely manufactured. Pop. (1851) 10,157; (1891) 11,717.

Troy. 'The tale of Troy divine,' which forms the background of the *Iliad* of Homer, briefly told is that Paris (Alexander), son of Priam, king of Troy, carried off Helen, wife of Menelaus, king of Sparta; that the Achæan princes, under the command of Menelaus' brother, Agamemnon, king of Mycenæ, undertook to recover Helen; that the Achæans, having besieged Troy for nine years, eventually sacked the city and recovered Helen. These events were regarded as historical not only by the Greeks themselves, but by the moderns within the last half century, and a date (1184 B.C.) was assigned with as much precision and confidence to the fall of Troy as to the fall of man. But the remarkable revolution in the views of scholars about mythology, which was begun by Lobeck (see Vol. VII. p. 371) in 1829, and by the brothers Grimm (q.v.), changed all that. Many of the incidents in the Trojan war were shown to be myths common to most Indo-European nations at least. The story of the *Iliad* reduced itself to 'the old fight between the night and the morning, the old story of the victory and death of the solar hero around the walls and battlements of the sky.' And as late as 1875 it was finally said that 'to seek for fragments of history in either of these is like looking for gold in the rays of the sun' (Sayce, *Principles of Comparative Philology*, p. 311, note). The Troy and Mycenæ of Homer were regarded as the airy fabric of a poet's dream, when Dr Schliemann, who had begun his excavations in 1870, brought to light the actual stone walls and battlements of Troy, and then proceeded to Mycenæ, where 'he dug up such masses of gold as even he, the millionaire, had perhaps never before seen upon one spot.' Nor did he stop here: guided by his simple faith that what Homer said was true, he continued his excavations until he had demonstrated, by 'the

science of the spade,' 'the former power and splendour of every city which is mentioned in Homer as conspicuous for its wealth and sovereignty.' It was natural enough that in the first joy of discovery he should straightway call the palace he revealed at Troy 'Priam's Palace,' the entrance to the citadel 'the Scæan Gate,' and the golden relics 'Priam's Treasure.' It was also natural that doubt should be cast on these identifications (subsequently withdrawn by Schliemann himself). In order, however, to understand the reasons for this doubt, we must state briefly what it is that Schliemann has done.

To begin with, the very site of Troy had been matter of dispute for 2000 years: tradition pointed unswervingly to the mound of Hissarlik, the learned unanimously (with the exception of Grote, who was in the right) declared that Hissarlik could not be the site. Schliemann excavated Hissarlik, and came first upon the remains of the Græco-Roman town, Novum Ilion; below it he dug out the ruins of four (or three) village settlements, one below another; below them he came upon 'the burnt city,' and finally upon the lowest, the oldest, the first city. The Græco-Roman city and the four (or three) village settlements have little interest for us; but the first city and 'the burnt city' are of the highest interest. The first and oldest city yielded in the way of relics principally pottery and stone implements. Metals were practically unknown to its inhabitants, who were plainly a settled pastoral and agricultural people, familiar with the art of weaving (as shown by the numerous spinning whorls discovered), and just beginning to use the potter's wheel. In fine, their culture shows a slight advance upon, but is fundamentally identical with, the culture ascribed by comparative philology to the pro-ethnic Indo-Europeans, who also were in the stone age, a pastoral and agricultural, but not a settled people, practised weaving and made pottery, but without the aid of the potter's wheel. The only other point to be noticed about the first city is that it must have been inhabited for a long time, because the circuit of walls first erected eventually proved too small to contain the inhabitants, and an enlarged ring of fortifications had to be built subsequently. The interval that elapsed between the desertion and decay of this first city and the foundation of the next must have been long, for a layer of earth 1 foot 9 inches deep intervenes between the debris of the first and the second or 'burnt city.' This city too enjoyed a long period of prosperity, for it also outgrew its original walls, which to begin with enclosed a larger area than that of the first city. The inhabitants of this city were, however, still in the stone age; but the number of gold and silver relics, and the presence of some copper implements, point to the approach of the bronze age, and seem to indicate a transition from the age of stone to that of metals. The potter's wheel was now regularly used; and heaps of oyster-shells prove that the inhabitants of the second city had attained a familiarity with the sea not possessed by the pro-ethnic Indo-Europeans. The two most important facts, however, in connection with this city are the discovery of 'Priam's Treasure' and the evidence that the city was destroyed in a conflagration. The treasure consists of big diadems of gold, chains and pendants of gold, golden ear-rings, all packed in a silver jar, bars of silver, 8700 small gold rings, discs, buttons, and small bars of gold, silver vases, gold cups, electrum cups, silver daggers, &c. The whole of this treasure had been packed together and stowed away probably in a secret chamber constructed in the acropolis wall.

We are now in a position to understand the first attitude assumed by criticism towards Schliemann's discoveries. It was admitted—it was impossible to deny—that Schliemann had proved that a wealthy and powerful city had existed in prehistoric times on the site which tradition asserted to be that of Homer's Troy, and that this city had been destroyed by fire; further, that he had proved that Mycenæ, which Homer makes the seat of the mighty Agamemnon, had been in prehistoric times a yet more wealthy and powerful city than Troy. But not only was there no evidence to show that Troy perished by *hostile* fire, there was actually conclusive proof that no expedition from Schliemann's Mycenæ could have destroyed his 'burnt city,' for, whilst Troy was in the stone age, Mycenæ was in the bronze age—i.e. belonged to a period which did not begin until long after the destruction of the 'burnt city.' Further, Homer could not possibly have known Mycenæ with personal knowledge, for he is familiar with the use of iron—i.e. the Homeric poems originated in the iron age, which did not begin until after the destruction of Mycenæ. Again, it was pointed out that the houses, the dress, the weapons, the mode of burial, and the religious beliefs of the Mycenæans were altogether different from those of the Achæans as described in Homer. The tradition, in fine, that Mycenæ and Troy had once been great and powerful cities may have been known to Homer, but he had no further knowledge than the tradition; and he simply ascribed (wrongly as it seemed) the culture of his own times to the age in which he (or the legend he received) laid the mythical and impossible expedition of the Mycenæans against Troy. This, the first attitude of criticism, still maintained by some critics, has been considerably modified of late by others. Objects have been discovered in 'the burnt city' of Troy decorated with the spiral and circular designs distinctive of Mycenæan wares; and this, it is argued, shows that the golden age of Troy just overlapped the Mycenæan period, and makes it possible, and even probable, that this contact between the two cities led to collision and to the destruction of Troy. Again, articles of iron have been discovered at Mycenæ, showing that Mycenæan civilisation continued into the beginning of the iron age. Further, though it is admitted that the earlier stage of Mycenæan culture (as presented in the shaft-graves) was absolutely unknown to Homer, it is now argued that the remains of the later period (as revealed in the bee-hive or domed tombs) may be reconciled with the older portions of the Homeric poems. But the discussion of these questions has hardly yet fairly begun. The importance of the discussion, however, is enormous: if it can be shown that the later period of Mycenæan culture is portrayed in any portion of Homer, the 'Homeric question' will be settled in favour of the disruptionists, for it is beyond doubt that they received their present form in the age of iron. Further, if the *Iliad* was sketched in firm outline in Mycenæan times, and was expanded and redacted afterwards, the transition from the one age to the other must have been gradual, and we shall have to look to Mycenæan culture for the origin of many things in Greek civilisation—whereas at present there seems to be an impassable chasm between the two civilisations.

Finally, we must state what additions Schliemann's discoveries have made to our knowledge of prehistoric Greece. Except for them our knowledge of Greece before 1000 B.C., the approximate date of the Dorian invasion (for which see Vol. V. p. 385), is a blank. In consequence of them we know that for some centuries before that date a homogeneous culture (of the bronze age) existed on the shores of most, if not all, of the lands and islands washed by the Ægean Sea. This culture may be called either Mycenæan, because

the remains discovered at Mycenæ show it in its most glorious form, or Ægean, because of its *locale*. During this Mycenæan or Ægean period a lively intercourse was carried on between the land and the isles of Greece, and commerce was frequent even with Egypt. The latter fact is established on the one hand by the Egyptian wares discovered at Mycenæ by Schliemann, and on the other hand by the Mycenæan vases discovered in Egypt by Dr Flinders Petrie. These objects, further, give us the date of the Mycenæan or Ægean period: the Egyptian scarabæi discovered amongst Mycenæan objects bear the names of Egyptian kings back to 1500 B.C., while the Mycenæan vases found in the tombs of the Fayyum can be definitely dated 1400 to 1100 B.C. Finally, the carrying-trade of this period, by whomsoever done, was not done by the Phœnicians: the suggestion made on p. 386 of Vol. V., that the Phœnicians did not establish their commercial supremacy until after the time of the Dorian invasion, has since been confirmed by the evidence of the pottery discovered in the Necropoleis of Cyprus. It was the Phœnicians who introduced iron into Europe, and the European iron age dates from and after the time of the Dorian invasion. So much for what we know of the Mycenæan or Ægean period. We do not know what was the centre from which this culture originated and spread. We do not know whence came the inhabitants of Mycenæ—whether they were natives or immigrants from the sea. We do not know their name, their race, or even what family of nations they belong to: some call them Semites, some Indo-Europeans, some more vaguely Asiatics, some Carians, some Greeks. The truth is that as yet there is not evidence enough in favour of any one of these guesses to make it even plausible. How or why these peoples allowed their carrying-trade to pass into the hands of the Phœnicians we know not; and even if we may regard it as now generally assumed that the Mycenæan period was brought to an end, as far as the Peloponnesus is concerned, by the Dorian invasion, it is still matter of discussion, as we have seen, whether the overthrow was complete or whether some of the culture of the Ægean period was transmitted to later times, and became an element in what we know as Greek civilisation. Before this question and others raised by Dr Schliemann's discoveries can be settled a long period of inquiry, examination, and further discovery must elapse. At the present time it seems just within the bounds of possibility that there may be a historic basis for the siege of Troy; it seems certain that no portion of the Homeric poems can be contemporary with 'the burnt city;' possible, but not probable, that the 'original Homer' was a contemporary of the later period of Mycenæan culture; improbable that the Dorians, who were notoriously uncultured, should have been the channel through which any elements of Mycenæan civilisation were conveyed to historic Greece; and highly improbable that important affinities will be discovered between Mycenæan or Ægean culture and that Greek civilisation to which (religion apart) modern civilisation owes whatever is good and beautiful and true in it.

To Schliemann's own books—*Trojan Antiquities*, *Ilios*, *Troja*, *Mycenæ*, *Tiryns*, *Orchomenos*—the best introduction is *Schliemann's Excavations*, by Schuchhardt (Eng. trans. 1891). The first attitude of criticism is seen most clearly in Baumeister's *Denkmäler* (articles 'Mycenæ,' 'Troja'), and most authoritatively in Köhler's *Kuppelgrab von Menidi*. The later attitude is seen in Schuchhardt and in Leaf's introduction to the Eng. trans. of Schuchhardt. Petrie's article in the *Journal of Hellenic Studies*, xi. 271–277, is important, but has been seriously called in question by Cecil Torr in the *Academy* of June to August 1892. See also Dümmler, *Athen. Mitt.* xi. (1886) 15 ff., 210 ff.; Köhler, *ib.* vii. 250, iii. 1 ff.; Milchhöfer, *Anfänge d. Kunst*, 201; Böttticher's *La Troie de Schliemann* for the crematorium theory; and Dörpfeld's record (in *Troja*, 1893) of his important excavations—what was believed to be the real Homeric city being discovered on a higher and more modern level.

THE LEGEND OF TROY.—The legend of descent from the exiled Trojans, so long a favourite notion of the Romans themselves, early took firm hold of the popular imagination in France and England, but it was not Virgil and Statius so much as the spurious histories of Dares the Phrygian and Dictys of Crete (q.v.) that supplied the threads from which was spun the mediæval tale of Troy divine. As early as the 2d century Philostratus (q.v.) in his dialogue the *Heroica* began the artistic elaboration of the theme, and we find traces of it in the Arthurian legends, the Fabliaux, and the like; another Greek work is the *Iliaca*, in hexameters, by Joannes Tzetzes, the 12th-century Byzantine grammarian; two Latin elegiac poems of the 12th century are extant, the first anonymous, the other by Simon Chèvre d'Or, canon of the abbey of St Victor in Paris; but it was in 1160 that it took its final literary form in the *Roman de Troie* of Benoît de Sainte-More, a poem of almost 30,000 lines, dedicated to the English queen Eleanor of Poitiers. The characters and incidents are transformed by the artist's touch, taking the colour of his own time, while entire episodes are freely invented—of which the finest, devoted to the loves of the faithless Briseïda, daughter of Calchas, first with Troïlus, next with Diomede, furnished to Boccaccio the subject of his poem *Filostrato*, on the loves of Troilus and Griseida. Of the *Filostrato* Chaucer's 'litill tragedie' *Troilus and Cryseyde* was a free and largely expanded translation, although he speaks of himself as a translator out of Latin, and in two places quotes his author by the name of Lollius. Gower in his *Confessio Amantis* follows Chaucer, enumerating Troilus and Cressida among his illustrious lovers. Benoît's work was much imitated; it was translated into German in the 12th century, and into Latin at Messina in the 13th by Guido delle Colonne, who did not name his source, and long passed as the author. This work again had a wide popularity in Italian, French, and German translations. It was the origin of the *Troy Book* of Lydgate (1412–50; printed by Pynson, 1513); Caxton's *Recuyell of the Historyes of Troye* (*c.* 1474), the first book printed in English, was a translation of Raoul Le Fevre's French version. The *Life and Death of Hector* was a modernisation of Lydgate by Thomas Heywood (1614). From Henslowe's Diary we find that Dekker and Chettle in 1559 prepared a *Troilus and Cressida;* Shakespeare (1609) followed Chaucer for the story, and Lydgate for some of the details. The Troy legend kept its place throughout the middle ages in graver histories as well as in romances and mysteries, and it long continued to maintain a shadowy existence in chap-books. Brut, the eponymous Trojan hero who found his way to Britain, flourished in Geoffrey of Monmouth, Gaimar, Wace, Layamon, and long after these in English chronicles whether in verse or prose, and indeed in the 16th century Polydore Virgil was thought a fool and worse for doubting him.

See the introduction of Moland and D'Hericault to *Nouvelles Françaises en Prose du XIV^e Siècle* (1858); Joly, *Benoît de Ste-More et le Roman de Troie* (1870); W. Greif, *Die mittelalterlichen Bearbeitungen der Trojanersage* (Marb. 1886); Collilieux, *Dictys et Dares* (Gren. 1886); and the admirable introduction to E. Gorra, *Testi inediti di storia Trojana* (Turin, 1887). For the relation of Chaucer's to Boccaccio's poem, see W. M. Rossetti in Chaucer Society's publications for 1875.

Troy, capital of Rensselaer county, New York, on the east bank of the Hudson River, at the head

of steamboat navigation, and 5 miles by rail above Albany, is built upon an alluvial plain 3 miles long and on the hills to the east (the southernmost known as Mount Ida). The most noticeable buildings are the marble court-house, the Troy Savings Bank building, including a fine music-hall, and several of the fifty churches. The city contains a high school, the Rensselaer polytechnic, and a Roman Catholic seminary. Cotton, hosiery, paper, stoves, car-wheels, bells, engines, machinery, axles, stone-ware, mathematical instruments, &c. are manufactured, and there are foundries, breweries, distilleries, carriage-factories, flour-mills, and a number of shirt and collar factories employing 8000 girls. Steamers run daily in summer to New York. Two bridges cross the Hudson to West Troy (q.v.). Troy was settled by the Dutch in 1659, and incorporated in 1816. Pop. (1850) 28,785; (1880) 56,747; (1890) 60,956.

Troyes, a town of France, the capital formerly of the province of Champagne and now of the department of Aube, on the left bank of the river Seine, 104 miles ESE. of Paris by rail. In spite of modernisations it is still an old-fashioned place, with many quaint timbered houses. The principal buildings are the cathedral, a splendid specimen of Flamboyant Gothic, founded in 872, and rebuilt between the 13th and 16th centuries; the churches of St Urban, the Madeleine, St Pantaléon, and St Rémi, the Hôtel de Ville (1624–70), and a public library, containing 110,000 vols. and 5000 MSS. Troyes carries on cotton, linen, and woollen manufactures, and, as the centre of a rich agricultural region, has a large transit trade. Pop. (1872) 38,113; (1891) 49,808. The capital of the Celtic Tricassii, Troyes was called by the Romans *Augustobona*, later *Civitas Tricassium*, and then *Trecæ*, whence the modern name. Under the Counts of Champagne it rose in the 12th century to great importance, and so late as the close of the 16th century had upwards of 60,000 inhabitants. Here the treaty was concluded (1420) between Henry V. of England and Charles VI. of France. See Boutiot's *Histoire de Troyes* (5 vols. 1870–80).

Troyon, Constant (1810–65), French landscape painter, was born at Sèvres. See the monograph on him by Dumesnil (1888).

Troy-weight seems to have taken its name from a weight used at the fair of *Troyes*, an important centre of commerce during the middle ages. Like Cologne, Toulouse, and other towns, Troyes may have had its own special system of weights. A Troy pound (of what value is unknown) is first mentioned in Britain in 1414, long before which period the standard pound of 12 oz. as well as another pound of 12 oz. (the Tower pound) was in use. The term 'Troy' was first applied to the standard pound in 1495, but at the same time no change seems to have been made in its value, and it continued, as before, to be exclusively employed by the dealers in the precious metals, gems, and drugs. See Pound. The troy pound contains 12 oz., each ounce 20 pennyweights, and each pennyweight 24 grains; thus the pound contains 5760 grains, and is to the avoird. pound as 144 to 175; while the troy ounce is to the avoird. ounce as 192 to 175. (The apothecaries' oz. and lb. are now practically obsolete; drugs are bought and sold by avoirdupois, though compounded by apothecaries' weight.) The old English pound, to which the term Troy was afterwards applied, was doubtless the pound of silver; and the Tower pound of 12 oz. differed from it only by $\frac{3}{4}$ths of an ounce.

Truce, a suspension of hostilities between two armies or states for a period specially agreed upon. During a truce it is dishonourable to occupy more advanced ground, or to resort to any act which would confer advantage. A truce requires ordinarily to be confirmed by the commander-in-chief to become binding. It is lawful to break it before the prescribed period on notice previously agreed on being given to the opposite party. This is called denouncing a truce. For the 'truce of God,' see God's Truce.

Truck-system (English *truck*, Scotch *trock*, French *troquer*, 'to barter') is the practice of paying workmen in goods instead of money. Where large undertakings are carried on at a distance from towns, it is almost necessary that employers should take steps to provide for a regular supply of provisions and other necessaries, to be sold to their men. This form of trading is open to objection on many grounds. The profit to the employer is very doubtful, for the capital which he devotes to his shop might probably be used to greater advantage in his proper business; the men are liable to be defrauded in various ways, because they cannot bargain on equal terms with their employer. A colliery owner, for example, may set up a shop, and may refuse to employ any man who does not deal at the shop. He may supply goods of inferior quality, and dismiss any man who is bold enough to complain. He may make the advances frequently required by the improvident wage-earner, intimating at the same time that he expects the money to be spent at his shop and no other; the account may be further complicated by vexatious deductions of pay for sharpening tools, &c.; and the workman may submit to all these exactions, because there is the threat of dismissal in the background. The evils of the truck-system are known in many countries; Canadian lumbermen, Newfoundland fishermen, and German Socialist leaders have protested in recent years against the abuses above described (cf. also Mexico, p. 168). In England the Truck Act of 1831 (extended by the amending act of 1887 to all persons engaged in manual labour, except domestic servants) was intended to provide a remedy. Wages are directed to be paid in current coin; the employer cannot plead payment in goods as an answer to an action for wages, nor can he maintain an action for the price of goods supplied. He may supply medicine, medical attendance, fuel and tools for mining, provender for beasts, house accommodation, and victuals prepared under his own roof. Deductions of pay are strictly regulated by the Act of 1887. These statutory rules are sometimes evaded; men who require advances of pay are too much at the mercy of employers to take advantage of the acts. The evils of the system are graphically described in Disraeli's *Sybil*. In 1853 Mr J. H. Burton was employed by the government to investigate the working of the system in Scotland. His report seems to indicate that legislation fails to reach the abuses complained of; attempts to suppress a long-standing practice may even strengthen its hold. Combination and improved habits of thrift among workmen put an end to the system by making them less dependent on their employers. Employers who evade the law usually allege that they cannot help themselves. The rate of wages, they say, is fixed on the assumption that part will come back in the shape of profit on goods; if they give up the shop, they must pay lower wages, and this the men will not stand. For the English law relating to this subject, see Macdonell, *Law of Master and Servant*. See also Crook (George).

Truffle (*Tuber*), a genus of fungi of the order Tuberacei, division Ascomycetes; globose, or nearly so; of a fleshy substance, with a distinct skin, the whole substance pervaded by a network of serpentine veins, which are the *hymenium*, and bear the spore-cases in minute cavities. The species are not

numerous; they are very generally diffused in temperate parts of the world; they are subterranean, often found at the depth of a foot or more in the soil, usually near the roots of trees, or rarely living on the surface. Some of them are amongst the most highly valued of esculent fungi. They are said to have a stimulating aphrodisiacal quality. The Common Truffle (*T. æstivum*) is of a black colour, and has a warty surface. It is the principal species sold in the English markets. It varies in size from that of a large plum to that of a large potato. On account of its agreeable flavour, it is used in the preparation of many dishes. It is common in the central and southern parts of Europe, chiefly in loose soils, in woods and pastures, as in the chestnut woods of France and Italy. In England it occurs pretty abundantly in the downs of Wiltshire, Hampshire, and Kent. Truffles probably occur in many districts, but owing to their subterranean growth are unsuspected. In England, and also on the Continent in localities in which they are known to grow, trained dogs are employed to discover their whereabouts, and in France and Italy pigs are employed for the same purpose. The best French Truffle, which is considered superior to the English, is *T. melanosporum*. The White Truffle of Germany, which also is found in England, is *Choiromyces albus*, a genus closely allied to Tuber, but less esteemed in cookery than the common truffle. The Red Truffle of the Bath market is *Melanogaster*, a genus of the allied order Hypogœi, and is not therefore a true truffle. The African truffles, species of Terfezia and Tirmannia, somewhat inferior to it in quality, are in some parts of Algeria and Tunis an important food-supply for the people. All attempts at cultivating the truffle in England have hitherto failed. In the south of France they have, it is said, been produced in woods which have been watered with water in which the parings of the truffle had been steeped. As yet, however, the manufacture of spawn, as in the case of the mushroom, has been attempted in vain. In Poitou the practice prevails of enclosing a space on the downs and sowing it with acorns. When the oaks are large enough to shade the ground, it is said there is sure to be a crop of truffles. Light chalk soil appears to be preferred by truffles, and they are found most usually in beech, oak, birch, chestnut, hazel, and hornbeam woods.

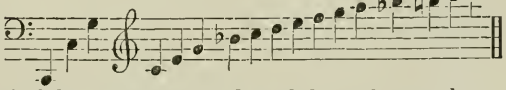
Truffle (*Tuber æstivum*).

Trujillo, (1) a town of Spain, the birthplace of Pizarro, is in Cáceres province, 60 miles NE. of Badajoz. It is built partly on a granite crag, and manufactures linen, leather, and pottery. Pop. (1887) 10,773.—(2) An episcopal city of Peru, capital of the dept. of Libertad, on a fertile plain near the seacoast. It was founded by Pizarro in 1535, has walls that were raised in 1686 to keep out the filibusters, and contains a college, a theological seminary, and high school. Its ports are Huanchaco and Salaverry. Pop. 7500.—(3) A port of Honduras, on the north coast, with 4000 inhabitants and an export trade of over $600,000 (bananas, hides, mahogany, rubber, and cattle). The town dates from 1524.

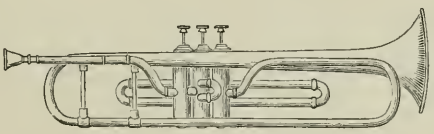
Trullan, the name (derived from the dome-roofed hall—Gr. *troullos*—of the palace in which the Fathers assembled) given to two church councils. The first Trullan Council (680) is the 6th œcumenical council, which condemned monophysitism. The second, called by Justinian in 692, established 102 canons for the discipline of the church, allowing the marriage of priests. This council, also called Quinisext, as being meant to supplement the 5th and 6th œcumenical councils, is not accepted by the Roman Church.

Trumbull, Jonathan, an American patriot, was born at Lebanon, Connecticut, 12th October 1710, and graduated at Harvard in 1727. He was successively judge, deputy-governor, and governor (1769–83) of Connecticut, and took a very prominent part in forwarding the war of independence. Washington placed great reliance on him, and frequently consulted him: to this habit, and his phrase, often repeated when in doubt, 'Let us hear what Brother Jonathan says,' has been traced the name which stands (though not so generally now as 'Uncle Sam') for a personification of the United States as 'John Bull' does for England. Trumbull died 17th August 1785. There is a Life by J. W. Stuart (Hartford, 1857).—His son John (1756–1843) was eminent as a painter. His best works are several portraits of Washington and others, 'The Battle of Bunker Hill,' 'Death of Montgomery,' and four paintings in the capitol at Washington, representing the Declaration of Independence, the surrender of Burgoyne and of Cornwallis, and Washington's resignation. A gallery of his historical pictures, of considerable value for their portraits, &c., became the property of Yale College in return for an annuity of $1000.

Trumpet, the most ancient of wind-instruments, is formed of a long, narrow, straight tube, bent twice on itself, the last fifteen inches tapering into a bell, and sounded by means of a cupped mouthpiece (for figure of mouthpiece, see Horn). The simple form of the instrument has been used from 'time immemorial' as a military signalling instrument, being specially attached to the cavalry and artillery branches, while the Bugle (q.v.) served the infantry. From its power and brilliancy of tone it has also been a favourite instrument with many composers of orchestral music. From the length and contracted nature of its bore its open harmonic notes (see Harmonics) in the upper register become nearly consecutive, the effective notes being



A slide arrangement, adapted from the trombone, invented some time during the 18th century and subsequently improved by the celebrated player



Valved Trumpet.

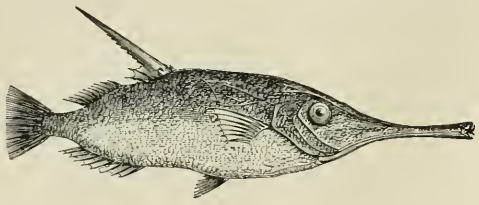
Harper, gives most of the chromatic scale. A simpler form with three valves, giving all the scale, though its tone is greatly deteriorated in consequence, is now generally used.

Its music is written in the key of C, and it is provided with a series of crooks to put it into the different keys required. These crooks lengthen the instrument from about 67 inches to 8 feet, and give it a range of the following keys: G, F, E, E♭, D, C. For trumpet sounds or calls, see Bugle; for trumpeter, see Band (Military).

Trumpeter (*Psophia*), a genus of crane-like birds. Only half-a-dozen species are known. The

Trumpeter (*P. crepitans* — the *Agami* of the Indians) is described by Schomburgk as occurring in large flocks throughout British Guiana, chiefly in damp forests near the coast. They are very easily tamed, and their flesh is palatable. The name trumpeter refers to 'the loud and very curious ventriloquous sound which these birds produce with closed mouth.' The same name is also applied to the whistling swans (*Olor*).

Trumpet-fish, or SNIPE-FISH (*Centriscus*), a genus of fishes referred to the family Fistularidæ,



Trumpet-fish (*Centriscus scolopax*).

or to a special family Centriscidæ. The compressed and somewhat oblong body is covered with small spiny scales; the toothless mouth lies at the end of an elongated tubular snout; the second ray of the first dorsal fin is a strong toothed spine, and the ventral fins, which lie in a groove, are also serrated. The fish measures about 5 inches in length; its colours are rose or reddish green above, silvery beneath. It sometimes occurs on the south coast of Britain, and is common in the warmer European waters. It is sometimes called sea-snipe, and, as this suggests, is esteemed a delicacy, and is often to be seen in the markets of Italy. The name 'trumpeter' is also given to a well-flavoured New Zealand fish (*Latris hecateia*), not far removed in relationship from the Scorpænidæ.

Trumpet-flower, the popular name of various plants which produce large trumpet-shaped flowers. The genera Bignonia, Tecoma, both belonging to the natural order Bignoniaceæ, and Solandra, belonging to Solanaceæ, are examples of the plants commonly named trumpet-flowers.

Trunk-fish, a name for the Coffer-fish (q.v.).

Trunnion. See GUN.

Truro, a city of Cornwall, of which it is considered the metropolis, though Bodmin is the county town, stands 12 miles NNE. of Falmouth and 54 W. of Plymouth, at the junction of the Allen and the Kenwyn, here met by a tidal inlet, the Truro River, whose banks present beautiful scenery, and which admits vessels of 100 tons to the quays of the town. Truro is the centre of a mining district, and largely exports tin and copper ore. The ancient Cornish bishopric of Truro was revived in 1876; and the foundation-stone of its cathedral was laid by the Prince of Wales on 20th May 1880, the building being consecrated on 3d November 1887. A granite Early English structure, designed by Mr L. C. Pearson, R.A., it incorporates a portion of the old parish church of St Mary's (1518), and will, when completed, measure 300 feet by 109 across the transepts, with a central tower 250, and two western towers 200 feet high. Other buildings are the Italian town-hall and market-house (1847); the Tudor public rooms (1868), with the county and Bishop Phillpott's libraries; the grammar-school (1546); and the Royal Cornwall Infirmary (1779). Foote, Bone, Martyn, and the Landers were natives, and Dr Wolcot practised here. A very ancient municipal borough, Truro returned two members to parliament from 1239 till 1885. Pop. (1851) 10,733; (1891) 11,131.

Truro, a Nova Scotian manufacturing town of 5000 inhabitants, at the head of Cobequid Bay, and 62 miles NNE. of Halifax by rail.

Truss. See HERNIA.

Trust, an arrangement by which property is handed to or vested in a person, in the trust or confidence that he will use and dispose of it for the benefit of another. At Rome such an arrangement was called a *Fidei-commissum* (q.v), and at first the honour of the trustee was the only security for the performance of his duty; Augustus gave legal validity to trusts, and appointed a special prætor to enforce them. In England land was in early times frequently conveyed to persons in whom the owner had confidence, that they might hold it to the use of other persons indicated by him. The courts of law looked only to the legal title, and took no notice of the uses to which the land was held; but the Chancellor would compel a 'feoffee to uses' to do his duty. The use was turned into a legal estate by statute in 1536, but the equitable powers of the Chancery remained, and were freely used to enforce any trust, whether relating to land or to personal property. Trusts of land must be declared in writing, but this rule does not apply to trusts raised by implication or construction of law. Thus, if A purchases land with the money of B, he holds it as trustee for B, although there may be no written agreement between them. The person who holds property in trust is a *trustee;* the person for whose benefit he holds is called *cestui que trust* (he that has the benefit of the trust). In declaring a trust no particular words are necessary, but the intention of the party making it must be clear. Thus, in wills, a testator sometimes uses words which do not amount to an express trust, but speaks of his 'wish and desire,' or his 'confidence,' that the executor or trustee shall do certain things. These are called in the law precatory trusts; they are enforced if no uncertainty exists as to the purposes or mode of carrying out the trust. But if a testator merely recommends an executor to 'consider certain persons,' 'to be kind to them,' or 'to do justice to them,' or 'to make ample provision for them,' &c., such expressions are treated as too vague to be binding, and therefore the executor may disregard them, or use his own discretion. A trustee's is not a compulsory office, but gratuitous, and therefore he need not accept the office unless he pleases. But if he once accept he is not at liberty afterwards to renounce, unless the trust-deed contain a provision enabling him to do so, or the court for good reasons discharge him. A trustee cannot delegate the office to a third person, but continues personally bound to do his duty. Where there are several trustees appointed the office is considered joint, so that if one dies the survivors continue to exercise the office. As a general rule, all must join in doing any act; but if the trust is of a public nature a majority may bind the minority. Each trustee is liable only for his own acts or defaults, and this is so even though, for form's sake, he join his co-trustees in signing a receipt, if he can show that he never received the money in point of fact. Nevertheless when money lies in the hands of one trustee the others ought not to be satisfied with his mere statement that the money has been invested by him, but should see that it is actually done. Another rule is that a trustee is not allowed to make a gain of his office; and so jealous is an English court of this rule that trustees have sometimes been restrained by the court from shooting over the trust estate. A trustee is personally liable if he trade with the trust funds, or buy shares in a joint-stock bank; for, even though the trust-deed authorise this to be done, he will be liable to pay the debts of the

trading concern, though far exceeding the amount of the trust funds. So, if a trustee is a solicitor, and does legal business for the estate, he will not be allowed to charge for his care and trouble, but at most will be allowed only the costs out of pocket. It is seldom, therefore, that a trustee can get any benefit to himself from the trust estate. Formerly if *cestui que trust* died without heirs land held in trust belonged to the trustee, but the rule has been altered by statute, and the escheat is now to the crown. It is the duty of a trustee to keep the trust funds safe; and if they consist of moneys, then he ought to invest them in government stock, and not let the money lie unproductive. He is not entitled to lend the money on personal security, or in the shares of any private company; but he may invest in mortgages, unless he is forbidden by the deed or will. If there is, therefore, no power to invest in mortgages, the trustee must invest in consols or in some other security authorised by the orders of the Supreme Court. The trustees, as a general rule, must pay interest whether they invest the funds or not (if they have had time to invest) to the *cestui que trust;* and they must account for all the profits they make with the trust funds, whether rightly or wrongfully. If a trustee has grossly misconducted himself as to the trust funds he will be charged 5 per cent. interest, and sometimes compound interest. A trustee is entitled to be indemnified for all the reasonable expenses or outlay attending the execution of the trust, but he must in general bear the loss of any mistake as to the law; but if there is any peculiar difficulty in carrying out the trust, he is entitled to take the opinion of, or even to throw the chief management upon, the Chancery Division of the High Court, as the only safe protection. When trustees are guilty of gross negligence, mismanagement, or misconduct the Court will remove them and appoint others (see Lewin on Trusts). By Act of 1867 Scottish trustees were limited to investment in Scottish heritable security, government stocks, public funds, and Bank of England stock. The Act of 1884 extended the choice, adding securities the interest of which is guaranteed by parliament, debenture stock, and some kinds of preference or guaranteed stock of certain British railways, stock or annuities issued by British municipal corporations if properly secured, certain East Indian and colonial stocks, and feu-duties. In Scotland, as in England, trustees holding shares of a joint-stock bank as part of the trust funds are liable personally to pay the debts of the bank.

A trust is also, especially in America, an arrangement for the control of several companies under one direction, to cheapen expenses, regulate production, and beat down competition. Trusts have provoked keen feeling and have been the subject of much discussion; the difficulties in the way of legislation are sufficiently obvious, apart from the vast influence of the trusts.

See Syndicate; Lloyd, *Wealth against Commonwealth* (1894); Von Halle, *Trusts in the United States* (1895); J. W. Jenks, *The Trust Problem* (1900).

Trygon. See Sting Ray.

Tryon, Sir George, K.C.B. (1832–93), vice-admiral, entered the navy in 1848, was at Sebastopol, became captain in 1866, and admiral in 1884. He was commander-in-chief on the Australian station in 1884–88, and in the Mediterranean from 1891 till the disastrous collision (29th June 1893) off the coast of Syria, when his flagship, the *Victoria*, by his mistaken order, collided, capsized, and sank with her commander and great part of her crew. See Life by Penrose Fitzgerald (1897).

Trypsin is a digestive ferment which occurs in the secretion of the pancreas. See Digestion.

Tsad, or Chad, Lake, a lake in the Soudan, northern Africa, with an estimated area of 10,000 sq. m. in the dry season, and four or five times that extent during the rainy months. The western half contains the real lake; the eastern is generally a complex of low islands, separated by shallow canals, and inhabited by a race of semi-amphibious Negroes. The few streams that reach the lake are all small, except the Shari, which comes from the south-east. Lake Tsad, whose waters are perfectly fresh, has no regular outlet. The first Europeans to see it were Denham and Clapperton; Nachtigal was there in 1870; of late the French have explored hereabouts. See Alis, *A la Conquête du Chad* (1892); Burnache, *Autour du Chad* (1894).

Tsaidam. See Tibet.

Tsaritzin, a town in the Russian province of Saratoff, on the Volga; pop. (1895) 47,650.

Tsarskoye Selo ('Imperial Town'), 15 miles S. of St Petersburg, is a royal residence, with a great palace and parks; pop. 18,500.

Tschaikovsky, Peter Ilyitch, composer, was born at the mining town of Votkinsk in Perm, Russia, and held a legal post before, in 1862, he began the study of music under Rubinstein. *Eugene Onegin* is the best known of his operas; he composed also symphonies, quartettes, concertos, &c. An LL.D. of Cambridge (1893), he died 5th November 1893.

Tschudi, Aegidius (1505–72), of Glarus, was a zealous Catholic. His great work is the *Schweizerchronik*, which, continued from 1470 by Johannes von Müller, was long the standard authority on Swiss history. Though it is proved to contain baseless legends and fables (some of them apparently his own invention), the work has great interest and literary merit, and has accurately preserved the text of many ancient documents which would otherwise have been lost. There are works on him by Fuchs (1805), Blumer (1871–74), and Herzog (1888). To the same family belongs Johann Jakob von Tschudi, the eminent traveller and naturalist, born at Glarus, 25th July 1818. After completing his studies at Leyden and Paris, he undertook (1838) a voyage round the world; but circumstances restricted his design to an investigation into the natural history and ethnography of Peru, where he remained for five years. He settled in Austria, and from 1866 till 1883 was Swiss ambassador at Vienna. He died 8th October 1889. His writings comprise works on the batrachians, the *Fauna Peruana* (1844–47), on the Quichua language, on Peruvian antiquities, a Peruvian drama, and sketches of his travels in Peru and the rest of South America.

Tsetse (*tse-tse;* native African name of *Glossina morsitans*), a dipterous insect which is a terrible pest of some parts of South Africa. It is not much larger than the common house-fly, which it resembles in shape, and is of a brown colour, with four yellow bars across the abdomen. The wings in repose project considerably beyond the abdomen. It is remarkably alert, at least during the heat of the day, and dexterously avoids any attempt to catch it with the hand. Its bite is

Tsetse (*Glossina morsitans*): *a*, natural size.

almost certain death to the ox, horse, and dog. Yet the bite is harmless to man, who feels no more annoyance than from the bite of an ordinary gnat, to the mule, the ass, the goat, and apparently to antelopes and the other wild animals of the country. The proboscis is adapted for piercing the skin, is grooved, and has a horny bulb at the base; and the fly lives by sucking blood. At first no effect is perceived; but sometimes in a few days after an ox has been bitten by the tsetse, sometimes not for weeks or even months, the eyes and nose begin to run, 'the coat stares as if the animal were cold,' a swelling appears under the jaw, and sometimes at the navel, emaciation and flaccidity of the muscles ensue, purging, sometimes staggering and madness, and finally death. No cure for the bite is known; but smearing cattle before passing through the 'fly-belts' with a paste of manure and other unpleasantness seems to some extent to ward off the fly. Nothing about the creature is more curious than the sharply-defined areas or 'fly-belts' (sometimes quite small) in which the fly is found, adjoining districts being, for no ascertainable reason, absolutely free of it. The valley of the Limpopo is a special haunt; also the region between the Transvaal and the east coast. The *Zimb* of Abyssinia is either identical with the tsetse, or is a similarly venomous dipterous insect.

Tsong-kha-pa. See LAMAISM.

Tuam, a town of County Galway, 130 miles NW. of Dublin by rail, on a branch of the Clare. Pop. 3567—mostly Catholics. It is the seat of a Roman Catholic archbishop and of an Anglican bishop. The (modern) Catholic cathedral is very large; the Anglican one, mostly rebuilt just prior to 1878, contains a chancel dating from 1150.

Tuareg, or TUARIK. See BERBERS, SAHARA.

Tuba, a name sometimes given to musical instruments of the Saxhorn (q.v.) species.

Tuber. This is one of the forms of subterranean stems, and is formed by a part of the stem becoming thick and fleshy. This tissue is of a simple parenchymatous nature (see TISSUE), well filled with starchy matter, which serves as a store of food material for the plant, and especially as a stock in trade for the young plants which often grow from the buds of the tuber to begin life upon. These buds, together with the minute scales in the axils of which they occur, show that tubers are not, as they are commonly thought to be, Roots (q.v.). The true roots arise from the tubers. The potato (*Solanum tuberosum*) is the most familiar example. The buds in this case are called 'eyes.' If they are cut off the tuber and set in the ground they grow into new plants. This is the method adopted by gardeners for the propagation of the potato plant. It has been observed that the ordinary aerial buds show a tendency, occasionally, to become tuberous. This is taken advantage of by gardeners, who, by surrounding the lower part of the stem with earth, cause the buried buds, which would normally grow into branches, to become tubers. The Jerusalem artichoke (*Helianthus tuberosus*) is another common tuber. The subterranean fructification of a group of fungi, the Tuberaceæ or Truffles (q.v.) are called tubers.

Tubercle is the characteristic product of a specific micro-organism, the *Bacillus tuberculosis*. It is a new formation, belonging to the group of Granulomata or granulative growths, which, in virtue of their recognised infectiveness, have been classed as Infective Granulomata. Tuberculosis (see CONSUMPTION, SCROFULA) is a specific infective disease, induced by the invasion of the *Bacillus tuberculosis*, and characterised by the presence of tubercle or other tuberculous formation. Tuberculosis is *local* or *general*, according to the distribution of the infection.

Prior to 1882 it would have been impossible to define tubercle in those words. Tubercle is, nevertheless, a term of great antiquity. Its connotation has varied considerably, and this has been the source of much confusion. By older writers, and up till the beginning of the 19th century, tubercle was used to signify a *nodule*, or small indurated mass. Such indurated masses (scirrhosities) had been recognised in the lungs and elsewhere. But in the description of these, tubercle had a morphological rather than an etiological significance; its application was not restricted to the product of a particular pathological process. With the development of anatomical study in the 17th and 18th centuries, these 'tubercles' of the lung received much attention; but they were misunderstood and interpreted incorrectly. Some observers spoke of them as altered glands. Sydenham speaks indifferently of 'glandules' and 'tubercles' arising in the lungs. Cullen recognised in tubercles one of the most frequent causes of pulmonary phthisis, but he did not attempt further definition than 'small tumours which have the appearance of indurated glands.' In the 18th century the occurrence of widely disseminated and more or less uniformly distributed tubercle—miliary tubercle of later times—was recognised. The classic comparison between such tubercle and the millet seed had been established—a comparison which has survived to our times and is in use in the schools by some who have never identified the millet seed.

Early in the 19th century the anatomical conception of tubercle was merged in the etiological through the work of the French physicians Bayle and Laennec (see CONSUMPTION), who expounded the view that 'consumption was essentially due to the presence in the lung of little granular masses of varying size and character.' This was the first suggestion of tuberculosis as a synonym for consumption or phthisis. The tubercular degeneration Bayle (1810) held was 'a chronic, specific affection, quite independent of any glandular or lymphatic inflammation.' This view was advocated strongly by Laennec (1834), who recognised four forms of tubercle—viz. (1) miliary, (2) crude, (3) granular, (4) encysted; and later by the French clinician, Lonis. Their united teaching led to the earliest crystallisation of the doctrine of tuberculosis, and proved the basis of much after-work.

The weight of Virchow's powerful argument (*Die krankhaften Geschwülste*, 1865) was directed against the view of a common specific element in Laennec's four groups. He concluded rather that the 'crude,' or yellow tubercle, was a product of retrograde cellular metamorphosis, and he limited the term tubercle to the first of Laennec's varieties. He emphasised the appearance of caseation or necrosis of the tissue elements, which occurs in tubercular (and other) foci, and thought that if a sufficiently careful examination were made, a precedent condition of caseation would be discovered, in nearly every instance, in relation to the eruption of tubercle. From the clinical side this view received support from Niemeyer (1866), who held that the order of events in most cases of consumption was the occurrence of a 'catarrhal pneumonia,' which might resolve naturally, or might be followed by the process of caseation or cheesy degeneration. A 'caseous catarrhal pneumonia' was followed by breaking down of the lung tissues and the establishment of the condition of 'phthisis.' The eruption of tubercle proper was, according to Niemeyer, a secondary feature. Most cases of 'phthisis' were to be traced to the effects of 'neglected cold,' and Niemeyer believed that the

assertion of Laennec and his followers, that such 'colds' had little influence, was fatal both to prophylaxis and treatment.

A new phase in the pathology of tubercle was inaugurated by the experimental researches of Villemin (1865), who, on introducing caseating material or the expectoration of phthisical patients subcutaneously into rabbits and other animals, found that they became tuberculous—i.e. that tubercles were discoverable in many of their viscera in periods varying from three to six weeks. This result followed the introduction of such material only. This led Villemin to the conclusion that tuberculosis was a specific inoculable disease, to be ranked along with other known infective processes. He believed that infection might result from inoculation, contagion, or the absorption of germs suspended in the air. Those views, though questioned at first, were fully confirmed by subsequent observers, some of the keenest critics (Cohnheim, Sanderson, Wilson Fox) being converted by a repetition of their own experiments. The following conclusions which were put in writing in 1866, as the result of ten years' observation and reflection by Dr William Budd of Clifton, form a most important landmark in the history of this question. In the light of more recent knowledge, they testify in an eminent degree to the prescience of their author. They are—(1) 'that tubercle is a true zymotic disease of specific nature in the same sense as typhoid fever, scarlet fever, typhus, syphilis, &c.; (2) that, like these diseases, tubercle never originates spontaneously, but is perpetuated solely by the law of continuous succession; (3) that the tuberculous matter itself is (or includes) the specific morbific matter of the disease, and constitutes the material by which phthisis is propagated from one person to another and disseminated through society; (4) that the deposits of this matter are, therefore, of the nature of an eruption, and bear the same relation to the disease phthisis as the 'yellow matter' of typhoid fever, for instance, bears to typhoid fever; (5) that, by the destruction of this matter on its issue from the body, by means of proper chemicals or otherwise—seconded by good sanitary conditions—there is reason to hope that we may eventually, and possibly at no very distant time, rid ourselves entirely of this fatal scourge.'

During the next fifteen years opinion gradually inclined more widely to the specific doctrine of tuberculosis. In 1880 Cohnheim declared that 'neither the nodular form, the histological structure, the occurrence of giant-cells, caseation, nor all these circumstances together are absolutely characteristic of tuberculosis. The only absolutely perfect and certain criterion is the capacity for infection.' At the end of 1881 Koch announced the discovery of the *Bacillus tuberculosis*. He proved that this organism was discoverable in all varieties of tuberculous disease; that a pure culture of the bacillus might be obtained artificially (see GERM THEORY); and that inoculation of animals with bacilli derived from such cultivation certainly led to a reproduction of the disease, with the characteristic development of further bacilli in the tissues. Koch was thus in a position to claim that the bacillus he had discovered was not only *one*, but *the only*, cause of tuberculosis, and that without the *Bacillus tuberculosis* there could be no tuberculosis. Most searching criticism and observation failed to invalidate his conclusions, and all subsequent experiment has attested the accuracy of his results. Koch's brilliant discovery has ended the fight over tubercle, and sanctioned the definition which prefaces the present article, that tubercle is a new growth, the characteristic product of the *Bacillus tuberculosis*.

The *tubercle bacillus* is a delicate rod-like body (see BACTERIA) of varying length, averaging one-third the diameter of a red blood-corpuscle (*circa* $\frac{1}{7000}$ inch), and approximately one-sixth as broad as it is long. With a powerful microscope, the individual rods present (fig. 1, *a*) a slightly curved form and frequently a beaded outline attributed to the presence of spores, but more probably the expression of vacuolation. The bacilli occur either singly or in groups. They may be discovered in one or several of the organs of the affected subject, in the blood, in the expectoration (fig. 1), in the urine, or other excretion. They have the special property of being stained in peculiarly 'fast' degree by certain of the aniline dyes. The bacillus may be cultivated artificially on sterilised blood-serum and other media. The organism is particular as to the nutrient soil, of slow growth, and requires a constant temperature of 86° to 105·8° F. Those facts would seem to indicate that a certain predisposition of tissues plays an important part in the determination of its development in the human subject.

Fig. 1.—Tubercle Bacilli in phthisical expectoration (× about 1500 diameters): *a*, bacilli; *b*, catarrhal cells. (After Crookshank.)

Its *distribution* in the affected subject varies much. It may be either universally disseminated or localised. In the former case the distribution occurs presumably by way of the blood-stream; in the latter, by way of the lymphatic channels or by continuous growth over contiguous surfaces—e.g. over mucous or serous membranes. It may be carried from the original seat of infection to distant parts, where its arrest leads to the production of the characteristic new growth. General miliary tuberculosis may be induced in this way. The organism is also the cause of other conditions, where the eruption of tubercle proper is less observable or is even absent—e.g. glandular and some varieties of pulmonary and intestinal tuberculosis, in all of which, however, the infective agent is the same. Even when tuberculosis is *general* certain organs or tissues are selected for special deposit—e.g. the lung and serous surfaces (pleura, peritoneum, meninges). Various names are in use, according to the organ or structure which is affected, to differentiate the condition from that of simple or other specific inflammation of the given part. Thus, we speak of tuberculous meningitis, tuberculous peritonitis, pulmonary tuberculosis, renal tuberculosis, &c. But tubercle may be found in almost every part—e.g. lung, larynx, intestine, liver, spleen, kidney, bladder, testicle, brain, choroid coat of eye, bone, skin, blood-vessel, &c. When *localised*, the lung is the favourite seat. Most cases of *general* tuberculosis are traceable to an earlier *local* focus. Thus, general tuberculosis sometimes follows rude interference with localised disease, through the consequent absorption of the tubercle bacillus into the blood-stream. This general or miliary tuberculosis is an acute inflammatory condition with symptoms indicative of severe involvement of the system—e.g. rapid wasting and grave prostration. The course of the disease may resemble to a remarkable degree that

of enteric (typhoid) fever, with which, indeed, it is sometimes confounded.

Anatomical Characters of Tubercle.—The typical tubercle is essentially a non-vascular nodule. It occurs usually in groups (fig. 2). The nodules

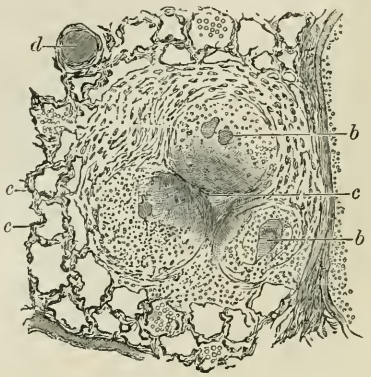


Fig. 2.—Tubercle of Lung (× 50 diams.):
bb, giant cells; *c*, centre of tubercle beginning to caseate; *d*, branch of pulmonary artery; *e*, alveolar framework of lung. (After Hamilton.)

are seen easily by the unaided eye. They are of more or less round shape, and in size approximate a mustard seed. Their outline is well defined and, in the early stage, the colour is grayish. The surface presents a characteristic shimmer. Older nodules, which have undergone degeneration (see below), lose this appearance and assume a whitish-yellow colour. When examined microscopically the tubercle presents, in most instances, a special structure. But this is not constant. The centre is differentiated by the presence of one or more so-called 'giant-cells' (fig. 3). This is a large multinucleated cell, in which the nuclei are disposed in more or less radiating fashion round the periphery. The cell may, or may not, contain the

Fig. 3.—Giant Cells from Tubercle of Lung (460 diams.).
The peripheral arrangement of the nuclei is well seen, as also the reticular meshwork external to the cell. (After Wilson Fox.)

tubercle bacillus. From the edge of the giant-cell delicate processes stretch outwards. These form a reticulum, in the meshes of which there occur large epithelium-like cells—so-called 'epithelioid' cells—and still more externally are found smaller rounded cells with one nucleus. But neither the giant-cell nor these other cells can be regarded as absolutely distinctive of tubercle. Atypical varieties of tubercle occur from which those are conspicuously absent, and whose structure appears to differ little from that of fibrous tissue.

Metamorphosis of Tubercle.—Tubercle is liable to certain metamorphoses—the so-called *degenerations*—commonest of which is the *cheesy* or *caseous* (fig. 2, *c*). The frequency of this led to much of the confusion which long existed on the subject. When caseating the tubercle assumes a more opaque and dull appearance, and its colour becomes whitish yellow. The advance of this process has been attributed to the absence of blood-vessels, and the toxic influence of the tubercle bacillus. It is a process of necrosis, or local death. On the other hand, the reticular elements may become more prominent and the nodule become fibrous.

Infectiveness.—Tuberculosis is contagious. The contagious element is the tubercle bacillus. Koch's early experiments with pure cultures, to which reference has been made, have been verified frequently. The tubercle bacillus has only to be introduced under the skin or into one of the closed cavities of the body to give rise to tuberculosis in the inoculated animal. The bacillus is found in enormous quantities in the sputum of consumptive patients. In some cases the expectoration contains an almost pure culture of the organism. It is to be found also in the juices and secretions of the body; thus it may occur in the milk of tubercular animals.

It may obtain *access to the human subject.* (1) By the respiratory passages. There is evidence for believing that this is most frequently due to the presence of dried particles of tubercular expectoration in the atmosphere. Hence the necessity of greater care than is usually exercised in the disposition of such sputum, and for the disinfection of rooms which have been long occupied by tubercular (consumptive) patients. The tubercle bacillus has been found clinging to the paper and curtains of such rooms, and from organisms thus collected pure cultures have been obtained. It is easy to induce tuberculosis in rabbits and other animals by exposing them in a confined space to the inhalation of a cloud of the dried particles of tubercular sputum. Similarly, the larynx seems to be affected secondarily by the contact of tubercular expectoration from the already affected chest.

(2) By the alimentary tract. Apparently the œsophagus and stomach are strongly resistant to the noxious influence. This is due probably to the frequent movement of the former and the presence of the gastric juice in the latter. The intestine, on the other hand, is readily infected. Thus the swallowing of tubercular matter may set up an intestinal process of this kind. Tuberculosis has been induced in animals whose food has been contaminated with such products. Domestic fowls are said to develop the affection from expectoration carelessly deposited in their vicinity. As has been seen, the milk from tuberculous cows may contain the organism—especially when the udder is affected—and such milk is certainly dangerous; hence the advisability of sterilising milk by exposing it to the influence of heat. Similarly, there is risk from the ingestion of the flesh of tubercular animals; hence the necessity for the thorough cooking of animal food. It has been proved experimentally that tubercular sputum, if boiled, is incapable of inducing the disease.

(3) By wounds. There can be no doubt that inoculation occurs in this way from time to time. But the frequency of such infection is not so great as might *a priori* have been expected. One meets cases, however, where, for example, tubercular sores of the hand have been so induced, and these have, in turn, been followed by involvement of the system generally. The disease known as *Lupus* is a peculiar, localised tuberculosis of the cutaneous tissues, which is probably traceable to superficial inoculation. Its limitation to the surface is charac-

teristic. The tubercle bacillus has been found in the tissues affected by lupus, and general tuberculosis has occasionally followed surgical interference.

Heredity and Predisposition.—In many cases of tuberculosis there has existed admittedly a predisposition. It is difficult to define the nature and limits of such predisposition. But we may justly reduce the application of hereditary influence, as the phrase was formerly employed. We have to deal probably with the transmission of tissues which are somehow less resistant to the invasion of the special micro-organism. Parents weakened by various causes are likely to produce a progeny with such reduced power of resistance. It is recognised that tissues which resist strongly one variety of attack yield readily to another. Some families are specially liable to one or more of the infective processes, while resisting others. The same may be predicated of races of men and of animals. The influence of heredity may meanwhile be held to be manifested in the transmission to the offspring of tissues which possess a large susceptibility to, or at least a diminished power of resisting, the tubercle bacillus.

Products of Tuberculous Growth.—It has been long recognised that the growth of micro-organisms is associated with chemical alteration of the medium in which they develop. This explains the various fermentations, some of which are of much economic value. The artificial cultivation of special organisms has rendered knowledge of those processes and their products more exact. It has been recently proved that, in some instances, such products exert a prejudicial influence on the growing organism itself. When they are separated and mixed with cultivation media, the development of the particular organism has been found to be retarded or prevented. This is illustrated by the group of so-called Toxalbumins. In the year 1887 it was shown that tuberculous expectoration contained a substance or substances of eminently toxic character. Similar extracts were obtained from pure cultivations of the tubercle bacillus. Relatively small doses of these were found to produce serious or even lethal results in animals. More than one attempt was made to utilise those products in relation to the treatment of tuberculosis. In 1890 Koch announced that he had discovered a remedy of large efficacy in many tubercular conditions. In a later communication he detailed the nature of the agent—a forty to fifty per cent. glycerine solution of a pure cultivation of the tubercle bacillus. In this fluid there is present everything from the cultivation that is soluble in glycerine, including extractives, colouring matters, salts, &c. The apparently active part of the extract is insoluble in absolute alcohol, and can be thus separated in less impure form. Koch believes that the agent is a derivative from proteids, to which it is probably closely allied. But inasmuch as it withstands high temperatures and is easily dialysable, it seems likely that it does not belong to the group of Toxalbumins. To the fluid the name Tuberculin, or Tuberculinum Kochii, has been given. But from its character and mode of production it cannot be admitted that the fluid is of absolutely fixed constitution or strength. The introduction of a minimal amount of tuberculin into the subcutaneous tissues of the healthy subject is followed by no conspicuous phenomena. The dose requires to be considerable (0·25 c.c.) to induce pronounced symptoms, and these pass away comparatively rapidly. In the subject of tubercular disease, however, injection of a fractional amount of the fluid induces marked changes, both general and local. The *general* symptoms include rigor, fever, pain in the limbs, languor, vomiting, and cough; the *local* reaction, occurring at the seat of tubercular disease, and not at the point of injection, which is chosen indifferently, is best studied in superficial tuberculosis, especially lupus. In a few hours the parts become swollen and red; later, exudation appears on the surface, which dries and forms crusts. In typical cases the healing process goes on below these. A similar effect is produced, presumably, at tuberculous foci, which lie more deeply. Hence Koch was led to predicate both a therapeutic and a diagnostic value. Doubts have been expressed as to the extent of the former. It has been found that many cases of tuberculous disease have not improved much under its use. Attention has been drawn to the fact that there is a risk of a wider diffusion of the tuberculous disease through its use. On the other hand, it must be acknowledged that a number of cases treated with tuberculin have stood the test of time, and remained cured after several years. It is further certain that the risks which accompany its use in qualified hands have been disproportionately magnified. From the diagnostic point of view it has proved of great service, even if its value is lessened by the occasional occurrence of a reaction in subjects in whom there is no suspicion of tuberculosis. The attempts which have so far been made to purify tuberculin, including those by Koch, which resulted in a modified tuberculin (1897), have not been sufficiently successful to warrant more detailed reference.

A review of the experimental and clinical evidence which has been adduced leads to the conclusion that in the discovery and application of tuberculin a great advance has been made, and that solid ground has been touched in the diagnosis and treatment of tuberculous disease, through the elaboration of an agent related to the peccant organism, which has the power of detecting the presence and disturbing the progress of the disease. And there is reason to anticipate further advance on similar lines.

Tuberculosis in Animals.—Tuberculosis is of frequent occurrence among the lower animals. It is especially common in cows and, speaking generally, in stalled animals. 'Perlsucht,' regarding which there has been much discussion, has been proved identical with tuberculosis. The same bacillus is present in the bovine and human disease. There is reason to believe that the conditions of life, in the case of cows, render successful inoculation more likely, while there is the additional risk of contagion in the presence of an already affected animal. Domestic fowls suffer from the disease, as also caged rabbits and guinea-pigs. The latter animals take the disease readily by artificial inoculation. Probably fowl tuberculosis is due to another allied variety of bacillus. On the other hand, dogs, goats, and other animals of more active habits are less liable to infection. This fact has suggested the treatment of the condition in man by the transfusion of the serum of such animals. This has been attempted by several physicians with uncertain results. The rationale of the process is, however, doubtful (see GERM THEORY). When occurring in the lower animals the disease may be distributed generally, or restricted to special organs —for example, the lung or mamma. The milk of tuberculous animals, especially those whose udders are infected, has been found to contain the tubercle bacillus. The lesions produced by the bacillus are essentially the same as those which occur in the human subject.

Of the immense literature, reference may be made to Klebs, in vol. xx. of the *Real-Encyclopädie der Gesammten Heilkunde* (2d ed.); Hamilton's *Pathology*, vol. i.; Fagge and Pye-Smith's *Principles and Practice of Medicine*. On special departments, see works bearing on this subject by Laennec (1834), Villemin (1868), Virchow (1863-65), Cohnheim (1879), Koch (1882-90), Bollinger (1883), Bang (1885), Woodhead, Heron (1890), and the writer of this article (1890).

Tuberose (*Polianthus*), a genus of plants of the natural order Liliaceæ, having a funnel-shaped perianth, with six-parted limb, stamens inserted in the tube of the corolla, a superior capsule, and flat seeds. The Common Tuberose (*P. tuberosa*) has rounded bulbous roots; a cylindrical, upright, unbranched stem, 3 or 4 feet high; both root-leaves and stem-leaves sword-shaped, and very acute; flowers spiked and somewhat aggregated, large, pure white, the tube a little in-curved. The plant grows well in the south of Europe, but only bears the open air in more northern climates during summer. The roots are a considerable article of export from the south to the north of Europe. The plant is in high esteem for the beauty and fragrance of its flowers, the odour of which is most powerful after sunset, and has been known to cause headache and asphyxia in a room. The fading flowers emit, in certain states of the atmosphere, an electric light and sparks. The flowers yield an essential oil, which is used by perfumers. The native country of the tuberose is Mexico. The tuberose has been known in Europe for about three centuries. There are double and single flowered forms in cultivation, the former being the more highly esteemed. They are very extensively grown by British and American florists, who, by planting the roots successionally, manage to keep up a supply of flowers at all seasons. Of the double-flowered form there are several varieties, known in commerce as the Double African, the Double American, the Double Italian, and the Pearl. The last named, being less in stature than the others, is preferred.

Double Tuberose (*Polianthus tuberosa*).

Tubes. See PIPES.

Tübingen, an important town of Würtemberg, 20 miles SW. of Stuttgart (35 by rail), is situated on a ridge between the Neckar and the Ammer, in a beautiful and fertile district. Tübingen is an old place, irregularly built, with steep and narrow streets in the main; but the suburbs, especially round about the new university and the railway station, have wide and spacious streets. Book-printing, bookselling, making of chemicals and surgical and physical instruments, milling, dyeing, and trading in field-produce, wine, hops, and fruits form the principal sources of employment, besides education. Tübingen has three Protestant churches (one, the Stiftskirche, dating from 1469–83, and containing the graves of twelve princes of Würtemberg) and one Catholic church. Its university, founded in 1477 by Eberhard im Bart, afterwards first Duke of Würtemberg, soon became a distinguished seat of learning, enjoyed for a time the presence of Reuchlin and Melanchthon, and continued to flourish long after the Reformation had firmly established itself. The Thirty Years' War, however, fatally checked its prosperity; and it was not till the early part of the 19th century that it began to reacquire a reputation. Under Baur (q.v.) it became celebrated as headquarters of the historico-philosophical theology known as the 'Tübingen School,' which has profoundly influenced the study of church history. Its medical faculty is of late distinguished. The university has nearly 100 professors and teachers, a library of 200,000 volumes (located in Duke Ulrich's *Schloss*, on the hill above the town, dating from 1535), and is attended by about 1300 students. Connected with it are an anatomical and physical institute, a botanical garden, a chemical laboratory, &c. There is a Protestant seminary and a Catholic one, in which university lectures are given and theological students reside. Uhland long lived here. Pop. with garrison (1880) 11,708; (1885) 12,251, of whom 1750 were Catholics.

Tuckahoe, or INDIAN BREAD (*Pachyma Cocos*), an underground fungus growing as a saprophyte on the roots of the trees in the southern United States. It is edible, but tasteless.

Tucker, ABRAHAM, was born in London, September 2, 1705, studied at Merton College, Oxford, and entered the Inner Temple, but being rich and unambitious settled down to the quiet domestic happiness of the country gentleman's life, on the estate of Betchworth near Dorking, which he bought in 1727. He died November 20, 1774. All his life long a student of ethical questions, he began about 1756 the preparation of his great work, *The Light of Nature Pursued* (1768–78). Of its seven volumes only three were published in his lifetime, under the name of 'Edward Search, Esq.' Not a regular systematic treatise, but a series of disquisitions on metaphysics, theology, morals, it shows originality, ingenuity of illustration, and solidity of understanding. The standard edition is that edited, with a life, by the author's grandson, Sir Henry Mildmay (1805).

Tucson, capital of Pima county, Arizona, on the Santa Cruz River, 978 miles by rail SE. of San Francisco, with some trade in wool, hides, stock, and gold-dust. Founded by the Jesuits in 1560, it was the capital of Arizona from 1867 to 1877. Pop. (1880) 7007; (1890) 5150.

Tucuman', a north-central province of the Argentine Republic, with an area of 13,500 sq. m. and a pop. (1887) of 210,000. It enjoys a delightful climate, and in the east is very fertile; in the west the country rises to the picturesque Sierra de Aconquija. Stock-raising is an important industry.—The capital, Tucuman, on the Rio Sil, 3 miles from the mountains and 723 miles by rail NW. of Buenos Ayres, contains some handsome public and private buildings, a normal school, and several saw and flour mills and breweries. In the neighbourhood are orange-groves, sugar-plantations, and distilleries. Tucuman was founded in 1564; and here in 1812 Belgrano defeated the Spanish forces, and in 1816 a congress of deputies from the various provinces proclaimed the independence of the La Plata states. Pop. 26,000.

Tude'la, a city in the Spanish province of Navarre, on the left bank of the Ebro, which is here crossed by a bridge of seventeen arches, 46 miles by rail NW. of Saragossa. Tudela is the seat of a bishop, has a Romanesque cathedral, and manufactures of woollens, silk, soap, earthenware. Pop. (1887) 9220. It was the birthplace of the great traveller, Benjamin of Tudela (q.v.).

Tudor, the surname of a family of Welsh extraction which occupied the throne of England from 1485 to 1603. In the Welsh language Tudor is the equivalent of Theodore. Owen Tudor, the first of the race known in history, claimed descent from Cadwallader, and seems to have been godson of Owen Glendower. He fought at Agincourt, became squire to Henry V. and Henry VI. His dancing at some court pageant is said to have first ingratiated him with Catharine of Valois, widow of Henry V., who appointed him to the office of Clerk of the Household, and before long entered into either an illicit connection or a private marriage with him. The indignation of the public

at this step obliged the queen to take refuge in a convent at Bermondsey, where she died (1437); and Tudor was sent to Newgate, but succeeded in escaping, and in obtaining two audiences of the young king, Henry VI., who afforded him protection and conferred on him the lieutenancy of Denbigh. He fought for the Lancastrians in the Wars of the Roses, was taken prisoner at Mortimer's Cross, and beheaded. Two sons had been born to him by the queen. On the elder, Edmond, the king bestowed the earldom of Richmond, and on the younger, Jasper, the earldom of Pembroke. The Earl of Richmond married Margaret, daughter and heiress of John Beaufort, Earl of Somerset, whose father was an illegitimate son of John of Gaunt; and his son ascended the throne of England as Henry VII. (q.v.). See also the articles on HENRY VIII., MARY, ELIZABETH, EDWARD VI.

Tudor Style, in Architecture, a rather indefinite term applied to the Late Perpendicular (q.v.), and the transition from that to Elizabethan (q.v.). See also FAN-TRACERY.

Tuesday, the third day of the week, is so called from *Tiwesdæg*, the day of Tiw, the Anglo-Saxon name for the god of war (see TYR).

Tuff, or VOLCANIC TUFF, in Geology, the name given to the comminuted rock-debris ejected from a volcanic orifice. The term is usually restricted to the finer kinds of volcanic detritus, or to fragmental igneous rocks in which such fine-grained materials predominate. Thus some tuffs may be described as masses of finely comminuted debris through which are scattered, more or less abundantly, lapilli and angular or subangular blocks of volcanic or other rocks. Other tuffs may consist wholly of very fine-grained materials or of the most impalpable volcanic dust. Most tuffs, whether deposited on a land-surface or accumulated under water, are stratified. Subaqueous tuffs shade off gradually into ordinary aqueous rocks. Thus we have *tuffaceous sandstones* and *tuffaceous shales*, made up of mixtures of volcanic detritus and the ordinary products of aqueous erosion; and many of these rocks are fossiliferous. Subaërial tuffs, likewise, not infrequently contain relics of land plants and animals. Many varieties of tuff are known by special names. Thus *trachyte-tuffs*, *basalt-tuffs*, &c. are rocks composed essentially of the debris of *trachyte*, or of *basalt*, &c. *Pumice-tuff* consists mainly of pumiceous materials —*Trass* being the name given to a variety of pumice-tuff met with in the Eifel. *Peperino* is an earthy granular tuff, containing abundant crystals of various volcanic minerals, which is well developed in the Alban Hills near Rome. *Palagonite-tuff* is a fine-grained tuff. The term *tufa*, once synonymous with tuff, is now restricted to Calcareous Tufa (q.v.).

Tugela, a river of Natal (q.v.), forming part of the northern frontier and running SE. into the Indian Ocean. In the Transvaal war Buller was defeated in an attempt to cross at Colenso on 15th December 1899; crossed twice, but had twice to recross (Spion Kop, Vaal Krantz); and was only finally successful in forcing the passage on 22d February 1900, so as to push on to the relief of Ladysmith (28th).

Tugendbund ('league of virtue'), a Prussian patriotic union founded at Königsberg in 1808, ostensibly for the promotion of social and other reforms, actually aimed at throwing off the French yoke; it was dissolved under pressure from Napoleon in 1809.

Tuileries, PALACE OF THE, built on the site of an ancient pleasure-house called the *Hôtel des Tuileries*, on account of its being built in a locality outside the city where there were several tile-works (*tuileries*). Francis I. bought this property from the Sieur de Villeroy, as a present to his mother, the Duchess of Angoulême. It was afterwards chosen by Catharine de' Medici as the site of a new palace instead of that of Tournelles, and the building was begun in 1564. The palace was burned by the Commune in 1871, and all that remained, save two wings leading to the Louvre, finally removed in 1883. Gardens now occupy most of the site. See PARIS, Vol. VII. p. 764.

Tuke, WILLIAM. See INSANITY.

Tula, an ancient and important manufacturing town of central Russia, capital of a government on the Upa, an affluent of the Oka, 110 miles S. of Moscow by rail. Its churches, its arsenal, museum, and government offices, and the ancient Kreml are the principal buildings. The principal industries are in iron and steel goods, especially the firearms of the great imperial gun-factory or private workshops. The Russian army is largely supplied with muskets and small-arms from the works of this town. Cutlery, locks, *samovars* or tea-urns, mathematical instruments, harmoniums, and bells are made; the Niello-work (q.v.) of Tula is famous; and dyeing, soapmaking, &c. occupy many of the (1895) 86,670 inhabitants.

Tulare Lake. See CALIFORNIA.

Tulchan Bishops, a term of contempt given to the titular bishops in Scotland, who in 1572 agreed to hold office, letting all the revenues of their charge, except a miserable pittance, be absorbed by the nobles as lay patrons. 'Tulchan' was a calf's skin stuffed with straw, used to induce a cow to give her milk freely.

Tuldja (Roum. *Tulcea*), a Roumanian port in the Dobrudja, just where the Danube divides into its three main branches. Pop. 21,826.

Tulip (*Tulipa*), a genus of plants of the natural order Liliaceæ, having an inferior bell-shaped perianth, of six distinct segments, without nectaries, a sessile three-lobed stigma, a three-cornered capsule, and flat seeds. The bulb is fleshy and covered with a brown skin. Between forty and fifty species are known, mostly natives of the warmer parts of Asia. The name tulip is derived through the French and Italian from the Turkish *tulbend*, Persian *dulband*, originally a Hindustani word, 'a turban.' The most famous of all florists' flowers is the Garden Tulip (*T. gesneriana*), which is from 18 inches to 2 feet high, with a smooth stem, bearing one erect, large flower; the leaves ovate-lanceolate, glaucous, and smooth. The tulip is a native of the Levant; it was brought from Constantinople to Augsburg by Conrad Gesner in 1559, and rapidly spread throughout all parts of Europe. The varieties in cultivation are innumerable. The tulip mania of the 17th century in Holland was the most remarkable of its kind that has ever occurred in horticultural or perhaps any other kind of commerce. Lindley and Moore say: 'Their (tulips') price rose above that of the most precious metals. It is a mistake, however, to suppose that the high prices paid for bulbs—amounting in some instances to 2500 and even 4600 florins—represented the estimated value of a root, since these large sums often changed hands without any transfer of property. Bulbs were bought and sold without even being seen—without even being in existence. In fact, they were the subject of a speculation not unlike that of railway scrip in this country at no very distant date.' The tulip is still most sedulously cultivated in Holland, especially at Haarlem, whence bulbs are largely exported; but attention is almost exclusively devoted to the cheaper varieties, which are used in hundreds or thousands for the purposes of decoration in gardens and rooms

throughout winter and spring. The purely florists' varieties, which gave rise to the tulip mania, are not suited for this purpose; they are nowhere now cultivated more zealously than in England, by a limited band of connoisseurs in the home counties and in Lancashire. The tulip is prized merely for the size and beauty of its flowers, its smell being rather unpleasant. Great attention is paid to the cultivation of tulips, not only in the gardens of the wealthy, but often in those of the humbler inhabitants of small towns and villages, in which beautiful beds of tulips may often be seen. Tulips succeed best in a light, dry, and somewhat sandy soil. Bulbs are planted in the end of October, or beginning of November, and the flowers are produced early in summer. Beds of choice tulips are protected in spring by hoops and mats; and in the flowering season an awning of thin canvas is spread over them, which greatly prolongs the duration of their beauty, as they are soon spoiled by exposure to strong sunshine. Tulips are propagated by offset bulbs, and new varieties are raised from seed. Another species of tulip cultivated in gardens is the Sweet-scented Tulip, or Van Thol Tulip (*T. suaveolens*), which has yellow or red flowers, inferior to those of the common garden tulip in beauty, but prized for their fragrance, and for appearing more early in the season. It is often cultivated in pots in windows. It is a native of the south of Europe. The Wild Tulip (*T. sylvestris*), a native of many parts of Europe and Asia, is admitted into the British flora, but is a very doubtful native of Britain. It is common in the woods and vineyards of Germany and the south of Europe. It has a slender stem, narrow lanceolate leaves, and a somewhat drooping, fragrant, yellow flower. It develops offset bulbs at the end of fibres thrown out from the root, at some distance from the parent plant. Its bulbs are eaten in Siberia, although bitterness and acridity characterise all the bulbs of this genus.

Tulip Tree (*Liriodendron tulipifera*), a beautiful tree of the natural order Magnoliaceæ, a native of the United States, having a stem sometimes 100 to 140 feet high and 3 feet thick, with a grayish-brown cracked bark, and many gnarled and easily broken branches. The leaves are roundish, ovate, and three-lobed, the middle lobe obliquely truncated. The flowers are solitary at the extremities of the branchlets; they resemble tulips in size and appearance. The bark has a bitter, aromatic taste, and, like that of all the Magnoliaceæ, contains a bitter principle, called *Liriodendrin*, which has been used as a substitute for quinine in fevers. The tulip tree is one of the most beautiful ornaments of pleasure-grounds wherever it grows, and flowers well—in Britain, however, only in the southern parts. It does not flower freely till the tree is from twenty to thirty years of age. It is now plentiful in many parts of the south of Europe. In some parts of the basin of the Mississippi it forms considerable tracts of the forest. The heart-wood is yellow, the sap-wood white. The timber is easily wrought, takes a good polish, and is much used for many purposes.

Tulip Tree (*Liriodendron tulipifera*).

Tullamore, the chief town of King's County, Ireland, is situated on the Grand Canal, 59 miles WSW. of Dublin by rail, and is a well-built agricultural town with some local trade. Pop. 5098.

Tulle, capital of the French dept. of Corrèze, at the confluence of the Solane and the Corrèze, 61 miles by rail ENE. of Périgueux. Its 12th-century cathedral was partly demolished in 1793; the principal industry now is the manufacture of small-arms. Pop. (1872) 11,848; (1891) 15,384.

Tulle, named from this place, is no longer made here. It is a kind of thin silk network fabric of a very open structure, used for the trimmings of ladies' dresses, and also for caps and veils. Of late years other light fabrics, especially silks of a different make, have largely taken its place for parts of dresses.

Tulloch, John, an eminent Scottish divine, was born at Bridge of Earn, in Perthshire, June 1, 1823, studied at St Andrews and Edinburgh, and was licensed to preach in 1844. Next year he accepted the charge of St Paul's at Dundee, in 1849 was presented to Kettins in Forfarshire, and was appointed in 1854 principal and primarius professor of Divinity in St Mary's College, St Andrews. Appointed in 1859 one of the Queen's chaplains, he became senior principal at St Andrews in 1860, deputy-clerk of the General Assembly in 1862, Clerk in 1875, and Moderator in 1878, and died at Torquay, February 13, 1886. From an early age he contributed to the magazines—*North British Review*, *British Quarterly*, and later the *Contemporary Review* and *Fraser's Magazine*, of which last he was for some time editor. His first book was the second Burnett prize essay on *Theism* (1855), and this was followed by *Leaders of the Reformation* (1859), *English Protestants and their Leaders* (1861), *Beginning Life* (addressed to young men, 1862), *The Christ of the Gospels and of Modern Criticism*—an answer to Renan (1864), *Rational Theology and Christian Philosophy in the Seventeenth Century*—altogether an admirable work, discussing with equal sympathy and insight the Falkland group and the Christian Platonists (2 vols. 1872), *Facts of Religion and Life* (sermons, 1876), *Pascal* in Blackwood's 'Foreign Classics' (1876), *The Christian Doctrine of Sin*—the Croall Lectures at Edinburgh (1877), *Modern Theories in Philosophy and Religion* (1884), and *Movements of Religious Thought in Britain during the Nineteenth Century* (1885). Tulloch was a fearless Liberal alike in politics and theology. His conception of an Established Church involved the idea of a comprehensiveness and tolerance unusual to Presbyterian theology, and he laboured throughout life to lay down the sure foundations on which a rational yet reverent Christianity might be firmly built, which should be distinguished by its inwardness and spiritual elevation rather than by the rigidity of its definitions. The strength and earnestness of his own religious convictions, his large-hearted benevolence, catholic sympathy and broad culture, his noble presence and impressive oratory made him conspicuous among men, whether on the floor of the Assembly, on the platform, or in the pulpit. See Memoir by Mrs Oliphant (1888).

Tumble-weed, or Rolling-weed, a name given to several plants whose globular flowering heads are detached in autumn, and rolled about, scattering their seed. Such are various species of Amarantus, Psoralea, Corispermum (Bug-seed), and Cycloloma (Winged Pig-weed).

Tummel. See Rannoch.

Tumour (Lat. *tumor*, 'a swelling') is the term applied in medicine to new formations characterised generally by their 'independent growth and almost independent life, so little do they appear to

concern themselves with the interest of the body as a whole;' 'their tendency to continuous growth;' and 'the tenacity with which they maintain their hold upon the individual, rarely disappearing or even diminishing in size.' They are thus separated on the one hand from simple hypertrophy of organs normally present, and on the other from inflammatory swellings, and the enlargements associated with syphilis, tubercle, glanders, &c. Many cysts, however, though grouped with tumours, are merely enlargements of normal cavities (see CYST).

The most important division of tumours is that into *innocent* or *benign* and *malignant* tumours. The malignant tumours tend (1) to grow continuously into the tissues surrounding them, irrespective of the natural boundary lines between different structures; (2) to recur after removal; (3) to cause secondary growths of the same nature in the neighbouring lymphatic glands, (4) and in distant parts of the body. Malignant tumours of different structures and in different organs possess these characters in varying degrees, and may not manifest them all; but if malignant at all they are dangerous, and certain sooner or later, if unchecked, to destroy life. Innocent tumours, on the other hand, are sharply marked off from the surrounding tissues, tend to grow by pushing aside, rather than by invading adjacent structures, do not return after removal, and do not lead to the occurrence of similar growths in other parts, though several or even many of them may be present in the same patient. They may cause death by interfering, on account of their situation, with the function of important organs, by becoming the seat of ulceration and hæmorrhage, &c.; but they have not the intrinsic dangers of the other group.

With regard to the causes of tumours little is known. In some cases they can be traced to the effects of injury or of long-continued irritation of a part, though the reason why they should so arise in a particular individual is often inexplicable; in some cases heredity seems to be an important factor in their occurrence. But 'in the large majority of cases they are formed without any apparent cause.' The organs most frequently affected are the womb and the female breast; hence they are on the whole more common in the female sex. But some organs common to both sexes are affected almost exclusively in males (e.g. the lip by cancer).

With regard to treatment, simple tumours demand removal, generally speaking, only when they give rise to discomfort or disfigurement; malignant tumours should be removed, if removal is practicable, at the earliest possible moment. With few exceptions removal by the knife, écraseur, or cautery is the only method of dealing with them.

The solid simple tumours resemble more or less closely the fully developed structures of the body, generally of the part in which they grow, and are classified accordingly. The most important groups are the fatty tumours (lipoma), the most frequent of all; the fibrous (fibroma); the cartilaginous (enchondroma); the bony (exostosis); the vascular (Nævus, q.v.); the warty (papilloma); and the glandular (adenoma). The malignant tumours are either aberrant developments of epithelium (carcinoma; see CANCER), or resemble imperfectly developed tissues (see SARCOMA).

Tumult. See RIOT.

Tumulus. See BURIAL, BARROW, CAIRN.

Tun, an obsolete liquid measure of capacity; in old ale and beer measure, 216 gallons; in old wine measure, 252 gallons. As a tun of water weighs a little more than 2000 lb., it is probable that the ton weight (see TON) was taken from the tun measure.

Tunbridge, or TONBRIDGE, a market-town of Kent, 29½ miles SE. of London, stands on the Medway, which here divides into six streams, one of them called the Tun. A castle, originally Norman, but largely rebuilt in 1280–1300, and held successively by Fitz-Gilberts, De Clares, Audleys, and Staffords, retains a fine Early Decorated gatehouse. The parish church, also Decorated in style, was almost rebuilt in 1878; and the grammar-school, founded in 1553 by Lord Mayor Sir Andrew Judd, occupies handsome new buildings of 1865. Remodelled in 1880, it has a rich endowment of £5500 a year, and over 300 boys; Sir Sidney Smith was an alumnus. The manufacture of toys, boxes, and other articles in 'Tunbridge ware' (a kind of wood mosaic in veneer) is a specialty. Pop. (1861) 5919; (1891) 10,123.

See works by T. P. Fleming (1865) and, on the school, by S. Rivington (1869).

Tunbridge Wells, a charming inland watering-place, on the border of Kent and Sussex, 5 miles S. of Tunbridge and 34½ SSE. of London. It occupies the head and slopes of one of the valleys of the Weald, and has in general a south-west aspect, commanding very fine views. The chalybeate waters, situated at the end of a parade called the 'Pantiles,' were discovered by Lord North in 1606, and patronised in 1630 by Henrietta Maria. Puritans also resorted hither, and to them the place owes such names as Mounts Ephraim and Sion; whilst among later visitors have been Catharine of Braganza, Evelyn, Queen Anne, 'Beau' Nash, Richard Cumberland, Dr Johnson, Richardson, Garrick, Chatham, and Queen Victoria. There are a breezy common of 170 acres, a church (1685) in two counties and three parishes, a public hall (1870), a new pump-room (1877), a friendly societies' hall (1878), and a considerable trade in 'Tunbridge ware.' The season lasts from July to September. Tunbridge Wells was incorporated as a municipal borough in 1889. Pop. (1851) 10,587; (1891) 27,895.

See works by J. Britton (1832) and, on the flora, by R. Deakin (1871); also Macaulay's third chapter, and Thackeray's *Virginians*.

Tundra, the vast plains which border on the Arctic Ocean. See DESERT, SIBERIA.

Tungsten (sym. W, equiv. 183·5), a rare metal, chiefly derived from Wolfram (whence the symbol W), which is a tungstate of iron and manganese, and likewise found in Scheelite, which is a tungstate of lime. The metal (Swed. *tung-sten*, 'heavy stone') is obtained either as a dark-gray powder or in heavy iron-gray bars, which are very hard and difficult of fusion, and have a specific gravity of 19·1. Aqua regia and nitric acid convert it into tungstic acid. When 10 parts of this metal are alloyed with 90 of steel a mass of extraordinary hardness is obtained. Tungsten forms two compounds with oxygen—viz. a binoxide, WO_2, which is obtained in the form of a brown powder by heating tungstic acid to low redness in a current of hydrogen, and which does not form salts with acids; and an acid oxide, known as *tungstic anhydride*, WO_3. Various tungstates have been formed and examined. Of these the most important is the tungstate of soda, which answers admirably as a means of preventing muslin, &c. from bursting out in a flame when brought in contact with fire.

Tunguses, an ethnographic group of the Ural-Altaic family; see SIBERIA, Vol. IX. p. 428.

Tunic (Lat. *tunica*), the Roman equivalent of the Greek *chitōn*, the chief under-garment of Greeks and Romans of both sexes. In its ordinary form it consisted of a plain woollen shirt, girded round the loins and reaching to about the knees, with two

short sleeves covering the upper part of the arm. Over this loose outside draperies in various forms were worn, as the Greek *pallium* and the Roman *toga*. The women's tunics (Lat. *stola*) were usually longer and looser than those of men, and were fastened under the bosom instead of round the loins.

Tunicata, or UROCHORDATA, a class of remarkable animals, many of which are popularly known as Ascidians (q.v.) or sea-squirts. As is explained in the article on Ascidians, the Tunicates are now regarded as occupying a lowly place among vertebrate or chordate animals. This is proved by the characteristics of the larval forms, and also by three or four genera—e.g. Appendicularia (q.v.)—which retain throughout life the vertebrate characteristics which the great majority lose in the degeneracy of their adult life. The class includes three orders —(1) Larvacea, of which Appendicularia is type; (2) Ascidiacea, or Ascidians; and (3) Thaliacea, free-swimming forms— Salpa (q.v.) and Doliolum.

See W. A. Herdman, 'Tunicata,' *Challenger* Reports, vi. 1882; xiv. 1886, &c.

Tuning-fork, a contrivance for regulating the pitch of the voice or of a musical instrument. It consists of two prongs of steel springing from a handle, and so adjusted as to produce a fixed note when struck. It is usually tuned in C in Britain and in A in Germany, but there is great diversity as to what should be the pitch of C (see PITCH). There are forks which are capable of adjustment to different standards of pitch by means of a movable brass slider fitted with a screw. Tuning-forks are much used in experiments on Sound (q.v.).

Tunis, a French protectorate of North Africa, bounded on the N. and E. by the Mediterranean Sea, on the W. by Algeria, on the S. by the Sahara, and on the SE. by Tripoli. It has an area of 45,000 sq. m., and a population, mostly Bedouin Arabs and Kabyles, estimated in 1901 at 1,906,000, including 26,678 French, 63,866 Italians, and 12,732 Maltese. Numerous bays and arms of the sea indent the coast, and branches and spurs of the Atlas range penetrate the interior. The country, indeed, is mostly high ground, a large proportion of its surface being occupied by hills and, towards the south, by desert steppes, seldom visited by rain. In the east the land is low and sandy. None of the rivers are navigable, most of them disappearing in the sand before reaching the coast. There is but one considerable lake; it lies towards the north. The soil is largely fertile, producing fine grain-crops. Fruit-culture is extensively engaged in, and oranges, dates, figs, olives, grapes, pomegranates, and almonds are raised. The pasturage is good and abundant, except in the height of the dry season, supporting numerous flocks of cattle and sheep. Tunis is rich in all minerals except gold. In late years quarries of fine and very beautiful marble have been discovered and worked, the character of the stone and the traces of ancient workings making it probable that from this district came the precious 'Numidian marbles' of the Romans. Towards the west lava and other volcanic rocks are presented.

The rainy season lasts from October till March, when the precipitation is plentiful over the whole country, with the exception of the desert steppes, as previously noticed. The annual rainfall varies from 10 to 50 inches. The heaviest rains occur in December and January, accompanied by north and north-west winds. Snow falls on the higher altitudes, and the greater mountain-peaks are always snow-clad. Showers are few during the great heat, and dew is unknown except near the sea, and even there it disappears at or a little before sunrise. Although often trying for Europeans, the climate cannot be called exceptionally unhealthy, but much depends on the situation.

The trade of Tunis is gradually increasing, but the value of the imports (about £1,740,000 per annum) is still nearly £50,000 per annum above that of the exports. Three-quarters of the cargoes are carried in French bottoms, Italy ranking second and Great Britain third. Commerce is carried on principally with the following countries, arranged according to the value of the imports received from each—viz. France, Algeria, Malta, Italy, Russia, Austria, and Great Britain. The exports are sent principally to Italy, France, Algeria, Great Britain, Malta, and Austria. The articles chiefly imported are cottons and textile goods, flour, cereals, colonial wares, and wines. The exports largely consist of olive-oil, wheat, tan, alfa, barley, fruits, wool and woollen goods (including *chechias*, or caps of red wool), sponges, and tunny-fish (in tins and salted). There are 860 miles of railways, with over 2000 miles of telegraphs. The piastre, with an average value of about sixpence, is the standard of monetary value; but French and Italian gold and silver coins circulate freely.

For the early history, see CARTHAGE. When European powers first began to recognise the utility, if not necessity, of occupying foreign shores with the view of commanding freedom in the transport of troops and merchandise, Tunis, from the facilities which its numerous bays and ports gave to movements in the Mediterranean, seems to have particularly engaged the attention of France, and in 1270 Louis IX. invaded the country, being assisted by the king of Navarre. Although his landing was unopposed, the troops suffered much from sickness, the king and his son falling early victims to disease. Notwithstanding the invaders managed to bring their enterprise to a successful issue. In 1575 Sinan Pasha brought the country completely under the Ottoman power, giving it a new constitution. The government was invested in a Turkish pasha as governor, with a council composed of the principal officers of the Turkish troops and the commander of the Janizaries. But in a few years a military mutiny overturned matters, and a dey, with limited authority, was raised to power, the chief executive functions being retained by the council, a bey being put at the head of the revenue and taxation departments. By slow degrees this officer so extended his influence and authority that at last Murad Bey succeeded in raising himself to the hereditary sovereignty, and his family governed Tunis for a century, enlarging their borders by conquests on land and greatly increasing their own and the country's opulence by piracy, directed against the Christian powers, by sea. In the 18th century, after a series of reverses, Tunis became tributary to Algeria; but in the beginning of the 19th century the country, under Hamuda Pasha, became again virtually independent. Under its later sovereigns, generally men of an enlightened and wisely-reforming spirit, Tunis made great progress. In 1881 France invaded Tunis, under pretext of chastising the Kroumir tribes which had been making incursions into Algeria; this invasion resulted in the signing of a treaty placing the country practically under French protection, under which it has made satisfactory progress. This occupation is the most important to France of any that she has undertaken in late years, as it gives her to a large extent the command of the Mediterranean and important coast-line, the use of many and secure harbours, and makes her the mistress of North Africa, besides, to a certain degree, lessening the strategic importance of Gibraltar and Malta.

See *The Piratical States of Barbary* (anonymous), Broadley's *Tunis Past and Present*, Banning's *Le Partage Politique de l'Afrique*, Arènes's *Vingt Jours en Tunisie*, Mayet's *Voyage dans le Sud de la Tunisie*, Lanessan's *La Tunisie*, Norman's *Colonial France*, Graham and Ashbee's *Travels in Tunisia* (with full bibliography, 1887; the *Bibliography* continued by Ashbee in 1890), Silva White's *Development of Africa* (1890), and Poiré, *La Tunisie Française* (1892).

Tunis, the capital, is situated on a small lagoon (El Bahira), near the south-west extremity of the Lake of Tunis, and about 3 miles from the ruins of Carthage (q.v.). The streets are narrow, filthy, and unpaved, but the bazaars are well supplied with oriental goods, fruits, and some of the chief imports. The mosques are always worth visiting, and several of them are magnificently decorated, as is the bey's palace. The citadel, the old slave prison, contains a fine collection of arms and objects of antiquarian interest. A channel 81 feet broad and 11½ deep has been dredged in the lagoon from Goletta to Tunis, where harbour-works have been constructed. There are manufactures of cloth and clothing, olive-oil, tapestries, leather, soap, and wax. Good modern barracks are occupied by the French troops, who have made their surroundings healthy and, to a certain extent, pleasant to the eye, but much remains to be done in the way of sanitary improvement within the city itself. Pop. 134,000. See Lallemand, *Tunis et ses Environs* (1889).

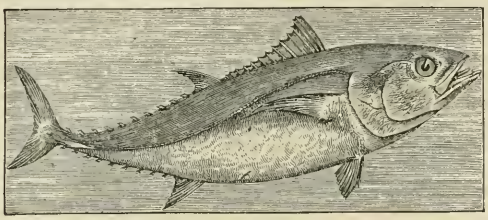
Tunkers (Ger., 'Dippers'), by corruption *Dunkards* (but by themselves called 'the Brethren'), a religious sect found chiefly in Pennsylvania, Maryland, Virginia, Ohio, Indiana, Illinois, Iowa, Missouri, Nebraska, and Kansas. Altogether they number nearly 100,000, and are almost confined to the United States, although small bodies exist in Denmark and Sweden. Yet the sect had its birth in Germany, being indeed a child of the Pietist movement of the 17th century; but between 1719 and 1729 all the members, harassed and persecuted at home, had, on Penn's old invitation, removed to Pennsylvania, and settled about Germantown and Philadelphia, from whence they gradually spread southward and westward. In their creed the Brethren are thoroughly evangelical. Baptism they administer by trine immersion (hence their name), and only to adults. Love-feasts are held in each congregation twice a year, preceded by washing of feet, and followed by the giving of the right hand of fellowship and the kiss of charity (women with women, and men with men), and then by the communion. Each congregation is independent, and elects its own deacons, ministers, and elders or bishops; the latter, who preside over the congregations, are chosen (generally by seniority) from among the ministers (who are authorised to baptise, marry, and preach). Ministers are supported by the church if they are poor or are sent out as missionaries, but as a rule no salaries are paid. There are district and general conferences for the settlement of questions not entirely local. Other customs of the sect that deserve notice are their plain and generally uniform dress, their avoidance of litigation, of war, and of any active share in politics; they take no oaths, and so may not join (or if converts remain members of) any secret society. Divorce and re-marriage are unknown among them, but the stories of their celibacy or discouragement of marriage are without foundation. They anoint the sick with oil; and they are total abstainers, and discourage the use of tobacco. Most of the Brethren are engaged in farming. They possess four schools or colleges, at Huntingdon, Pennsylvania, Mount Morris, Illinois, Bridgewater, Virginia, and McPherson, Kansas; the publishing headquarters are at Mount Morris.

Tunnel, an arched passage driven through an elevation, or mountain, or under a river. They may be divided into land or subaqueous tunnels, and according to their purpose into railway or canal tunnels, tunnels for sewage, water-supply, &c. Tunnels have been in use from an early period in history, notable ancient ones being those under the Pyramids (q.v.), that for draining Lake Fucino (q.v.), and the Cloaca Maxima (q.v.). But it is since the 16th century that they have been most largely used. From the difficulties and uncertainty connected with their construction, they have proved to be the most costly part of the work in making canals and railways, averaging from £45 to £60 per lineal yard. In making a tunnel, the nature of the material to be excavated is first ascertained by vertical shafts at different points in its length. Some of these are temporary, others are permanent, and serve for ventilation when the tunnel is completed. These shafts must not be less than 9 feet in diameter, so as to admit of lowering and raising men and the material excavated, fixing pumps, &c. When the workmen have reached the top of the tunnel they begin by excavating in opposite directions, and thus, independent of the two ends, many faces can be worked at the different shafts, until a small 'adit' or hole is driven through its entire length. This first passage when completed through rock is 6 or 7 feet high and along the top of the tunnel; the centre line is then marked off, and the adit or passage enlarged at the sides and bottom to the required dimensions. Sometimes in hard rock no brick lining is required. If, however, the material excavated is clay, loose soil, or friable rock, the full size of the tunnel is carried forward from the beginning, the brick lining following close up to the faces of the excavations. Tunnels through lofty mountains, or below rivers or arms of the sea, can only be worked from the two ends, vertical shafts being inadmissible, and from the experience gained in recent years in tunnels of great length, and with improved boring and drilling-machinery driven by compressed air, combined with the use of more powerful blasting materials, it is probable that the older methods of constructing tunnels from vertical shafts will be superseded in the future, the comparative progress under equal conditions being in favour of the newer machinery by as much as three and four to one. Important departments of the work of tunnel-making have been already discussed in the articles Blasting (q.v.) and Boring (q.v.); see also Mining. There are sixty-eight tunnels on canals and nearly 87 miles on the railways of Great Britain. The Channel Tunnel (q.v.) remains a project. See also Aqueduct, Pneumatic Despatch, Railways.

The longest in the world are the Alpine mountain tunnels under the St Gotthard (9¼ miles; 1872–80), the Mont Cenis, and the Arlberg, noticed under their several heads, as are also the other more important tunnels (see Hoosac Mountain, St Clair, &c.). The 'Underground Railway' in London is practically a series of tunnels. The old Thames Tunnel of Brunel (1825–43) is now used for a railway. In 1891–97 the London County Council constructed a new tunnel under the Thames at Blackwall at a cost of £1,500,000. The longest canal tunnels in England are the Marsden, on the Huddersfield Canal (5280 yards; opened 1798), and the Sapperton, on the Thames and Liverpool (4300 yards; 1790). The longest railway tunnels are the Severn tunnel (7665 yards; 1886), the Dore and Padley (6200 yards; 1892), the Stanbridge (5342 yards; 1839), and the Woodhead (5297 yards; 1867).

Tunny. The tunnies belong to the mackerel family, or Scombridæ, and have somewhat the

appearance of gigantic mackerel. There are several genera and species. The Common Tunny (*Thynnus vulgaris* of Cuvier, *Orcynus thynnus* of Günther) is the *thynnus* of the ancients. It is a large fish, reaching 9 feet in length, and 1000 lb. in weight. It occasionally occurs on the British coasts, but is particularly abundant in the Mediterranean. It has a large mouth with small teeth; two dorsal fins, the first elongated and reaching nearly to the second, which is shorter; behind the second dorsal and anal are eight or nine finlets like those of the mackerel. There is a keel on



The Common Tunny (*Thynnus vulgaris*).

each side of the free portion of the tail, and the tail fin is crescentic. There are small scales all over the body, but they are larger in the anterior part, where they form a well-defined corselet. An air-bladder is present. The tunnies approach the coasts in summer, chiefly for the purpose of spawning, and it is at this time that the fishery is carried on. Like the mackerel, the fish are gregarious and migratory, but it is untrue that they all leave the Mediterranean in autumn, as was formerly supposed. The Phœnicians established a tunny fishery at a very early period on the coast of Spain, and the tunny appears on Phœnician medals of Cadiz and Carteia. Salted tunny was much esteemed by the Romans, and was called *Salta-mentum Sardicum*. The tunny is generally captured by means of nets arranged in a funnel-like form, the fish entering the wide mouth of the funnel, and being gradually driven to the narrow end, where they are killed by lances and harpoons. The line of nets is often more than a quarter of a mile long. The principal fisheries at the present day are at Cadiz, the Gulf of Lyons, Corsica, Sardinia, Sicily, Tunis, and in the Black Sea. At Tunis most of the fish are cut up and preserved in olive-oil, and exported in tins; others are salted and sent to Malta and Sicily, but fetch only half the price of those in oil. The common tunny also occurs on the western side of the Atlantic, from the Caribbean Sea to Newfoundland. The Long-finned Tunny (*Orcynus germo*) is distinguished by the great length of the pectoral fins; it is scaled all over, and the corselet is ill-defined. It is much smaller than the common tunny, seldom reaching 3 feet in length. It is caught by long and strong 'whiffing' lines trailed from a boat, the fishery being principally carried on in the south part of the Bay of Biscay. A few stragglers have been caught on the coasts of Devon and Cornwall, but its ordinary range is from the Bay of Biscay to the Cape of Good Hope. The Bonito (q.v.; *Thynnus pelamys*) has no scales at all on its body except in the corselet. *Pelamys sarda* has very fine scales on the posterior part of the body, and a small corselet. *Auxis rochei* is distinguished by the distance between the two dorsal fins; its weight does not exceed 6 lb. A few other species of these genera occur in the Pacific and Indian Oceans.

Tunstall, a market-town of Staffordshire, 4½ miles NNE. (and since 1885 within the parliamentary borough) of Newcastle-under-Lyme. It has a town-hall (1884), manufactures of earthenware and iron, and neighbouring collieries. Pop. (1811) 1677; (1851) 9666; (1891) 15,730.

Tunstall, Cuthbert, was born at Hackforth in Yorkshire in 1474, brother of the Sir Brian Tunstall who fell at Flodden. He was educated at Oxford, Cambridge, and Padua, and became in turn Rector of Stanhope, Archdeacon of Chester, Rector of Harrow-on-the-Hill, Master of the Rolls, Dean of Salisbury (1519), Bishop of London (1522) and of Durham (1530). In 1516 he went on an embassy to Charles V. at Brussels, and there formed a fast friendship with Erasmus. Between 1516 and 1530 he was often employed on embassies to France and Germany, and in 1527 he had accompanied Wolsey on his magnificent embassy to France. He accepted the Royal Supremacy, but took alarm at the sweeping measures of reform under Edward VI., and was at length in 1552 deprived, through the influence of Northumberland, who coveted the wealth of the see. The accession of Mary restored the bishop, but under his mild rule not a single victim died for heresy throughout the diocese. On Elizabeth's accession he refused to take the oath of supremacy and was deprived, September 29, 1559. About six weeks after he died at Lambeth in the house of Archbishop Parker, and was buried in the chancel of Lambeth church. Tunstall was a ripe scholar and an admirable man, but left little beyond a defence of transubstantiation and a number of Latin prayers. He was uncle to the famous apostle Bernard Gilpin.

Tupelo (*Nyssa*), a genus of trees, natives chiefly of the southern parts of the United States, having simple alternate leaves, mostly entire, greenish inconspicuous flowers at the extremity of long stalks, the fruit a drupe. *N. villosa* attains a height of 60 to 70 feet. It is often called Black Gum Tree. *N. tomentosa*, the Large Tupelo, is a lofty and beautiful tree, remarkable for the extraordinary enlargement of the base of the trunk, which is sometimes 8 or 9 feet in diameter, whilst at no great height the diameter diminishes to 15 or 20 inches. The fruit resembles a small olive, and is preserved in the same way by the French settlers in America. *N. candicans* or *capitata*, the Ogeechee Lime or Sour Gum Tree, is a small tree, of which the fruit is very acid, and is used like that of the lime. The wood of all the species is peculiarly curled in the grain, rendering the fibre very tenacious and difficult to split, and is in request for making naves of wheels, hatters' blocks, &c., but is not otherwise valuable.

Tupper, Martin Farquhar, D.C.L., F.R.S., poet and inventor, was born at Marylebone, 17th July 1810. His father, an eminent London surgeon, who twice refused a baronetcy, came of a family, originally German, which since 1550 had been settled in Guernsey. Martin was educated at the Charterhouse and under five private tutors, and at nineteen went up to Christ Church, Oxford. A stammer hindered him from taking orders, so, after graduating in 1831, he entered Lincoln's Inn, and in 1835 was called to the bar. But a single will and marriage settlement was his first and last exploit in the way of law; he had found his vocation in a life of authorship. Its chief events were his election to the Royal Society (1845), two visits to America (1851, 1876), and a series of English and Scotch readings from his own works. Of those works, forty in number, one, *Proverbial Philosophy* (3 series, 1838–67), brought him and his publisher, Hatchards, a profit of 'something like £10,000 apiece.' His inventions were not such successes (safety horseshoes, glass screw-tops to bottles, steam-vessels with the paddles inside, &c.). A

friend 'whose ambition it was to be Tupper's Boswell' predeceased him; but from his own huge 'archives' he compiled *My Life as an Author* (1886)—a curious self-study of a poet. He died at Albury, his Surrey home, on 29th November 1889.

Turanian, a philological term apt to be misleading and now going out of use. Originally the word *Turan*, meaning '*not Iran*,' was used by the Sassanian kings of Persia for those parts of their empire outside of Iran (q.v.), and the Persians still know Turkestan under this name. Hence in philology 'Turanian' came to be used for the non-Aryan languages (see ARYAN RACE) of those regions—languages of the Ural-Altaic or Finno-Tartar group (see ASIA, Vol. I. p. 493). But the term was extended sometimes so as to include the Dravidian tongues of India, also of the agglutinative type (see PHILOLOGY, Vol. VIII. p. 126); thus erroneously suggesting affinity between non-Aryan and non-Semitic groups of languages which are probably quite unconnected (see URAL ALTAIC).

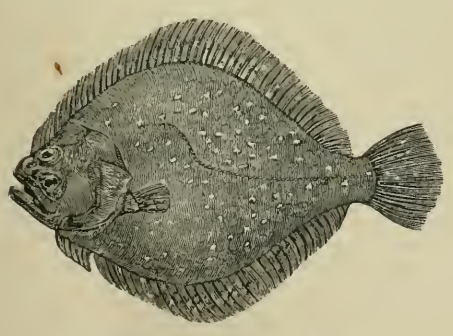
Turbary, in the law of England, is a right to go upon the soil of another and dig turf, and carry away the same.

Turbellarian. See PLANARIAN.

Turberville, GEORGE (about 1530–1600), poet and secretary to Sir Thomas Randolph (q.v.), wrote epigrams, songs, sonnets, *The Booke of Faulconrie* (1575), *The Noble Art of Venerie* (1576), an unpublished translation of Tasso, &c.

Turbine. See WATER.

Turbot (*Rhombus maximus*), a fish of the family Pleuronectidæ or Flat-fishes. The genus Rhombus includes the turbot and brill only among British flat-fishes: its distinguishing characters are that the eyes are on the left side, the ventral being anterior, the mouth terminal and large, with teeth on both sides, the shape rhomboidal, and that the lateral line has a semicircular curve above the pectoral fin. The dorsal fin commences on the snout in front of the eyes, and its rays like those of the ventral are branched. The turbot is distinguished from the brill by the fact that it has no scales, but on the upper side bony plates in the skin from which blunt tubercles project: it is also broader in proportion than the brill. The adult turbot is about 2 feet long, and it has been known to reach a weight of more than 30 lb. It feeds principally on other fishes, but also on crustaceans,



Turbot (*Rhombus maximus*).

molluscs, and echinoderms. It occurs on sandy ground all round the British and Irish coasts, becoming rarer towards the north. The largest supply comes from the North Sea. It breeds in summer: the eggs are very small and are buoyant or pelagic. Buckland calculated the number of eggs in a single female at over fourteen millions. The young, unlike those of other flat-fishes, are provided with an air-bladder, and continue to swim at the surface during their metamorphosis. At this period of life they approach the shores, and are found in harbours and bays. After the metamorphosis the young fish remain in shallow water, where also larger specimens occur in summer-time. The turbot in the market is only surpassed in price by the sole: its average price on landing in 1890 was 7d. per lb. The total value of turbot landed in that year in the United Kingdom was £58,831. Owing to its predaceous habits and large mouth, the turbot is caught on hooks as well as by the trawl. The range of the turbot extends along the coasts of France and in the Mediterranean as far as the Adriatic. Like the sole, it is entirely absent from the American coast. *R. maculatus*, the only American representative of the genus, found on the coasts of New England and New York, is of little value as food from the extreme thinness of the body, to which it owes its common name of 'window-pane.' It rarely exceeds a pound or two in weight. Another species, *R. mæoticus*, occurs in the Black Sea.

Turcomans. See TURKESTAN.

Turcos, a popular name for the Tirailleurs Algériens, a body of native Algerian troops recruited for the French service.

Turdidæ. See THRUSH.

Turenne, HENRI DE LA TOUR D'AUVERGNE, VICOMTE DE, one of France's military heroes, was the second son of the Duke of Bouillon and Elizabeth of Nassau, daughter of William (I.) of Orange, and was born at Sedan, 11th September 1611. Brought up in the Reformed faith, he was sent, on the death of his father in 1623, to Holland, where, under his uncle, the celebrated Maurice (q.v.), he was initiated into the art of war. Returning to France in 1630, he was favourably received by Richelieu, who at once gave him a commission. During the alliance of France with the Protestants in the Thirty Years' War he fought with distinction (part of the time under Bernhard of Weimar), and helped to bring about the capture of Landrecies, Maubeuge, and Breisach. The victory of Casale in the Italian campaign of the following year added to his laurels, and in 1641 he was entrusted with the supreme command. The rapid conquest of Roussillon from the Spaniards in 1642 was rewarded in 1644 with the baton of a marshal of France and the chief command on the Rhine. Condé's arrival transferred him for a time to a subordinate position; and his restoration to supreme command was followed by the commission of a strategic error for which he was severely punished by the Imperialist general Count Mercy, who completely routed him at Marienthal, 5th May 1645; but on August 3 of the same year this disgrace was amply avenged by Condé at Nördlingen; and Turenne gloriously concluded France's share in the war by the reconquest of the Trèves electorate, by the conquest of Bavaria (1646–47) with the Swedes, and by a successful campaign in Flanders.

In the civil wars of the Fronde (q.v.) Turenne joined the party of the *frondeurs*, moved by his passion for the Duchess of Longueville; but after being defeated at Rethel (December 15, 1650) he withdrew to Flanders, returning on Mazarin's retirement. On the minister's return Turenne joined his party, while Condé deserted to the *frondeurs*, and the two greatest generals of the period were for the first time pitted against each other. Turenne triumphed over his former chief at Gien and the Faubourg St Antoine (1652), and ultimately forced him to retire from France; after which he subdued the revolted cities, crossed the northern frontier, and conquered much of the Spanish Netherlands. His defeat of Condé at

the Dunes (1658), with the help of Cromwell's 6000, closed their long struggle. In 1660 Turenne was created Marshal-general of France, and in 1668 he became a Catholic from loyalty. His next campaign in Holland was triumphant (1672), and the year after he held his ground against both the Imperialist Montecuculi and the Elector of Brandenburg. In 1674 he dashed across the Rhine, defeated the Duke of Lorraine at Sinsheim, next mercilessly ravaged the Palatinate, crushed Brandenburg at Colmar, laid waste Alsace, and then advanced into the heart of Germany again to meet a worthy antagonist in Montecuculi. But their famous four months' passage of strategy was left unfinished, Turenne being killed by a cannon-ball while reconnoitring at Sasbach, 27th July 1675. His remains, entombed at Saint Denis, were respected at the Revolution, and were placed by Napoleon under the dome of the Invalides.

Turenne left *Mémoires* (published 1782); and there are Lives by Ramsay (Paris, 1733), Raguenet (1738), Duruy (5th ed. 1889), Hozier (Lond. 1885); and works on his strategy and tactics by Neuber (Vienna, 1869), Roy (Paris, 1884), and Choppin (Paris, 1875 and 1888).

Turf. See PEAT; for turf laws, HORSERACING.

Turfan, an important city in the east of Eastern Turkestan (part of which is sometimes named after it), on the southern slope of the Tian-shan Mountains and on a tributary of the Tarim River. Its once important trade fell off seriously in 1860–70 owing to the troubles in Kashgar. Pop. 30,000.

Turgenief, IVAN SERGEITCH (whose family name is represented by spellings as various as *Tourghénieff*, *Turgenjew*, *Turgenef*), one of the greatest of Russian novelists, and the first to make the life of Russia familiar to western Europe, was born the son of a noble and wealthy family at Orel, 9th November 1818, and educated at Moscow, St Petersburg, and Berlin. For about a year he held a post in a government office (1840–41), but retired voluntarily into private life, subsequently living on his estate in Orel, at St Petersburg, or abroad. He became known as a poet in 1843; but his *Annals of a Sportsman* (1846; trans. New York 1885) made him famous—especially for his singularly vivid pictures of the life of the serf and his powerful impeachment of the evils of serfdom. His outspoken liberalism in a *Letter on Gogol* (1852) led to a short imprisonment and his seclusion on his own estate till 1855. Thereafter he lived mainly in Baden-Baden (till 1871) and Paris—where he was a member of the most brilliant literary circles—with short summer visits to Russia. He died at Paris 3d September 1883; and his body was taken to Russia and buried at St Petersburg on the 9th October. A careful rather than a facile writer, Turgenief was a prolific author; though none of his novels is long (many of the most striking extend to only thirty or forty pages), and all are very slight in plot. In *Roudine* (1855; Eng. trans. 1883), *A Nest of Nobles* (1858; trans. by Ralston as *Lisa*, 1869), and *Helene* (1860; trans. as *On the Eve*, 1871) he depicts scenes and characters from the period of enthusiastic dreaming and theorising; in *Fathers and Sons* (1861; trans. 1867), *Smoke* (1867; badly trans. in 1868, better in 1872), and *Virgin Soil* (1876; trans. 1877, and another in 1878) he deals with the period of practical reform and the triumph of Slavophil ideas. But in the latter series he shows himself suspicious of a movement carried through on lines he, an admirer of the methods of western Europe, did not sympathise with, and he dwells too exclusively on the errors and extravagances of the new ideas, caricaturing Young Russia in a manner that gave much offence and led to the author's being regarded as reactionary. His freshness, noble realism, and poetic insight are somewhat impaired by increasing pessimism and hopelessness: the really good men are mostly fools, and progress leads but to evil continually. His accuracy of observation, variety of interests, and width of sympathy are everywhere visible; he is a master in the art of character-sketching; and his style is singularly finished and perfect. Even in France he was by many regarded as the greatest novelist of his time. He left several collections of epic and lyric poems and a series of dramas; and of his other tales—all on Russian themes—*First Love*, *Mumu*, *Annouchka*, *An Unfortunate Woman* have also been translated into English, some of them by American translators. In person Turgenief was exceptionally tall and strongly built, with a majestic bearing; his hair and full beard were in his later years silver-white. He was a magnificent talker in several tongues; some of his novels he wrote in French. He had read much English literature and paid several short visits to England.

See Henry James, *French Poets and Novelists* (1884) and *Partial Portraits* (1888); C. E. Turner, *The Modern Novelists of Russia* (1890); De Vogüé, *Le Roman Russe* (1888); Paul Bourget, *Psychologie Contemporaine* (1888); and German monographs on Turgenief by Zabel (1883) and Thorsch (1886).

Turgot, ANNE ROBERT JACQUES, an eminent French statesman, born at Paris, May 10, 1727, was descended from one of the most ancient families of Normandy. His father held the highest municipal offices at Paris. In his boyhood Turgot was shy, over-sensitive, and awkward; and these failings were aggravated by the harshness of his mother. Being a younger son, he was educated for the church; but soon after attaining to manhood he resolved to abandon the ecclesiastical for the legal profession; 'he could not consent,' he said, 'to wear a mask all his life.' At an early age he had joined the ranks of the philosophic party, who were rapidly imbuing the opinion of France and of Europe with new ideas. Even before he left the Sorbonne, where he had a distinguished career, he wrote essays which gave him a place among the most enlightened students of history of his time. After holding some legal appointments of subordinate importance Turgot was appointed to the office of Intendant of Limoges in 1761. Though more than once invited to more attractive positions, he filled the post for thirteen years, eagerly and resolutely striving to apply to his province the principles of justice and progress, which he loved. The Limoges was in a very low condition when he entered on his functions. In many ways it was merely a sample of the prevalent state of things all over France before the Revolution; in some respects it was worse than other districts. The soil was not fertile, and the natural defects of the soil were made unspeakably worse by a system of government which was irrational and unjust to a degree almost inconceivable. The people were poor, rude, immoral, and superstitious, the victims from time immemorial of ignorance, degradation, and oppression. Turgot introduced a better administration of imposts, and succeeded in abolishing the method of repairing roads and bridges by compulsory labour. He introduced the cultivation of the potato into the Limoges, overcoming the prejudices of the inhabitants by using it at his own table. In 1770 he had to meet a famine, which lasted two years and reduced the people to the severest straits. It should be said that the central government, of which Turgot was the representative, readily supported him in his schemes as far as it was able; and he also received cordial assistance from the rural priests in reaching the minds of the people. The evils with which he had to contend were rooted in

the social and political system of France, especially in the overgrown privileged classes, which, as intendant, he was powerless really to change.

On the accession of Louis XVI. in 1774 Turgot had a brief opportunity of attempting the regeneration of France on a wider scale. He was first appointed minister of Marine, and soon afterwards controller-general of Finance, at that period the most important department of government. His rise was hailed with joy by his friends Voltaire, Condorcet, and other chiefs of the school of progress; it was fervently hoped that by a philosopher in power great things would be accomplished. In his letter to the young king he adopted as the principles of his administration that there should be 'no bankruptcy, no augmentation of imposts, no loans;' and he at once entered upon a comprehensive scheme of reform. He reduced the expenditure, augmented the public revenue without imposing new taxes, and introduced exactness of payments and fidelity to engagements into all his financial operations. He sought to break down that immunity from taxation which had been enjoyed by the privileged classes, and so effect a better distribution of the burdens of government. He established free trade in grain throughout the interior of the kingdom of France, and in every way sought to remove the fiscal barriers which prevented free intercourse between the various provinces of the country. He also issued an edict to abolish the exclusive privileges of the *jurandes* or trade corporations, maintaining that the free right of labour was the first and most sacred right of humanity. It need not be said that these efforts towards a more economical, efficient, and equitable administration brought him into antagonism with all the privileged orders of France. Courtiers, nobles, prelates, farmers of revenue, financiers, and the members of the trade corporations alike saw their selfish interests menaced by the innovations of the new minister, and they combined for his overthrow. Louis XVI. was too weak to resist such pressure. He had not been in full sympathy with the philosophic minister. He complained that his controller-general never went to mass. Turgot was too austere, reserved, and perhaps also too inflexible and doctrinaire; and it was certainly a tactical mistake to unite against himself so many enemies. He attempted too many reforms during the short time he was in power. It may be that he lectured the king too severely on his duty as ruler. Yet Louis greatly esteemed his minister. He had once sadly observed, 'It is only M. Turgot and I who love the people.' The end was that Turgot was dismissed after holding office for twenty months, and France drifted rapidly into the great catastrophe of 1789. He retired quietly into private life, where he occupied himself with literature and science till his death from gout, March 8, 1781.

The efforts of Turgot towards a reform of the French political system have a profound and pathetic significance. By reason of his integrity, zeal for the public good, and administrative intelligence, Turgot was the best man to undertake the regeneration of France. 'He has,' Malesherbes said, 'the head of Bacon and the heart of L'Hôpital.' In practical affairs he was the fittest and most capable representative of the new ideas; and it was natural that Voltaire and other chiefs of the new school should lament his failure as a misfortune that touched them most nearly. It really meant that the hope of a reasonable and temperate change had passed away, through the weakness of the king and the folly and selfishness of the privileged classes. 'The part of the sages was played out; room was now for the men of destiny.'

Turgot's most important work was his *Réflexions sur la Formation et la Distribution des Richesses* (1766). It is the highest development of the Physiocratic school, with its excellences and also some of its characteristic errors, as that agriculture is alone productive, and that there should be only one tax, that on land; and it largely anticipates the teaching of Adam Smith. See POLITICAL ECONOMY.

Masson, 1888); W. Walker Stephens, *The Life and Writings of Turgot* (1895).

Turin (anc. *Augusta Taurinorum;* Ital. *Torino*), a city of Northern Italy, formerly capital of Piedmont, and for a time of the kingdom of Italy, is situated in a beautiful plain bounded by mountains, near the confluence of the Po and the Dora Riparia, 54 miles from the Cenis tunnel by rail, and 80 miles NW. of Genoa. It stands at the meeting-point of several great roads through the Alps, and strategically has been of great importance. Really a very ancient city, it has a very modern appearance: ancient moats and fortifications have been removed, and the place is famed for its handsome streets, squares, and gardens. Some of the finest are Piazza San Carlo, Piazza Castello, Piazza Vittorio Emanuele (perhaps the finest square in Europe for size, regularity of architecture, and beauty of situation), Piazza Carlo Felice, &c. Among the numerous churches the principal are the cathedral of San Giovanni, originally built in the 7th century, and reconstructed as a cruciform Renaissance church in 1498; San Filippo, the finest church in Turin; La Consolata, containing several striking statues and a wonder-working Madonna; La Gran Madre di Dio; and a Waldensian temple. On the summit of a hill near the town is La Superga, a splendid Basilica, raised by Victor Amadeus to fulfil a vow, and now the mausoleum of the House of Savoy; its terrace, reached by a cable-railway, is a favourite resort for the enjoyment of a glorious view. Among the 'palaces' must be noticed the royal palace, designed by Castellamonte, rather poor in outward appearance; the Carignano Palace, an odd building, by Guarini; the town-hall, designed by Lanfranchi; the university, with 210 professors and lecturers and over 2000 students, a library of 225,000 volumes and 2000 MSS.; the Accademia delle Scienze (once the Jesuit college), by Guarini; the Seminary; the Hospital of San Giovanni. There are of course innumerable schools or seminaries, military and technical colleges, and museums. The private palaces are numerous and vast, but not in a noble style of architecture. The number of statues is exceptionally great, and many of them are fine. Among famous natives were Gioberti, Cesare Balbo, Cavour, Marochetti, D'Azeglio, and the French mathematician Lagrange. The manufactures of Turin consist of cotton, woollen, and silk fabrics, carpets, velvet hats, paper, iron, pottery, leather, gloves, bijouterie, furniture, wax matches, tobacco, and liqueurs. Pop. (1700) 40,000; (1800) 42,000; (1881) 233,134; (1895) 345,000. Turin was originally inhabited by the Taurini, a tribe of Ligurians. It is first mentioned in history in the time of Hannibal, by whom it was taken and sacked on his descent into Italy. Turin became a Roman colony under Augustus. On the fall of the empire it passed to the Lombards, and became the capital of one of the thirty Lombard duchies. Charlemagne made it the residence of the Duke of Susa, whose line ruled till 1060, when the House of Savoy succeeded it. The place acquired importance when Amadeus V. made it his capital and residence, and built a castle. It was taken by the French in 1536, and

was held by them until 1562. They once more took it in 1640; and in 1796 it was dismantled, and in 1800 united to the French Republic with the name of the department of the Po. In 1815 restored to the House of Savoy, it was the capital of Sardinia till 1860, and from 1860 to 1865 the capital of the kingdom of Italy. See works by Cibrario (1847), Promis (1869), and Borbonese (1884).

Turkestan, 'the country of the Turks,' called by the Persians *Turan* (see TURANIAN), is an extensive region of central Asia, stretching from the Caspian Sea eastward to beyond Lob-nor (110° E. long.), and from Siberia and Dzungaria southward to Persia, Afghanistan, and Tibet. Until recently it was supposed that the Bolor Tagh, a mountain-chain of the first magnitude, running north and south, divided it into two parts. English explorers entering Turkestan from the south, and Russians from the north, have shown that no such range exists. Its place is taken so far, however, by a lofty tableland, the Pamir (q.v.), which separates the rivers running eastward to the desert of Gobi from those which run to the Sea of Aral, and divides Turkestan into a western and an eastern portion.

WESTERN TURKESTAN, or simply Turkestan, consists of the great hollow plain of the Caspian and Aral Seas, which occupies its west and centre, and of the hilly and well-watered districts formed by the ramifications of the Tian-shan Mountains and Hindu Kush. The plain is composed of deserts of loose shifting sand, interspersed with oases where a subsoil of clay renders the formation of lakelets of rain possible; strips of fertile land along the banks of rivers, and occasional tracts clad with coarse thin grass; the eastern districts abound in valleys of remarkable fertility. The climate varies on the plains from extreme cold to burning heat; in the eastern highlands, although the cold is almost as intense in winter, the heat of summer is much less. The rivers of Turkestan are the Syr-Daria (see JAXARTES) and Amu-Daria (see OXUS); the Zarafshan, which rises on the south of the Asfera-tagh, and flows westward for 400 miles, terminating in a small salt lake or marsh near Bokhara; and the Murghab, which rises in the mountains of Ghur, and, after a west-north-west course of 450 miles, loses itself in a marsh beyond Merv. The vegetable products of the country are fruits, grain, cotton, flax, hemp, and tobacco. Silk is also produced in considerable amount. Coal has been recently discovered in Ferghana, and salt is abundant, large tracts of desert being strongly impregnated and even crusted over with it; and sal ammoniac is common. Agriculture and the breeding of the domestic animals are the occupations of the great mass of the population; but manufacturing industry is also considerable, the produce consisting of cotton, silk, linen, and woollen goods, shagreen (superior to that manufactured in Europe) and other kinds of leather, paper made of raw silk, carpets, and a few sabres, knives, and rifles.

Western Turkestan is divided into Russian Turkestan, including Khokand, now Ferghana, in the north and north-east, and the Tekke Turkoman country, with Merv, in the south-west; Khiva, under Russian influence, in the west; Bokhara, in the east and centre; and Afghan Turkestan, including Badakshan and Kunduz, Balkh, Maimaneh, Andkhui, and Sir-i-pul. The population comprises Uzbegs, the dominant race, Turkomans, Karakalpaks, Kirghiz, Sarts, Tajiks, Persians, Kiptchaks, and a few Arabs, Hindus, and Jews. Of these the Sarts and Tajiks, the original inhabitants of the cities, are of ancient Persian stock, and along with the Uzbegs, Hindus, and Jews form the settled population; the Persians are mostly descendants of slaves; the other races are largely nomad and predatory. For the ethnographic relations of the Turkomans, see TURKS. The prevalent religion is Mohammedanism, and most of the tribes are Sunnites; a few Shiites, Sûfîs, and Buddhists are also found. The number of inhabitants in Russian Turkestan amounts to 3,750,000, those of Khiva to 260,000, and of Bokhara to about 1,800,000. The area of Russian Turkestan is estimated at 410,000 sq. m., that of Khiva at 25,000 sq. m., and that of Bokhara at 90,000 sq. m. There are separate articles on the various countries and races.

Turkestan has played an important part in Asiatic history from the very earliest times. The contests between the Iranian and Turanian races occupy a prominent place in Firdausî's sketch of the semi-mythical traditions of Persia; and the earliest light of history shows us Bactriana (Balkh) and Sogdiana (Bokhara) as well cultivated and populous countries, generally attached to the Persian empire, and inhabited by Persians, to whom most of the prominent cities of Turkestan owe their origin. With Persia Turkestan passed into the hands of the Macedonians, who made Bactria an independent Greek kingdom, while the rest was in possession of the Parthians. Under the Sassanides the Persian boundary was again advanced to the Jaxartes; but the gradual gathering of Turkish tribes from the north-east on the right bank of that river led to a constant state of warfare on the frontier, which ultimately resulted in the occupation of *Mavera-ul-neher* ('the country between the rivers'—i.e. the Oxus and Jaxartes) and of Kharasm (Khiva) by the invaders. In the 8th century of the Christian era the Arabs possessed themselves of Turkestan, and during the decline of the califate it became the seat of various minor dynasties, as the Samani in Mavera-ul-neher, and the shahs of Kharasm. After a brief union with the Seljuk empire in Persia it was mostly united to Kharasm, and along with it overrun by the Mongol hordes under Genghis Khan (q.v.), on whose death it became one of the four divisions of his vast empire, and was allotted to his son Jagatai —after whom was named the Turkish dialect formerly spoken in Persia and all over the East. On the decline of Jagatai's dynasty Timûr (see TAMERLANE) rose to supreme authority in Turkestan, and in the course of a thirty-five years' reign made it the centre of an immense empire, which stretched from the Hellespont to the frontiers of China, and from Moscow to the Ganges. This period was the golden age of Turkestan; its powerful monarch was never weary of adorning its cities with the spoils of victory; colonies of learned men, skilled artisans, and all whose knowledge or abilities could be of service to his subjects, were either transferred to Turkestan from the countries he had conquered or induced by the most munificent offers to settle there; till under him and his more immediate successors Samarkand became a focus of enlightenment and learning. But after the death of Shah Rokh, Timûr's youngest son, the empire was split up into numerous fragments; and after a time a new dynasty snatched Persia from Timûr's family, while the Uzbegs, under Sheibanî Khan, drove them (1500) from the country north of the Amu-Daria; one of the expelled princes, Bâber Mirza, who had ruled in Ferghana (the south half of Khokand), subsequently founding the 'Great Mogul' empire in India. The Uzbeg empire generally included Badakhshan, Herat, and Meshed; but these were lost on its division, in 1658, into various independent khanates. Khiva was conquered by Nadir Shah in 1740, and Bokhara limited to the north bank of the Amu-Daria; but the Kirghiz of the Little Horde restored the independence of Khiva, which they ruled till 1792, when the

W & R. CHAMBERS LIMITED LONDON & EDINBURGH

present Uzbeg dynasty obtained the throne; and Shah Murad (1806–22) effectually gave back its former extensive sway to the Bokhariot sceptre. Khokand, after emancipating itself from the authority of Sheibani's successors, was incorporated with Bokhara, but afterwards united with the states of Eastern Turkestan. The recent history of Turkestan records a series of wars between Bokhara and Khokand, and Bokhara and Khiva, in which the Bokhariots had generally the advantage, owing to the aid of the Turkomans of the southern desert; the raids of the Turkomans along the northern frontier of Persia; the advance of the Afghans from the south-east; and the progress of Russian conquest from the north and west. Between the deserts of Turkestan and those of Persia lies a long and fertile tract running from the south-east of the Caspian to Herat, the 'key to India;' over it pass the great routes from western to eastern Asia.

North of it, chiefly in the deserts, dwell the Turkomans, long notorious as brigands and man-stealers, and till of late constantly engaged in marauding expeditions against the Northern Persians. The atrocities they committed far exceeded anything recorded of the African slave-trade. In 1860 the Persians marched against them, but were defeated in attempting to capture their entrenchments in a marsh, and 15,000 Persians and thirty guns were taken by the Turkomans. In 1865 a more successful expedition proceeded against Sarakhs. In 1849 the Afghans invaded the south-eastern part of Turkestan for the recovery of possessions they claimed north of the Hindu Kush. In 1850 they took Balkh and Khulm, and in 1859 Kunduz, Badakhshan at the same time submitting to pay a large tribute. Elsewhere the Russians bade fair soon to absorb all that remained of independent Turkestan; in 1864 they took Tashkend and Khokand. A struggle followed with Bokhara; on the 20th May 1866 was fought the important battle of Irjar, when the emir had to flee for his life. In 1868 the Russians, 8000 men, again advanced. The troops of the emir, 40,000 men, took to flight; and a treaty was concluded by which Bokhara transferred Samarkand to Russia. Early in 1873 an expedition was sent against Khiva, which fell in June of that year. A great part of Khivan territory north of the Amu-Daria was ceded to the conquerors; and after a fierce struggle in 1875 and 1876 with the warlike inhabitants of Khokand, Russia formally annexed the whole. In 1879 the Russians unsuccessfully attacked the Akhal Tekke Turkomans living on the southern edge of the Kara Kum desert, between the Caspian and Merv; but in 1880–81, under Skobeleff, they completely subjected the Tekkes, and Merv became Russian. In 1885 a long talked of commission, English and Russian, was appointed to delimit the frontier in dispute between Afghanistan and Turkestan, now Russian, especially in the steppe region between Merv and Herat; the Oxus being accepted as frontier farther east. After the English Commission was on the ground very serious diplomatic difficulties arose, threatening to issue in war between England and Russia, and a battle took place between Russians and the Afghans at Penjdeh. Ultimately a frontier line was agreed on, which left Penjdeh and Pul-i-Khatun to Russia, and Maruchak and Zulfikar to Afghanistan (q.v.). *Russian Turkestan* had in 1895 an area of over 410,000 sq. m. and a population of near 3,750,000, being divided into the provinces of Zarafshan, Semiretchinsk, Syr-Daria, Russian Kuldja, Amu-Daria, Ferghana. A railway 1000 miles long, from Krasnovodsk on the eastern shore of the Caspian Sea to Samarkand, connects this outlying province of Russia with the mother-country, and has wrought a great change in the economical conditions of Turkestan.

See the present writer's *Bokhara* (1873); Schuyler's *Turkestan* (1877); Marvin's *Merv, Queen of the World* (1881); O'Donovan's *Merv Oasis* (1882); Curzon, *Russia in Central Asia* (1889).

EASTERN TURKESTAN, known formerly as *Chinese Turkestan*, *Little Bukharia*, and *Túrfan*, is bounded on the N. by the Tian-shan Mountains, on the W. by the Pamir tableland, and on the S. by the highlands of Tibet or Cashmere. Towards the east it sinks to the desert plain of the Gobi, round the western bay of which it forms a vast crescent-shaped oasis from 4000 to 5000 feet in elevation, drained by the tributaries of the Tarim. This river flows eastward into the desert and empties itself in the Lob-nor, after a course of 1500 miles. The Lob-nor, a lake or rather series of lakes and marshes, was first visited by Colonel Prejevalsky in 1877. The region around it is very desolate and unattractive. Canals ramify the country, sometimes crossing one another at three levels. But large areas are very unproductive; and though there are numerous villages and towns, some of them large, the population of the country as a whole—probably some 600,000—is but thin. The country produces gold and abundance of silk; and the inhabitants are skilful in making gold and silver stuffs, carpets, and linen, cotton, and silk goods. The political capital is Kashgar, the seat of a Russian consul; the commercial capital, Yarkand. Kuldja, taken by the Russians from the rebels against Chinese authority in 1871, was retained by Russia in spite of Chinese protests. In 1881, however, Chinese persistence carried the point, and Kuldja was restored to China. Since the re-conquest of the country by China anarchy has given way to public security, and trade is now flourishing. The inhabitants speak Turkish, but there are also Tajiks of Persian descent. Little is known of Eastern Turkestan previous to its conquest by Genghis Khan; but after the decay of his empire into petty states, among which are Kashgar, Yarkand, Aksu, and Khoten, the chiefs of these were constantly quarrelling with each other, till several of the leaders, with the Yarkand prince at their head, invited the Chinese to take possession of the country, and in 1758 it became a province of China. In 1864, however, a mutiny among the Chinese troops induced the dispossessed native chiefs to stir up a Mohammedan insurrection. They invited a Khokand prince, Buzurg Khan, to assume the government; and he, through his lieutenant Yakoob Beg, dispersed the Chinese garrison. But the lieutenant soon superseded him, and became sole Emir under the title of Atalik Ghazi. He possessed civil as well as military capacity, and raised the country to a state of considerable prosperity. From 1869 he successfully resisted the encroachments of Russia, but in 1876 the Chinese again advanced, defeated him, and retook their old province in 1877.

See Forsyth's *Report* (1875); *From Kulja, across the Tian Shan*, by Prejevalsky (1879); Boulger's *Yakoob Beg* (1878); Lansdell's *Chinese Central Asia* (1893); and the reports given by Ney Elias, Carey, and Younghusband.

Turkey, or the OTTOMAN EMPIRE, comprises the wide but heterogeneous territories really or nominally subject to the Osmânlî sultan, in Europe, Asia, and Africa. These territories, which once extended from the Danube to the Cataracts of the Nile, and from the Euphrates to the borders of Morocco, have been considerably reduced in the 19th century by the aggression of France in Algiers and Tunis, by the influence of England in making Egypt practically independent of its titular sovereign the sultan, and by the treaty arrangements which followed the Russo-Turkish war of 1877. Algiers has belonged to

Copyright 1892 in U.S. by J. B. Lippincott Company.

France since 1830; Tunis has been practically a French province since 1881; Egypt, though still tributary to 'the Porte' or Turkish government, has since 1882 been in no danger of ever reverting to its former condition of a Turkish province; whilst by the decisions of the Berlin Congress of 1878 the tributary states of Roumania and Servia became independent kingdoms, and obtained an increase of territory in the Dobrudja and about the Morava respectively; the independence of Montenegro was recognised, and its borders enlarged to include Dulcigno and Antivari; Austria-Hungary took Bosnia and Herzegovina under its protection; Greece was to push her frontier northward and absorb Thessaly (q.v.); and in the very heart of European Turkey Bulgaria was cut off and created a tributary principality, to which Eastern Roumelia was added in 1885, under the guaranty of the Great Powers. The result of these limitations is that Turkey in Europe consists merely of a strip of territory south of the Balkans, stretching across from the Black Sea to the Adriatic, and including ancient Thrace, Macedon, Epirus, and Illyria; Turkey in Africa is practically reduced to the regency of Tripoli; while Turkey in Asia still spreads from the Euxine to the Red Sea and Persian Gulf, intact, save for the cession of Kars and Batoum to Russia after the war in 1877, and the transference of the administration of Cyprus to England. The area and population of the Turkish empire may be approximately tabulated as follows; it being premised that statistics in Turkey are not precise:

	Sq. Miles.	Pop.
Immediate Possessions—		
In Europe	65,000	4,500,000
In Asia	730,000	16,000,000
In Africa (Tripoli)	400,000	1,000,000
	1,195,000	21,500,000
Tributary States—		
Bulgaria (with Eastern Roumelia)	38,000	3,300,000
Bosnia and Herzegovina (under Austria)	24,000	1,500,000
Cyprus (under Britain)	3,700	210,000
Egypt (under Britain)	400,000	9,800,000
	465,700	14,810,000
Total	1,660,700	36,310,000

These figures do not include the population of the Soudan and the Upper Nile basin restored to Egypt in 1898. Crete ceased to be Turkish in 1898. By vilâyets or provinces, the population of European Turkey is estimated as follows: Constantinople, 873,565; Adrianople, 778,603; Salonica, 966,308; Monastir, 497,930; Janina, 513,216; Scutari (Albania), 102,819; Kossovo, 561,282; total, 4,293,723, of which 2,329,000 were males. The most populous vilâyets of Asiatic Turkey are those of Smyrna (Aidîn) and Trebizond, each with over a million inhabitants. Of cities in European Turkey Adrianople has 100,000 inhabitants, and Salonica 60,000; whilst in Asia Damascus has 200,000, Baghdad 180,000, and Aleppo 120,000.

Turkey in Europe, generally undulating, is traversed by a mountain-system which has its origin in the Alps, enters Turkey at the north-west corner, and runs nearly parallel to the coast, under the names of the Dinaric Alps and Mount Pindus, as far as the Greek frontier. This range sends numerous offshoots east and west; the great eastern offshoot being the Balkan (q.v.) range, with its numerous branches to north and south. The Balkans are no longer included in Turkey proper, and the highest peaks of modern European Turkey are now in the Despoto Dagh or Rhodope range (7474 feet) and the Skar Dagh (10,000 feet) on the Albanian frontier. The rivers of Turkey are chiefly, to the north of the Balkans, the Morava and numerous other tributaries of the Danube; and to the south, the Maritza, Karasu, Struma, and Vardar, which flow into the Ægean, and drain Roumelia (Macedon and Thrace); the Narenta, Drin, and Voyutza fall into the Adriatic. On the high lands the cold is excessive in winter, owing to the north-east winds which blow from the bleak and icy steppes of southern Russia; and the heat of summer is almost insupportable in the western valleys. Violent climatic change is, on the whole, the rule in European Turkey; but those districts which are sheltered from the cold winds, as the Albanian valleys and parts of Roumelia, enjoy a comparatively equable temperature. The soil is for the most part very fertile; but owing to oppressive taxation little progress has been made in the art of agriculture, and the most primitive implements are in common use. The cultivated products include most of those usual in central and southern Europe—maize, rice, rye, barley, millet, besides tobacco, madder, and cotton. The mineral products are iron in abundance, argentiferous lead ore, copper, sulphur, salt, alum, and a little gold; some deposits of coal have been found, but none are worked. Sheep-breeding is largely carried on. The wild animals are the wild boar, bear, wolf, wild dog, civet, chamois, wild ox, and those others which are generally distributed in Europe. The lion formerly roamed the Thessalian mountains.

Turkey in Asia is still more mountainous. The two almost parallel ranges, Taurus and Anti-Taurus, which are the basis of its mountain-system, cover almost the whole of the peninsula of Asia Minor (q.v.) or Anatolia with their ramifications and offshoots, forming the surface into elevated plateaus, deep valleys, and enclosed plains. From the Taurus chain the Lebanon range proceeds southwards parallel to the coast of Syria, and, diminishing in elevation in Palestine, terminates on the Red Sea coast at Sinai. The Euphrates, Tigris, Orontes, and Kizil-Ermak are the chief rivers. On the whole, Turkey in Asia is ill supplied with water; and though the mountain-slopes afford abundance of excellent pasture, the plains, and many of the valleys, especially those of the Euphrates, Tigris, and Jordan, are reduced by the parching droughts of summer to the condition of sandy deserts. In ancient times these now desert districts were preserved in a state of fertility by artificial irrigation; but during the six centuries of almost constant war which convulsed this once fair region the canals were neglected, and have, ever since the rise of the Osmânlî power, remained in an unserviceable condition. Nevertheless the fertile portions produce abundance of wheat, barley, rice, maize, tobacco, hemp, flax, and cotton; the cedar, cypress, and evergreen oak flourish on the mountain-slopes, the sycamore and mulberry on the lower hills, and the olive, fig, citron, orange, pomegranate, and vine on the low lands. The mineral products are iron, copper, lead, alum, silver, rock-salt, coal (in Syria), and limestone. The fauna includes the lion (east of the Euphrates), the hyæna, lynx, panther, leopard, buffalo, wild boar, wild ass, bear, wolf, jackal, jerboa, &c.; and the camel and dromedary must be added to the ordinary list of domestic animals.

Turkey in Africa is described at Tripoli, Tunis, and Egypt, of which the first alone can properly be termed a direct Turkish possession.

Industry, Manufactures, and Trade.—Notwithstanding the primitive state of agriculture in Turkey, the extreme fertility of the soil makes ample amends for this defect. The exports include cereals, tobacco, raisins, dried figs, olive-oil, silk, wool, mohair, red cloth, dressed goat-skins, excellent morocco, saddlery, swords of superior quality, shawls, carpets, dyestuffs, embroidery, essential oils, attar of roses, opium, plum-brandy, meerschaum clay, honey, sponges, drugs, madder, gall-

nuts, various gums and resins, and excellent wines. The imports are manufactured goods of all kinds, glass, pottery, arms, paper, cutlery, steel, amber, and especially cotton goods. In 1890–95 the annual value of exports was about £14,000,000, and of imports £22,000,000: Great Britain imports to a value of £5,000,000, and exports to Turkey about as much. The countries trading with Turkey are, in order of importance, Great Britain, France, Austria, Russia, Italy, Greece, Persia, &c.; and the principal ports are Constantinople and Smyrna. In 1895 Turkey had 786 sailing-vessels of 151,800 tons (mostly coasters), and 78 steamers of 37,843 tons. In 1894–95 there entered and cleared at Turkish ports 192,269 vessels of 37,618,549 tons. There are 930 miles of railway open in European Turkey, and in Asiatic Turkey 970.

Races.—The population consists of a singular mixture of races. Turks, Greeks, Slavs, and Albanians are largely represented, besides Armenians, Jews, Circassians, and Frank residents. In European Turkey the Turks are about 2,000,000, the Greeks and Bulgarians 1,300,000, the Albanians 1,500,000. In Asia the Turks are about 7,000,000, the Kurds 1,000,000, the Greeks 1,000,000, the Armenians over 2,000,000; while the rest is made up of Syrians, Arabs, Jews, Druses, Franks, Gypsies, Tartars, Circassians, &c. Of these the Greeks and Armenians are principally traders; the Turks, Slavs, and Albanians are the chief agriculturists in Europe, and the Turks, Armenians, and Syrians in Asia. Of the 15,000,000 Mohammedans, 12,000,000 are in Asiatic Turkey.

Administration, Religion, and Education.—The government of Turkey has always been a pure despotism; for the constitution promulgated in 1876 and revoked in 1878 was merely nominal. The sultan (also called Pâdishâh, Grand Signior, Khân, Hunkiâr) is represented in all matters spiritual by the Grand Mufti or Sheykh-el-Islâm, who enjoys considerable influence as head of the Ulema (q.v.), and in temporal affairs by the Grand Vezîr (or Sadr-A'zam), under whom are the members of the cabinet or divan, including the president of the council, the ministers of foreign affairs, of war, of the navy, of artillery, of the interior, of justice, of finance, and the other heads of departments of the administration. Governmental crises are frequent, especially of late; and palace intrigues have always been a powerful factor in Turkish politics. The governors of the *vilâyets*, or provinces, who are appointed by the sultan, are styled *vâlis*; each vilâyet is divided into *sanjaks*, or *livas*, ruled by inferior officers; and each liva is subdivided into districts and communes. The provincial governors have no longer the power of life and death; and their freedom to practise extortion on those under their rule has been greatly restricted; but so long as they are ill-paid and hold a precarious tenure of an expensive office their administration is sure to remain venal and corrupt. The established religion is Islâm or Mohammedanism, but most other creeds are recognised and tolerated; and since 1844, thanks to the strenuous efforts of Lord Stratford de Redcliffe (q.v.), a Mohammedan has been free to change his religion without becoming liable, as before, to capital punishment. The Protestant religion was for the first time officially recognised in Turkey in 1845. Education was long neglected, but in 1847 a new system was introduced, and since then schools for elementary instruction have been established throughout Turkey, and middle schools for higher education, and colleges for the teaching of medicine, agriculture, naval and military science, &c.; whilst among the Christians education has notably improved. Many wealthy Turks send their sons to France or Britain to be educated, with somewhat doubtful results.

Revenue and Debt.—Long before the Russo-Turkish war of 1877 the Turkish exchequer was evidently on the brink of insolvency, as was manifested by the violent expedients proposed for escaping from part of its liabilities. In 1875 a decree reduced the interest payable on the debt to one-half; and by another decree in October 1876 the empire was declared bankrupt; but an unsatisfactory arrangement was come to with its creditors. The enormous expenditure of the war, and the loss of valuable provinces, added to the utter disorganisation of Turkish finances. In 1875–76 the revenue was estimated at £19,106,352, and the expenditure at £23,143,276. In 1878–79 the revenue was guessed at £14,000,000; expenditure (with part of the war expenses), £50,000,000. At the end of 1880 the *Times* reckoned the available annual revenue at £9,450,000, and the budget expenditure was nearly £12,000,000. In 1897–98 the revenue was estimated to cover an expenditure of a little over £18,000,000. Between 1854 and 1896 some twenty loans had been contracted. In 1896 the debt on account of various loans was £131,228,464, without counting £27,000,000 outstanding of the £32,000,000 claimed by Russia as war indemnity. In 1897–98 the budget showed a small surplus with a revenue of £16,700,000, but did not provide for the large and regularly recurring extraordinary expenditure; the actual deficit being of late years over £1,000,000 annually.

Navy and Army.—The navy consists of about twenty armour-clad vessels, fifty smaller steamers, and forty torpedo boats. In the course of the war with Russia Turkey contrived to put on a war footing no less than 752,000 men, including reserve and irregular troops. At the end of the war the disorganised remnant amounted to about 120,000 men. Extraordinary efforts have been made to keep up the army: in 1880, when it had seemed necessary to call out the reserves, the empire actually had an army of 300,000 men, well armed and fairly equipped. According to the reorganisation in progress at that time the military forces of the Ottoman empire consist of the active army (*nizam*), twelve army corps of landwehr (*redif*), and a landsturm (*mustafiz*). The first numbered in 1897 about 200,000, forming 278 battalions of infantry, 192 squadrons of cavalry, 159 field batteries, 30 mounted batteries, besides engineers and gunners at the forts. In case of war the total force of all arms could be raised to 750,000.

Clark (New York, 1883), Sutherland Menzies (3d ed. 1883), Rudler and Chisholm (1885), E. de Laveleye (Eng. trans. 1887), Lucy Garnett (1891–92), and D. Georgiades (*La Turquie actuelle*, 1892); also, for Asiatic Turkey, by Geary (1878), Davis (1879), W. M. Ramsay (1890), and Cuinet (Paris, 1891), and other works cited at SYRIA, BULGARIA, &c.

History.—The Osmânlîs or Ottoman Turks trace their descent from a small clan of the Oghuz, who were pressed forward from their old camping-ground in Khorâsân by the advance of the Mongols, and, coming to Armenia early in the 13th century, were fortunate enough to assist the Seljûk sultan of Iconium at a critical moment in his resistance to the Mongol avalanche, for which service they were rewarded with lands in Asia Minor. Ertughrul, the leader of the 400 horsemen who had thus come to the rescue of the Seljûks at the battle of Angora, was allowed to pasture his flocks and pitch his tents in the province anciently known as Phrygia Epictetus (now to be called Sultanöni), on the borders of the Byzantine province of Bithynia, and made the city of Sugut (Thebasion) his headquarters. Sugut was the birthplace of the Ottoman empire: thirty-five sultans have

followed Ertughrul in the male line without a break, and, after six centuries, his descendant still stands lord over wide provinces and peoples of various races and languages. At Sugut in 1258 was born Osmân (or Othmân), from whom his followers took the name Osmânlîs, which Europeans have corrupted into Ottoman. At the beginning of the 14th century the Seljûk kingdom split up into ten states, one of which, the Ottoman province of Sultanöni, gradually absorbed the rest. Osmân, who reigned from 1301 to 1326, waged a guerilla war upon his Greek neighbours, and captured many fortresses, pushed his conquests to the verge of the Hellespont, and took Brûsa the capital of Bithynia. His son, Orkhân (1326–59), reduced Nicæa (1330) and absorbed one of the ten Seljûkian states, the ancient Mysia (1336). Thus in two generations the little clan of nomads had possessed themselves of the whole north-west corner of Asia Minor, and obtained the command of the eastern shores of the Bosporus and Propontis. Then for twenty years peace reigned between the Greeks and Ottomans, and Orkhân and his brother, 'Alâ-ed-dîn, devoted themselves to the task of organising the state, forming a standing army (the first in modern times) out of the material supplied by the mixed population of their dominions, and inaugurating the famous corps of Janizaries (*Yeni cheri*, 'new soldiery') which for centuries constituted the flower of the Ottoman army. This celebrated force was recruited entirely from Christian children, who were educated as Moslems, and carefully trained and disciplined. Deprived of all ties of kinship, but encouraged by every inducement to zeal and devotedness, this military brotherhood became the most devoted as well as the most fanatical instrument of imperial ambition which has ever been devised, until they abused their power so wantonly that they had to be summarily exterminated in 1826 by Mahmûd II. (see JANIZARIES). Besides this military organisation, the civil administration was skilfully ordered, and the government of the Turks contrasted favourably with the corrupt and nerveless rule of their Byzantine neighbours, who, for their part, humbled themselves by abject concessions, delivered up their imperial princesses to the harems of the Osmânlîs, and allowed them to levy blackmail in their raids for Christian slaves.

The Turks could not look across the Bosporus upon the domes of Constantinople without longing for its possession. In 1358 they occupied Gallipoli on the European side of the Dardanelles, and a few years later Adrianople and Philippopolis fell before the onslaught of the new sultan, Murâd I.—the first 'Amurath' of European writers (1359–89)—who in 1364 decisively routed the united Servians, Hungarians, and Vlachs, on the banks of the Maritza. In 1375 he took Nissa, the birthplace of Constantine, and received the homage of the despot of Servia and the kral of Bulgaria. The Balkan Peninsula was now a Turkish possession, with the exception of the territory immediately surrounding Constantinople. Twice again the Christians endeavoured to turn back the wave of Moslem conquest. Lazarus the Servian in 1389 led a great army against the Turks, but was severely defeated in the battle of Kosovo, which was, however, followed by the assassination of Murâd I. by the Servian Milosh Kobilovich. His successor, Bayezîd I. (Bajazet, 1389–1402), surnamed *Yilderim*, or 'Thunderbolt,' by reason of his impetuous valour, annexed the remainder of the Seljûkian states of Asia Minor, and meeting a vast army of the Christians of all Europe, who had vowed a crusade against the Turks in 1394, cut them to pieces at Nicopolis. Ten thousand prisoners were butchered in heaps before the eyes of the pitiless sultan from daybreak till four in the afternoon. The invasion of Timûr (Tamerlane) interrupted the victorious course of the Ottoman arms, then, apparently, on the eve of the capture of Constantinople. The Tartar hordes overran Asia Minor, and totally defeated near Angora, in 1402, the army which Bayezîd had vaingloriously brought into the field. The sultan was taken prisoner, and died in captivity eight months later. Timûr reinstated the Seljûk princes; the Christians of Europe were free; and the history of the Ottoman empire seemed to have suddenly come to an end. Its extraordinary revival was due partly to the physical and moral superiority of the Osmânlîs over their neighbours in Europe and Asia, partly to the enduring strength of their civil and military organisation, which contrasted strikingly with the demoralised condition of the Greek empire, and largely to the wisdom and prudence of Mohammed I., 'the Restorer,' also called *Chelebi*, or 'the Gentleman' (1402–13). By sound statesmanship, firm yet conciliatory, this able sovereign recovered all that had been lost in the Tartar convulsion. His foresight was displayed in an ominous step: he transferred the capital of his dominions from Asia to Europe, from Brûsa to Adrianople. The interval of prudent consolidation of the empire was followed by another period of aggression. His son and successor, Murâd II. (1421–51), was as wise as his father, but his lines were fallen in fighting times. A terrible foe had arisen in the person of Hunyady, the 'White Knight' of Wallachia (an illegitimate son of Sigismund, king of Hungary), who for twenty years was a cruel scourge of the Balkan provinces, and who inflicted grievous losses upon the Ottomans at Hermannstadt (1442), Vasag, and Nissa (1443). A ten years' peace was concluded by the treaty of Szegedin, by which Servia regained her independence and Wallachia was annexed to Hungary. Murâd was now weary of war and kingship, and abdicated in favour of his son Mohammed; whereupon the Christians, in violation of their oath and treaty, invaded the Ottoman dominions, led by Hunyady, and sanctioned by the presence of Frankish crusaders under the command of Cardinal Julian. This flagrant breach of faith drew Murâd from his voluntary retirement. He collected 40,000 veterans, induced the Genoese to ferry them across the Bosporus, and, displaying the violated treaty on a lance as his standard, fell upon the Christians at Varna (10th November 1444), and won a decisive victory. The king of Poland and the cardinal were among the slain. Henceforth, for more than two centuries, the Turks had nothing to fear from European invasions until the rise of the Russian power created a new danger.

Murâd's long reign of thirty years was soiled by no breath of dishonour; his character was as noble as it was commanding. His successor, Mohammed II., 'the Conqueror' (1451–81), reigned also thirty years, but his rule was marked by violence and treachery, and the new sultan was as cruel and unscrupulous as he was conspicuously able. The great event of his reign was the siege and capture of Constantinople (29th May 1453), whereby the miserable remnant of the Byzantine empire was extinguished for ever, and the Turks obtained that commanding position on the Bosporus which has contributed more than anything else, directly and indirectly, to the maintenance of their empire. In the north the progress of Ottoman conquest was arrested by the heroic defence of Belgrade in 1456 by Hunyady and John Capistran, and by the subsequent resistance of Hunyady's successor, Matthias Corvinus. In the west Scanderbeg for a while kept the Turks back in Albania. But towards the end of the reign they were making substantial progress. They had conquered the Crimea (1475), their arms

were menacing Venice (1477), they had annexed Greece and most of the Ægean islands, made their first attempt upon the stronghold of the Knights of St John at Rhodes, and even planted their foot on Italian soil by the capture of Otranto in 1480. In the following year, whilst fitting out a vast expedition, Mohammed the Conqueror died, amid the thanksgivings of Europe. The long reign of his son, Bayezîd II. (1481–1512), was marked by no great conquests, and the chief interest centres in the adventures and fate of his unlucky brother, Prince Jem. With Bayezîd's son, Selîm I., 'the Grim' (1512–20), however, a new epoch of transcendent glory began to dawn. In his brief eight years of sovereignty he drove back Isma'îl, the powerful shah of Persia, after a furious battle at Chaldiran, and incorporated Kurdistân and Diârbekr in the Turkish empire, annexed Syria, and wrenched Egypt from the hands of the valiant Mamlûks (1517), who had possessed it almost since the days of Saladin. With Egypt came the Hijaz and its Holy Cities, while from the last 'Abbâsy Caliph of Cairo Selîm received relics of the Prophet Mohammed and the inheritance of the title of Caliph, by which his successors to the present day signify their claim to the homage of all orthodox Mohammedans. Selîm, however, did but usher in the great epoch (1520–66) of his son, Suleymân the Magnificent, though without the father's warlike genius it may well be doubted whether the son would have been able to attain to the glory with which his name is associated. His epoch is famous for many triumphs both by land and sea. He conquered Belgrade, and, after a heroic siege, reduced (1522) the rocky stronghold of the Knights of St John at Rhodes, who were allowed to evacuate the island upon honourable terms. In 1526 the sultan marched north, at the head of an army of 100,000 men and 300 guns, and utterly crushed the Hungarians on the field of Mohács, and slew their king, Louis II., and 20,000 of his followers. Buda and Pesth fell, and Hungary became an Ottoman province for a century and a half. Quarrels over the now nominal kingship of Hungary drew Suleymân northward again in 1529 to support his nominee, Zápolya, and after enforcing his authority, and laying the country waste, the sultan proceeded to push forward to Vienna. Austria was incapable of meeting him in the field, but Vienna heroically withstood a furious siege for eighteen days. The Turks abandoned their design for the moment, and the sultan retreated in disgust to Constantinople, and eventually made a truce with Charles V. in 1533. Eight years later, however, Suleymân led his ninth campaign in the north, and compelled the emperor to sue for peace, the Archduke Ferdinand agreeing to pay a heavy tribute to his lord the sultan, who retained the whole of Hungary and Transylvania. War and sieges, however, continued to the death of Suleymân in 1566. The sultan's claim to be called 'the Great' rests not merely upon his undoubted wisdom and ability, and the splendid series of his successes, but upon the fact that he maintained and improved his grand position in an age of surpassing greatness—the age of Charles V., Francis I., Elizabeth, and Leo X.; of Columbus, Cortes, and Raleigh. In the great days of Charles he dared to annex Hungary and lay siege to Vienna; and in the epoch of great navies and admirals, of Doria and Drake, he swept the seas to the coasts of Spain, and his admirals Barbarossa, Pialé, and Dragut created panic fear along all the shores of the Mediterranean, drove the Spaniard out of the Barbary States, and defeated pope, emperor, and doge together at the great sea-fight off Prevesa in 1538. But just as Vienna had resisted him in 1529, so the Knights of Malta withstood a powerful Ottoman armament in 1565, and 25,000 Turks fell in the fruitless siege.

Selîm II. (1566–74), a degraded sot, owed whatever renown belongs to his reign to the ability of his father's old statesmen and generals. Sinân Pasha subdued Arabia in 1570, and Cyprus was conquered in 1571; but these successes were outweighed by the utter defeat of the Turkish fleet by Don John of Austria, 7th October 1571, off Lepanto, which first broke the spell of Turkish prestige at sea. During this reign occurred the first collision of the Turks with the Russians. The connection of the Don and Volga by a canal was a project which, by allowing the passage of ships from the Black Sea into the Caspian, would obviously serve both military and commercial purposes; and accordingly 5000 workmen were despatched to cut the canal, and an army of 80,000 men to aid and protect them. The possession of Astrakhan formed part of the programme; but the attack upon this town brought upon the Turks the vengeance of the Russians, a people till then unknown in southern Europe; three fourths of the Turkish army was lost in the expedition, and the project was abandoned. On the other hand, Tunis was taken from the Spaniards in 1574. The reign of Selîm's son, Murâd III. (1574–95), is chiefly notable for the reception of the first English embassy to Turkey in 1589, which was sent with the object of concluding an alliance against Philip II. of Spain. War with Persia ended in the extension of the Turkish frontier, so as to include Georgia, and a fresh contest with Austria was marked at first by success, but afterwards by severe reverses, until in the reign of the next sultan, Mohammed III. (1595–1603), the tide of failure was turned by a signal victory over the Austrians and Transylvanians on the plain of the Keresztes (1596). The victory, however, was not followed up; and the prestige of the Ottoman arms continued to wane. The Turks were no longer the terror of Europe. Of the next four sultans, Ahmed I. (1603–17), Mustafa I. (1617–18, 1622–23), Osmân II. (1618–22), and Murâd IV. (1623–40), the last alone resembled his great forefathers, and by his campaign against Persia and conquest of Baghdâd (1638) vindicated his title to be the last of the fighting sultans of Turkey. The death of Murâd IV. was the signal for fresh troubles. Mustafa, the grand vezîr (vizier), a man of great ability and integrity, indeed, continued to direct the helm of government under Ibrahîm (1640–48), took from the Poles their conquests, and in a war with the Venetians (1645) obtained Candia and almost all the Venetian strongholds in the Ægean Sea, though with the loss of some towns in Dalmatia. But the empire was distracted by military factions and seraglio intrigues, and the new sultan, Mohammed IV. (1648–87), began his reign under the most unfavourable auspices. He was only seven years of age, and the whole power was vested in the Janizaries and their partisans, who used it to accomplish their own ends. Fortunately for Turkey, in 1656 Mohammed Köprili, an old Albanian of seventy, but possessed of an iron will, was appointed vezîr with practically absolute powers; and the extraordinary talents of this man proved to be the salvation of Turkey at this critical juncture. He had 36,000 persons executed in his five years of office, and then died with a good conscience. He was succeeded (1661) in office by his son, Köprili-zâda Ahmed, a man of even greater ability, and under his guidance the central administration recovered its control over even the most distant provinces; a formidable war with Austria, though unsuccessful and marked by a severe defeat at St Gothard on the Raab (1664), was concluded by a peace advantageous to the Turks; Crete

was finally subdued, and Podolia defended from the Poles; though these advantages were somewhat overshadowed by the crushing defeats administered at Choczim and Lemberg in 1673 and 1675 by John Sobieski (q.v.). The next vezir, Kara Mustafa, who was not a Köprili, relied too much upon the success of his predecessors. He invaded Austria at the head of 400,000 men in 1682, and, undeterred by the great Suleymân's discomfiture, had the audacity to lay siege to Vienna. But the second siege ended even more disastrously than the first. The grand vezîr's army was totally routed by Duke Charles of Lorraine and John Sobieski, king of Poland. The Austrians followed up this victory by repossessing themselves of Hungary (1686), inflicting upon the Turks a bloody defeat at Mohácz, whilst Louis of Baden entered Bosnia, and the Venetians seized the opportunity to conquer the Peloponnesus and bombard the Acropolis of Athens. The fortunate appointment of a third Köprili, Mustafa, as grand vezîr by Suleymân II. (1687–91), was the means of restoring to some extent the faded honour of the Turkish arms; but with his death (1691) fortune deserted the Turks. Meanwhile Sultans Ahmed II. (1691–95) and Mustafa II. (1695–1703) enjoyed their state in their palace on the Golden Horn. The latter indeed tried to emulate his warlike ancestors; but the Austrians under Prince Eugene effectually cooled his zeal at the disastrous battle of Zenta (1697). The treaties of Carlovitz (1699) and that of Passarovitz (1718) mark the end of Turkish rule in Hungary, Transylvania, and Podolia, and brought the frontier to very nearly the same line as it occupied before the treaty of Berlin in 1878.

Ahmed III. (1703–30) was noble enough to refuse to deliver up the refugee king Charles XII. of Sweden to the Russians after the battle of Pultowa, and the result was an invasion of Moldavia in 1711 by the Czar Peter, who, however, soon found himself in great straits, from which he was rescued by the genius and bribes of his queen, afterwards Catharine I. But for her, Peter and his army would have become Turkish prisoners. The recovery of the Morea by the vezîr Damad 'Aly (1715) from the Venetians, and the loss of Belgrade and parts of Servia and Wallachia, recovered during the reign of Mahmûd I. (1730–54), and the commencement of a long war with Persia (see NADIR SHAH) were other events of Ahmed's reign. In 1736 the career of Russian aggression recommenced with the seizing of Azov and Oczakov; but a scheme for the partition of Turkey between Austria and Russia was foiled by the continued series of disgraceful defeats inflicted upon the Austrian armies by the Turks. The Russians, on the other hand, were uniformly successful; but the czarina, desirous of peace, resigned her conquests in Moldavia, and concluded a treaty at Belgrade (1739). Osmân III. (1754–57) soon gave place to Mustafa III. (1757–73), under whom the empire enjoyed profound tranquillity; but after his death the Russians, in violation of the treaty of Belgrade, invaded Moldavia. The war with Russia continued during the succeeding reign of Abdul-Hamîd I. (1773–89); the fortresses on the Danube fell; and the main army of the Turks was totally defeated at Shumla. The campaign was ended July 1774, by the celebrated treaty of Kuchuk Kainarji. In defiance of its provisions the czarina in 1783 took possession of the Crimea and the whole country eastward to the Caspian. The sultan was compelled, by his indignant subjects, to take up arms in 1787. In 1788 Austria made another foolish attempt to arrange with Russia a partition of Turkey; but, as before, the Austrian forces were completely routed. The Russians, however, with their usual success, had overrun the northern provinces, taken all the principal fortresses, and captured or destroyed the Turkish fleet. The accession of Selîm III. (1789–1807) was inaugurated by renewed vigour in the prosecution of the war; but the Austrians had again joined the Russians. Belgrade surrendered to the Austrians, while the Russians took Bucharest, Bender, Akerman, and Ismail (see SUVÓROFF); but the critical aspect of affairs in western Europe made it advisable for Russia to terminate the war, and a treaty of peace was accordingly signed at Yassy, 9th January 1792. By this treaty the provisions of that of Kainarji were confirmed; the Dniester was made the boundary line, the cession of the Crimea and the Kuban was confirmed, and Belgrade was restored to the sultan. Numberless reforms were now projected for the better administration of the empire. The people were, however, hardly prepared for so many changes, and the sultan's projects cost him his throne and life. The occupation of Egypt by the French brought on a war between them and the Turks, in which the latter, by the aid of the British, were successful in regaining their lost territories. After the ephemeral reign of Mustafa IV. (1807–8), the able and energetic Mahmûd II. (1808–39) ascended the throne; and though his dominions were curtailed by the loss of Greece, which established its independence in 1828, and of the country between the Dniester and the Pruth, which by the treaty of Bucharest in 1812 was surrendered to Russia, and in spite too of a disastrous war with Russia in 1827–28, the reformation he effected in all departments of the administration checked the decline of the empire. Egypt, during his reign, attempted unsuccessfully to throw off the authority of the sultan (see EGYPT, Vol. IV. p. 242. His son, Abdul-Mejîd (1839–61), continued the reforms commenced in the previous reign (see STRATFORD DE REDCLIFFE); but the czar, thinking that the dissolution of the Ottoman empire was at hand, constantly tried to wring from the sultan some acknowledgment of a right of interference in the internal affairs of the country. It was an attempt of this sort to obtain the exclusive protectorate of the members of the Greek Church in Turkey, that brought on the Crimean War (q.v.) of 1853–55, in which the Turks were effectively supported by England, France, and Sardinia. The treaty of Paris (1856) restored to Turkey the command of both sides of the lower Danube, excluded the czar from his assumed protectorate over the Danubian principalities, and closed the Black Sea against all ships of war. The Porte, apparently adopted into the family of European nations, made proclamation in the Hatti-Humâyûn of 1856 of equal civil rights to all the races and creeds of the Turkish dominions. But a massacre of Christians in Lebanon and at Damascus provoked western intervention in 1860. Abdul-Mejîd, whose last years were disgraced by irrational profuseness of expenditure, was succeeded by his brother Abdul-Azîz (1861–75). Meanwhile the nominally subject peoples of Moldavia and Wallachia ventured to unite themselves into the one state of Roumania; and in 1866 the empire, becoming more and more enfeebled through its corrupt administration, had to look on while the Roumanians expelled their ruler, and, in the hope of securing western support, chose Prince Charles of Hohenzollern to be hereditary prince of the united principalities. The rebellion of Crete in 1866 threatened a severe blow to the integrity of the empire, but was ultimately suppressed in 1868, in spite of active help from Greece. Servia, already autonomous within her own frontiers, demanded the removal of the Turkish garrisons still maintained in certain Servian fortresses; and in 1867 Turkey saw herself compelled to make this

concession. In the same year the sultan distinguished the pasha of Egypt by granting to him the unique title of Khedive (q.v.). The vassal king drew down the wrath of his suzerain in 1870 by negotiating directly with foreign courts, and was compelled to give formal tokens of vassalage. But later concessions have made the Khedive virtually independent of Turkey. The Russian government took the opportunity of war between Germany and France to declare, in 1871, that it felt itself no longer bound by that provision of the Paris treaty which forbade Russia to have a fleet in the Black Sea; and a London conference sanctioned this stroke of Russian diplomacy. Between 1854 and 1871 the Turkish debt had increased by more than £116,000,000; and in 1875 the Porte was driven to partial repudiation of its debts. An insurrection in Herzegovina in the later part of 1874 marked the beginning of a very eventful and critical period in the history of Turkey. The insurrection smouldered on through 1875 and part of 1876, and excited all the neighbouring Slavonic peoples. A threatened revolt in Bulgaria in May 1875 was repressed with much bloodshed; and the merciless cruelty displayed by the Bashi-bazouks or Turkish irregulars alienated foreign sympathy from the government. In May Abdul-Azîz was deposed; and his nephew, Murâd V., son of Abdul-Mejîd, who succeeded him, was destined in turn to make way for his brother, Abdul-Hamîd II., in August of the same year. In June Servia declared war, and Montenegro followed her example. Before the end of the year the Servians were utterly defeated, in spite of the help of many Russian volunteers; but the state of affairs in the Turkish provinces seemed to call for a conference of the great powers at Constantinople. The proposals then made for the better government of the Christian subjects of Turkey were rejected by the Turkish authorities, who had, during the conference, taken the extraordinary step of bestowing a purely nominal parliamentary constitution on the Ottoman empire. Russia took upon herself to enforce on Turkey the suggestions of the conference, and on 24th April 1877 declared war. Both in Armenia and Bulgaria the opening of the campaign was favourable to Russian arms, but later the Turks rallied and seriously checked the triumphant progress of the invaders. Even after the Russian forces had been greatly augmented the Turks resisted energetically. Kars, besieged for several months, resisted till the middle of November; Erzerûm did not surrender until after the armistice had been concluded. Osmân Pasha, who established himself in Plevna early in July, repelled with brilliant success repeated and determined assaults from a besieging army of Russians and Roumanians until the 10th December, when he surrendered. Desperate fighting in the Shipka Pass had till then failed to expel the Russians from their position in the Balkans. The victorious Muscovites occupied Adrianople in January 1878; in March the 'preliminary treaty' of San Stefano was signed; in June the Congress at Berlin mediating between Russian and English interests sanctioned the changes noted at the beginning of this article. Troubles at Sasun in 1894 led to slaughter and atrocities on an appalling scale in various parts of Armenia throughout 1895 and part of 1896—by June 1896, 80,000 Armenians had perished. The intervention of the Powers had barely secured a tardy concession of some reforms by the sultan, when a rising in Crete (1895) began a new series of Turkish atrocities, and compelled the intervention of the Great Powers. When practical autonomy for Crete had been promised, the case was complicated by a Greek invasion of Crete, followed by a Greek irruption into Macedonia. But the Greeks were disastrously defeated by the Turks, who occupied Thessaly, and could with difficulty be induced by the Powers to withdraw even on the promise of a large indemnity and a slight rectification of frontier in Thessaly. The European Powers, acting formally in concert, found it exceedingly difficult to secure harmony amongst themselves and overcome the obstructive tactics of the Porte alike in the Armenian, Cretan, and Greek negotiations. Russia declined to allow any one Power to interfere in Armenia, and Germany was hostile to Greek aspirations; but the 'Concert,' though hampered in action, nowhere left Turkey a free hand.

See Hammer-Purgstall's *Geschichte des Osmanischen Reiches* (1835); Creasy's *History of the Ottoman Turks* (1854); the present writer's *Turkey* (1888); also works on special periods by Finlay, Chesney, Moltke, Kinglake, Freeman, and the diplomatic papers of Gentz, Metternich, and Lord Stratford de Redcliffe.

Literature.—Turkish poetry is closely modelled upon the Persian style with which the Ottomans became familiar during their association with the Seljûks (q.v.), who had become deeply imbued with Iranian ideas in their long residence among the Persians. Like the Seljûks, the Osmânlîs assimilated the literature of the people they subdued. Firdausî and Nizâmî had already written their masterpieces before the name of Ottoman was heard, and at the time of their settlement in Asia Minor Sa'dî and Jelâl-ed-dîn Rûmî were attracting the admiration of the eastern world. The latter was a resident at Iconium (Kôniya), the Seljûk capital, and his mystical verses or *mesnevis* impressed their character upon the whole literature of the new power then rising in Anatolia. Ottoman poetry is full of the subtle esoteric ideas which are characteristic of its Persian exemplars. Its long metrical romances, while apparently treating of the loves of Leylî and Mejnûn, of Khusrev and Shîrîn, or of Joseph and Zuleykha, are really occupied with the deeper thoughts of the longing of the soul for God, the yearning of the heart for heavenly wisdom, the struggle between human passion and the endeavour towards divine serenity. The short odes or *ghazels*, the most characteristic of Ottoman poetic forms, 'though outwardly mere voluptuous songs, are in reality the outpourings of hearts drunken with the love of God.' Nor is the mystic spirit the sole gift of Persia to the Turkish poet. He has also borrowed the history and mythology of his predecessors, and, instead of the deeds of the old Turkish chiefs and the cult of the gods of the Caspian nomads, he celebrates the prowess of Persian heroes, of Rustem and Jemshîd, Kay-Khusrev and Ferîdûn, and the loves and tragedies of Leylî and Shîrîn and other Persian heroines. And the Ottoman poet followed the forms as well as the ideas of his Iranian masters, such as the *kasîda* or Arabian lyric, adopted by the Persians, in which the second hemistychs rhyme throughout the whole length of the composition; the Persian *mesnevi*, or rhymed couplet; and the *ghazel* or sonnet of the East. In all these the Persian love of playing upon words, far-fetched conceits, and extreme elaboration of metaphor is not merely emulated but exaggerated to intolerable excess: the grace of expression and finish of the form alone redeem the artificiality of the style and thought. Turkish poetry, it must be admitted, is lamentably unreal: it lacks warmth, and earnestness, and sincerity. It is throughout essentially a court poetry, mannered and insincere. There is nothing robust or healthy about it. There is nothing strong or masculine in its love or its patriotism. Throughout we trace the effects of an artificial town life, where genius is cramped in convention, and poetic art is no longer an inspiration, but a cast from the face of the dead.

Ottoman poetry begins soon after the establishment of the Ottoman empire. Already in the beginning of the 15th century Ahmed Dâ'î's 'gay and flowing songs of love and wine' delighted the court of Prince Suleymân at Adrianople, and poems had been indited by Ghâzî Fâzil, who had crossed the Hellespont on a raft with that prince on the night when the Osmânlis gained their first foothold in Europe. To write poetry soon became part of the accomplishments of kings and courtiers. Of the thirty-four sultans of Turkey twenty-one were poets of a sort, and Amurath the Great (Murâd II.), Mohammed the Conqueror, and Selîm I. (the Grim) were accounted bards of repute. The unhappy Prince Jem was especially noted for his poetic talent; and from Murâd II. to Murâd IV. (1421–1623) twelve successive sultans left poems which have come down to us. Generals and ministers followed the imperial example. The grand vezîr Mahmûd Pasha (d. 1474), the conqueror of Negroponte, delighted in the composition of *ghazels*, and Kemâl Pasha Zâda (d. 1534), as he rode to the conquest of Egypt with the Sultan Selîm the Grim, beguiled the way with recitations of the leading events of Egyptian history in choice Turkish verse. He was the author of the *Nigâristân*, a poem modelled on the *Gûlistân* or 'Rose-Garden' of Sa'dî.

The greater poets of Turkey, however, were not high dignitaries, but sons of mechanics, cutlers, saddlers, shoemakers; few were of rank or wealth. Their numbers and their merits rise and fall as the tide of Turkish conquest flows and ebbs. It is ever in a period of strong national feeling that the poetry of a people is called forth; and it was in the golden prime of Sultan Suleymân, when the confines of the kingdom were at their broadest, when the name and fame of the Ottoman empire stood higher than ever before or since, that the opportunity of Turkish poetry arrived, and with it came the masters of the art. To the age of Suleymân and his predecessor Selîm belong Mesîhî (d. 1512), Lâmi'î (d. 1531), Ghazâlî (d. 1534), Fuzûlî (d. 1562), Fazlî (d. 1563), and Bâkî (d. 1600). The best Turkish poetry is chiefly included in this epoch, which partly corresponds in time with our Elizabethan era. Lâmi'î's works, to which Von Hammer devoted 174 pages of his great History, include poems on old Persian romances, besides a multitude of *ghazels* and other short pieces. Fuzûlî, on the whole the greatest of Turkish poets, in spite of his provincial idiom, is best known by his *Leylî and Mejnûn* and his charming odes. Bâkî, the most famous of Turkish lyricists, was the friend of four successive sultans, filled some high offices of state, and received the unhesitating homage of all the poets of his day and the admiration of all succeeding generations. His famous elegy on Suleymân the Great is unsurpassed in Ottoman literature. The appreciation of nature which is shown in such poems as Mesîhî's 'Ode to Spring' and Bâkî's and Lâmi'î's odes to 'Autumn,' and which is characteristic of their period, forms one of the best features of Turkish poetry. Their love-songs, on the other hand, are disappointingly stilted and artificial; and it is singular that, in spite of their military renown, the Turks have no martial poetry of the old time: there is hardly a respectable war-song in the whole range of mediæval Ottoman literature.

The classical period of Ottoman poetry, which began with the 16th century, did not end with the glorious reign of Suleymân the Great (d. 1566). Nef'î of Erzerûm (d. 1635), the most renowned of Turkish satirists, wrote in the time of Murâd IV.; Nabî (d. 1712) wrote thousands of couplets of a didactic tendency; and Nedîm (d. *c.* 1727), perhaps the most finished and certainly the most blithe of Turkish singers, belongs to the time of Ahmed III. He was the last of the old classical school of Ottoman poets, though Sheykh Ghâlib (d. 1795), the author of 'Beauty and Love' (*Husn-u-Ashk*), was little inferior to any of the older writers. During the past half century a notable change has come over Turkish poetry. It is as voluminous as ever, but it turns for inspiration to Paris instead of Shîrâz. *Ghazels* and *kasîdas* have given way to western forms; the very vocabulary has been modified; and a modern Ottoman poem would hardly be comprehensible to the older writers of the classical epoch. Wâsif, who tried to write in colloquial Stambûlî Turkish, 'Izzet Molla, 'Akif Pasha, and the poetesses Fitnet and Leylâ were among the lights of the transition period; Shinâsî, Ekrem, and Hamîd Bey the dramatist have been the leaders of the European style, of which it is too early yet to express a general criticism. One of the modern school has to some extent wiped out the stigma, already mentioned, of the want of martial poetry among the Turks: Rif'at Bey has at last written an Ottoman war-song.

Turkish prose writers have been and are very numerous, though here again originality is lacking, and their activity has been chiefly displayed in translations from the Persian and Arabic. One of their earliest works is the well-known *History of the Forty Vezîrs*, a collection of old folk-stories, written in the first half of the 15th century, and now translated by E. J. W. Gibb. Sinân Pasha, however, the vezîr of Mohammed the Conqueror, was the first prose stylist of merit. Sa'd-ed-dîn, the historian, in spite of his elaborate style and alliteration, was a writer of conspicuous ability, and Na'îma, his successor, is as vigorous and direct as Sa'd-ed-dîn is circumlocutory and ornate. The *Tâj-et-Tevârîkh* of the former goes down to 1520, and Na'îma's history covers the ground from 1591 to 1659. Evliya the traveller, and Hâjjî Khalîfa, an encyclopædic writer on history and bibliography, are among the best-known Turkish authors. Jevdet Pasha is the leading Turkish historian of the 19th century, and Kemâl Bey one of the most notable modern men of letters. Printing was begun in Turkey in 1728, and the products of the Turkish press in the present day are numerous and often valuable. Turkish prose as well as poetry has been revolutionised by the introduction of western ideas since the reforms of Mahmûd II.

The standard but not very satisfactory work on Turkish poetry is Von Hammer-Purgstall's *Geschichte der Osmanischen Dichtkunst* (Pesth, 1836). The best English works are Sir James W. Redhouse's *History, System, and Varieties of Turkish Poetry* (1878) and E. J. W. Gibb's *Ottoman Poetry* (1882). See also the latter's chapter on Ottoman literature in the present writer's *Turkey* ('Story of the Nations' series), and the article on Ottoman Poetry by the present writer in *Macmillan's Magazine*, January 1883. Redhouse and Wells have compiled the best Turkish dictionaries and grammars.

Turkey (*Meleagris*), a genus of gallinaceous birds, according to some ornithologists of a distinct family, Meleagridæ, but included by others in Phasianidæ. The head is bare, the neck wattled, and the bill of the male surmounted with a conical fleshy caruncle, sometimes erected, sometimes elongated and pendulous. A curious tuft of long hair springs from the base of the neck of the male, and hangs down on the breast. The bill is rather short, strong and curved; the tail is broad and rounded, capable of being erected and spread out, as the male delights to do when he struts about in pride, with wings rubbing on the ground, uttering his loud peculiar *gobble*. The Common Turkey, the largest of gallinaceous birds, well known as an inmate of our poultry-yards, is a native of North America, where it exists in two forms. The typical

M. gallo-pavo, with the tail tipped with rusty, and the tail-coverts with dark chestnut, ranges from southern Canada to Florida and eastern Texas, and westward to the edge of the great Plains; farther south it is replaced by a subspecific form, *M. mexicana*, having the tail and its coverts tipped with buffy white, and inhabiting the table-lands of Mexico, and extending north to the southern border of the United States, and south to Vera Cruz. It is from this latter race that our domestic turkeys are descended, the breed having been introduced into Europe in the beginning of the 16th century by a lieutenant of Sebastian Cabot. Norfolk and Cambridge are celebrated for their turkeys; the Norfolk breed is black, and the Cambridge variegated or bronze, the birds of the latter colour most resembling the wild species. This, however, attains a larger size in its native woods than in the poultry-yard; and the finest tame turkeys are those of the American bronze breed, which has been created by crossing tame birds with the true *M. gallo-pavo*. The size of the birds has been thus increased, and the young rendered hardier. But the wild turkey is richer in colour and stronger on the wing than the tame; though even in the wild birds the wings are short, scarcely extending beyond the base of the tail, and their powers of flight are not great, inasmuch as when on their migrations they come to a river a mile wide many fall in on attempting to cross it. These, however, usually save themselves by swimming. Wild turkeys, like other game, have greatly decreased in the United States. The males associate in flocks of from ten to one hundred, and seek their food during great part of the year apart from the females, which go about singly with their young, or associate in flocks, avoiding the old males, which are apt to attack and destroy the young. At the pairing-time desperate combats take place among the males. Wild turkeys feed on all kinds of grain, seeds, fruits, grass, insects, and even on tadpoles and lizards. They roost on trees and make their nests on the ground, merely gathering together a few dry leaves, and often in a thicket. The eggs are usually from nine to fifteen in number, sometimes twenty. The birds spread themselves in summer over the higher grounds, but in winter congregate in the rich low valleys. The sexes mingle in winter, and form larger flocks than in summer.

On account of the size and the excellence of its flesh and eggs, the turkey is one of the most valued kinds of poultry. The management of it differs little from that of the common fowl. The young are tender for the first few weeks, and require care, particularly to keep them from getting wet by running among long grass, or the like; but afterwards they are sufficiently hardy. Nettles are excellent food for young turkeys, and are often chopped up for them, to be given in addition to grain, onion tops, dandelion, hard-boiled eggs, meal, boiled potatoes, and other such food.

The only other known species of turkey is *Meleagris ocellata*, a native of Yucatan and the adjacent parts of Honduras. It is not so large as the common turkey, and has no tuft on the breast. The neck is less wattled, but the head has a number of fleshy tubercles. The plumage is beautiful, rivalling that of the peacock in metallic brilliancy: blue, green, bronze, red, and golden hues being intimately and finely mingled, and forming *eyes* on the tail; whence the specific name. In South Africa the Bald Ibis (*Geronticus calvus*) and in Australia the Australian Bustard (*Eupodotis australis*) are incorrectly called wild turkeys. The so-called Brush-turkey or Talegalla (q.v.) belongs to a different family of gallinaceous birds, the Megapodes or Mound-birds (q.v.).

Turkey Buzzard. See VULTURE.

Turkey-red. See DYEING, Vol. IV. p. 137.

Turkmanshai, a village of Azerbijan, 65 miles ESE. of Tabriz, is the place where, on February 22, 1828, was concluded the treaty between Persia and Russia, by which the former resigned to the latter the Armenian provinces of Erivan and Nahitchevan.

Turks, an important and wide-spread family of the human race, found from the banks of the Lena through central Asia and Asia Minor to the European shores of the Bosporus and the Ægean. Formerly classed amongst the 'Turanian' peoples, it is now more usual to say that they are of the Mongolo-Tartar ethnological group, and speak languages of the Ural-Altaic family. To them belong at the present day Yakuts, Siberian Tartars, Kirghiz, Uzbegs, Turkomans, Karakalpaks, Kazan Tartars, and Dungans, as well as the Ottoman Turks; linguistically the Bashkirs and Tchuwashes fall under the same head. Old Turkish stocks no longer extant were the Petschenegs in Russia, the Cumanians, the Chazars, the White Huns, and the Seljuks (from whom the Ottoman Turks are sprung). The existing Turkish peoples are all Moslems, save the Yakuts, and mostly nomadic. They have often sent forth conquering hordes of warriors, and have given ruling families or races to China, Persia, India, Syria, Egypt, and the empire of the Califs.

See especially the articles TURKESTAN and TURKEY; ASIA, Vol. I. p. 493; SELJUKS; BABER; TAMERLANE; TARTARS; Vambéry, *Skizzen aus Mittelasien* (1868), and *Das Türkenvolk* (1885).

Turk's Islands. See CAÏCOS.

Turmeric, the rhizome or rootstock, usually having pointed cylindrical branches, of *Curcuma longa* (nat. ord. Zingiberaceæ). This species of Curcuma is a handsome herbaceous plant, the flowering stem of which has long, narrow, sheathing leaves, and above these a leafy spike of yellow flowers. It is cultivated all over India, but it is also grown in the East Indian Islands, China, and the Fijis. The tubers, which are yellowish externally, yield a deep yellow powder of a resinous character. Turmeric has been long employed in the East as a medicine, and as a yellow dye which can be changed into a deep, brownish red by alkalies, but neither colour is permanent. It is a principal ingredient in some Indian articles of food, including curry-powder. In western countries it is not now much used in dyeing, nor in medicine, but it is very useful as a chemical test for the presence of alkalies, any alkaline substance quickly changing its colour from yellow to reddish brown. Mustard is frequently adulterated with turmeric, and so also are some other substances. Turmeric has an aromatic

Turmeric (*Curcuma longa*): *a*, root; *b*, spike of flower; *c*, leaf before expansion (Bentley and Trimen).

taste and a peculiar odour not unlike that of ginger. The odour is due to an essential oil called *turmerol*, of which the tubers contain about 1 per cent.; and the colouring principle is known as *curcumin*. African turmeric, brought from Sierra Leone, is obtained from a species of Canna.

Turnau, a town of Bohemia, on the Iser, 64 miles by rail NE. of Prague. Its specialty is jewellery. Here on 26th June 1866 the Prussians defeated the Austrians. Pop. 4948.

Turnberry, a shattered castle on the Ayrshire coast, 6 miles N. of Girvan. Either it or Lochmaben was Robert Bruce's birthplace. A lighthouse (1874) stands within the ruined walls.

Turnebus, the Latinised family name of Adrien Turnèbe, a great scholar of the 16th century, born at Rouen in 1572. According to some accounts he was of Scottish descent, his family name having been originally Turnbull. Educated at the university of Paris, he greatly distinguished himself in the study of the ancient classics, and eventually, as professor of Greek and Philosophy in the Collége Royal in Paris, attained a European reputation. Montaigne, who knew him personally, declares that he was the greatest man of letters who had appeared for a thousand years. When Turnèbe died (12th June 1565) it was the universal opinion that learning and virtue could not have sustained a greater loss. See Maittaire, *Historia Typographorum aliquot Parisiensium* (8vo, Lond. 1717). An account of Turnèbe is also prefixed to his miscellaneous works published at Strasburg in 1600.

Turner, CHARLES TENNYSON, born July 4, 1808, at Somersby, second son to the vicar (see TENNYSON, ALFRED), educated at Louth School and Trinity College, Cambridge; graduated 1832, ordained 1835; for many years the devoted vicar of Grasby, a village in the Lincoln wolds. In 1837 he married Louisa Sellwood, sister to Emily, Lady Tennyson. Took the name of Turner under the will of a relation; died April 25, 1879; commemorated by his deeply loved and loving brother Alfred in the lines *Midnight*, June 30, 1879.

From 1830 to 1873 C. T. Turner published several small series of verse (collected in one volume, with a memoir, 1880). The first, issued during his college days, won much praise from S. T. Coleridge. Throughout life the poet adhered to the sonnet form, but with an irregular distribution of the rhymes. His was a nature singularly and nobly simple, pure, and tender with a woman's tenderness: 'at once,' his nephew Hallam (preface to the volume of 1880) justly observes, 'childlike and heroic.' Add that he was a well-read scholar, gifted also with very fine and sympathetic observation of nature and of village-life. Hence these idyllic sonnets—sincere, pathetic, subtle, sometimes verging on quaintness—cover, in their pensive range, a vast number of motives from English country ways. By him and by his admirable contemporary poet, W. Barnes of Dorset, a hundred wild flowers, we might say, effaced or disappearing under the remorseless ploughshare of modern progress, have been preserved for us. Such work in an age like ours should have a wide appeal to Englishmen. But fit audience and few will almost uniformly be the fate of the writer who confines himself to the form of sonnet-sequence.

Turner, J. M. W., the most celebrated of English landscape-painters, is generally believed to have been born in Maiden Lane, Covent Garden, on the 23d of April 1775, but he himself said to Mr Cyrus Redding that he was born at Barnstaple in Devonshire. His full names were Joseph Mallord William, of which he signed only the initials.

Copyright 1892 in U.S. by J. B. Lippincott Company.

He was the son of William Turner, a barber, who taught him to read and sent him to school at Brentford and afterwards to Margate, but he had little regular education and remained almost illiterate through life. He may possibly have heard something about Rome and Carthage at Brentford, cities that always had a great interest for him. Very early in life he got some initiation into architecture and worked with the architect Hardwick, who perceived his natural gift for painting and recommended him to become a pupil of the Royal Academy. Turner's childhood was remarkable for the absence of any civilising feminine influence. His mother is said to have had an ungovernable temper, and to have been almost if not quite insane. In other respects the early life of Turner was more fortunate. He soon found friends and instructors. He knew Sir Joshua Reynolds and studied in his house. He got an early initiation into water-colour through his acquaintance with Dr Monro and Girtin, and, being in a city where art was to be seen, he became acquainted with most of the elder masters of landscape, at least in their works, and with those of the then modern water-colour painters. Turner began exhibiting at fifteen when still an incipient student, but such was his precocity, and perhaps also the relatively low state of art at that time, that he went on exhibiting and learning during the same years. At eighteen he began to travel, being sent by a publisher into four English counties, and at twenty he had visited Wales. A year later he made architectural drawings in some of the principal English cathedral cities. Like Titian he was wide-awake and hard at work already in his profession early in the morning of life. On attaining his majority he was already an established artist, and as early as 1799 he began as a marine painter. In the same year, at the age of twenty-four, he was elected an Associate of the Royal Academy. At twenty-eight he was elected Academician, and at thirty-three professor of Perspective. During these years he does not appear to have earned a large income, but being a strict economist soon knew how to place himself above pecuniary difficulties.

The biography of Turner is of little interest except as a study of character. He never married, he took no share in public life, kept aloof from society, and knew no changes, except a few changes of residence in England and his home or foreign tours. Though economical to miserliness, after 1808 he had always two residences and sometimes even three. This indulgence may be attributed to a love of personal secrecy and obscurity. His town-house in Queen Anne Street was a sufficiently commodious residence with a studio and a gallery; his country-houses were first at Hammersmith and afterwards at Twickenham. By hard work and economy Turner soon attained pecuniary independence, and worked in complete freedom from any money-pressure, yet with remarkable rapidity. His travels were of the nature of furtive disappearances; he wandered much about England, France, Switzerland, and Italy, but the story of these excursions is told by his works alone, except that some chance traveller met him now and then, always with his pencil in his hand and travelling very economically, for the most part on foot. That his travels were a part of his life is indicated by the title of one of his publications, *Turner's Annual Tour*. He rose very early in the morning, worked many hours each day and always in complete secrecy, and it is not believed that in his own house he ate any regular meals. His houses were very badly kept, even his gallery of pictures being dirty and disorderly. So he went on in solitary toil till old age, and died in his seventy-seventh

year (19th December 1851) in a temporary lodging at Chelsea under the assumed name of Booth.

Everything in Turner is indicative of the man of genius. His artistic gift was a special faculty, cultivated to the utmost by a long life of the hardest labour and to the neglect of everything else. The artistic gift that absorbed all his energies was itself of a most peculiar character. He perceived more in nature than any landscape-painter who had preceded him, yet at the same time his imagination was so overpowering that it modified all his materials. His power of drawing was remarkable both for strength and for an extreme refinement, but accuracy was made impossible for him by his constant desire for beauty or sublimity of line and for agreeable composition. He habitually increased the relative height of objects such as towers, hills, river-banks, &c., and he compressed every subject by bringing materials together from all quarters. He almost invariably altered the character of what he saw in order to attain some expression that he desired. His dominant impulses were to make things more beautiful, mysterious, and sublime than they are in nature. His system of light and shade was founded at first on the old masters with their heavy darks; but afterwards in his more independent maturity he worked out another scheme, that of pale general tones with a few strong darks for opposition. Turner was in various ways clever in black and white. Almost all his work done directly from nature consisted of memoranda in chalk or pencil, on gray or white paper, without colour, the colour being often added afterwards from memory. He was also an excellent etcher in pure line, but did not attempt to combine line and shade (except slight indications of shade) in etching, trusting for that to the finishing of his plates in mezzotint. His etched work is the *Liber Studiorum*, begun in 1807 and cut short in 1819. It was to have consisted of 100 plates, of which seventy-one were completed. As a water-colour painter Turner was unrivalled in delicacy and in brilliance of execution, but he never became *technically* one of the supreme painters in oil, nor did he make progress in his later work, which resembled water-colour in principles of treatment. Turner's position in art is that of one of the three most famous landscape-painters (Claude, Turner, Corot). In knowledge of nature he was far superior to the other two, in the sense of elegance at least their equal, and there was a tragic side to his genius that is wanting in the others. Turner has had singularly little practical influence on landscape art, which has gone more in the direction of Constable.

Although by nature very reserved and disposed to keep aloof from mankind, Turner was sometimes friendly and nobly generous. The object of his saving was to found an asylum for distressed artists, an intention plainly expressed in his will, but thwarted by the lawyers because the testator was ignorant of legal forms. Turner kept many pictures that had proved unsaleable at first, though tempting offers were made for them later, and he bequeathed them to the National Gallery on condition that they were to be kept together in rooms bearing his name. Whilst the estimate of his work has risen, it is now understood that his intellect was that of a prodigy with abnormal activity in one direction and feebleness or incapacity in almost all others. His personal appearance too was against him, as he was plain and short and had not the style or bearing of a gentleman.

The following are a few of the most important chronological memoranda of Turner's professional career. 1796, he exhibited eleven pictures at the Royal Academy. 1798, he began to paint mountain scenery, and an effect in the view of Norham Castle, which did much to found his reputation. 1799, date of a naval picture, the Battle of the Nile. 1802, ceased to pay deference to topographic truth, and painted his famous but anti-topographical picture of Kilchurn Castle. 1803, beginning of continental subjects: 'The Vintage at Mâcon,' 'Calais Pier,' also first studies of the Alps. 1806, imaginative picture of the 'Garden of the Hesperides, with the Goddess of Discord choosing the Apple.' 1807, Turner invited a comparison between himself and Claude, by painting his 'Sun rising in Mist' in rivalry with the French master. 1811, 'Apollo and the Python.' 1813, 'The Frosty Morning.' 1815, 'Crossing the Brook,' an idealisation of Devonshire scenery; also the imaginary 'Dido building Carthage.' 1823, an idealisation of Italy in the 'Bay of Baiæ,' and idealised views of Yorkshire in Whitaker's *History of Richmondshire*, marking a great progress in illustration. 1824, *The Rivers of England*. 1825, *The Provincial Antiquities of Scotland*. 1827–38, the *England and Wales* series. 1829, the great imaginative picture, 'Ulysses deriding Polyphemus.' 1832, an idealisation of Italy in 'Childe Harold's Pilgrimage.' 1830–34, vignette illustrations of Rogers' Poems. 1834, illustrations to Scott. 1833–35, *The Rivers of France*. 1834, 'The Golden Bough,' a poetical picture. 1838, 'Phryne going to the Bath as Venus.' (In these years Turner's idealising faculty attained its utmost development.) 1839, 'The Teméraire.' (In 1840 he entered on his decline.) 1843, 'Opening of the Walhalla,' 'The Approach to Venice,' and 'The Sun of Venice'—the two latter remarkably beautiful though unreal. 1844, 'Rain, Steam, and Speed,' a purely impressionist picture attempting the severance of motion from substance.

BIBLIOGRAPHY.—*Modern Painters*, by John Ruskin, M.A., in 5 vols., first published by Messrs Smith and Elder at different dates between 1843 and 1860. This brilliant and famous book did much to increase Turner's reputation amongst the reading classes, but did not create his position, as he had already been for forty-one years an Academician, and had attained wealth and success when the first volume appeared. Mr Ruskin estimated Turner's rank as that of 'the greatest painter of all time,' which is very disputable on technical grounds, especially with reference to his work in oil. A *Life of Turner* by Mr Walter Thornbury appeared in 1862, a carelessly constructed biography, being hardly better than a collection of materials. The next *Life* was that by the writer of the present notice. It appeared in 1878, and was little more than an attempt to put already existing materials into a readable form, as at that date it had become almost impossible to add to them anything of any real importance. In 1879 appeared a *Life of Turner* by Mr Cosmo Monkhouse, which added whatever new details could be ascertained, and contained some valuable biographical criticisms. In 1889 the present writer published a new and shorter *Life of Turner* in French at the *Librairie de l'Art*, Paris. All biographies of Turner must, however, be inevitably meagre and unsatisfactory, as the materials were collected too late and Turner himself left hardly any letters or writings of any kind, and his few notes are very brief. Public interest is concentrated in his works, he himself being so little attractive as a subject for the writer or reader of biography.

Turner, SHARON, was born in London, September 24, 1768, was articled to an attorney at the age of fifteen, and succeeded his master in the business before the period of his clerkship had expired. The intervals of a busy life he gave to hard reading and patient collection of materials, and published a meritorious *History of the Anglo-Saxons* (1799–1805). Other works were the laborious but badly written *History of England from the Norman Conquest to the Death of Elizabeth* (1814–

15-23), *Sacred History of the World* (1832), a volume of essays and poems, &c. Turner died in London, February 13, 1847. For the last years of his life he enjoyed a pension of £300.

Turnhout, a town of Belginm, in the Campine district, 26 miles ENE. of Antwerp. It has a palais de justice (1371) and manufactures of cotton, linen, lace, paper, &c. Pop. 17,800. Here on 22d January 1597 the Netherlanders, under Prince Maurice, won a victory over the Spaniards; and on 27th October 1789 the patriots over the Austrians.

Turning, the art of shaping wood, metal, ivory, or other hard substances into forms having a curved (generally circular or oval) transverse section; and also of engraving figures composed of curved lines upon a smooth surface, by means of a machine called a *turning-lathe*. The immense variety of work performed by turning-machines necessitates great variations in their construction; but their mode of operation is always the same, and consists in fixing the work in position by two pivots or otherwise, causing it to revolve freely round an axis of revolution of which the two pivots are the poles, and holding a chisel or other cutting-tool so as to meet it during its revolution, taking care that the cutting-tool be held firmly and steadily, and moved about to different parts of the work till the required shape be obtained. Lathes are divided, with respect of the mode of setting them in motion, into *pole*-lathes, *foot*-lathes, *hand-wheel* lathes, and *power*-lathes; with respect to the species of work they have to perform, into *centre*-lathes, which form the outside surface, and *spindle*, *mandrel*, or *chuck* lathes, which perform hollow or inside work, though this distinction is for the most part useless, as all lathes of good construction are now fitted for both kinds of work. *Bed*-lathes are those used by turners in wood, and *bar*-lathes for the best sort of metal-work; and the small metal centre-lathe used by watchmakers is known as a *turn-bench*.

Turnip (*Brassica rapa;* see BRASSICA), a biennial plant, with lyrate hispid leaves; the upper part of the root becoming, especially in cultivation, swollen and fleshy. It is a native of Europe and the temperate parts of Asia, growing in borders of fields and waste places. It is commonly regarded as a native of Britain, although in most cases where it is found apparently wild it may be doubted if it has not derived its origin from cultivated varieties. It has been long cultivated, and is to be found in every garden of the temperate and cold parts of the world as a culinary esculent; it is also extensively grown in fields for feeding cattle and sheep. It was cultivated in India long before it could have been introduced by Europeans, and is common there in gardens and about villages. The cultivated varieties are very numerous. In them the upper part of the root assumes a globose, oblong, or roundish depressed form. Some are common to the garden and the farm, and some of the largest kinds attain such a size as to weigh 20 or 25 lb. Although the turnip is of great value for feeding stock, it is not very nutritious, no less than 90 to 96 parts of its weight actually consisting of water. Garden turnips are sown from the end of March to the end of August; field turnips generally in June, it being requisite that they should not be sown so soon as to incur a risk of their throwing up flower-stems in the first year, which, when it takes place, prevents in a great measure the swelling of the root and renders it coarse and fibrous. In dry weather the plants are apt to throw up flower-stems, and so disappoint the hope of the gardener. Moist cloudy weather is most favourable. Garden turnips are sown and allowed to grow much closer than field turnips, being gradually thinned out, and the thinnings used even when of small size. The garden turnips are generally of comparatively small size, more rapid in growth, and more delicate. The Swedish Turnip, or Ruta Baga, which was introduced into cultivation in Britain, from the north of Europe, more recently than the common turnip, and has proved of very great value to the farmer, is regarded by some botanists as a variety of the same species, and by some as a variety of *B. napus*, but more generally as a variety of *B. campestris*, a species common in cornfields and sides of ditches in Britain and the north of Europe.

The cultivated turnip grows best in a rich free soil. The mode of culture varies with the soil. Where the soil is light and dry a smaller amount of ploughing, harrowing, and drilling is necessary than on stiff soils. The turnip is not well suited to clay soils, although it is often grown on them. A complete pulverisation of the soil is requisite before the sowing of the seed. On light soils a crop of turnips generally succeeds wheat or oats. Turnip-land is generally made up in raised drills by the plough, and the seed is sown by the drilling-machine on the top of the narrow ridges, which are about 27 inches wide. Moderate dressings of artificial manure, such as superphosphate of lime, crushed or dissolved bones, kainit and nitrate of soda, or other such manures, produce great crops of turnips. The more general practice, however, is to give a mixed dressing of farmyard dung and artificial manure. The young plants are thinned out by the hand-hoe to from 9 to 11 inches apart, and the ground is stirred and carefully kept clean by the plough or horse hoe. The turnip-crop is thus of great use in clearing the land of weeds. In many places part of the crop is eaten on the ground by sheep, which are confined to a small part of the field by means of movable fences. It is common to leave one of each three rows of turnips for this purpose, the other two rows being carried to the farmyard for feeding cattle or stored. Turnips are stored either in a house or in conical heaps, covered with straw and earth. They are sometimes protected from frost by being earthed up in rows by the plough. Some kinds are much more easily injured by frost than others; the Swedish turnips least of all.

The introduction of the turnip as a field-crop is one of the most important events in the history of British agriculture. It has rendered possible a rotation of crops which has been extremely advantageous, and has made the supply of butcher-meat more constant, by providing a supply of winter-food for cattle and sheep, whereas formerly all depended on the pasture. As a field-crop turnips were not raised in Britain till the end of the 17th century. Turnip-husbandry was introduced into Roxburghshire from Leicestershire about the year 1764, but was soon carried to a perfection in Scotland far beyond what it had previously reached. The climate of Scotland is well adapted for it, as is also that of Ireland; whilst the climate of North America is so unfavourable to it that it has not become an important crop there. Turnip-crops in Britain suffer very much from the two distinct diseases called anbury, or club-root, and finger-and-toe (see ANBURY). Superior culture is the best means of preventing these diseases. Plants weakened by drought are liable also to suffer from a white mould, a species of Oidium, which attacks the leaves and greatly injures the plant.

The turnip crop has to encounter many insect enemies. The most destructive in recent years has been the turnip-fly (*Phyllotreta nemorum*, Chevrolat), which devours the young plants before

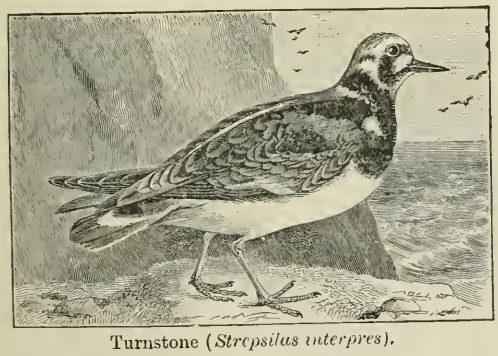
they are strong enough to be thinned. The leaves of the young turnip-plants are also attacked and often much injured by the green-fly or turnip aphis (*Aphis rapæ*, Curtis); by the maggots of two kinds of Diptera—*Phytomyza nigricornis*, Macquard, the black-leaf miner, and *Drosophila plana*, Fallen, the yellow-leaf miner; by the caterpillar of the diamond-back turnip-moth (*Cerostoma xylostella*, Curtis); by the caterpillar of the common dart moth (*Agrotis segetum*, Westwood); by the grubs of the turnip sawfly (*Athalia spinarum*, Fabricius); and by at least two varieties of weevil, Curculio, the most destructive being the little Curculio, *Centorhynchus contractus*, ¼ inch long, which punctures the seed leaves with its rostrum. The diamond-back moth fortunately seems to pay its visits of destruction at long intervals. It played great havoc with the crop in England and Scotland in 1891, destroying it beyond recovery in many parts. In Ireland the attack was lighter. Earlier serious attacks occurred in 1851, 1837, and 1826. For all insect attacks the best preventive measure is a dressing of stimulating manure to force on the growth of the plants. Spraying the crop with a mixture hurtful to the insects, by means of the Strawsoniser, an air-power distributor, is also recommended.

Turnpike Roads. See ROADS, TOLL.

Turnsole (Old Fr. *Tournesol*, 'turning to the sun'), a name sometimes given to the Heliotrope and other plants, especially to the euphorbiaceous *Chrozophora tinctoria*, from which a deep purple dye is obtained. Turnsole-blue is a name sometimes given to a colour obtained from archil.

Turnspit. See DACHSHUND.

Turnstone (*Strepsilas*), a small genus of birds of the plover family (Charadriidæ), intermediate between the true plovers and the sandpipers. The Common Turnstone (*S. interpres*) appears in



Turnstone (*Strepsilas interpres*).

Britain as a winter migrant, but is not known to breed there; its breeding-places being the shores of the Arctic Ocean in Europe, Asia, and America, though it breeds on the coasts of Scandinavia down to Denmark, laying four eggs of a greenish-gray colour, spotted and streaked with bluish-ash and brown, in a shallow depression lined with a few dry leaves and bents. In winter the turnstone is found on the seashore all over the world, being probably the most cosmopolitan of all birds. It derives its name from its habit of turning over stones with its bill in search of its food, which consists of small crustaceans and molluscs. The common turnstone is 9 inches in length, and is handsomely marked with black, white, and chestnut; the last-named colour is reduced in autumn, when the plumage becomes duller; the legs and feet are orange. Another species, the Black-headed Turnstone (*S. melanocephalus*), breeds in Alaska and winters in California; and some place the Surf-bird (*Aphriza virgata*) in this genus.

Turpentine is a semi-solid resinous substance secreted by various coniferous trees. The name turpentine is commonly understood to mean the product of the Scotch pine, the swamp pine of America, and the *Pinus maritima* of France. Venice turpentine is obtained from the larch, and Chian turpentine from the 'Turpentine-tree' (see PISTACIA); but from a commercial point of view they are practically unused. The chief supplies of turpentine are obtained from America, and to a less extent from France. Cavities are cut through the bark and into the wood about one foot from the ground, and the bark hacked a little above. The exuded turpentine runs into these cavities, commencing to flow in May, and if the bark is hacked a little higher up every ten days a constant supply is obtained throughout the summer. In consequence of the necessity of injuring the bark at a higher and higher point, in the course of years the hacking takes place at a height of 12 to 15 feet, the tree remaining productive for about fifty years. The first year's yield is the purest, having the shortest distance to run down the trunk into the cavity; but afterwards a portion concretes as it passes down, and constitutes the common frankincense or *gum thus* of commerce. The turpentines are mixtures of resin and essential oil. The latter, amounting to from 15 to 30 per cent., consists chiefly of hydrocarbons having the chemical formula $C_{10}H_{16}$. When distilled along with water the oil of turpentine passes over, and the Resin (q.v.) or rosin remains behind.

Oil of Turpentine does not always possess the same properties. Its boiling-point ranges from 305° to 341° (152° to 172° C.), and the specific gravity from ·856 to ·870. Some samples rotate the plane of polarisation to the right, and others to the left. These variations are due to the presence of different isomeric compounds. Oil of turpentine, or turpentine as it is often called, is a powerful solvent of resins and oils, and is much employed in the manufacture of varnishes and oil paints. It is very inflammable, and unites with chlorine so energetically as to burst into flame when brought in contact. When air is passed through it it becomes powerfully antiseptic. Applied to the skin it acts as a local irritant, and is much employed in the treatment of rheumatism, &c. When agitated with sulphuric acid and allowed to separate it yields on distillation a fragrant liquid, terebene, which is much employed as an antiseptic and internally in the treatment of coughs.

Turpin. Archbishop of Rheims, friend and companion of Charlemagne, the supposititious author of the *Historia Karoli Magni et Rotholandi*. According to Gaston Paris, this falls into two parts: the first (*c.* 1050) dealing in five chapters with Charlemagne's conquest of Spain without reference to Roland; the second (early in 12th century) giving the legend of Roland, the treachery of Ganelon, Roland's heroic death at Roncevaux, and the king's vengeance upon the Saracens. In the *Chanson de Roland* itself Turpin dies beside its hero, and is buried with him and Oliver at Blaye near Bordeaux. There was actually an Archbishop Tilpinus of Rheims (753–800); but there can be no doubt that the romance in its present form was put together in the first third of the 12th century, most probably with a view to the glory of St James of Compostella. From internal evidence it has seemed to critics highly probable that Pope Calixtus II. either wrote or at least inspired the work himself while yet Guy de Bourgogne, Archbishop of Vienne. The conclusion of Gaston Paris in his admirable work, *De Pseudo*

Turpino (1865), however, is that the first five chapters were written in Galicia, before the pretensions of Compostella had risen so high as they did towards the end of the 11th century; that the remaining chapters are too secular and too little in harmony with Galician traditions to have been written, or even formally sanctioned, by Calixtus; and that the epistle sometimes appended, bearing the name of that pope, is a manifest forgery. He goes on to state that the archbishop of Vienne, after the death of his brother in 1108, visited Compostella, and conjectures that one of his train found the first five chapters there, and that the remaining chapters were adapted from various French chansons by a monk of St André at Vienne. Reinhart P. A. Dozy, in the third edition of his *Recherches sur l'Histoire et la Littérature de l'Espagne pendant le Moyen Age* (1881, tome ii.), concludes that these five chapters have been written by a Frenchman, and that subsequently to 1131; that chap. xx. is due to one of the clergy of Compostella, who wished to push its claims against Toledo for the primacy of Spain, perhaps between 1120 and 1124, perhaps much later; and that chap. ix. names three Mohammedan princes of Spain and Africa who flourished respectively in 1106–43, 1116–23, and 1125–38. Gaston Paris in *Romania* (tome xi. July 1882) accepts most of Dozy's conclusions, admits that the five chapters were written by a Frenchman at Compostella after 1069, but is reluctant to place them much later than 1100. He finally conjectures that the whole work may have been completed towards 1150 by Aimeri Picaud, the author of the Itinerary to Compostella.

The chronicle was printed by Simon Schard in *Germanicarum rerum IV. vetustiores chronographi* (Frankf. 1566), and by Justus Reuber in his *Veteres Scriptores* (Frankf. 1584); but the edition now generally used is that of Sebastiano Ciampi (Florence, 1822). An edition was prepared under the auspices of the Montpellier Société pour l'Étude des langues Romanes, by Ferdinand Castets (Montpellier and Paris, 1880). See Gaston Paris, *De Pseudo Turpino* (Paris, 1865); also the excellent account in H. L. D. Ward's *Catalogue of Romances in the Department of Manuscripts in the British Museum* (vol. i. 1883).

Turpin, Dick, born at Hempstead, Essex, in September 1705, was, successively or simultaneously, a butcher's apprentice, cattle-lifter, smuggler, housebreaker, highwayman, and horse-thief. He was hanged at York on 10th April 1739 for the murder of an Epping keeper, besides which he had accidentally shot his comrade, King. The myth of his ride to York, widely current through Ainsworth's *Rookwood*, belongs, if to any one, to 'Swift Nick Nevison,' who in 1676 is said to have robbed a sailor at Gadshill at 4 A.M., and to have established an 'alibi' by reaching York at 7.45 P.M. that same evening.

Turquoise (i.e. 'the Turkish stone;' spelt also *turkis*, as by Tennyson, and *turquois*), an ornamental stone, essentially a phosphate of alumina, but containing also a little oxide of iron and oxide of copper. It is harder than felspar, but softer than quartz, and has a greenish-blue colour, and occurs as thin veins in slate rock. It is opaque, or sometimes translucent at the edges. The true oriental turquoise is found only near Nishapur in the Persian province of Khorassan. Old mines no longer worked are found in the Sinaitic peninsula; and of late Mexico produces good turquoises. A famous one, which once belonged to Nadir Shah, was two inches long, and was offered for sale at Moscow in the 18th century for £780. The name *Callaite* has been given to turquoise.—Fossil turquoise or *odontolite* is simply the fossil ivory of the Mammoth (q.v.), coloured blue by phosphate of iron, a blue which seldom fades. A mineral very like a greenish turquoise is found in Brittany, and has been named *Variscite*. It is sometimes called Oriental Turquoise; whilst the name Occidental Turquoise is given to a substance of similar colour, found near Simon, in Languedoc, which is said to be merely bone coloured with phosphate of iron.

Turretin, a distinguished family of theologians of Geneva, descended from Francesco Turretini, who emigrated for conscience' sake from Lucca to Geneva in 1579. His son, Benedict Turretin (1588–1631), became pastor at Geneva in 1612 and professor in 1618.—His son, François Turretin (1623–87), laboured at Geneva as pastor to the Italian congregation, and from 1653 as professor of Theology. He took a principal part in originating the Helvetic Consensus, and wrote a meritorious *Institutio Theologiæ Elencticæ* (Gen. 1679–85; 3 vols. Edin. 1847–48).—His son, Jean Alphonse, often called Turretin the Younger, and by far the greatest of the name, was born in Geneva in 1674. He studied theology there under Tronchin, visited Leyden, next both Oxford and Cambridge, and on his return became pastor of the Italian congregation, in 1697 professor of Church History, in 1705 of Theology. Throughout life he laboured to promote a union of the Reformed and Lutheran Churches (the aim of his *Nubes Testium*, 1729), and succeeded in abolishing the Helvetic Consensus in 1725. His famous large-minded *Discourse concerning the Fundamental Articles in Religion* was translated at London so early as 1720. He died at Geneva, May 1, 1737, in which year was published his *Cogitationes et Dissertationes Theologicæ* (2 vols.). See the biographical study by E. de Budé (Lausanne, 1880).

Turret Ship. See Navy.

Turtle (a corruption of *tortoise*, or of the Spanish *tortuga*, 'a tortoise'), any tortoise, but especially the edible Green Turtle (see Tortoise), prized for the soup made from its flesh, chief glory of aldermanic banquets. *Calipash* is the part of the animal that belongs to the upper shield, a fatty gelatinous substance of a dull greenish colour; *calipee*, the yellowish meat of the lower shield. 'Mock Turtle' is made of calf's head in lieu of turtle meat.

Turtle-dove (*Turtur*), a genus of Columbidæ, of graceful build, with small head and slender bill, long wings, and long rounded tail. The genus includes about thirty species, all of which are confined to the eastern hemisphere. The Common Turtle-dove (*T. vulgaris*) is abundant all the year round in the warmer parts of Europe and Asia, but is only a summer visitor in the colder parts. It is found in the south-eastern counties of England during the summer months, and occasionally further north, or even in the south of Scotland. The nest, a very rough loose structure of twigs, is placed on a branch or fork of a tree at no great distance from the ground. Two eggs are laid at a time, and several broods are reared in a season, the male taking an active share in the work of hatching and rearing the young. The food of the turtle-dove consists chiefly of seeds, and in some districts the number of birds present in a season is said to depend on the quantity of pine seeds. The turtle-dove is timid and cautious in its habits, and is effectively protected from birds of prey by its power of flying swiftly and almost noiselessly in and out among the trees even in the thickest part of a forest. Its plumage, though not so brilliant as that of the true pigeons, is very beautiful, the various tints of reddish-brown and gray shading softly into each other; the head and neck are blue, the tail-feathers tipped with white. Their beauty of form and colour, their soft cooing, and their affection towards each other and their young have made this

and other species of turtle-dove favourite cage-birds. They are easily tamed, breed readily in captivity, and have been known to live as long as fourteen years. *Turtur risorius*, called turtle-dove and ring-dove, is of a pale cream-colour, with a black half-ring round its neck. See PIGEON.

Tus. See MESHHED.

Tuscaloosa, once the capital of Alabama, 55 miles by rail SW. of Birmingham, is the seat of the state university and insane asylum, and has two women's colleges. Pop. 2500.

Tuscan Order, in Architecture, the simplest of the five classic orders, being a Roman modification of the Doric style with unfluted columns, and without triglyphs. See COLUMN.

Tuscany, formerly a sovereign grand-duchy in the west of Italy, lying for the most part, but not wholly, south and west of the Apennines, with an area of 9291 sq. m. Pop. (1860) 1,800,000; (1881) 2,208,869; (1890) 2,274,191. The north and north-east of the country is filled with mountains, whence numerous rivers and streams flow down to the sea, the most important of which is the Arno. This district is also the source of the Tiber (q.v.). The rest of Tuscany is an undulating region of hills and dales, except the coasts, which are flat and marshy (see MAREMMA). For the eight provinces of Tuscany, as a *compartimento* of the kingdom, see ITALY. Its ancient history is described at length in the article ETRURIA, and its mediæval history in the article FLORENCE (cf. also ITALY). It is only necessary to add that modern Tuscany was first constituted in its present dimensions in 1569, when Cosimo de' Medici became Grand-duke. On August 16, 1860, the national assembly of Tuscany pronounced the deposition of the reigning dynasty, and declared for annexation to Sardinia; and in February 1861 it was declared part of the new kingdom of Italy.

Tuscaroras, a tribe of Indians who were driven out of North Carolina by the settlers in 1715, and joined the Iroquois (q.v.).

Tusculum, anciently a city of Latium, about 15 miles S. of Rome, was situated on a ridge of hills known as the *Colles Tusculani*, and forming part of the Alban range. Octavius Mamilius, ruler of Tusculum, married a daughter of Tarquinius Superbus, and played a conspicuous part in the last of the great struggles made by the banished tyrant to regain his kingdom. But the Latins were so thoroughly beaten at Lake Regillus (496 B.C.) that they were fain to enter into an alliance with the victor, and ever after, except in the Great Latin War (340–338 B.C.), remained steady in their fidelity to Rome. As early as 378 B.C. the inhabitants of Tusculum received the Roman franchise. Towards the close of the Republic Tusculum became a favourite country residence of the wealthy Romans; Lucullus, Cato, Brutus, Hortensius, Crassus, Cæsar, and Cicero had villas here; and here the great orator composed his *Tusculanæ Disputationes*. In 1191 Tusculum was stormed by the Romans and ruined for ever; lower down arose the town of Frascati (q.v.). The amphitheatre, theatre, and city walls of ancient Tusculum remain.

Tusculum, a small town in the N.E. of Tennessee, U.S., with a small school notorious for granting various kinds of university degrees freely.

Tusk. See TORSK.

Tuskar Rock, 7 miles NE. of Carnsore Point, on the coast of Wexford, has a lighthouse 110 feet high, with a light visible for 15 miles.

Tussac Grass (*Dactylis cæspitosa*; syns. *Festuca cæspitosa*, *F. antarctica*, *F. flabellata*), a large grass of the same genus with the Cock's-foot Grass of Britain, a native of the Falkland Islands, remarkable for forming great tufts, sometimes 5 or 6 feet in height, the long tapering leaves hanging over in graceful curves, from 5 to 8 feet long, and an inch broad at the base. It is, however, sufficiently delicate to be very good food for horses and cattle; and it has been tried with success in the Hebrides, Orkney Islands, and other localities in which there is a peaty soil exposed to winds loaded with sea-spray. The inner part of the stem a little above the root is soft, crisp, flavoured like a hazel-nut, and often eaten by the inhabitants of the Falkland Islands. The young shoots are boiled and eaten as asparagus.

Tussac Grass (*Daetylis cæspitosa*).

Tussaud, MADAME, the foundress of the well-known exhibition of wax-work in London, was born (Marie Grosholtz) at Berne in 1760, and learned the art of modelling in wax in Paris. For a time she was engaged in giving lessons in modelling to Elizabeth, sister of Louis XVI., and in this way became acquainted with the leading personages at court. Imprisoned for three months during the Revolution, in 1802 she established herself in London, where she died 16th April 1850. The collection of upwards of 300 portrait figures (that of Voltaire and others still on view modelled by Madame Tussaud herself from life), with the 'Chamber of Horrors,' devoted to figures of murderers, instruments of torture, the guillotine of the Revolution, &c., is one of the sights of London. See the Life by Hayley (1878).

Tusser, THOMAS, in Fuller's phrase, 'successively a musician, schoolmaster, serving-man, husbandman, grazier, poet, more skilful in all than thriving in any vocation,' was born at Rivenhall in Essex about 1527. After serving as a chorister in the chapel of Wallingford Castle, and at St Paul's, he went to Eton, where he was whipped by Udall, was elected in 1543 to a scholarship at King's College, Cambridge, but soon afterwards removed to Trinity Hall, where he tells us that he dwelt trimly and passed his time joyfully with a number of learned men. After a residence at court as a retainer of Lord Paget, he married and settled as a farmer at Cattiwade, near East Bergholt, in Suffolk, where he compiled his famous work, *A Hundreth Good Pointes of Husbandrie* (1557). Quarrelling with his landlord, Tusser left his farm, and became a lay clerk in Norwich Cathedral, which post he again gave up for a farmer's life. He died in London about April 1580, and was buried in the church of St Mildred in the Poultry. Tottel published in 1573 an edition of his book enlarged into *Five Hundreth Pointes of Good Husbandrie*, with a curious metrical autobiography. Warton says well that this old English Georgic has much more of

the simplicity of Hesiod than of the elegance of Virgil, still it reflects in a pleasing manner the simpler virtues of the good old times.

Editions are by Dr W. Mavor (1812), Mr Arber (1873), and the English Dialect Society (1879).

Tussila'go, a genus of plants of the natural order Compositæ, sub-order Corymbiferæ. *T. farfara*, sometimes called Colt's-foot, is the only British species. It has single-flowered scaly scapes, appearing before the leaves in early spring, the flowers yellow, both disc and ray; the leaves heart-shaped, angular, downy beneath. The leaves have a somewhat glutinous and subacrid taste, and are used either by smoking or in the form of a decoction for relief of asthmas and troublesome coughs. They are clothed on the under side with cottony down, formerly used as tinder. The feathery pappus-hair which succeeds the flowers is eagerly sought by goldfinches to line their nests. Nearly allied to this genus is Petasites, of which one species, the Butter Bur (*P. vulgaris*, formerly *T. petasites*), is a native of Britain. The leaves resemble those of *T. farfara*, but are much larger; the flowers also appear before the leaves, but in a dense thyrsus, and are of a pale flesh colour. The flowers of both are much sought after by bees, as are those of *P. alba* and *P.* (both formerly *T.*) *fragrans*, natives of the south of Europe, not uncommon in British flower-gardens.

Colt's-foot (*Tussilago farfara*).

Tussock Moth and Caterpillar.

Tussock Moth (*Dasychira pudibunda*), a grayish-white moth about an inch long, the caterpillars of which do great mischief in hop grounds, and are known as *Hop-dogs*. The caterpillar is delicate green in colour, with brush-like tufts of yellow hairs on several of the segments. It feeds on leaves throughout the summer, becomes a hairy chrysalis about September, and emerges as a moth in the following spring. Miss Ormerod recommends a hard syringing if the caterpillars are present in large numbers.

Tutbury, in Staffordshire, on the river Dove, 6 miles by rail NW. of Burton-on-Trent, with the ruins of the pre-Norman castle where Mary Queen of Scots was twice imprisoned. Pop. 2306.

Tuticorin (*Tuttukudu*), a port at the south-east corner of India, 35 miles E. of Tinnevelly by rail, with pearl-fisheries and Catholic missions. Pop. 11,000.

Tutor, in the law of Scotland, means a guardian of the person as well as of the estate of a boy under fourteen, or a girl under twelve: that is, while they are in a state under that of puberty. See GUARDIAN, INFANT.

Tuttlingen, a town of Würtemberg, on the Danube, 20 miles WSW. of Sigmaringen. It has manufactures of boots, knives, &c. Here on 24th November 1643 an Austro-Bavarian force defeated the French. Pop. 8659.

Tver, capital of a Russian government at the confluence of the Volga and Tvertsa, 100 miles NW. of Moscow by rail. There are manufactures of cottons, hosiery, and nails. Pop. (1890) 39,280.

Twain, MARK. See CLEMENS, S. L.

Tweed, the noblest of Scottish rivers, rises far up in Peeblesshire at Tweed's Well, 1500 feet above sea-level, and flows 97 miles north-eastward, eastward, and again north-eastward, through or along the boundaries of Peeblesshire, Selkirkshire, Roxburghshire, Berwickshire, and Northumberland, till it falls into the German Ocean at Berwick-on-Tweed. It receives Gala Water, Ettrick Water (itself fed by Yarrow), the Leader, the Teviot, the Till, the Whitadder, and a number of lesser tributaries; is tidal for 10 miles, but almost quite unnavigable; and traces the English border for only 18½ miles, so that 'North of the Tweed' is a none too accurate phrase. It is famous for its salmon-fisheries, but more famous far for its memories: 'which of the world's streams,' asks George Borrow, 'can Tweed envy, with its beauty and renown?' For it flows by Neidpath, Peebles, Traquair, Ashiesteel, Abbotsford, Melrose, the Eildons, Bemersyde, Dryburgh, Kelso, Coldstream, and Norham Castle; nor are these a tithe of Tweedside's historic scenes. Merlin, Thomas of Ercildonne, and Michael Scott—the Tweed has dim legends of these; and its ripple was the last sound heard by a fourth and a mightier wizard than them all, Sir Walter.

See BORDERS; Sir Thomas Dick Lauder's *Scottish Rivers* (new ed. 1890); and Veitch's *River Tweed* (1884).

Tweed, 'BOSS.' See TAMMANY SOCIETY.

Tweedmouth. See BERWICK-ON-TWEED.

Tweeds. See WOOL.

Twelfth-day, the twelfth day after Christmas, the feast of the Epiphany (q.v.), was once a time of great popular festivities, originally designed to honour the Three Kings (see MAGI). One of the chief features was the choosing of a king of the feast by means of a bean hidden in the *Twelfth Cake*. When on the eve of the feast this cake was cut up and distributed, the person in whose portion the bean was found was king—hence called Bean-king. This choosing of a king by means of a bean was in use at some other festivals also.

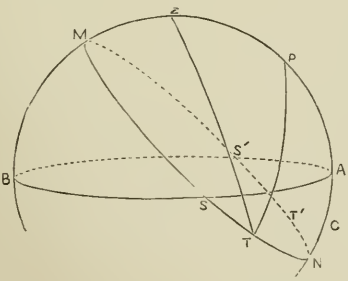
Twelve Patriarchs, TESTAMENTS OF THE, a work of the 2d century after Christ, in which, on the model of Jacob's blessing of the tribes in Genesis xlix., discourses and prophecies of Christ are put into the mouths of the fathers of Israel. There are monographs on it by Vorstmann (1867), Sinker (1879), and Schnapp (1884).

Twelve Tables (Lat. *Lex Duodecim Tabularum*), the name given to the earliest code of Roman law, civil, criminal, and religious, made by the decemvirs in 451–449 B.C. (A.U.C. 302–304). These, originally comprised in ten tables, to which next year two others were added, were supposed to form the basis of all Roman law, and in Cicero's time were still committed to heart by boys at school. But they were very far from being a complete system. The occasion for them arose in the constant complaints made by plebeians of oppression by patricians; and the principal aim of the twelve tables

was to define rights, fix penalties, and prevent oppression under legal forms. Some of them were based on Greek models; most of them were derived from earlier Roman legislation. But laws about which there was no dispute were not included; thus they did not deal with the family, the succession, or ordinary legal procedure, and contained little of customary law. Many older laws were left intact by them, and reappear in Justinian's code. To the original tables commentaries were from time to time added. It is probable that the original bronze tablets on which the laws were written perished in the sack of Rome by the Gauls in 390 B.C.; copies of them stood in the forum in the 2d century A.D. Of the text we possess only fragments edited by Schöll (1866), Voigt (1884), and Godefroy; see also Wordsworth's *Fragments* (1874), Ortolan's *History of Roman Law* (trans. 1871), and Muirhead's *Historical Introduction* (1886).

Twickenham, a town of Middlesex, on the north bank of the Thames, 11½ miles SW. of London. It is a place of many villas, and has been the residence of many notabilities—Catharine of Aragon, Lord Bacon, Lord Clarendon, Pope (who is buried in the church), Horace Walpole (Strawberry Hill still remains, although a good deal altered), Kitty Clive, several of the Orleans family, J. M. W. Turner, Lord Tennyson, &c. Pop. (1851) 6254; (1891) 16,026. See R. S. Cobbett's *Memorials of Twickenham* (1872).

Twilight. If the earth had no atmosphere we should be involved in total darkness from the instant of sunset till the instant of sunrise. The transition from day to night, and from night to day, occupies an interval which varies with the latitude and the declination of the sun, and this intermediate stage is called twilight. As long as the sun is not more than 18° below the horizon its light is reflected by the air and the clouds and vapour suspended in it in sufficient quantity to render even distant objects visible. The question of the duration of twilight is, therefore, simply reduced to this: How long after sunset, or before sunrise, does the sun reach a position 18° below the horizon of a given place? And this can be answered easily by calculation in spherical trigonometry. Thus, if Z be the zenith, P the pole of the



heavens, ASB the horizon, and MSTN the (small) circle which the sun describes about the pole; there is twilight while the sun moves from T to S, ZT being an arc of 108°. In the spherical triangle ZPT, we know the three sides, for ZP is the colatitude of the place, PT the sun's polar distance, and ZT is 108°. Hence we can calculate the angle ZPT, which is the sun's *hour-angle*; and from this we find at once how long before or after noon the sun passes the point T. If ZT′ be also 108°, we see that it is night while the sun moves from T′ to T, day while it moves from S (through M, its meridian position) to S′, morning twilight from T to S, and evening twilight from S′ to T′. Make ZC = 108°, then, if PN be less than PC, but greater than PA, there will be no point of the sun's path (MS′NS) so far as 108° from Z; and therefore the points T and T′ will not exist. In this case the sun will set and rise, but there will be *no night*, or, rather, twilight will occupy the whole interval from sunset to sunrise. This cannot occur in low latitudes, but does occur during certain periods of the year in northern and southern countries. For

PN is 90° − sun's declination,
PC is latitude + 18°,

and our condition is, therefore, that 90° − sun's declination, while greater than the latitude, does not exceed it by more than 18°. Or, in a simpler form, the latitude, together with the sun's declination, must lie between 90° and 72°. Now the sun's greatest declination is about 23° 30′, and therefore in lat. 48° 30′ (72° − 23° 30′) there will be one night in the year (at the summer solstice) consisting wholly of twilight; for higher latitudes, more; and for lower, not one.

Twill, a woven fabric, in which the warp is raised one thread, and depressed two or more threads for the passage of the weft: this gives twill a curious appearance of diagonal lines.

Twining, THOMAS, translator of Aristotle's *Poetics*, was born the son of a prosperous tea-merchant in 1734, but, preferring study to business, entered Sidney Sussex College, Cambridge, and graduated B.A. in 1760. He took orders, and became in 1768 rector of White Notley in Essex, in 1770 also of St Mary's, Colchester. A pious and scholarly man, of wide reading and good critical powers, he discharged his clerical duties with zealous honesty, finding his solace in music, letter-writing, and travelling over England, and died, after a well-spent life, 6th August 1804. His translation of the *Poetics* of Aristotle—a sound piece of scholarship—appeared in 1789. His great-nephew published in 1883 a selection from his correspondence under the title *Recreations and Studies of a Country Clergyman of the 18th Century*. Its success induced a further book, the much less interesting *Selections from Papers of the Twining Family* (1887), the chief contributor in which is not the clergyman, but his brother, Richard Twining, head of the tea-business.

Twinkling. See SCINTILLATION.

Twiss, SIR TRAVERS, jurist, was born in Westminster, 19th March 1809, and was educated at University College, Oxford. Successively fellow and tutor of his college, a public examiner at Oxford, professor of Political Economy at Oxford (1842–47), and of International Law in King's College, London (1852–55), he became in 1855 professor of Civil Law at Oxford. In 1858 he became Chancellor of the Diocese of London, in 1862 Advocate-general of the Admiralty, Queen's Advocate-general in 1867, being knighted that same year. He served also on various royal commissions. He resigned all his offices in 1872, but thereafter in 1884 drew up for the Belgian King Leopold II. a constitution for the Congo Free State, and in 1885 acted as legal adviser to the West African Conference at Berlin. He died on the 14th January 1897. His writings rank admittedly among the most authoritative on questions of public and international law. Among the most important are *View of the Progress of Political Economy since the 16th Century* (1847), *Lectures on International Law* (1856), *The Law of Nations* (1861), *Law of Nations in Times of War* (1863), *Monumenta Juridica: The Black Book of the Admiralty* (4 vols. 1871–76), an edition for the Rolls series of the *De Legibus et Consuetudinibus Angliæ* of Henry de Bracton (6 vols. 1878–83), and *Belligerent Right on the High Seas* (1884).

Tyburn. See LONDON, p. 705, and EXECUTION.

Tye, CHRISTOPHER, English musician, was born at Westminster about 1500, was educated in the King's Chapel, and was musical instructor to Edward VI. He received his Mus. Doc. from Cambridge in 1545, from Oxford in 1548. Under Elizabeth he was organist to the Chapel Royal, and produced various fine services and anthems.

Tyldesley, a town of Lancashire, 10 miles NW. of Manchester, with cotton-mills and collieries. Pop. with Shakerley (1881), 9953; (1891) 12,891.

Tyler, JOHN, tenth president of the United States, was born in Charles City county, Virginia, March 29, 1790, graduated at William and Mary College in 1807, and two years later was admitted to the bar. He sat in the state legislature from 1811 till 1816, when he was chosen to fill a vacancy in congress. He was returned in 1817, and again in 1819, and distinguished himself as a strict constructionist, opposed protection, and, on the Missouri question, denied the right of congress to limit the extension of slavery, or to control it at all in the territories. In 1825–26 he was elected governor of Virginia, and in December 1826 a United States senator—partly by the votes of Clay's supporters; but in the senate he pursued an independent course, and, while in 1832 he supported Jackson rather than Clay for the presidency, in February 1833 he was the only senator who recorded his vote against the 'force bill' granting extraordinary powers to the president in dealing with South Carolina (see JACKSON). And yet Tyler disapproved of Nullification (q.v.); only he disapproved still more of arbitrary and unconstitutional action on the part of the federal executive. This motive accounts for his action also in the case of the United States Bank (see JACKSON). He had denounced its existence from his first entrance on a public career; but he resented the despotic methods by which Jackson overthrew it, and he supported Clay's motion to censure the president, and, declining to obey instructions to vote for expunging this motion from the minutes, in 1836 resigned his seat. In 1840 he was elected vice-president of the United States, with General Harrison as president. President Harrison died April 4, 1841, a month after his inauguration, and by this event Tyler became president. In the first year of his administration he had to face a struggle with the Whig majority in congress and the senate, headed by Clay, who regarded the result of the election as a victory for them and for the project of a re-established national bank. Two bills were passed to this end, and both, in spite of the storm raised, were vetoed by the president. After the second veto, in September 1841, all his cabinet except Daniel Webster resigned; and Webster followed the rest in 1843, his place being taken in 1844 by John C. Calhoun. But victory lay with the president, whose firmness utterly and finally destroyed the project, and with it the notion of paternal government. In 1842 he vetoed two protective bills providing for a distribution of the surplus revenues among the states. Besides the Ashburton (q.v.) treaty, the most important act of his administration was the annexation of Texas, in March 1845. At the close of his term of office he retired to Virginia and to private life until 1861, when he was president of a peace convention at Washington. Failing in his efforts at a compromise, he gave his adhesion to the Confederate cause, and was a member of the Confederate congress until his death, at Richmond, January 18, 1862. See his son's *Letters and Times of the Tylers* (2 vols. Richmond, 1884–85).

Tyler, WAT, leader of the peasant revolt of 1381. According to the traditional story, an insult offered by a tax-gatherer to the daughter of Walter the Tyler (a tiler of roofs) at Dartford in Kent led to the outbreak. Wat brained the tax-gatherer; and under Wat and Jack Straw the populace rose throughout Kent and Essex. Their first act was to liberate John Ball, who lay in Maidstone prison for Wyclifite teaching and seditious utterances, and then they marched on London. The several causes of the rebellion, its brief course, and its swift and summary suppression, with the death of Wat at the hands of Lord Mayor Walworth, are treated at RICHARD II.

Tylor, EDWARD BURNETT, the most philosophical of our anthropologists, was born at Camberwell, 2d October 1832, and had his education at the Friends' school, Grove House, Tottenham. Meeting the ethnologist Mr Henry Christy in Cuba in 1856, he accompanied him on a scientific journey through Mexico, one result of which was his *Anahuac, or Mexico and the Mexicans* (1861). An F.R.S. (1871), an LL.D. of St Andrews (1873), and a D.C.L. of Oxford (1875), he was appointed keeper of the Oxford University Museum (1883), Reader in Anthropology (1883), and Professor of Anthropology (1895). He was in 1888 Gifford lecturer at Aberdeen, and became president of the Anthropological Society in 1891. His *Researches into the Early History of Mankind* (1865) and *Primitive Culture* (2 vols. 1871; 3d ed. 1891) stand first among works of their class, in learning, arrangement, grasp of principles, and breadth of view. The foundation of his philosophy of man is involved in the new sense which he has given to the word Animism (q.v.). One of the best introductory handbooks to a subject ever written is his *Anthropology* (1881).

Tympanum. See EAR.

Tyndale, WILLIAM, memorable in the history of the English Bible, was born about 1484, and was a native of Gloucestershire, born most probably at Melksham Court in the parish of Stinchcombe, rather than at Hunt's Court, North Nibley. He had his education first at Oxford—at Magdalen Hall, says unvarying tradition—and graduated B.A. in 1512. His name occurs in Boase and Clark's *Register of the University of Oxford* (1884–88) as William Hychyns—a name said to have been assumed by his great-grandfather, and by which at any rate, together with Tyndale's, he is described in official documents. It is probable enough that at Oxford he may have been influenced by the disciples of Colet, who himself lectured here till 1505, and it is still more probable that he was attracted to Cambridge by the fame of Erasmus, who lived there from about 1510 to 1514. He left Cambridge most probably about the close of 1521 to become chaplain and tutor in the household of Sir John Walsh of Little Sodbury in Gloucestershire. His sympathy with the new learning soon aroused suspicion, and in 1523 he went up to London, where he was hospitably entertained in the house of Humphry Monmouth. He was already a competent Greek scholar, and in his unsuccessful application to Tunstall, Bishop of London, he carried with him a translation of part of Isocrates as a recommendation. In the spring of 1524 he went to Hamburg, probably made his way thence to Wittenberg, next in the autumn of 1525 to Cologne, and there, with the help of a Franciscan friar named William Roye, and another, began with Quentel in 1525 the printing of his English New Testament in an impression of 3000 copies in quarto size. This had not proceeded beyond the gospels of Matthew and Mark when the officious intrigues of Cochlæus forced Tyndale to flee to Worms, where, instead of completing Quentel's unfinished work, Peter Schoeffer printed for him another impression of

3000 copies in a small octavo size, without prefaces to the books or annotations in the margin. The quarto was completed soon after, most probably also by Schoeffer, with general introduction, prologues, inner marginal references, and outer marginal glosses, these last largely taken from Luther's version of 1522, the references especially being faithfully copied in many cases even to the errors. The translation itself owed much to Luther, much also to the 3d ed. (1522) of the Greek Testament of Erasmus with its Latin translation. Tunstall and Warham denounced the book, hundreds of copies were bought up and burned by their authority, but in both forms it made its way by the summer of 1526 to the hearts of Englishmen, and the strong simplicity and homely vigour of its style established a standard of biblical translation into English, and bequeathed its phrases imperishable to all posterity. By 1530 as many as six editions, of which three were surreptitiously printed at Antwerp, had swiftly and silently been dispersed, yet, says Westcott, so fierce and systematic was the persecution that of these six editions, numbering perhaps 15,000 copies, there remains of the first quarto fragment but one copy, and that imperfect (Grenville Library, Brit. Mus.; photo-lithographed by Mr Arber, 1871), of the first octavo but two, one incomplete (in St Paul's Cathedral Library), the other wanting only the title-page (in Baptist College, Bristol; fac-simile by Mr Francis Fry, 1862), and of the others but two or three copies, and these not satisfactorily identified.

Meantime Tyndale continued to toil indefatigably at the labour of his life. In 1530 he published at Malborow (Marburg) by Hans Luft his version of the *Pentateuch* (reprinted by Rev. Dr J. I. Mombert, 1885), where the marginal glosses, almost all original, contain many violent attacks on the pope and the bishops, full of rich satire, irony, and even humour. It is scarcely possible, *pace* Dr Mombert, that Tyndale could have found time to master Hebrew very thoroughly, and we find that here, still more than in his New Testament, he leans heavily on Luther. Later, in 1531, appeared his version of *Jonah*, with a prologue (fac-simile by Mr Fry, 1863). An unauthorised revision of Tyndale's New Testament was made at Antwerp by George Joye in August 1534, and in November of the same year Tyndale himself issued there at the press of Marten Emperowr a revised version with short marginal notes and prologues, together with a translation of the 'Epistles taken out of the Old Testament which are read in the church after the Use of Salisbury upon certain days of the year.' These include a large number of portions from the Old Testament and the Apocrypha. One copy of this work, probably that preserved in the British Museum, was struck off on vellum and beautifully illuminated for presentation to Queen Anne Boleyn, under whose favour apparently was printed in 1536 by T. Godfray a reprint of Tyndale's revised New Testament—the first volume of Holy Scripture printed in England. Once again before the end Tyndale revised his Testament (1535), this time without the marginal notes, but with the innovation of headings to the Gospels and Acts, but not the Epistles. Another point of difference was a peculiarity of orthography (*macster*, *faether*, *moether*, *stoene*, *moost*, &c., 200 in all), long suspected erroneously to have been an attempt to supply provincial forms for English rustics, but more probably, as Mr Demaus, Bishop Westcott, and Mr Ellis believe, due to the copy being read to a Flemish compositor, who gave the Flemish equivalents of the English vowel-sounds.

But now it wanted only the crown of martyrdom to consecrate the lifelong devotion of Tyndale to his task. Already the emissaries of Henry VIII. had often tried to get hold of him, or at least to discover his hiding-place. He had spent two quiet years of constant labour at Antwerp, part of the time in the house of Thomas Poyntz, when he was seized through the treachery of one Henry Philips, 24th May 1535, 'not without the help and procurement of some bishops of this realm' says Hall. For sixteen months he lay in the castle of Vilvorde, and it appears that Cromwell made some ineffectual efforts to save him. A single letter in Latin, discovered by M. Galesloot in the archives of the Council of Brabant, is reproduced in fac-simile by Mr Demaus, and gives a touching picture of the noble martyr sitting through the long winter nights in the cold and darkness of his dungeon, and asking above all things for a lamp and his Hebrew Bible, Grammar, and Dictionary. It is highly probable that his prayer was granted, and that before the end he had completed, according to unvarying tradition, the translation of the Old Testament to the end of the Books of Chronicles. This part of his work was printed by John Rogers, along with Tyndale's Pentateuch and New Testament, in what is usually known as Matthews' Bible. Tyndale's protracted trial was apparently not begun till 1536; on Friday the 6th October of that year he was first strangled, then burned. Foxe tells us that at the stake he cried 'Lord, open the king of England's eyes!' Eight years before he had written, 'If they shall burn me, they shall do none other thing than that I look for. . . . There is none other way into the kingdom of life than through persecution and suffering of pain, and of very death, after the ensample of Christ.'

Tyndale's chief original works were *A Parable of the Wicked Mammon* (1527); *Obedience of a Christian Man*, his most elaborate book (1528); and *Practice of Prelates* (1530), a pungent piece of controversial polemic, called forth by Sir Thomas More's *Dialogue* (1529), which he met formally with his plain and pointed *Answer* (1531). More followed next year with the first part of his long and intemperate *Confutation*, a work unworthy of its author's reputation. Tyndale's *Works* were published, together with those of his dear friend Frith, and Barnes, in folio by John Daye in 1573. His *Doctrinal Treatises and Introductions to Different Portions of the Holy Scripture* were published by the Parker Society in 1848; his *Expositions and Notes on the Holy Scriptures, together with the Practice of Prelates*, in 1849, and the *Answer to More's Dialogue* in 1850. It was fortunate for our literature that the task of translating the Bible fell to a writer with such a splendid sense of English as William Tyndale. He gave to his work an independent and ineffaceable stamp of originality, and, if later revisers of greater learning have amended his renderings, the characteristic language of the English Bible remains his own. See the admirable biography by the Rev. R. Demaus, revised ed. by Richard Lovett (1886); also Westcott's *General View of the History of the English Bible* (2d ed. 1872), and Francis Fry's *Bibliographical Description* of forty editions of Tyndale's version in English (1878).

Tyndall, John, physicist, was born 21st August 1820 at Leighlin-Bridge, County Carlow, was employed for a time on the ordnance survey, and for three years was a railway engineer at Manchester. In 1847 he became teacher of physics at Queenwood College, Hampshire, where he began original researches. In 1848 he and his colleague, Dr Frankland, went to Germany and studied at Marburg (under Bunsen); and there, at Berlin, and elsewhere he made investigations into diamagnetism and the magneto-optic properties of crystals. Already an F.R.S., he was in 1853 made professor to the Royal Institution, of which in 1867 he became superintendent. In 1856 Professor Huxley and he made a visit to the Alps, which resulted in a joint work on the structure and motion of glaciers. Tyndall was the first who ever climbed the Weisshorn. In 1859 he began his important

researches on radiation; a later subject was the acoustic properties of the atmosphere. In 1874 he was president of the British Association at Belfast, and by the materialist tone of his presidential address raised keen and long-lasting controversies. He was for some years scientific adviser to the Board of Trade and to the light-house authorities, but in 1883 retired from most of his appointments and established himself in the country (in Sussex). He was especially famous as a brilliant lecturer and as a popular exponent of modern physical science. The proceeds of a successful lecturing tour in the United States (1872) he devoted to founding scholarships for original research at Harvard and Columbia colleges. Among his honours were the LL.D. of Edinburgh and Cambridge, and the D.C.L. of Oxford. He died (from an overdose of chloral) 4th December 1893.

His works comprise *The Glaciers of the Alps* (1860); *Mountaineering* (1861); *Heat as a Mode of Motion* (1863); *On Radiation* (Rede Lecture, 1865); a volume on Light, one on Sound, one on Electricity, one on Faraday, and one on the forms of water in clouds, rivers, ice, &c.; also *Hours of Exercise in the Alps* (1873); *Fragments of Science* (5th ed. 1876); Essays on the *Floating Matter of the Air* (1881); and *New Fragments* (1892).

Tyne, a northern English river, formed by the confluence of the North Tyne and the South Tyne, a mile NW. of Hexham. It flows east for 30 miles, and enters the sea between Tynemouth and South Shields. Some of the head-streams of the North Tyne rise in Scotland, about 11 miles SE. of Hawick. It flows south across Keelder Moor, and south-east to Hexham, with a total length of 32 miles, and receives on the left the Reed Water near Bellingham. The South Tyne rises on the slopes of Cross Fell, flows 19 miles north to Haltwhistle, then 14 miles east to Hexham, receiving the Allen on the right. The scenery of the two head-streams is beautiful beyond most, and few districts of England, moreover, are richer in romantic and historical associations. The Tyne itself flows through the richest coal-mining region of Britain, and on its banks stand Corbridge, Ovingham, Newburn, Ryton, Blaydon, Newcastle and Gateshead, Walker, Jarrow, North and South Shields. Its chief affluents are the Derwent and the Team on the right. Navigable from Blaydon, about 8 miles above Newcastle, from that city to the sea it is one continuous harbour. The salmon-fisheries have decayed, but the shipbuilding maintains its importance. The multifarious manufactures carried on on Tyneside (which sadly defile the lower course of the stream) may be realised by referring to the article NEWCASTLE, where also the sea-borne trade and the deepening of the river are referred to. For statistical and some other purposes, Newcastle and North and South Shields are grouped together as the 'Tyne ports.' The Tyne is also famous among English rivers for its boat-racing (see ROWING). See Guthrie's *River Tyne* (1880), Palmer's *Tyne and its Tributaries* (1881), and Cassell's *Rivers of England*.

Tynemouth, the chief watering-place of Northumberland, 9 miles E. of Newcastle, occupies the angle formed by the line of the coast and the Tyne. The municipal and parliamentary borough comprises the townships of Tynemouth, North Shields (q.v.), Chirton, Cullercoats, and Preston. From an early period Tynemouth was a place of importance. Edwin, King of Northumbria, is said to have founded here, about 627, a church of wood, wherein his daughter Rosella took the veil. King Oswald rebuilt it of stone about 640, and probably established the monastery, which in the succeeding centuries suffered much from the hands of the Danes. It was refounded in 1090 by Mowbray, Earl of Northumberland. The monastic buildings were dismantled at the dissolution in 1539. The remains of the priory are chiefly those of the church, which was built about 1100 and enlarged about 1220. The chancel, whose eastern and southern walls are still standing, is one of the most exquisitely light and graceful specimens of Early English architecture in the country. The Lady Chapel, a chantry of the Percies, was founded towards the close of the 14th century. Tynemouth castle was built about 1296. All that remains of it now is the great gateway of 14th-century date.

Tynemouth is a clean, healthy town, with several good streets and terraces. A wide road extends to Cullercoats called the Grand Parade. The sands are nearly a mile long, and the Permian cliffs are very picturesque. The aquarium, built 1877–78, is now used for promenade concerts. The pier, over half a mile in length, was built in 1854–92. On the cliff above it is the lighthouse, 62 feet high. A monument to Lord Collingwood, by Lough, was erected in 1845 on Galley Hill. The Tynemouth Life Brigade, formed on the 5th December 1869, was the first volunteer life brigade in the kingdom. The borough sends one member to parliament. Pop. of township (1881) 22,548; (1891) 28,307; of borough (1891) 46,267. See W. S. Gibson's *Monastery of Tynemouth* (2 vols. 1846).

Type, in Chemistry, a chemical compound which represents the composition and structure of many more complex compounds; especially Gerhardt's four types—hydrochloric acid (HCl), water (H_2O), ammonia (NH_3), and marsh-gas (CH_4).

Type, in Theology, specially the foreshadowing in the Old Testament of something realised in the New (the *antitype*). Thus in the New Testament the brazen serpent is a type of Christ (John, iii. 14), and so is the paschal lamb (1 Cor. v. 7). The seeking and finding of types was carried to an arbitrary extreme in the allegorical interpretation (see EXEGESIS, ORIGEN). See Fairbairn, *Typology of Scripture* (1845–47; 6th ed. New York, 1880).

Types (Gr. *typos*, 'an impression' or 'stamp') are pieces of metal, wood, or other material, on one end of which is cast or engraved a character, sign, &c. Provided that black ink and white paper are used, the character printed by the type will be in black, in which case it will be raised or in relief, or in white, when it will be incised or in intaglio, when the surrounding parts will print. The latter kind of letters is only used for decorative purposes. The word 'type' is held to include many characters which are not letters, such as punctuational signs, astronomical signs, ornaments, pieces of borders, musical characters. A necessary complement to types are the spaces which divide words and fill up openings in composed 'forms.'

A fount (see PRINTING) of Roman and Italic comprises no less than 227 different characters or 'sorts,' as they are called. The Roman capitals, including diphthongs, number 28; small capitals, 28; lower case and ligatures, 34; ordinary accents, 21; points and references, 16; figures and £ mark, 11; Italic capitals and diphthongs, 28; lower case and ligatures, 34; ordinary accents, 21; points, 6. *Ligatures* are types cast together, as fi, fl, ffi. Other kinds of types are *logotypes*, or word-types—the letters of a word, an affix or prefix, in frequent use, such as *the*, *and*, *ing*, *com*, which are sometimes cast in one piece in order that they may be picked up by one motion from the cases, instead of being lifted separately. The economy of using logotypes has never been satisfactorily demonstrated. Certain type-composing machines cast whole lines of letters forming a bar, but these are

not classed as types. Types are short letters (a, e, o), ascenders (which go above the line of the shorts, as b, d, h), or descenders (g, p, y). The sizes of types are designated by different names in respect of their 'body'—i.e. the depth of the 'face' which comes in contact with the ink plus the 'bevel' and 'beard'—or nearly the whole square at the end of the 'shank' on which the 'body' is formed (see fig. 1 in PRINTING); for there may be several sizes of face on one size of body. Below is a list of the number of lines to the foot of the respective bodies as made in metal types, large wooden types being otherwise described:

Canon.....18½	Bourgeois.....102
Two-line Double Pica.....20¾	Brevier.....111
Two-line Great Primer.....25½	Minion.....122
Two-line English.....32	Emerald.....128
Two-line Pica.....35	Nonpareil.....144
Double Pica.....41½	Ruby Nonpareil.....162
Paragon.....44½	Ruby.....166
Great Primer.....51¼	Pearl.....179
English.....64	Diamond.....204
Pica.....72	Gem.....222
Small Pica.....83	Brilliant.....238
Long Primer.....89	Semi-nonpareil.....288

The figures are not absolutely accurate; a type of the same name may be at one foundry cast slightly larger than at another; but the discrepancy is very minute. Many pages of type are 'leaded,' have spaces or leads between the lines, and to such this table will not apply, unless the width of the lead is known. The present page is 'solid,' not 'leaded,' and the body of the type can be readily identified. In America types are designated according to the number of 'points' of which the body consists. The point is $\frac{1}{72}$ of a Pica; Nonpareil would accordingly be called six points. On the continent of Europe the point is $\frac{1}{72}$ of a Cicero, a body between Pica and English. The following specimen lines show the usual bodies used in the text of books and newspapers; (1) being set in English, (2) in Pica, (3) in Small Pica, (4) in Long Primer, (5) in Bourgeois, (6) in Brevier, (7) in Minion, (8) in Nonpareil, and (9) in Pearl.

Types vary greatly in *width;* indeed in a complete fount, including spaces, &c., there are no less than 190 different widths or thicknesses between f, i, j, l and m and w. These widths are arbitrary, and in some cases are the result of accident. To meet the requirements of newspaper printing several letters have been made broader of recent years, as may be seen from the *Times*, in which some ordinarily thin letters have a larger proportion of space at the side than the others.

Type-metal is composed of tin, antimony, copper, and lead; for average purposes the proportion may be given as lead, 100 lb.; antimony, 35 lb.; tin, 15 lb.; copper, 4 lb. But type-founders have certain secrets jealously guarded. The antimony gives hardness (and brittleness); and as it expands on solidifying in the mould, ensures sharp faces. Tin gives toughness and makes the metal flow more easily. Copper slightly hardens and toughens. Old type, stereotype, &c. are sometimes utilised, but are rather adulterants. The faces of types are sometimes electroplated with copper, nickel, &c. For resisting great tear and wear brass types are made to a limited extent, both for letterpress printing (labels, advertisements, &c.) and for bookbinders' 'blocking' work. Large wooden types, which are cheaper, lighter, and not so easily fractured by a fall, are cut or engraved either by hand or by a machine which combines the principles of a Pantagraph (q.v.) and an engraver's 'routing' machine.

Various substitutes for type-metal have been proposed, mainly by non-practical inventors—potter's clay, moulded wood, paper pulp, sawdust, glass. Vulcanised rubber has been largely used (since 1868) for making the upper face of single letters and of small casts to be used as stamps. The letters of Type-writers (q.v.) are generally of india-rubber. And for large letters an elastic surface has been used which has glue for its chief ingredient.

In type-founding there are five principal processes—(1) cutting the punch, (2) sinking and adjusting the matrix, (3) compounding the type-metal, (4) casting the type, (5) finishing and dressing the type. A well-tempered steel punch is engraved with the design of the character in relief. This is next struck or punched into a piece of soft metal—finely-burnished copper; a separate piece being required for each character, which, when finished and justified, becomes the matrix. A cheaper kind of matrices is made from ordinary type or specially engraved type by a process of electrotyping. In founding the matrix is fitted to the mould, an ingenious mechanism in two parts, each constructed of several pieces of steel screwed together and fitting closely everywhere except in the centre, where an opening remains of sufficient extent to form the body of the type. The hand-mould, as distinguished from the machine-mould, is further enclosed in a wooden box to save the workman's hand from injury. Attached to the mould is a spring to hold the matrix in position. A spoonful of molten metal is quickly poured into the opening of the mould, which receives at the same time an upward jerk or throw, the matrix removed, the mould opened, and the newly-cast type pulled out.

In 1838 David Bruce of New York invented the type-casting machine which has revolutionised the art of type-founding. By the hand-casting process from 2000 to 3000 ordinary body types was considered a good day's work; by the machine the quantity produced is increased at least fourfold, the method of casting is also much simplified and the labour of the caster rendered less arduous. In place of the many motions necessary in hand-casting, the simple turning of a crank-handle produces a letter in a marvellously short space of time. The mould for the machine has, however, undergone little change beyond being adapted to a new position in the apparatus. In 1862 J. R. Johnson and J. S. Atkinson of London patented a machine in which all operations subsequent to punch-cutting and matrix-justifying were performed automatically; and this was afterwards improved by Mr P. M. Shanks.

Styles of Types.—The earliest books were printed with types resembling the styles for book-writing then popular in the middle of the 15th century. Pointed Black Letter (q.v.) was preferred for church service-books; but for books for the laity a simpler form of black letter was preferred (*lettre de somme*, semi-Gothic, or better, pointed Gothic). Neither form was popular in Germany, and in 1486 Rewich took the departure which led to the German character in which most German printing is still done. The first printers of Italy, themselves Germans, Sweinheym and Pannartz (1465–73),

began works with new types of the Roman form, but with many features of the black letter. In 1467 a rival German printer, Hahn, began printing in another Roman letter, which also showed a preference for the Gothic form. The first really good form of Roman, adopted everywhere to the suppression of all others, was made by Jenson of Venice, and shown in his *Eusebius* of 1470. Accepted by the educated, it was, however, rejected by the common people, who were just beginning to buy books; and Jenson had to print popular books in Gothic characters; and the most beautiful contemporary books of Paris, the Netherlands, and England were in pointed letters. The first book printed in England in Roman type was Henry VIII.'s treatise which secured for him the title of 'Defender of the Faith;' so printed by Pynson possibly in deference to Italian taste and in compliment to the pope. Aldus Manutius (see ALDINE EDITIONS) added a new style, the Italic, based on a written style then popular with copyists. The Italic, first shown in the 1501 *Virgil*, differed from modern Italic in several respects, notably in the fact that the capitals are upright and stand apart from the text. Aldus's Italic and others imitated from it was soon found to be less readable than Jenson's Roman, and was relegated to the work of a 'display letter'—to distinguishing foreign or emphatic words in a sentence (even for this purpose its use is now diminishing).

The Lyons founders, moved by the popularity of Italic, soon after produced the Cursiv-François or Civilité, an unreadable letter. The disuse of black letter in France was largely due to the fantastic schemes of Tory of Paris, as illustrated in his book, *Champ Fleuri* (1526). The patronage of Francis I. led to the beginning of the great printing house which, as 'Royal,' 'Imperial,' or 'National,' has survived till now, and in its school of typography most great French punch-cutters, including Garamond, 'the father of type-founders,' were trained. In 1561 Le Bé's foundry was most famous, and made the types for Plantin's Antwerp Polyglot (1573). The most notable Dutch founders were Van Dijck, whose types, wrongly called Elzevirian, went out of fashion before 1770; and Fleischman, a German in the employ of the Enschedes at Haarlem, whose types on French models satisfied the type buyers of England and Holland for many years.

The first book in the English language—Caxton's *Recuyell of the Histories of Troy*—was printed in the Netherlands. The type resembles that attributed to Colard Mansion, a printer of Bruges. Whether Caxton made the types he afterwards used in England or had them brought over from the Netherlands is not ascertained; their style was distinctly Flemish. His immediate successors, De Worde, Pynson, and Faques, were of French birth, and had French tastes, and their types resembled the black letters of the printers of the day of Paris and Rouen. Black letter maintained its popularity in England and in the Netherlands after it had fallen into disuse in France. There was no English foundry of note before the time of John Day (printed 1546 to 1584), and English printers had for the time to accept Dutch types with their mannerisms. English readers, in fact, showed a marked preference for black letter, which was used in some of the most popular books such as the first edition (1525) of Tyndall's New Testament, Coverdale's Bible (1535), Cranmer's Great Bible (1540), and the authorised prayer-books. In the reign of the Roman Catholic Mary Roman was the proper text for books of devotion; but under the reign of Protestant Queen Elizabeth prayer-books in black letter had the preference. Fox's *Acts and Monuments* (1560) was in black letter. Soon after the printers evinced a partiality for Roman for English classics: the writings of Shakespeare and Bacon appeared in Roman. Black letter was out of fashion at the close of the 16th century. It is now only a display letter.

The first English type-founder of note was Joseph Moxon, who founded from 1659 to 1683. His types could not be compared with those of his rivals in France and Holland. The first English founder who was really able to compete with these foreign houses was William Caslon (1692–1766). His types were not novel in design, but their merit consisted in their technical excellence—their careful cutting and good founding. They were especially readable. The style retained its supremacy in Great Britain for more than half a century. Baskerville of Birmingham (1706–75) was another eminent founder. His first types followed the style of Caslon; afterwards he developed a style of his own. His Roman was remarkably round, open, and clear, and is to many book-lovers the embodiment of all that is beautiful in type. Before the 18th century had closed the styles of both Caslon and Baskerville had lost favour, and the publishers called for a character less angular and more curved. Jackson, a pupil of Caslon, introduced a new style, shown in the magnificent Bible printed by Bensley for Macklin. Vincent Figgins, who commenced founding on his own account in 1792, cut founts in exact imitation of those of Jackson, and his types were very favourably regarded by the publishers. When improvements were made in presses, paper, and ink, light-faced and delicate types were again in the ascendant for book-work. For ordinary work and for newspapers such types were, however, not effective, and Robert Thorne introduced the style known as *bold-faced*.

Alexander Wilson, the first founder in Scotland, who began in 1742, was undoubtedly ahead of his rivals in making types that were at once useful and elegant. They were used by Andrew and Robert Foulis (q.v.) in books that for excellence of typography will favourably compare with those of the vaunted French printer Barbou or the even more celebrated Didot. Wilson's sons maintained the reputation of their father's foundry, and 'Scotch type' was soon regarded throughout the kingdom as the synonym of the highest merit. The new Scotch style was everywhere imitated—even in France it was known as the style Ecossais. Before long publishers began to regard the character as too ornate and feminine. A stronger and more austere face then obtained preference, and has maintained its supremacy to the present day. It has had to contend with one most notable competitor. About 1850 the London publisher Pickering induced the printer Whittingham to procure a fount of types from the ancient and then altogether disused matrices of the first Caslon. These were brought out of the limbo in which they had remained for many years, and types were cast from them by modern methods. These proved an extraordinary success. Thus was originated the revival of the 'old style' faces in which so many of our best books are now printed. Other founders, such as Messrs Miller & Richard of Edinburgh, who had no antique matrices, cut faces in imitation of those of Caslon, and by some these are regarded as better than the originals. The two styles—the 'modern' after that of Jackson and the 'old' style after that of Caslon, are those in which nearly all present-day books are printed in Great Britain. A good deal of type is, however, imported from France, and it displays the peculiarities of the French founders of the last century. The Dutch type of the Enschedes of Haarlem is very graceful, but little used at the present day. Several very meritorious adaptations of the Caslon faces to modern fashion

have been produced in America, especially by the Mackellar foundry of New York.

The chief *qualities* which constitute good type are, according to Southward's *Practical Printing*, the quality of the metal from which it is made; its smoothness, sharpness of angle, and perfection of finish; sufficient depth of face and the clean formation of the feet and groove; accurate range with all the other letters of the same fount, both in height and width and depth of body; strength of part supporting the 'kern,' if any, and the character of the design of the face, including regularity of gauge, exactness in lining and setting, evenness in 'colour' (equalising of the thickness of the strokes), and due apportionment of space to the 'counter,' producing a harmonious general effect in the impression.

Legibility of Type.—Prolonged experiments made in France about 1882 by means of inquiries instituted among people quite unacquainted with the technics of type-founding and in no way connected with printing, showed that reading was done with less fatigue according as the letters are (1) rounder, (2) more equal in thickness, (3) the up-strokes are shorter, (4) each letter is unlike the others, (5) the long letters are well proportioned to their own body. These conditions, it was held, are best fulfilled by the Elzevir, the Baskerville, and the Didot or 'old style' faces.

See the works cited at PRINTING, many of which deal also with type-founding; Monet, *Les Machines et Appareils Typographiques* (Paris, 1879); the *Caslon Circular*, an English periodical established in 1875; for the history of English type-founding, Talbot B. Reed's *History of the Old English Letter Founders* (1887); and for a general survey of other founders, Theo. L. De Vinne's *Historic Printing Types* (New York, 1886), on which the history given above is based. See also PROOFS (CORRECTION OF), ALPHABET, BLACK LETTER, BOOK, BIBLIOGRAPHY, WRITING.

Type-setting Machines. The first type-composing machine on the Records of the English Patent Office appears to be that of Mr W. Church, dated March 1822. Some others, twenty years later in date, such as those of Young and Delcambre, were for a long time before the public without being adopted by printers, and it is only recently that the prejudice against composing machines is being overcome. Very large sums have been spent by inventors on machines which have proved failures, but still year by year the vast increase of printing and the desire to cheapen the production induces inventors to persevere in the attempt to construct machinery that will satisfactorily take the place of hand compositors.

In the early composing machine by Church 'the types are arranged in files in a case at the top, each file being directly over a slit in a horizontal frame. One of a number of jacks protrudes through each of these slits, each jack being connected with a key in a manner somewhat similar to the jacks and keys of a harpsichord.' It is surprising how closely this description conveys to us the leading idea in most of the type-composing machines invented since 1822. Hattersley's machine, for example (1857), has somewhat analogous movements, but the keys are arranged more like those of a concertina, and the details are different. The 'Fraser' (Edinburgh), the 'Kastenbein' (German), and the 'McMillan' (American) are also on much the same principle, differing, however, materially in details. The leading feature of this class of machine is in having the types in tubes or trays in the upper part of the machine, so that the operator by depressing any particular key releases the corresponding type, which by gravity descends by means of a grooved plate to the composing-stick, this operation being repeated as fast as the keys can be touched till sufficient is set for a line, which is then spaced so as exactly to fill the line as in hand-setting.

Another kind of machine is that of Mackie of Warrington. Two machines are required to complete the operation. By means of the first strips of paper are perforated in such a way that each letter is represented by a particular perforation or position on the slip of paper. This slip, on being run through the second machine, automatically sets the type in lines, which are then spaced as above. In an American machine on this principle (1892) electricity is employed to actuate the apparatus of the second machine, which thus sets the types automatically. As the lines are set they are impressed into matrix paper till a column is completed, which is then ready for stereotyping.

Another kind is the 'Thorne,' a combined composing and distributing machine for which the types require to be nicked, each type having its distinctive nick or nicks. The column of type to be distributed is placed on the upper part of a cylinder which is made to revolve, and each type as it comes opposite the groove fitting its special nick drops into it, and is conveyed to the composing apparatus, which is thus kept supplied with type. The composing part of the machine is actuated by means of keys as in the machines described above, the types being set in long lines which are divided and spaced by another operator.

Still another class is the Mergenthaler or Linotype, in which types are dispensed with, matrices with the letters stamped upon the edge being set instead of types. The matrices are set by means of keys as in other machines, and when sufficient have been set to form a line the matter is automatically spaced out to fill the line exactly by an ingenious application of wedge-shaped spaces. The line being complete, the casting apparatus in connection with the machine is brought into operation, and the *line* is cast solid and ready for printing by simply depressing a lever—hence the name of Linotype. When cast the matrices are reconveyed by suitable apparatus to their respective receptacles, and are available for further setting. The linotype machine is very extensively used in newspaper offices. It is very suitable for that class of work from its speed and the fact that no distribution of type is required.

Various other composing machines have been invented, but the above comprise most of those in practical use.

The distributing of the type has always been an important consideration for machine-setting, and various plans have been adopted. One plan, as in use with the Thorne and McMillan machines, is to have a distinctive nick or nicks on the shank of each type by means of which each letter is automatically distributed into its proper compartment in the composing machine. But the type is much weakened and there is a large amount of breakage in consequence. For the Fraser, Kastenbein, and Hattersley machines no nicking is required, the distribution in the two former being effected by keys, similar to those in use in the composing machine, while Hattersley employs a hand apparatus to distribute. The automatic plan has the advantage in more rapid distribution, but cannot be adopted for small type; while the keyed machines are not so rapid, but suit any size of type.

Regarding the speed of composing by machine in comparison with hand-setting much depends upon the nature of the work, and especially on the kind of copy supplied. If so plain that he who runs may read, any of the above machines may be run at a high speed—8000, 10,000, or even 12,000 types an hour for a limited time, one operator setting in continuous line while another does the

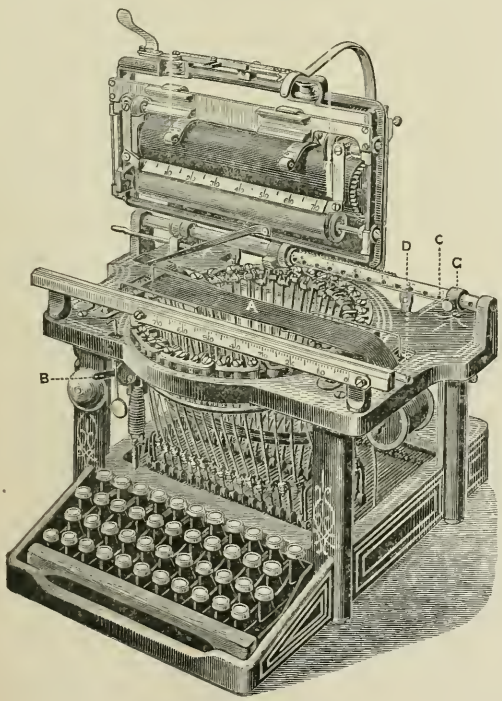
spacing; but it is evident that so large an output as 12,000, which is equal to about three and a half types per second, cannot be maintained. That machines will come largely into use before long need not be doubted; but it would be well if promoters were to modify the statements in prospectuses as to the capabilities of the operators, if not of the machines.

Type-writer, a machine for producing legible characters on paper by mechanical means without the use of a pen. The Remington (1873) was invented in 1866–68 by C. L. Sholes of Milwaukee. Each letter is produced separately, either by a series of distinct arrangements of the machine as a whole at the will of the operator, or else by actuating a separate device for each letter, each such device being set at work by means of a key on a keyboard. The construction may, or may not, be simplified by contriving that one key shall be available for more than one letter. On this basis type-writers may be divided into two-hand machines and keyboard machines. In the former the operator moves an index with one hand until it coincides with the desired letter or character on an indicator, and then with the other hand he presses a mechanism which brings the paper into contact with an inked type corresponding to the character required. The mechanism then automatically carries the paper along through the breadth of one letter, and the process can be repeated for the next and succeeding letters. Apparatus of this kind is usually fairly cheap, the most expensive being the Hall at £8; and though they are not capable of very great speeds, neat work can generally be done with them. In keyboard instruments each key is marked so as to indicate the character or characters which can be printed by means of it; and as the keyboard is so arranged that those letters which are most frequently in use are nearest to one another, the operator has to 'learn the keyboard,' so that he may be able to strike the appropriate keys without looking for them, before he can acquire high speed of manipulation. In some instruments — Remington, English, Hammond — there are fewer keys than there are characters producible; in that case the operator must move a key or knob with the hand which is the less occupied at the moment when one of the less usual characters (such as a capital letter or a figure) is required: and this action shifts the interior mechanism. In others—Caligraph, Yost, Smith Premier—there is a separate key for every character producible. The opinion of operators seems to be divided as to which of these methods is the more convenient in practice. A keyboard instrument of the last-mentioned class can, so far as the keyboard is concerned, be worked with one finger of one hand; but a rapid operator uses both hands, and generally uses his fingers like a piano-player. Different instruments differ in their touch: some, like the Hammond, require a *legato* rather than a *staccato* touch; others require smarter raps on the keys. In some cases the force with which the type is made to produce an impression on the paper depends on the force of the original stroke; in some the pressing of the key liberates mechanism which acts independently of the finger stroke. The former is advantageous when it is desired to change suddenly from ordinary type-writing to manifolding: the latter is conducive to uniformity of impression, and in most cases machines of this type can have the force of the impact between the type and the paper adjusted by varying the tension of a spring. When the key is pressed down what happens inside the machine depends upon the way in which the types are arranged; in one class of machines ('type-bar' machines) they are fixed at the end of bars arranged in a circle or an arc of a circle, and so pivoted that they will all strike at a common printing point—e.g. Remington, Caligraph, Yost, Smith Premier; in others they are engraved on a type-wheel which is brought round into the proper position by the appropriate key, and the paper pressed against it (Hammond). The advantage of the latter class of machine is that the type-wheel can be changed, and thus small type for foot-notes, italics, small capitals, and other typographical devices can be readily employed, whereas with the type-bar machines such a change can only be effected by extracting each individual type and substituting another for it.

Among type-bar machines some — Remington, Caligraph, Yost, Smith Premier—have the type striking upwards from below, so that the writing is not in sight until the top of the machine (the paper-carriage) is lifted, or, as in the Smith Premier, pulled forward: others have the type-bars starting backwards from a semicircle or the arc of a circle and striking from above or from the front so that the writing is always in sight—Bar-lock, English, and Maskelyne. One very important requisite in this type of machine is that all the letters should come to precisely the same printing point. In the earlier type-writers this desideratum was imperfectly secured: the bearings on which the bar was pivoted were narrow, and the bar itself long: consequently when the joint worked loose, or the bar became a little bent, the work produced was bad in alignment, or straightness of line. In order to obviate this the type must be guided to the exact spot, as in the Bar-lock, where the type-bar falls into a groove, and is there locked in its proper position before the impression is taken, or in the Yost, where the type strikes through a bevelled aperture in a centre guide; or else the construction must be such as not to allow any deviation, as in the Smith Premier, in which the problem has been most ingeniously solved of using very short type-bars with very wide bearings. In type-wheel machines the alignment depends on the accuracy of rotation of the type-wheel into position without axial shift, or with just the proper amount of axial shift, as the case may be. Another desideratum which it seems impossible to attain at present is to avoid the unpleasant effect which is caused to the eye, accustomed to typography, through the apparently abnormal distribution of the letters in a word. In printing, the type 'm' is wider than the type 'i;' in type-writing 'm' and 'i' must occupy an equal space. The objection to this has been largely overcome by the mode of cutting the type-writer fount of types, but by no means wholly so.

The mode in which the type is made to mark the paper differs in different machines. In most cases the type marks the paper through an intervening ribbon saturated with an appropriate ink, which ribbon is automatically made to travel a little at each impression, being wound off one spool on to another, and thus not presenting precisely the same point twice in succession to be squeezed between the type and the paper. In most cases the ribbon is simply unwound; in the Smith Premier the whole breadth of the ribbon comes into use once in each line of printing. In the Yost machine there is no ribbon: the type rests normally against a pad saturated with ink, and the type prints directly on the paper just as in ordinary typography. Different machines present, in addition to the above leading features, greater or less ingenuity in devices designed for practical convenience, as well as for durability and easy repair and maintenance in good condition. One thing of importance in studying any particular machine is to observe what happens when two contiguous keys are sharply depressed at the same

time, as may occur by accident in rapid working, if the keys are too close together. Some machines will take paper of any width, others only paper of limited width; some are better provided than others with means for taking up wear of the apparatus; some are more nearly noiseless than others; some have simpler arrangements than others for bringing a given part of the paper to the right place for printing or for correction; some have more convenient arrangements for maintaining margins at any desired breadth; some have more convenient devices for cleaning the types, as in the Smith Premier, where this is rapidly accomplished by means of a circular brush screwed up from the base of the machine; some (Smith Premier) lock the mechanism at the end of a line, so that printing comes to an end until the paper-carrier is run back to a new line; in some a smaller depression of the keys is necessary than in others; in some (English) the number of wearing points is brought to a minimum; in some the various parts of the machine are more accessible than in others for cleaning, dusting, and oiling; in some a change is more conveniently made than in others, whereby a hard 'platen' may be substituted for a softer one. The platen is a cylinder against which the type presses the paper: if this be too hard it tends to wear the type and cut the paper; but if it be desired to make copies on carbon paper the carbon paper is placed behind the printing paper with thin paper between; and this alternation of thin paper and carbon paper may be repeated up to



Remington's 'No. 5' Type-writer.

an appreciable thickness; then by firm strokes against a *hard* platen a number of copies may be made. A type-written document may also, if a copying ribbon (one saturated with appropriate copying-ink) be employed, be copied in the copying-press; and if lithographic ink has been employed the print may be transferred to stone. By means of Edison's Mimeograph the type-writer may also be utilised for making numerous copies in printer's ink; but the presence of a ribbon tends to interfere with its efficiency in this respect.

We add by way of illustration a figure of a Remington machine, No. 5, with the paper-carriage at the top raised into the position assumed when the last word written is being looked at. The keyboard and the circle of type-bars will be seen; A is the inking ribbon running from spool to spool; B is the shifter which effects the change from small letters to capitals, and near it is the bell which rings when the end of a line is being approached. The carriage runs on C and D when in its normal position. G is the stop which limits the length of the line.

Typha, one of two distinct reed-like plants to which the name of Bulrush (q.v.) is given.

Typhoid Fever. The name, though firmly rooted in popular and even in scientific usage, is an unfortunate one, as it tends to perpetuate the confusion which long existed between this disease and typhus fever. It is best called *enteric* (i.e. intestinal) *fever;* and that term will be used here. 'Gastric fever' generally means this disease, but this term has been very loosely employed, and should be given up. Enteric fever was long confounded with typhus; though it can now be traced in the records of disease with much probability as far back as the 16th century. Early in the 19th century the connection of severe fevers with intestinal lesions was recognised in France; but the credit of finally proving the non-identity of typhus and enteric fever was due to Dr (Sir William) Jenner in 1849-51.

Symptoms and Course.—Enteric fever chiefly affects children and young adults; it is rarely met with after middle life. The period of incubation (see MEASLES) is generally from ten to fourteen days, but may in rare cases be as short as two days, or as long as three weeks. The onset is generally gradual, the patient complaining of weariness, headache, sickness, or diarrhœa for some days before he is compelled to take to bed. It may, however, be quite sudden. All the usual symptoms of the feverish state succeed; the temperature generally reaches 103°, sometimes 105° or 106°, but is one or two degrees lower in the morning than at night. The pulse, except in severe cases, is less quickened than in most febrile diseases; frequently it does not exceed 90 or 100 per minute throughout. The tongue is generally coated on the dorsum, but red at the tip and edges. The digestive organs are much disturbed; sickness and vomiting are frequent at the beginning of the attack; there is almost always some discomfort and tenderness in the abdomen; and diarrhœa, though not a constant, is a very characteristic symptom. Generally during the second week the characteristic rash appears, consisting of small rose-coloured spots coming out in successive crops, so that, though each spot lasts only three or four days, some can be discovered for ten days or more. The rash is rarely copious, and sometimes altogether absent, but it bears no proportion to the severity of the case. The pupils are generally somewhat larger than normal. Some cough is very frequently present. Delirium may be absent throughout, but when present is apt to be very severe and troublesome. The feverish state usually lasts about three weeks, by the end of which time the patient is very thin and weak. Its subsidence in the great majority of cases is very gradual, and convalescence is slow, while relapses are not infrequent. Death may take place by coma, by exhaustion, in consequence of severe hemorrhage from the bowels or of perforation of their coats, or from pneumonia or some other complication; rarely from any cause before the second week.

The death-rate in hospital cases has varied from 10 to 30 per cent.; usually it is between 15 and 20. It is least below the age of twenty, and increases, though not very markedly, with age. Slight and abortive cases are by no means uncommon.

Post-mortem Appearances.—The one characteristic lesion associated with enteric fever has its seat in Peyer's patches and the solitary glands of the intestine (see DIGESTION, Vol. III. p. 814), particularly at the lower part of the small intestine. They first become congested and swollen, then grayish; the swollen tissue dies and is cast off, leaving an ulcer corresponding in shape to the affected patch. All these stages may frequently be met with in a single case. These lesions explain the diarrhœa and abdominal pain, and the liability to intestinal hemorrhage and perforation which are so characteristic of the disease.

Treatment.—In no disease is careful nursing of more vital importance. The patient must be kept in bed, and saved from fatigue as far as possible. The diet must be regulated with special care, not only during the continuance of the fever, but after convalescence has set in. Milk should be the chief food, artificially digested if necessary, and supplemented with beef-tea, chicken-tea, or other animal soups. No solid food should be given, except perhaps a little dry toast if the patient can take it; solid fragments of food, such as grape-stones, or even particles of the pulp of fruits, may so irritate the ulcers as to lead to hemorrhage or perforation. Stimulants are usually necessary in severe cases. No drug is known to cut short the disease; and in many cases none is required. High temperature may often be brought down with benefit, either by cold bathing or by quinine or other antipyretic drugs. Diarrhœa should be checked by opium or astringents.

Causation.—Enteric fever is one of the most ubiquitous of diseases, being probably present in all parts of the world; but it is less frequent in tropical countries. It is now proved to depend on defective hygienic conditions, and particularly on imperfect disposal of excreta. The poison appears to be discharged in the patient's dejecta, but not to be active till it has been some time outside the body. It is rare, if proper care is taken, for nurses or others attending on cases of the disease to become infected; but the gases from drains into which the dejecta have passed are very dangerous; and still more so are drinking-water and milk which have accidentally become contaminated with them. In the great majority of instances the disease can be traced to infection from a previous case. It has long been recognised that the infective agent must be an organism, and in 1880 Eberth described a form of bacillus as the real cause of the disease. His observations were confirmed by subsequent observers. But it has since been stated that this bacillus is not constantly present in cases of enteric fever; that a very similar though not identical organism, commonly present in healthy stools, called *Bacillus coli communis*, is found in large quantity; and that Eberth's bacillus is merely a variety of this commoner organism, modified by its cultivation within the body. The question that had generally been regarded as definitely settled by clinical evidence in the affirmative, whether typhoid fever is a specific disease always due to infection from a previous case, is thus reopened in a new form.

See Murchison's *Continued Fevers;* Hirsch's *Geographical and Historical Pathology;* and with reference to the organisms connected with the disease, Vallet, *Le Bacillus Coli Communis*, &c. (Paris, 1892); also Barr, *The Treatment of Typhoid Fever* (1892).

Typhon, the Greek name of a son of Seb and Nut (Rhea). See EGYPT, OSIRIS.

Typhoons. See STORMS (Vol. IX. p. 753), WHIRLWIND, WIND.

Typhus Fever (Gr. *typhos*, 'mist,' 'stupor') has probably had an important place among the pestilences attending upon war and famine in all ages; it can be traced back with some definiteness to the 11th century, and from the 16th at least has been a frequent epidemic. It is generally regarded as the pestilence of the 'Black Assize' (q.v.), and has been known as *jail fever* or *camp fever* at various times.

Symptoms and Course.—Typhus occurs at all ages, but most frequently between ten and thirty. The period of incubation (see MEASLES) is most commonly about twelve days, but may be as long as three weeks, or may be absent, the symptoms beginning immediately after infection. The onset is generally definite, sometimes quite sudden; severe headache, with pains in the back and limbs, shivering, prostration, and loss of appetite are generally the early symptoms. The prostration rapidly increases; the face is flushed and dusky, and the expression dull; the temperature generally rises to 104° or 105°, without much remission, and the pulse to 100 or 120 per minute. The tongue is at first white, but generally, except in very mild cases, becomes dry and brown. Vomiting and diarrhœa are only exceptionally present. Generally about the fourth or fifth day the characteristic rash, called by Sir W. Jenner the *mulberry rash*, appears, and after two days or so no fresh spots come out. The rash consists of rounded or irregular spots, which may be at first bright red, but may be from the beginning, or if not soon become, livid or dusky, owing to minute hemorrhages (Petechiæ, q.v.) into the skin, of which they are the seat. The rash is rarely absent, except in children; and its copiousness and lividity are generally in direct proportion to the severity of the case; when very dark, it constitutes the so-called *black typhus*. It generally remains visible till the crisis. About the end of the first week the headache gives place to delirium, generally of a quiet type; and during the second week this often passes into partial or complete unconsciousness. The pupils are generally much contracted. Towards the end of the second week the patient becomes more and more feeble and prostrate; tremors of the muscles, with jerkings of the limbs, or picking at the bedclothes are almost always present. But about the fourteenth day, if the patient live so long, a rapid change takes place called the *crisis*. Within from twelve to thirty-six hours the temperature falls to normal or lower; the pulse is slowed in proportion, intelligence returns, and the patient feels no discomfort but weakness. In a few days the appetite becomes ravenous, and convalescence is rapid and uninterrupted. Relapses are almost unknown, and complications infrequent. In fatal cases death usually takes place in the second week, either by coma, by failure of the heart, or by asphyxia from congestion of the lungs; but it sometimes occurs after a few days' or even a few hours' illness. The death-rate in hospital cases is usually from 15 to 25 per cent.; but under unfavourable circumstances—e.g. in wars or sieges—it has sometimes been 50 per cent. or even higher. In children typhus is hardly ever fatal; its danger increases in a very marked degree with the age of the patient.

Post-mortem Appearances.—If the patient die while the rash is present, it remains visible after death. The internal organs present no distinctive changes, the fluidity of the blood and softening of tissues present are also met with in other rapidly fatal febrile diseases.

Treatment.—No means is known of cutting short the disease. Good nursing, a plentiful supply of fresh air, administration of abundant liquid nourish-

ment, in many cases free stimulation are required. Sleeplessness is often a serious symptom, and requires to be met by opiates.

Causation.—Typhus is a disease specially associated with filth and overcrowding. It is generally met with, therefore, in the squalid parts of large towns. Epidemics are very frequently associated with want and privation, as in war and famine. It is extremely contagious; but there is abundant evidence that the virulence of the poison is much reduced by abundant dilution with fresh air, hence the special importance of free ventilation in its treatment. In the great majority of cases it can be traced to infection from a previous case; instances to the contrary are so few that its origin *de novo*, strongly maintained by Murchison, must be regarded as extremely improbable. No characteristic organism has been discovered. The infection can be conveyed by clothes, &c., but much less readily than some other infectious diseases—e.g. scarlet fever and smallpox. It is rare for a person not himself infected to convey the disease to one who has not been in contact with the sick.

It is a disease for the most part of temperate climates. At the present day Ireland, Russia, Italy, Persia, and North China are its chief seats.

See Murchison's *Continued Fevers;* Hirsch's *Geographical and Historical Pathology.*

Tyr, the name of a war-god in the old Norse mythology, a son of Odin. He loses his hand in binding the Fenriswolf, and is himself slain in the struggle which slew Garm, the fiercest hell-hound of all. The third day of the week, the *Dies Martis* of the Romans, is called after Tyr, in old Norse *Týs* (gen. of *Týr*) *dagr;* A.S. *Tiwes dæg* (the first word being in genitive), from which our English *Tuesday.* The word is of course seen in Lat. *Ju*-piter, Gr. *Zeus,* Sansk. *Dyaus.* See SCANDINAVIAN MYTHOLOGY.

Tyrant (Gr. *tyrannos*), a name given in modern times to an arbitrary and oppressive ruler, but originally applied not necessarily to one that exercised power badly, but merely to one that had obtained it illegally, and therefore equivalent to our word *usurper.* See GREECE, Vol. V. p. 387; GOVERNMENT.—The THIRTY TYRANTS in Athenian history were a body of rulers invested with sovereign power after the close of the Peloponnesian war. They were all native Athenians, but members of the aristocratical party, and chosen by the Spartan conquerors, who, knowing the animosity existing between the democracy and oligarchy of Athens, hoped to rule the city through the agency of the latter. Their government was a positive 'reign of terror,' marked by the most infamous cruelties. It lasted only one year, when it was overthrown by the return of the Athenian exiles under Thrasybulus. For the Thirty Tyrants in Roman history, see GALLIENUS.

Tyrant-birds (*Tyrannidæ*), a family of passerine birds, chiefly confined to tropical regions. Among the 350 species of which the family consists, there is great diversity of form and even of habit. Noteworthy species are the 'Scissor-tail' (*Milvulus forficatus*), remarkable for its grace of form and beauty of plumage, and the common American Shrike-billed Kingbird or Bee-martin (*Tyrannus tyrannus*). The latter, like all the tyrant-birds, is of a pugnacious temper, and is a determined enemy to sparrow-hawks and other small birds of prey; but it is much disliked by farmers on account of its propensity for eating bees.

Tyrconnel, RICHARD TALBOT, EARL OF, was born in Ireland about 1625, but early crossed to London, and soon gained the favour of the royal family by a readiness for such dirty work as the plot to blacken the reputation of Anne Hyde. James II. on his accession at once created this scoundrel Earl of Tyrconnel, with command of the troops in Ireland, and in 1687 appointed him Lord-deputy of Ireland. He strove hard to undo the Protestant ascendency, but the Revolution quickly brought his schemes to nought. With characteristic treachery he tried to intrigue with William, but it was not by wretches of his stamp that the liberties of Englishmen were to be built up. On the discrowned king's arrival in Ireland in 1689, the Earl was created Duke of Tyrconnel. After the fatal battle of the Boyne Tyrconnel retired to France, returned in 1691, but died at Limerick in August of the same year. His name occurs in the doggerel ballad of *Lilliburlero,* which 'whistled a deluded prince out of three kingdoms.'

Tyre (Phœn. *Sûr* or *Sôr,* 'rock'), a city of ancient Phœnicia, situated in 33° 12′ N. lat., which probably derived its name from the double rock on which it was first founded. There were two towns of Tyre closely connected together in historical times; one on the continent, the other on the island opposite, with an area of 200 acres. The more important of the two was the continental town, called Palæ Tyrus. 'It stands out in the sea, as the palm of the hand does from the wrist,' says an old writer. The situation of the entire city was one of the most fertile, and its magnificent combination of land and sea scenery formed the theme of many an ancient poet and seer.

Its ancient history is fully dealt with under PHŒNICIA. Tyre was a city on an island in the sea in the 14th century B.C., when it is described in an Egyptian papyrus: 'Tyre the double port is its name; water is carried to it in boats; it is richer in fish than in sands.' There is a list of places that traded with Tyre in Ezekiel xxvii., with the names of the articles of commerce, including its famous purple dye. Isaiah called it the 'mart of nations.' Explorations were made here in 1874, 1877, and 1881. Its two ports—the Sidonian to the north, and the Egyptian to the south, each about 12 acres—have been identified by Major Conder, as also the probable site of the old cemetery. Alexander the Great made a causeway from the shore, which has increased in breadth to a quarter of a mile by drifting sand. An aqueduct bringing water from the springs at Ras el Ain existed previous to 724 B.C. The population of the island city seems to have been crowded together, the houses rising story upon story, so that a larger number might be accommodated. Tyre was enlarged and beautified by Hiram, and sustained sieges by Shalmaneser, Nebuchadnezzar, Alexander (332 B.C.), and Antigonus. Under the Romans, Cleopatra received Tyre as a present from Antony; but the last trace of its independent existence was taken from it by Augustus. A Christian community was founded there at an early period. In St Jerome's time it was again the noblest and most beautiful city of Phœnicia, nay, one of the most prosperous and noble cities of the whole East. In the 7th century it came under the dominion of the Saracens, and so remained until taken by the Crusaders, who defended it till 1291. Soon after it was destroyed by the Moslems; a visitor in 1355 found it a mass of ruins. From the settlement of the Metâweleh or Persian schismatics, in 1766, the town began to be rebuilt. About 5000 inhabitants now dwell among the ruins of its ancient glory, finding scanty livelihood in its insignificant exports. Here Origen and the bones of Frederick Barbarossa are buried.

Tyree′, an Argyllshire island, one of the Inner Hebrides, 19 miles NW. of Iona. Having a maximum length and breadth of 14 and 6 miles, and an

area of 34 sq. m., it is treeless and flat, with a mean elevation of only 20 feet, except in the south, where three hills attain 400 feet. There are a score of fresh-water lakes. Nearly forty Scandinavian forts dot the shores, and there are also a ruined castle, nine standing stones, &c. Pop. (1831) 4453; (1891) 2600, who rear cattle, fish, and export poultry and eggs.

Tyrnau (Magyar *Nagy-Szombat*), a town of Hungary, on the picturesque Waag valley railway, about 30 miles NE. of Presburg. 'Little Rome' it used to be called, and not inappropriately, when it was the place of residence of the Hungarian primates. Its university (1635–1774) was transferred to Pesth. Pop. 10,830.

Tyrol (Ger. *Tirol*; in England usually called *the* Tyrol), a crown-land of the Austrian empire, lying between Bavaria on the N., Switzerland on the W., Italy on the S., and Salzburg and Carinthia on the E., and embracing an area of 10,302 sq. m., to which is administratively added Vorarlberg (q.v.), 1005 sq. m., on the western frontier. The province is traversed from east to west by the three chains of the Alps; the central chain (11,000 to 12,500 feet), which is crossed by the road over the Brenner Pass (4588 feet), the principal line of communication between Italy and Germany, separates the German from the Italian side. The population consists of Germans (60 per cent.) and Italians (40 per cent.), and numbered 805,176 in 1880; Vorarlberg had at the same date 107,373 inhabitants. The population of both combined was 928,920 in 1890. The people are noted for their fidelity to the Catholic faith and their devotion to their country, but are somewhat backward in education. The romantic mountain-scenery attracts thousands of visitors. The more important valleys are formed by the river Inn (flowing north to the Danube) and the Adige (going south to the Adriatic), and their tributaries. Pastoral pursuits furnish the chief occupations, though some grain is grown, and considerable attention is paid to the cultivation of the forests (46 per cent. of the area), of fruit, wine (5,720,000 gallons annually), and silkworms. The mines were formerly of great value; but little is now extracted, except of salt (at Hall), anthracite, and a little iron. Metal industries flourish in German Tyrol, cotton manufactures in Vorarlberg, and silk in Italian Tyrol. The chief town is Innsbruck (q.v.), with a university (1677; with 700 students); Trent, Roveredo, Brixen, and Bozen are the next towns of consequence. The provincial chamber consists of sixty-eight members, excluding Vorarlberg, which has its own chamber of twenty members.

Tyrol, the ancient Rhætia, was conquered by the Romans under the Emperor Augustus. After the fall of the empire it was occupied by the Boiardi (Bavarians) and Langobardi. During the middle ages the most important rulers in Tyrol were the counts of Tyrol and the bishops of Trent and Brixen. In 1363 the counts bequeathed their possessions to the Duke of Austria, and they have formed an appanage of the House of Hapsburg ever since, except during the short period 1806–14, a period made memorable by the patriotic resistance of Andreas Hofer (q.v.) and his associates to French and Bavarians.

See Miss Busk, *Valleys of the Tyrol* (1874); Zingerle, *Sagen aus Tirol* (1859); and histories by Egger (1872–80) and Jäger (1880–91).

Tyrone (*Tir-Eogain*, 'Owen's country'), an inland county in the heart of Ulster, Ireland, 48 miles long, with an average breadth of 28. Area, including part of Lough Neagh, is 1260 sq. m. or 806,658 acres, of which 110,000 acres are barren mountain, 72,000 bog, 32,000 water, roads, &c. The surface in general is hilly, and often extremely picturesque, this county lying for the most part between the two mountainous districts which traverse Ulster from east to west; the highest point is Sawell (2236) in the north-east. With the exception of Lough Neagh, the lakes, which are numerous, are small. The principal rivers are the Foyle, Mourne, Blackwater, and the Ballinderry. The geological structure is very much diversified, including mica and primitive limestone in the mountains; old red sandstone occupies much of the plain. Between Dungannon and Stewartstown there is a small coalfield, the produce of which is rich; marble is quarried; and there are traces of iron, copper, and lead. The climate is moist, and the low lands are often flooded. The soil of the plain is a well-tilled fertile loam; that of the hilly districts, sandy or gravelly. There is a large proportion of bog. There are manufactures of linens, coarse woollens, earthenware, whisky, and soap. The chief towns are Omagh (the capital), Strabane, Dungannon, Cookstown, and Aughnacloy; Clogher gives its name to the episcopal see both in the Episcopal and Roman Catholic churches. The county has four parliamentary districts, and returns four members to the imperial parliament. Pop. (1841) 313,011; (1861) 238,500; (1881) 197,719; (1891) 171,278, of whom 93,569 were Catholics, 38,909 Episcopalians, and 33,710 Presbyterians. See Ulster.

Tyrone, Hugh O'Neil, Earl of, 'the arch-rebel,' was the son of an illegitimate son of Conn O'Neil, the first Earl of Tyrone, and was himself in 1587 invested with his grandfather's title and estates. But he soon plunged into intrigues both with the Irish rebels and with Spain against the authority of Elizabeth, and in 1597 assumed the ancient title of 'The O'Neil,' and began the struggle openly. His success soon spread the flame of insurrection over all Ulster, Connaught, and Leinster. The queen sent over Essex with more than 20,000 men, and at Ballyduich Tyrone met him under truce, and submitted his demands to Elizabeth. Lord Mountjoy soon succeeded Essex, and quickly subdued the most of the country. But at length in 1601 a Spanish force of 5000 men landed at Kinsale, and 2000 more at Castlehaven. Mountjoy at once besieged Kinsale, while Tyrone advanced to its relief, but was defeated with heavy loss, and severely wounded. Mountjoy pursued him to the north and ravaged his country. After Kinsale fell Tyrone made his submission at Mellefont and was reinstated in his earldom. But under James I. he intrigued anew with Spain, and finally in 1607 found it necessary to flee. His lands were confiscated, and he himself died at Rome in 1616. See Ireland, Vol. VI. p. 204.

Tyrrhenian Sea (anc. *Tyrrhenum Mare*), that part of the Mediterranean Sea (q.v.) between the islands of Corsica, Sardinia, and Sicily on the west and the Italian peninsula on the east.

Tyrtæus, famed for his political elegies and war-songs, was either an Athenian or a citizen of Aphidnæ, in Attica, who lived in the 7th century B.C. The story which represents him as a lame schoolmaster, of mean family, whom the Athenians (ignorant of his lyric power, and jealous of Lacedæmonian domination in the Peloponnesus) sent to the Lacedæmonians, during the second Messenian war, as the most inefficient commander they could select, must be received as a fiction of later times. He rendered, however, to the Lacedæmonians a kind of assistance which the Athenians little foresaw; and while by his elegies he stilled their dissensions at home, by his war-lyrics he so animated their courage in the field

that they were finally triumphant in their conflict with the Messenians, whom they reduced to the condition of Helots. His songs, a few of which we have complete, and must regard as amongst the finest remains of antique poetry, lived on the lips of the Spartans so long as Sparta was a state. There are editions in Schneidewin's *Delectus* and in Bergk's *Poetæ Lyrici Græci*.

Tyrwhitt, Thomas, the first adequate editor of Chaucer, was born in London, 29th March 1730. He was descended from a good Lincolnshire family, and his father, at his birth rector of St James's, Westminster, was afterwards canon of St Paul's, archdeacon of London, and canon of Windsor. He was educated at Eton and Queen's College, Oxford, and was elected fellow of Merton in 1755, but left college in 1762 to become clerk of the House of Commons. Finding this office too arduous for his health, he resigned in 1768, and devoted the rest of his life to letters down to his death at London, 15th August 1786. Tyrwhitt was a man of unusual amiability of character, as well as a scholar of great learning and industry, and of fine critical insight besides. His most important work was the well-known and admirable edition of the *Canterbury Tales*, with dissertations, notes, and glossary (2 vols. 1775; 5 vols. 1778); the next, the posthumous edition of Aristotle's *Poetics* (edited from his papers by Burgess and Randolph, 1794). Other books were a refutation of the antiquity of the Rowley poems of Chatterton (1778), a dissertation on Babrius (1776), and *Conjectures* on Strabo, on Æschylus, Euripides, Aristophanes, &c.

Tytler, William, of Woodhouselee, historian and antiquary, was born at Edinburgh, 12th October 1711, educated at the High School and the university, admitted a member of the Society of Writers to the Signet in 1744, and died 12th September 1792. His best-known works are an *Inquiry into the Evidence against Mary Queen of Scots* (1759; 4th ed. 1790), in which he attempted to vindicate her from the charges brought by Robertson and Hume, and an edition of the *Poetical Remains of James I. of Scotland* (1783).

His eldest son, Alexander Fraser Tytler, a historical writer, and a judge with the title of Lord Woodhouselee, was born at Edinburgh 15th October 1747, educated principally there, but also at Kensington, and admitted to the Scottish bar in 1770. He obtained in 1780 the chair of History in the university of Edinburgh, in 1790 the office of Judge-advocate of Scotland, and in 1802 was raised to the bench of the Court of Session. His acquirements were of the most varied kind, embracing most departments of literature and the fine arts. His writings include a biography of Henry Home, Lord Kames; a Dictionary of Decisions of the Court of Session; and the work by which he is best known, his *Elements of General History* (1801), which has been translated into most of the languages of Europe, and even into Hindustani. He died 5th January 1813.—*His* fourth son, Patrick Fraser Tytler, an eminent historical writer, was born at Edinburgh, 30th August 1791, and educated chiefly there, being called to the Scottish bar in 1813. Of his thirteen works the most valuable is his *History of Scotland* (9 vols. 1828–43), beginning at the accession of Alexander III., and terminating at the union of the crowns, a book of more critical research than any work on the same subject that had preceded it, and itself by no means yet wholly superseded. Others were Lives of the Admirable Crichton (1819), Sir Thomas Craig (1823), Wyclif (1826), Scots Worthies (3 vols. 1831–33), Raleigh (1833), and Henry VIII. (1837), and *Progress of Discovery on the Northern Coasts of America* (1832). In consideration of his merits as a historian, Sir Robert Peel conferred on him in 1844 a pension of £200; and he died at Malvern, 24th December 1849. See Dean Burgon's *Life of Patrick Fraser Tytler* (1859).

Tzana, Tana, or Dembea, a great fresh-water lake on the high plateau of Abyssinia, south of Gondar. The greatest length is 60 miles; the breadth varies from 30 to 40. It is fed by numerous streams and is the main reservoir of the Blue Nile (q.v.), which flows into and out of it under the name of Abai. The water is clear and full of fish, with hippopotami; there are many small basaltic islands, some of them inhabited.

Tzar. See Czar.

Tzarskoye. See Tsarskoye Selo.

Tzetzes, Johannes, a Byzantine author of the later half of the 12th century, known as the author of certain works in prose and verse, which, though excessively dull, and without a vestige of literary genius, are valuable as storehouses of classical information not elsewhere to be had. The principal are (1) *Iliaca*, consisting of three distinct poems, entitled *Ante-Homerica*, *Homerica*, and *Post-Homerica* (ed. Bekker, 1816; Lehrs, 1840); (2) *Biblos Istorike*, more commonly called *Chiliades*, or a collection of more than 600 stories, mythical, legendary, &c. (ed. Kiessling, 1826), written in that worthless sort of verse, called *political*, which had regard only to syllables, and not to quantity; besides commentaries on Homer, Hesiod, and Aristophanes.

U

is the twenty-first letter in our alphabet. The Semitic alphabet ended with *t*, which is now followed by the four new letters *u*, *v*, *w*, and *y*, which have been placed at the end because they are differentiated forms, developed at various periods out of the Semitic letter *vau*, whose direct descendant is *F*, which retains its original place as the sixth letter of our alphabet. The letter *vau* was derived from the Egyptian hieroglyphic picture of the cerastes or horned asp (see ALPHABET), which had the value of f. The two bars of our F represent the horns, and the vertical stroke represents the body of the snake. In Y we have the horns and the body, in U and V the body has disappeared, while W is constructed of four strokes which stand simply for four horns. From the Phœnician symbol, whose form was intermediate between F and Y, the Greeks evolved two characters—one was the Digamma (q.v.), which had a consonantal sound, and was carried to Italy before it fell out of alphabetic use in Greece, and survives as our letter F; the other was a sign called *upsilon*, which at first resembled our Y, but soon lost the tail, and took the form V, which had the value of *u*. The form V was carried to Italy, where it represented the sound *u* as well as that of our *w*. From V, the lapidary and capital form, the cursive and uncial forms U and u were developed. In the 10th century the capital form V began to be preferred for initials, and the uncial form u for medials, and the consonant being more common at the beginning of Latin words, and the vowel in the middle, the initial form V was gradually appropriated as the symbol for the consonant, and the medial form u as the symbol for the vowel. But the old usage long survived. Thus as late as 1611 *v* and *u* were still used in King James's Bible merely as initials and medials, as is shown by such spellings as *vnto* and *haue*. In modern English the letter has three principal sounds, the long *u*, the short *u*, and the neutral vowel. The long *u*, heard in the word *rude*, has the sound of the A.S. *ú*, which in southern English has usually become a diphthong, represented by *ou*, as in the words thou, house, mouse, written *thú*, *hús*, *mús* in A.S., or by *ow*, as in the words how, now, cow, brow, town, written *hú*, *nú*, *cú*, *brú*, and *tún* in A.S. In northern English the old sound is frequently retained, cow, house, and town being pronounced *coo*, *hoose*, and *toon*. In the word room (A.S. *rúm*) and booth (A.S. *búth*) the spelling has been changed, but the old sound has been preserved. The short A.S. *u* has in a few cases retained its sound, as in the words *full* and *bullock*, but, like the long *ú*, it has frequently lapsed into the neutral vowel, as in *sun* and *hunger* (A.S. *sunne* and *hungor*). This sound is now more commonly represented by *o*, as in son and some, A.S. *sunu* and *sum*. Here again the old sound is occasionally retained in northern English, as in come (A.S. *cuman*), pronounced *coom*. In French (as in *du*) and in Welsh *u* has a narrow sound unknown in English (though common among the lower classes in some parts of Scotland), which is nearly the same as that of the German *ü* in Müller. The peculiar sound of the *u* in duke is due to the fact that it is a loan-word from the French *duc*. The German and Italian *u* is the long *u* in brute.

Ubeda, a town of Spain, on a plateau between the Guadalquivir and Guadalimar, 26 miles NE. of Jaen. It contains a large castle, and manufactures cloth, soap, and leather. A flourishing town under the Moors, it witnessed the victory in 1210 of the kings of Navarre and Castile over Abdallah Mohammed of Morocco. Pop. 19,500.

Ucayali, a river of Peru, one of the head-waters of the Amazon, is formed by the confluence of the Apurimac and Urubamba, and winds more than 1200 miles north to join the Marañon opposite Nauta. It traverses a rich, heavily wooded country, of great heat and moisture, and very unhealthy: enormous areas are flooded during the rainy season. It is navigable for large vessels as high as Sarayacu (6° 30′ S.).

Udaipur, or MEWAR, a native state of Rajputana (q.v.); area, 12,670 sq. m.; pop. (1891) 1,832,420. The capital is Udaipur (sometimes spelt *Oodeypore*), picturesquely situated on a ridge overlooking a romantic lake, 140 miles SW. of Ajmere; pop. 38,143.

Udall, NICHOLAS, author of *Ralph Roister Doister*, the earliest English comedy, was born in Hampshire about 1506, was admitted a scholar of Corpus Christi College, Oxford, took his B.A. degree in 1524, and became the stern master of Eton and of Westminster, and canon of Windsor. He died in December 1556. Neither his translations from Erasmus and P. Martyr, his *Flovres for Latin Spekynge* (from Terence), nor his Latin plays (*De Papatu*, *Ezekias*) would have preserved his name without his *Ralph Roister Doister*, a merry comedy in the manner of Plautus, licensed and believed to have been printed in 1566, but almost certainly written twenty-five years before. The plot turns on the gull and coxcomb Ralph Roister Doister's ridiculous and unsuccessful courtship of the comely widow Dame Christian Custance, the intrignes of his parasite Matthew Merrygreek, and the final triumph of the successful suitor, Gawin Goodluck, after his return from sea. Editions are by Durant Cooper for the Shakespeare Society (1847) and Mr Arber (1869).

Udal Right. See ALLODIUM, LAND LAWS.

Udine, a walled town of Italy, capital of a province, lies in a rich wine country, 85 miles by rail NE. of Venice. It has wide, handsome streets, and contains a Romanesque cathedral, an archbishop's palace, a beautiful campo santo, and, on a hill in the midst of the city, a castle, formerly the residence of the patriarchs of Aquileia. Udine manufactures silk, leather, gloves, hats, &c. Bonaparte resided in the doge's castle at Passariano, close by, during the preliminaries of the peace of Campo-Formio. Pop. 23,254.

Ueberweg, FRIEDRICH, philosopher, was born 22d January 1826 at Leichlingen in Rhenish

Prussia, studied at Göttingen and Berlin, and, after teaching in a school at Elberfeld and lecturing at Bonn University, became in 1862 professor at Königsberg, where he died, 9th June 1871. He is best known by his *System of Logic* (1857; 5th ed. 1882; Eng. trans. 1871) and his *History of Philosophy* (1863–66; 7th ed. 1886–88; Eng. trans. 1872), a compendious handbook from an empirical and eclectic standpoint. He gained the Vienna Academy's prize for an essay on the authenticity and order of Plato's works; and an essay on Schiller as historian and philosopher was published posthumously. See a monograph by Lange (1871).

Ufa, capital of a Russian government extending to the foot of the Urals, stands 280 miles ESE. of Kazan, on the Bielaia, a stream which through the Kama falls into the Volga. Pop. 34,500. The government, till 1865 part of Orenburg, is nearly the size of Roumania (see RUSSIA).

Uganda, a British protectorate in East Africa, extending along the north-west shore of the Victoria Nyanza, and lying on both sides of the equator. It was first visited (in 1862) by Speke and Grant, and by Stanley was called the 'Pearl of Africa.' The country is partly mountainous, partly undulating, partly a plain, very fertile on the whole, and well wooded. The climate is mild and singularly uniform throughout the year, the variation being from 50° to 90° F. The Waganda, who may number three millions, are a warlike and highly intelligent people speaking a language of the Bantu stock, with well-developed native industries. At the request of King Mtesa, English Protestant missionaries settled here in 1877, and French Catholics followed in 1879. The Christians had much to endure from Mtesa's son, King Mwanga, by whose orders Bishop Hannington (q.v.) was murdered in 1885 on the borders of Uganda, and hundreds of Christians were burned. The presence of Arabs and Mohammedanism further complicated matters, and intestine struggles were not long in breaking out. Dr Peters tried to extend German influence hither, but the Imperial British East Africa Company regarded Uganda as being within the British sphere under the Anglo-German agreement of 1887, and that it was so was settled between England and Germany in 1890. In 1894 a British protectorate was proclaimed over Uganda proper, and in 1896 this was extended to include Unyoro and Usago, all under a commissioner resident at Port Alice on the Victoria Nyanza. By treaties in 1899–1900 the boundaries with the Congo Free State were adjusted, and the protectorate now includes all the countries between the British East Africa protectorate, the Congo Free State, Lakes Victoria and Albert Edward Nyanza, and Lake Albert. Its area is about 120,000 square miles, and the population is estimated at about 4,000,000. King Mwanga of Uganda rebelled in 1897, and, being defeated, fled to German territory; his infant son was recognised by the British government as ruler under a native council. In 1897 also part of the Soudanese troops in the protectorate mutinied, and were only suppressed after many months' severe fighting, in which several British officers were killed. The military force (Indian soldiers and Soudanese) has since been reorganised. The trade consists of ivory, cattle, wild coffee, and rubber. Roads have been constructed under the protectorate, and regular criminal courts established. The outside trade is expected to be greatly developed on the completion of the railway from Mombasa, of which about 470 miles (of the total of 580) were completed in 1900.

See STANLEY; Felkin and Wilson, *Uganda* (1881); the Life of A. M. Mackay (1890); Mrs Stock's *Story of Uganda* (1892); Lugard, *Rise of our African Empire* (1893); Portal, *Mission to Uganda* (1894); Ashe, *Chronicles of Uganda* (1894); Colville, *Land of the Nile Springs* (1895); and Ansorge, *Under the African Sun* (1899).

Ugolino, COUNT, head of a family long dominant in Pisa, which backed the people against the nobles, and as Ghibellines were the irreconcilable enemies of the Visconti, who headed the Guelphs. The most famous of this family is Count Ugolino della Gherardesca, whose name and fate have been invested with undying interest by Dante. Having resolved to usurp supreme power over Pisa, he formed an alliance with Giovanni Visconti, the head of the Guelphic party. The plot was, however, discovered, and both Giovanni and Ugolino were banished from the city. The latter, uniting himself with the Florentines and the Lucchese, forced the Pisans in 1276 to restore to him his territories, of which he had been deprived. No sooner was he reinstated in his possessions than he began to devise anew ambitious schemes. The war of the Pisans with the Genoese afforded him the opportunity he desired. In the battle fought at the island of Malora, 6th August 1284, Ugolino, by treacherously abandoning the Pisans, occasioned the complete annihilation of their fleet, together with a loss of 11,000 prisoners. When the news of this disaster spread, the Florentines, the Lucchese, the Sienese, the Pistoians, and all the other enemies of the Pisan republic gathered together to destroy it, as the stronghold of the Ghibellines in Italy. Being thus brought to the brink of ruin, the Pisans had no other resource left than to throw themselves into the arms of him whose treachery had reduced them to such misery. From the time of his election he gave free scope to his vindictive, despotic nature, persecuting and banishing all who were privately obnoxious to him, on pretext of state delinquency, till at length a conspiracy was formed against him, headed by his former supporter, the archbishop. Dragged from his palace, 1st July 1288, after a desperate defence, he was thrown into the tower of Gualandi, with his two sons and two grandsons, where they all perished amid the agonies of starvation, for which reason their dungeon has since borne the ominous name of the 'Tower of Hunger.' In spite of this, the family again rose into importance; and in 1329 we find a Gherardesca at the head of the republican authority in Pisa.

Ugrians, a name used by Castrén for Ostiaks, Voguls, and Magyars belonging to the Ugro-Finnic division of the Ural-Altaic peoples. See FINLAND, Vol. IV. p. 625.

Uhland, JOHANN LUDWIG, German poet, was born at Tübingen, 26th April 1787. When a young man at the university of his native place his mind was divided between law and ancient German literature. The latter was his favourite pursuit, and he began to publish poems at an early age, his first collection of *Gedichte* appearing in 1815. To this he kept adding all the rest of his life: the 60th edition was published in 1875, and there have been many more since. Other productions of Uhland's are admirable essays, *Ueber Walther von der Vogelweide* (Stuttg. 1822) and *Ueber den Mythus von Thor* (1836); a most valuable collection of old popular songs, *Alter hoch- und nieder-deutscher Volkslieder* (1844–45); *Schriften zur Geschichte der Dichtung und Sage* (8 vols. 1866–69); and two respectable dramas, *Herzog Ernst von Schwaben* (1818) and *Ludwig der Baier* (1819). He died at Tübingen, 13th November 1862. Uhland was a patriotic politician as well as a poet. He entered the representative assembly of Würtemberg in 1819 as liberal deputy from Tübingen, and was also a delegate to the Frankfort Assembly of 1848; but though Germany has reason to be grateful for his services to the cause of constitutional liberty, it is as a

poet he is best remembered. His pieces are full of spirit, spontaneity, and truth, finely picturesque in their sketches of nature, and exquisite in their varied tones of feeling. Nothing, indeed, can surpass the brevity, vigour, and suggestive beauty of his ballads, in which a romantic sweetness of sentiment and a classic purity of style are happily combined. Uhland is the acknowledged head of the 'Swabian school' of German poets. Longfellow translated some of his ballads in *Hyperion;* and translations by Platt (1848), Skeat (1864), and Sandars (1869) have also appeared. See Lives by his widow (1874), Dederich (1886), Holland (1886), and H. Fischer (1887).

Uhlans, a name (derived through the Polish from the Turkish-Tartar) originally given to light cavalry armed and clothed in semi-oriental fashion. A body of Uhlans was formed for the French army by Marshal Saxe. But the word is now best known as a term for the Prussian light cavalry armed with the lance, who gained glory by their dash, bravery, and swiftness of movement during the Franco-German war.

Uigurs, a Turkish people of Eastern Turkestan who long preserved a separate identity. See GENGHIS KHAN.

Uintah Mountains. See ROCKY MOUNTAINS.

Uist, NORTH, an island of the Outer Hebrides, 65 miles SSW. of Stornoway. It is 18 miles long from west to east, and from 3 to 13 miles in breadth. The eastern half of it is so cut up by lochs and watercourses as to have the appearance of an archipelago—a brown, peaty, dreary bog, partly relieved, however, by a line of hills (1133 feet) running along the coast. In the west part, which as a rule is hilly (1500 feet), there is a tract of uneven, low land, exceedingly beautiful in certain seasons, rendered fertile by the drifting of shell-sand from the coast, and producing good clover and grain crops. Pop. 3371.—SOUTH UIST, 36 miles SW. of Lochmaddy in North Uist, Benbecula lying between them, has a maximum length and breadth of 22 and $7\frac{3}{4}$ miles. Its east coast is much indented by Lochs Skiport, Eynort, and Boisdale. The eastern district is hill or mountainous (2035 feet); the western is alluvial and productive under proper treatment. Pop. 3825 crofters, engaged in fishing and agriculture, and almost all Catholics.

Uitenhage (now pronounced *Yootenhaig*), capital of a district in Cape Colony, is 25 miles NW. of Port Elizabeth by rail; pop. 5350.

Ujiji, a district on the eastern shore of Lake Tanganyika. The chief town is the terminus of the great caravan route from Zanzibar, and has long been an important Arab station. Christian missions have been established here. See Hore's *Tanganyika* (1892).

Ujjain, a walled town of Central India, in Sindia's dominions, anciently the capital of Malwa, and one of the seven sacred cities of the Hindus, stands on the right bank of the Sipra, 30 miles N. of Indore. It is 6 miles in circumference, and contains a palace and exports opium. Pop. 34,691.

Ukase, or OUKAZ (Russ. *ukasáty,* 'to command,' 'to speak'), a term applied in Russia to all the orders or edicts, legislative or administrative, emanating from the czar directly or from the senate. The term is not extended to the orders of ministers.

Ukraine (Polish, 'frontier country'), the name given in Poland first to the frontiers towards the Tartars and other nomads, and then to the fertile regions lying on both sides of the middle Dnieper, without any very definite limits. The Ukraine was long a bone of contention between Poland and Russia. About 1686 the part on the east side of the Dnieper was ceded to Russia (Russian Ukraine); and at the second partition of Poland the western portion (Polish Ukraine) also fell to Russia, and is mostly comprised in the government of Kieff. The historic Ukraine forms the greater part of what is called Little Russia (a name first appearing about 1654), which is made up of the governments of Kieff, Tchernigoff, Poltava, and Kharkoff. Compare the maps at POLAND and at RUSSIA; and for the physical features, see RUSSIA, Vol. IX. p. 34. See also MAZEPPA.

Ulcers (Lat. *ulcus,* 'a sore spot'). Ulceration is 'that part or effect of an inflammatory process in which the materials of inflamed tissues, liquefied or degenerate, are cast off, in solution or very minute particles, from free surfaces, or, more rarely, are absorbed from the substance of the body' (Paget on 'Ulcers,' in Holmes's *System of Surgery*). Generally speaking, however, the name of ulcer is not applied to any inflammatory result, unless the substance of a tissue deeper than the epithelial is exposed; and when the cast-off particles are only epithelial the result is termed desquamation, abrasion, or excoriation, although the process may be essentially the same. Ulceration is closely allied to gangrene, the two processes differing in degree rather than in kind. 'When the degenerate or dead substance,' says Sir J. Paget, 'is cast off in one or more portions visible to the naked eye, the process is usually called gangrene; when the portions are not so visible, or are quite dissolved, it is called ulceration.' The degenerate tissues are always suspended or dissolved in a liquid, termed the 'discharge,' or 'ichor,' which varies in appearance and properties according to the cause and characters of the ulcerative process. 'From some ulcers—e.g. the primary syphilitic—it is contagious; from many it appears corrosive, exciting by its acridity inflammatory changes in the tissues with which it is in contact.'

Ulcers may occur on any surface of the body—e.g. the eye, mouth, stomach, intestines, &c.: here attention will be restricted to ulcers on the skin. They may be classified according either to their obvious characters or to their cause. It is most convenient in the first instance to adopt the former arrangement.

A *common, simple,* or *healthy ulcer* is such as is left after the separation of an accidental slough in a healthy person, and is merely a healthy granulating surface, tending to cicatrisation. Its edges shelve gently down to the base, and are scarcely harder than the adjacent healthy skin. Their surface near the border is of a purplish blue tint where the young epidermis modifies the colour of the healing granulations; and within this the granulations have a deeper hue than those at the centre, being most vascular where the cuticle is being chiefly developed. The discharge from such an ulcer is healthy or 'laudable' pus. *Inflamed ulcers* differ less than most kinds from the above described common or healthy ulcers. Their most common seat is on the lower half of the leg or shin. The surface is red, and bleeds easily; the discharge is thin and watery; the edges irregular or shreddy; and the surrounding skin shows a red tinge, and is the seat of a hot and aching sensation. This ulcer most commonly occurs in the infirm and old, the ill-fed and overworked. Hence constitutional treatment, good diet, and complete rest (with elevation of the limb) are here necessary. *Sloughing ulcers,* in the mildest form, are characterised by an aggravation of the symptoms observed in inflamed ulcers; while the surface becomes gray and is cast off in shreds, and the ulcerative process extends rapidly. They are generally associated with a debilitated state of the system. *Phagedæna* (Gr., from *phagein,* 'to eat or corrode') designates a severer variety of sloughing ulcer in which there is much infiltration, and at

the same time rapid destruction of the affected part, with severe constitutional symptoms. The sore presents an irregular outline, and a gray or yellowish surface; it gives off a profuse bloody or ichorish discharge, and is extremely painful. When occurring in isolated cases it usually attacks persons whose constitutions are not merely debilitated but vitiated by scrofula, by the syphilitic virus, by the abuse of mercury, by intemperance, &c. A link between this virulent form of ulceration and gangrene, though more closely allied to the latter, is the terrible disease known in civil practice as *sloughing phagedæna*, and in military and naval practice as *hospital gangrene*. This disorder requires for its development the influence of some of those undefined causes which regulate the outbreak of epidemics, and is peculiarly characterised by its contagious and infectious nature. It is usually engendered by the overcrowding of sick and wounded men, and some idea of its virulence may be formed from the fact that on the return of the French fleet from the Crimean war, no less than sixty deaths from it occurred in one ship in the course of thirty-eight hours. *Weak ulcers* are those in which the granulations are prominent, pale, and soft. They are generally met with in scrofulous cases. *Exuberant* or *fungous ulcers* have also prominent granulations (popularly called 'proud flesh'), but they are firm and bright red like those of a healthy ulcer. They are most often seen in the healing of severe burns. The *chronic, indolent*, or *callous ulcer*, beyond all doubt, gives more trouble to the poor-law medical officer and the workhouse surgeon than any other half-dozen surgical affections. It is usually seated in the lower half of the leg, and is most commonly of an oval form, with its long axis parallel to that of the leg. 'Its base lies deep, and is flat, pale, or tawny and dusky, with very minute or no visible granulations. The margin is usually abrupt, or unequally shelving, or more often thickened, smooth, and rounded. Both the margin and all the surrounding integuments, often for many inches round, are thickened, hardened, "callous," as with a kind of very firm œdema.'—Paget, *op. cit.*, p. 147. Many volumes have been written on the proper means of treating this form of ulcer. The distinguished surgeon from whose Memoir we have so largely quoted especially recommends opium, regulated pressure, and blistering. A grain of opium night and morning is usually sufficient. The pressure is applied with straps of adhesive or lead plaster on linen, or with an elastic bandage. The object of blistering is not only to stimulate the ulcer, but to soften its callous edges by causing absorption of part of the exudation with which they are infiltrated, and desquamation of the cuticle which covers them. The expediency of healing old ulcers of this kind has often been called in question, inasmuch as serious diseases are said to have followed the healing of such ulcers. In the great majority of cases, however, no untoward results are met with.

The recognition of the *causes* of an ulcer are, however, of even more importance than the characters it presents; for that determines the methods to be employed in order to cure it. It may result from chemical or mechanical injury; from defective circulation, particularly the existence of Varicose Veins (q.v.); and in each of these cases the local cause must be attended to. But it may originate or be kept from healing by a constitutional cause, syphilis, struma, scurvy, or gout; and if so constitutional treatment is of prime importance. Ulceration is also a frequent incident in the progress of malignant, particularly cancerous, tumours. But there is one form of disease, now proved to be cancerous, in which the tumour formation is so slight, and the ulceration so prominent, that it has generally been known under the name of *rodent ulcer*. It generally occurs in the upper part of the face. As in other cancers, free removal is the only treatment which gives hope of cure.

In the *local treatment* of ulcers generally, as of other breaches of surface, the most scrupulous cleanliness is of prime importance; and here, no less than in other departments of surgery, the use of the Antiseptic Method (q.v.) has proved of the greatest value as a means of attaining this end. The particular form of antiseptic most suitable depends on the condition of the sore: in healing ulcers boracic ointment, or if the ulcer be too dry a wet boracic-dressing, usually does well; in inflamed and sloughing ulcers much stronger applications are required. Prominent granulations are generally best treated by the occasional application of solid nitrate of silver.—Ulcer of the stomach is treated at STOMACH.

Uleåborg, a seaport town of Russian Finland, capital of a government, stands on the south bank of the Uleå, on the eastern shore and near the head of the Gulf of Bothnia. It was founded in 1605, and nearly all burned down in 1822. It has dockyards, and carries on a trade in tar, pitch, and timber. In 1854 an English flotilla burned the government property in the place. Pop. 12,360.

Ulema (Arabic, plur. of *'âlim*, 'learned' or 'wise'), the collective name (which cannot be used as a singular) of the body of professional theologians and doctors of divinity, and therefore of law, in any Mohammedan country. They form the legal and judicial class, and interpret the Koran and the law derived therefrom; they also constitute whatever there is of the nature of a hierarchy in Islam, and their power and influence have often curbed the irresponsible authority of a despot. There are necessarily Ulema in every Mohammedan city, but the most renowned are the Ulema of Constantinople, of Mecca, and of the Azhar university at Cairo. The Ulema of Turkey are the best organised, and possess many privileges and immunities. They include (apart from the *softas*, who are a species of undergraduates training for the rank of Ulema) the *imâms* or readers of the public prayers at the mosques; the *muftis* or doctors of the law, who act partly as barristers, partly as assessors in the courts; and the *kâdis* or *mollas*, who are the regular magistrates, and are under the authority of two chief-justices, the *kâdi asker* of Europe and of Asia; whilst over them all stands the Grand Mufti or *Skeykh-el-Islâm*, the spiritual head (under the Caliph) of orthodox Mohammedanism and supreme judge of the Ottoman empire. The verdicts or decisions of the Ulema are called *fetvas*. The Ulema form the ultra-conservative party in all Mohammedan countries; their interpretations of the Koran, when honest, are rigidly and pedantically in accordance with established tradition, but as individuals they are far from incorruptible. To them more than to any other class is due the lifeless formalism that generally prevails in Mohammedan countries, and they are the prime movers in all outbreaks of fanaticism.

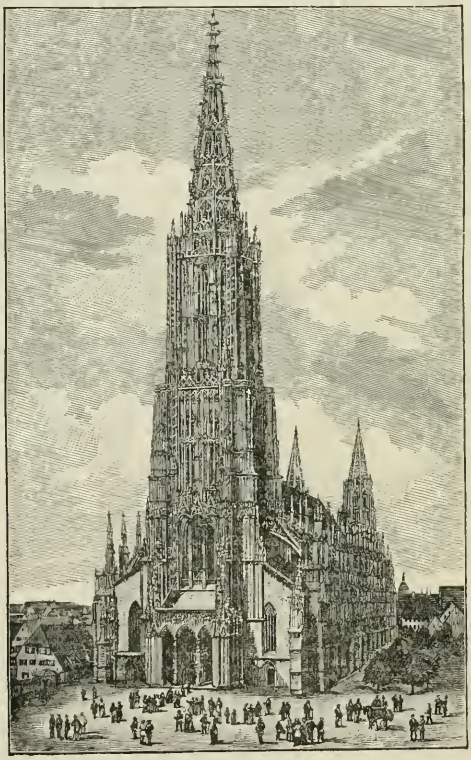
Ulfilas. See ULPHILAS.

Ullmann, KARL, Protestant theologian, was born at Epfenbach near Heidelberg, 15th March 1796, and except during the years 1829–36, when he was professor at Halle, spent most of his life as student and as professor at Heidelberg, where he represented a 'Mediation school' of theology. He died 12th January 1865. His best-known works are on *The Sinlessness of Jesus* (1841; 7th ed. 1863; Eng. trans. 1870) and *Reformers before the Reformation* (2d ed. 1860; Eng. trans. 1841–42). He also wrote against Strauss, and on the essentials

of Christianity (1849; 5th ed. 1865). There is a monograph by Beyschlag (1867).

Ullswater, after Windermere the largest of the English 'Lakes,' between the counties of Cumberland and Westmorland, 5½ miles SW. of Penrith and 11 ESE. of Keswick. Lying 477 feet above sea-level, it is 9 miles long, ¼ to ¾ mile broad, and 218 feet in maximum depth. It is divided into three reaches, which increase in beauty and grandeur as one goes up it from Pooley Bridge to Patterdale, a chief feature of the landscape being the lofty mountain Helvellyn (q.v., 3118 feet), which rises from the south-west extremity of the lake. See the map and the works cited, at LAKE DISTRICT.

Ulm, the second city of Würtemberg, 58 miles SE. of Stuttgart and 91 WNW. of Munich, on the left bank of the Danube, which here receives the Blau and the Iller and becomes navigable. On the Bavarian side of the river is New Ulm, with 7593 inhabitants. Ulm till the war of 1866 was a fortress of the Germanic Confederation, garrisoned by troops of Würtemberg, Austria, and Bavaria. Its fortifications (1842–66) have since been greatly extended. The Protestant cathedral



Ulm Cathedral.

is remarkable for architectural beauty, and is, next to the cathedral of Cologne, the largest church in Germany. It is 455 feet long, 186 broad, and 134 high; the tower and open-work spire (530 feet, the highest in the world; see Vol. IX. p. 644) was only completed on 30th June 1890. The cathedral was begun in 1377, and carried on until 1494; its restoration was undertaken in 1844, and it has a splendid organ (1856–88) with 6268 pipes. Other edifices are the 15th-century town-hall, the 'New Building' (1603) on the site of a palace of Charlemagne's, and the Teutonic Knights' Commandery (rebuilt 1718). Leading industries are the manufacture of cotton, woollen, and other textiles, of paper, leather, beer, &c. Ulm is famed, moreover, for ornamental pipe-bowls and pastry called Ulmer bread. Pop. (1871) 26,290; (1890) 36,201, of whom one-fourth were Catholics. The Romans had a settlement at this important point. In 1531 the city accepted the Reformation. Ulm was in October 1805 the scene of the defeat by Ney of General Mack, and of his surrender with 28,000 Austrians. In 1802 it was attached to Bavaria, and in 1810 became part of Würtemberg. See works by Pressel (1873–78), Schultes (1881), and Löffler (1881), besides an article in the *English Illustrated Magazine* (1886).

Ulmaceæ, or ULMEÆ. See URTICACEÆ.

Ulphilas, or WULFILA, the translator of the Bible into Gothic, was born about 311 A.D. among the Goths north of the Danube. Consecrated a missionary bishop to his fellow-countrymen by Eusebius of Nicomedia in 341, after seven years' labour he was forced to migrate with his converts across the Danube. For over thirty years he laboured in Lower Mœsia, at the foot of the Hæmus, visited Constantinople in 360 in the interest of the Arian party, and again in 381, only to die a few days after his arrival. For the history of the great monument of Teutonic philology which renders his name for ever memorable, see GOTHS.

See the Lives by Waitz (Hann. 1840) and Bessel (Gött. 1860), the Hulsean Essay by C. A. Scott (1885), and H. M. Gwatkin, *Studies of Arianism* (1882).

Ulpianus, DOMITIUS, a celebrated Roman jurist, born at Tyre about 170 A.D., who held juridical offices under Septimius Severus and Caracalla, and, on the accession of Alexander Severus (222), became his principal adviser and *præfectus prætorio.* He was murdered in a mutinous riot by his own soldiery in 228. Ulpian was a voluminous writer, and as a jurist he takes the first rank after Papinian. In the *Digest* of Justinian there are no fewer than 2462 excerpts from Ulpian, forming about a third of the whole. Of the originals, which are almost entirely lost, the principal were *Ad Edictum*, a commentary on the Edict in eighty-three books, and *Ad Sabinum*, a commentary on the *Jus Civile* in fifty-one books. The so-called *Fragmenta* of Ulpian, first published at Paris by Tilius in 1549, consist of twenty-nine titles —the *Tituli ex Corpore Ulpiani*, edited by Hugo (Berlin, 1834) and Böcking (Bonn, 1836). See Abdy and Walker, *The Commentaries of Gaius and the Rules of Ulpian* (1870; 3d ed. 1885).

Ulrici, HERMANN, a German writer on philosophy and æsthetics, was born at Pförten in Lower Lusatia, 23d March 1806, studied law at Halle and Berlin, but early devoted himself exclusively to literature and philosophy. In 1834 he was appointed to a chair at Halle, and here he laboured till his death, January 11, 1884. In philosophy he belonged to the theistic school of Fichte the younger, Wirth, and Carriere, revolting from the pantheistic tendencies of Hegel's idealistic rationalism. His first work was his *Geschichte der Hellenischen Dichtkunst* (1835), which was followed by a very ingenious essay, *Ueber Shakspeare's dramatische Kunst* (1839; Eng. trans. 1846). Other works are *Ueber Princip und Methode der Hegelschen Philosophie* (1841); *Das Grundprincip der Philosophie* (1845–46); and a *System der Logik* (1852). His books *Glauben und Wissen* (1858), *Gott und die Natur* (1862), *Gott und der Mensch* (1866), and *Leib und Seele* (1866) naturally appealed to a still wider circle of readers. Further Shakespearian studies were an edition of *Romeo und Julia* (1853) and a *Geschichte Shakspeares und seiner Dichtung* in vol. i. of the German

Shakespeare Society's version of the Schlegel-Tieck translation (1867).

Ulster (Lat. *Ultonia*), the most northern of the four provinces of Ireland, is divided into nine counties—Antrim, Armagh, Cavan, Donegal, Down, Fermanagh, Londonderry, Monaghan, and Tyrone, each of which is separately described. Ulster seems to have formed one of the most ancient divisions of Ireland, and was the seat of the Hy-Nialls or O'Neills, as well as of the lesser septs of O'Donnell, O'Cahan, O'Doherty, Maguire, Mac-Mahon, &c. The north-eastern portion, now the county of Down, was early overrun by John de Courcy, and subsequently by Hugh de Lacy, and was the most permanent seat of English power in the north; but although various efforts were made by the English to effect a permanent settlement in the north and north-west, the success was but nominal until the reigns of Elizabeth and of James I., when the plantation of Ulster was effected (see IRELAND, Vol. VI. pp. 204, 205). Of this gigantic scheme of colonisation the chief seat was the county of Londonderry (q.v.). The Scottish element has long been dominant in some parts of Ulster, especially the north-east, but is very unequally distributed. The originally English and Scottish element varies from 75 per cent. in Antrim to about 20 in Cavan. Ulstermen had a very important share in extending the area of civilisation and culture in the United States. When about 1720 the great exodus of Irish Protestant Nonconformists began (100,000 are said to have crossed the Atlantic in ten years) the English settlements south of New England consisted of the strip of country east of the Alleghanies. Scoto-Irishmen formed the vanguard that penetrated beyond amongst the dreaded Indians, and were the main stock from which descended the backwoodsmen and fighting farmers who for fifty years bore the brunt of Indian warfare. In 1861 the whole population of Ulster was 1,914,236, the Roman Catholics numbering 966,613; in 1871 the total was, owing to emigration, 1,833,228, of whom the Catholics were only 897,230; of the total in 1881, 1,730,542, the Catholics were 833,566; and in 1891, of a total of 1,617,877, there were 744,353 Catholics, 427,810 Presbyterians, 361,917 Protestant Episcopalians, 40,525 Methodists, and 41,885 of all other denominations. The distribution of confessions varies in different parts of the province; while the Protestants are about 75 per cent. of the whole in Antrim, they are only 20 per cent. in Cavan. The preponderance of Protestants in parts of Ulster has led to diversity of feeling and aims between Ulster and more thoroughly Catholic parts of Ireland; and the determination of Ulstermen to offer resolute resistance to all schemes of Home Rule was emphasised by a great convention of 12,000 delegates at Belfast on 17th June 1892. Belfast (q.v.) is the most enterprising town of Ulster and of Ireland; flax-spinning is the most important industry after agriculture. In 1890 the area under flax was 96,896 acres, in 1891 only 74,612; in 1890 there were used in Ulster 20,045 tons of home-grown flax as compared with 19,607 tons imported; in 1891 the figures were 12,455 tons of home-grown and 25,387 tons imported. The order of baronets, nominally founded for the defence of Ulster, had the 'bloody hand' of the O'Neills, the Ulster arms, given them as their cognisance (see BARONET). For the Ulster Herald, see HERALD. The Ulster system of 'Tenant Right' has been substantially incorporated in Irish legislation of 1870–87 (see LAND LAWS). See, besides works cited at IRELAND (and in the section of that article on the Irish Church), the articles TYRCONNEL, TYRONE, ORANGEMEN; and John Harrison, *The Scot in Ulster* (1888).

Ultimus Hæres, in Law, means the crown or the state, which succeeds to the property of those who die without leaving next of kin, or who, being bastards, have no next of kin.

Ultramarine. See BLUE.

Ultramontane (Lat., 'beyond the mountains'—the Alps—namely, in relation to France), that party in the Church of Rome which assigns the greatest weight to the papal prerogative. See GALLICAN CHURCH, INFALLIBILITY, OLD CATHOLICS, PIUS IX., POPE. (Italians of course use the word in a converse geographical sense for people beyond the Alps and so in the north of Europe.)

Ulugh-Beg, the grandson of Tîmûr, or Tamerlane (q.v.), governed Western Turkestan as regent for his father Shah Rokh, while the latter was employed in regulating the affairs of the southern half of the empire, and succeeded in 1447 to the imperial throne on his father's death. He was a successful warrior, as every ruler of this period had to be, but happened, unfortunately, to conceive suspicions of the loyalty of his eldest son, suspicions founded only upon astrological indications. The offended and injured prince rebelled, defeated and captured his father, and soon after caused him to be put to death, thus fulfilling the prediction, 1449. Ulugh-Beg is known to posterity as the founder of the observatory at Samarcand, as the liberal patron of astronomers, and as himself a most diligent observer. The astronomical tables which bear his name, in all probability compiled by himself and his fellow-labourers, enjoy a high reputation for accuracy. The astronomical works of Ulugh-Beg were written in Arabic, afterwards translated into Persian, and thence the chronological portion of them rendered into Latin (Lond. 1650) by Greaves, who followed with a Latin version of the geographical part in 1652. An independent version of the same work in Latin and Persian was published by Dr Thomas Hyde, at Oxford, in 1665. A new edition of Ulugh-Beg's catalogue of stars will be found in the *Memoirs of the Royal Astronomical Society*, vol. xiii. Some of Ulugh-Beg's coins have been published by S. Lane-Poole, *Catalogue of Oriental Coins in the British Museum*, vol. vii., and *Additions*, part ii.

Ulundi. See ZULUS.

Ulverston (locally *Ooston*), a market-town of Lancashire, in the district of Furness, near the influx of the Leven estuary into Morecambe Bay, 8½ miles NE. of Barrow-in-Furness and 22 NW. of Lancaster. It stands in an extensive agricultural and mining district, has a ship-canal 1 mile long, and manufactures iron, paper, boots, &c. Pop. (1851) 6433; (1881) 10,008; (1891) 9948.

Ulwar. See ALWAR.

Ulysses (also *Ulyxes* or *Ulixes*), the Latin form of the Greek ODYSSEUS, the name of one of the most celebrated heroes of the Trojan war. A son either of Laertes or of Sisyphus and Anticleia, he married Penelope, and by her became the father of Telemachus. Agamemnon visited Ithaca and with difficulty prevailed on Ulysses to take part in the Trojan expedition. Later traditions represent him as feigning madness in order to escape, but in vain. He brought with him twelve ships, and during the siege showed himself equal to any of the chiefs in courage, and superior to all in prudence and ingenuity of resource. His adventures after the fall of Troy form the subject of the Homeric poem called the *Odyssey*. Of these the most remarkable befell in the country of the Lotus-eaters, where the companions of Ulysses ate of the wondrous fruit, and wished to rest for ever; the island of the Cyclops, where he escaped with difficulty from Polyphemus; the island of Ææa, inhabited by

the sorceress Circe, with whom he sojourned a year; the country of the Cimmerians, where darkness reigns perpetually; the perilous island of the Sirens, the fatal charms of whose singing he resisted by lashing himself to the mast and stopping his men's ears with wax; the alternate horrors of Scylla and Charybdis; the island of Ogygia, where he lived eight years of quiet happiness with the nymph Calypso; and the shores of Scheria, the island of the Phæacians, where in his shipwrecked condition he was succoured by Nausicaa, daughter of King Alcinous. At length he reached Ithaca, and in his beggar's disguise was recognised by his nurse and by his old dog Argus alone. Aided by Telemachus and the swineherd Eumæus, he slew all the insolent suitors of his faithful wife, Penelope. See Lamb's *Adventures of Ulysses*, with introduction by A. Lang (1890).

Umâ, another name for the goddess Kali, wife of Siva (q.v.).

Uman, a town of Russia, 120 miles S. of Kieff, on the Umanka. Pop. 15,393.

Umballa, or AMBÁLA, a city of India, capital of a district of the same name in the Punjab, 150 miles N. by W. of Delhi. The new part of the town has wide roads, monotonously straight, and a handsome church, club-house, and hotels. It is an important railway junction, and carries on a very large trade. The cantonment is 4 miles SE. At Umballa Shere Ali was received at a grand darbár in March 1869. Pop. (1891) 79,270.

Umbelliferæ (*Apiaceæ* of Lindley), a large and important natural order, containing more than 150 genera, 1300 species, abounding chiefly in the temperate regions of the northern hemisphere. A peculiar regularity distinguishes the inflorescence of most of this order—a number of stalks radiating from a common centre at the top of the stem, or of a branch, each of which bears a flower at its extremity, thus forming what is called an *umbel*. The umbel is often compound, the primary stalks dividing in a radiated manner, and forming *secondary umbels* or *umbellules*. The flowers are generally small, although the umbel which they compose is often large. They are generally white, rarely yellow, still more rarely red, though frequently tinged with pink at the edges. The fruit is very peculiar, and consists of two one-seeded, unopening carpels, rarely fleshy, touching one another on the inner side, and there attached to a little column (the *carpophore*), their common axis. The Umbelliferæ are mostly herbaceous plants, rarely shrubby. They usually have divided or compound, rarely simple leaves. They generally abound in a resinous secretion, and a volatile oil, from which many of them derive poisonous and medicinal properties, which are more or less common to all parts of the plant, and often highly developed in the seeds. Acridity is their general characteristic. Some are pleasantly aromatic, others have a powerful and disagreeable smell. In the roots of some, especially when enlarged by cultivation, starch and sugar are secreted, so that they become useful for food, although the peculiar flavour of the essential oil is still retained. Of esculent-rooted Umbelliferæ the carrot and parsnip are the best-known examples; skirret, earth-nut, and arracacha are also of some value. The blanched stems of celery, enlarged by cultivation, are a favourite salad. The candied stalks of eryngo were once much esteemed, and those of angelica are still used. The leaves of parsley, chervil, fennel, &c. are used for flavouring. Lovage (*Levisticum officinale*) is sometimes cultivated as a salad plant. The seeds of anise, caraway, coriander, &c. are used as carminatives. Hemlock, water hemlock, water parsnip, fool's parsley, and many others are narcotic poisons; asafœtida, galbanum, sagapenum, and opoponax are medicinal products of this order.

Umber, a brown earthy mineral used as a pigment. It is found in Italy, Cyprus, England, and other countries. Like Ochre (q.v.), umber contains a large proportion of sesquioxide of iron, but it differs from ochre in containing, to the extent of about one-fifth of its weight, one of the higher oxides of manganese. The mineral is prepared for use as a pigment by grinding it to a powder, washing it with water, and then drying it at 212° F. When so treated it is known as *raw umber*, and is of a pleasing but rather pale grayish-brown hue. *Burnt umber* is prepared from raw umber by calcination, and is of a darker, richer, and more transparent brown colour. Both kinds are permanent either as water-colours or oil-colours, and burnt umber especially is much used by artists as well as by house-painters. Umber was one of the colours employed by the old masters.

Umbilical Cord. See FŒTUS.

Umbrella (Lat. *umbra*, 'a shade'). As a shade from the sun, the umbrella is of great antiquity. In the sculptures of Egypt, Nineveh, and Persepolis umbrellas are frequently figured (see Vol. I. p. 517). In the East, however, its use seems anciently to have been confined to royalty, having the ceremonial significance of the Baldachin (q.v.) or Canopy (q.v.). In China, Burma, &c. umbrellas, especially as sun-shades, are very familiar still. In Greece and Rome umbrellas were regularly used by women, but by men only if they were content to be regarded as effeminate. The custom was probably continued in Italy from ancient times; but at the beginning of the 17th century the invention seems to have been little if at all known in England. In that century, however, it came into use as a sun-shade for the luxurious; and in the reign of Queen Anne it had become common in London as a screen from the rain, but only for the weaker sex. Gay's *Trivia* (1716) speaks of good housewives treading through the wet 'defended by the umbrella's oily shed.' In that century it became not unusual to have a common umbrella in coffee-houses; and *Notes and Queries* (e.g. 5th series, vol. vi. pp. 202, 313) contains many allusions to parochial umbrellas, kept to protect the bare-headed clergyman at funerals. These were made of leather, and were accordingly very heavy and cumbrous. The first person of the male sex who had the moral courage regularly to carry an umbrella in the streets of London was apparently Jonas Hanway (q.v.)—a practice he persisted in in spite of obloquy for thirty years, when his example began to be followed. Still it was long regarded as a sign of infirmity or effeminacy to use umbrellas, and those who did so suffered much unpleasant jeering in consequence. Umbrellas and parasols (the name allotted to the sun-shade, which the word umbrella properly suggests) were at first all brought from abroad, chiefly from India, Spain, and France; now the manufacture of umbrellas has reached an enormous extent in Great Britain. Cotton, oiled silk, gingham, alpaca, silk, and various mixtures of silk and wool are in use for umbrellas. The substitution of steel for whalebone frames became common about the middle of the 19th century.

Umbrella Bird, a fruit-crow of South America (Cephalopterus), so called from its radiating crest.

Umbrella Tree. See MAGNOLIA.

Umbrette. See STORK.

Umbria, one of the ancient divisions of Italy, lying west of Etruria, and north of the country of the Sabines. It is usually described as extending from the Tiber eastward to the Adriatic; but when the Umbrians first come into history we find them restricted to the ridges of the Apennines, the lowland region bordering on the Adriatic from the Æsis (*Esino*) to the Rubicon, being held by a race of Gallic invaders, known as the Senones. The most important memorial of the Umbrian language is the so-called Eugubine Tables (q.v.); here it is enough to say that it belongs to the Latino-Italian stock. The Umbrians were subjugated along with the Etruscans, but joined the Samnites in their last gallant struggle against Rome, and were crushed at Sentinum (295 B.C.).

On the language there are works by Grotefend (Hannov. 1835–39), Aufrecht and Kirchhoff (Berlin, 1851); see also Saveloberg's *Umbrische Studien* (1873), and Bücheler's *Umbrica* (Bonn, 1883).

Umlaut, a German word invented by Grimm, and now used by all writers on the philology of the Teutonic tongues, including English, for a vowel change in their languages brought about on a preceding vowel by the vowel *i* (or *e*) modifying the first in the direction of *e* or *i*. It is common in German (thus *gänse*, the plural of *gans; schlüge*, the subjunctive of *schlug*); and there are survivals in English, as *men* from *man*, *fell* from *fall*, *mice* from *mouse*.

Umritsir. See AMRITSAR.

Umrohah, a town of the North-west Provinces of India, 23 miles NW. of Moradabad. Pop. 36,145.

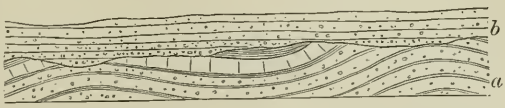
Unalashka. See ALEUTIAN ISLANDS.

Uncial Letters. See PALÆOGRAPHY.

Unclaimed Money, and things left without an apparent owner, were assigned by the Roman jurists to the first person who took possession of them. According to feudal law land left without an owner escheated or fell back to the superior of whom it was held, and movables to which no person could make out a claim were given to the crown as *bona vacantia*. By modern rules of law facilities are given to persons claiming to be entitled to money in court or government stock; subject to any rightful claim, the money or stock is transferred to some public account. Thus, for example, the National Debt Act, 1870, provides that stock on which no dividend has been claimed for ten years shall be transferred to the National Debt Commissioners. A list of names, out of which stock has been transferred, is to be kept, and the list is open for inspection. Re-transfer is made to any claimant who can show his right, public notice being given to enable other claimants to appear. The court will not as a rule direct a re-transfer without an inquiry as to persons interested. Expense is sometimes incurred by persons who put forward claims as next of kin to owners of stock, &c. who have died intestate. In such cases it is well to remember that similarity of name, or vague evidence of relationship, is not enough to establish a title to property.

Unconditioned. See RELATIVITY.

Unconformity, or UNCONFORMABILITY, in Geology, is a structure which implies an interruption in sequence. When strata occur in regular sequence—each successive bed resting regularly upon the surface of the bed subjacent to it—they are said to be conformable. But when one set of beds extends over the denuded surface of another series we have what is called *unconformity*. The structure is shown in the accompanying section, where we have a discordant junction between two sets of strata, the upper series (*a*) resting unconformably on the upturned and denuded edges of the lower series. Such an unconformity usually points to the lapse of a long period of time. In the section the lower series (*a*) must first have been deposited, and subsequently folded and subjected to much denudation, which removed the



tops of the anticlinal arches so as to expose the truncated ends of the beds. In many cases this denudation has been in great part subaërial—the rocks have formed part of a land-surface for some protracted period. Afterwards the denuded land-surface was submerged, so that newer deposits (*b*) were accumulated unconformably upon the older series. A well-marked unconformity thus usually indicates the following succession of changes: (1) a movement of elevation, followed by (2) terrestrial conditions and more or less excessive denudation; and thereafter (3) subsidence accompanied by deposition of sediment over a gradually increasing area.

Unconscious, THE. See HARTMANN.

Unction. See EXTREME UNCTION.

Underground Railway, specially the Metropolitan and Metropolitan District railways of London. See RAILWAY. In the United States the term 'underground railroad' was given before the abolition of slavery to a secret arrangement for helping slaves to escape, by passing them along from one hiding-place to another till they reached Canada or other territory where they were safe from recapture.

Undines (Lat. *unda*, 'wave'), the name given in the fanciful system of the Paracelsists to female water-spirits. They intermarry readily with human beings, and the Undine who gives birth to a child under such a union receives with her babe a human soul. But the man who takes an Undine to wife must be careful not to go on the water with her, or at least must not vex her while there, or she returns to her native element. This notion is elaborated in Fouqué's *Undine;* see also MELUSINE, SYLPH.

Undulatory Theory. See articles INTERFERENCE, LIGHT, OPTICS, POLARISATION, PHOSPHORESCENCE, REFLECTION, REFRACTION, SOUND, SPECTRUM, WAVE, and literature there cited; also Basset's *Physical Optics* (1892).

Ungava, a Canadian territory delimited in 1895, and named from Ungava Bay in the NE. of Labrador. It extends from Hudson Bay to the Atlantic, bordering to the S. on Quebec.

Unguents. See OINTMENTS.

Ungulata ('hoofed'), an order of mammals, including (1) the Artiodactyla (with an even number of toes)—e.g. pig, hippopotamus, peccary, camel, chevrotain, and ruminants like cattle, sheep, and deer; (2) the Perissodactyla (with an odd number of toes)—e.g. tapir, rhinoceros, and horse. Many zoologists include (3) the Hyracoidea—e.g. Hyrax (q.v.)—and (4) the Proboscidea or Elephants (q.v.). See ARTIODACTYLA.

Ungvár, a town of Hungary, 325 miles by rail NE. of Budapest; pop. 12,300.

Uniats. See GREEK CHURCH.

Unicorn (Lat. *unum cornu*, 'one horn'), a fabulous animal, mentioned by ancient Greek and Roman authors as a native of India, its body resembling that of a horse, exceeding swift, and having one straight horn a cubit and a half long on

the forehead. Aristotle makes the oryx (an antelope) and the Indian ass one-horned. Although the descriptions of the unicorn given by the ancients are very unlike the Indian rhinoceros, yet probably that animal was the origin of them all. The word unicorn was unhappily used in translations of the Old Testament for the Hebrew *rĕ'ĕm*. The Septuagint led the way in this, by using the Greek *monokerōs;* and it has been supposed by many that the animal meant is a rhinoceros. But from Deut. xxxiii. 17 (where the Authorised Version has 'horns of unicorns') it is obvious the animal was two-horned; the revised translation has 'horns of the wild ox.' Elsewhere the alternative 'ox-antelope' is given in the margin of the new version. The spirally twisted unicorn's horn of heraldry is probably derived from the 'horn' of the Sea-unicorn or Narwhal (q.v.). The unicorn, as the sinister supporter of the royal arms, was adopted by James I. at the union of the crowns (cf. HERALDRY, Vol. V. pp. 668, 669).

See G. R. Brown, *The Unicorn* (1881); C. Gould, *Mythical Monsters* (1886).

Uniform ('one shape') is the distinguishing dress of any special body of individuals—whether soldiers, sailors, or members of a society or club. *Military uniforms* in Great Britain may be said to date from the Restoration, and the consequent formation of a standing army. As early as Henry VIII.'s time the sovereign's bodyguard (now the Honourable Corps of Gentlemen-at-Arms in England and the Royal Archers in Scotland) received a distinctive dress. But this dress was several times changed—e.g. cloth of gold and silver became red and yellow damask in 1529, and then white and black shortly afterwards. The life guards and horse guards, formed in 1661 from the troops which had fought on opposite sides during the Great Rebellion, in buff coats, cuirasses, and steel caps, were then dressed in scarlet coats, feathered hats, and jack boots. Cocked hats were soon after given them, and in 1812 helmets. Somewhat similar changes have taken place in the rest of the army. Military uniform consists of a coat of one prevailing colour, variously ornamented and 'faced' according to rank and corps, a special head-dress and trousers or kilt. Scarlet may be said to be the national uniform of the British army, blue of the German and French. But this only applies to the tunic or jacket, and there are many exceptions. Thus British artillery and many cavalry regiments wear blue, all rifle regiments green, some regiments of the Indian army yellow, drab, and French gray, some colonial and other volunteers gray. In hot climates, during summer, only white uniform is worn, and the white helmet is universal for European troops. The kilted dress of the Highlanders is peculiar to the British army, but the black soldiers of the less well-known West India Regiment are dressed like Zonaves, the jacket being red and trousers blue instead of the reverse. Blue is the uniform of the United States army, the overcoat and trousers sky-blue, the blouse and uniform-coat dark-blue. The head-dress is a very distinctive part of the uniform. At home the Scots Greys and foot-guards wear bearskins, and all fusiliers hats of similar shape; hussars and horse artillery wear Busbies (q.v.), kilted regiments the feather bonnet, Highland Light Infantry the shako, rifle regiments now a small astrakhan busby, staff-officers cocked hats. All others wear helmets, metal for cavalry, blue cloth for other arms; native Indian regiments generally turbans. Forage caps of various patterns are worn in undress. Facings, formerly very prominent, are now confined to collars, cuffs, the busby bags of hussar regiments, and the breast-pieces of lancers' tunics. The rule is blue for royal regiments wearing scarlet, and *vice versâ;* white for English, yellow for Scotch, and green for Irish, if not royal. Cavalry regiments do not follow this latter rule. The colours of the plumes too are very numerous—black, white, red, and a mixture of two of these colours, yellow or green. Generally all hussars and lancers wear blue, all other cavalry red tunics with blue overalls; but the 11th Hussars have crimson overalls, the 6th Dragoon Guards blue tunics, and the 16th Lancers red. Officers of all arms wear, in addition to other marks, badges of rank on their shoulder-straps. One star denotes a lieutenant, two a captain, a crown a major, a star and crown a lieutenant-colonel, a second star a colonel. Cross-swords added to these signify the various grades of general officer, and cross-batons a field-marshal. In the United States army the shoulder-straps of a second-lieutenant are plain, those of a first-lieutenant bear a silver bar at each end, those of a captain two silver bars at each end, those of a major a gold oak-leaf at each end (silver for a lieutenant-colonel); a colonel's shoulder-straps bear a silver eagle, a brigadier's a silver star, a major-general's two and a lieutenant-general's three silver stars, and the general's two silver stars with a gold eagle and device between. The Confederate uniform was gray.

Uniforms in the British navy were not laid down until the reign of George III. Like other nations, the prevailing colour is blue. Tail coats and epaulettes, discarded by the army after the Crimean war, are still worn by officers in full dress, and cocked hats. Rings of gold lace and badges on the epaulettes denote the rank (see EPAULETTE). In the United States navy dark navy-blue is the uniform colour, but in warm weather a service coat of white linen duck trimmed with white braid is substituted, and a white cork helmet may take the place of the cocked hat or service cap. All commissioned officers wear gold bullion epaulettes on each shoulder; rank is indicated by strips of gold-embroidered white oak-leaves or of gold lace, and by devices on the shoulder-straps.

Since the beginning of the 19th century, with its development of field-sports and travelling, it has become usual for British officers not to wear their uniforms when off duty, save on special occasions. In 1815 officers sitting in parliament wore their uniforms; and twenty or thirty years later officers when on leave wore a frogged coat—a spurious kind of undress of their own invention. The *privilege* of wearing plain clothes, now granted also to warrant officers, to a great extent rests with the general in command, and might at any time be withdrawn. In late wars, especially in South Africa, all British troops have worn practically the same uniform of *khaki* or dust colour.

Uniformitarian. See GEOLOGY, p. 149.

Uniformity, ACT OF, a measure passed in 1662, by which a number of clergymen, variously stated at from 800 to 2000, were driven out of the English national church. See ENGLAND (CHURCH OF), p. 359, INDEPENDENTS, NONCONFORMISTS, and works cited under the first two articles.

Unigenitus. See JANSEN, GALLICAN CHURCH.

Union. The crowns of England and Scotland were united under one sovereign on the accession of James VI. of Scotland to the English throne as James I. in 1603; but for above a century longer each country continued to be ruled by its respective parliament, the interest of the one often coming into collision with that of the other. After various fruitless proposals for a closer connection of the countries, the Scots were in 1702 prevailed on to send twenty commissioners to London, who, with twenty-three English commissioners, should

deliberate on the terms of union. Their proceedings, after being broken off, were resumed in 1706. The union, though popular in England, was the subject of great dissatisfaction in Scotland, being regarded by the bulk of the community as a surrender of national independence to a powerful rival. The treaty was, however, after strennous opposition, ratified by the Scottish as well as the English parliament, and ultimately completed on May 1, 1707. Its principal condition was the incorporation of England and Scotland into the United Kingdom of Great Britain, the succession of whose monarchs was to be the same as that of England. There was to be one parliament, in which the peers of Scotland would be represented by sixteen of their number elected each parliament, and forty-five Scottish members were to sit in the House of Commons (see PARLIAMENT, NOBILITY). All rights and privileges were to be common between the subjects of both kingdoms, unless when otherwise agreed. The Episcopal Church was confirmed in England, and the Presbyterian in Scotland. Scotland was to retain her Courts of Session and Justiciary, and to have a separate seal for private rights and grants. While the parliament was to raise £2,000,000 by land-tax, Scotland would contribute £48,000 of that sum. The laws of trade, customs, and excise in Scotland were to be assimilated to those of England, and the coinage, weights, and measures of the two countries were to follow a uniform standard. In other matters the laws of Scotland were to remain in force, but might be altered by the parliament of Great Britain. The separate Privy Council of Scotland, which the Act of Union left untouched, was abolished the following year. See SCOTLAND, and books cited there; also FLAG.

Ireland remained a distinct kingdom till 1801, when it was united with Great Britain into the United Kingdom of Great Britain and Ireland. By the terms of the union the separate parliament of Ireland was done away with, and Ireland was represented in the parliament of the United Kingdom by four lords spiritnal and twenty-eight lords temporal in the House of Lords, and 100 members of the House of Commons. For the arrangements as to Irish peers, see NOBILITY. The churches of England and Ireland were united into one Protestant Episcopal Church (see under IRELAND the section IRISH CHURCH). The subjects of Ireland were placed on the same footing as those of Great Britain in respect of trade and navigation, and in all treaties with foreign powers; and the law-courts of Ireland were to continue, subject to the regulations of parliament, writs of error and appeals being decided by the House of Lords of the United Kingdom. See IRELAND, GRATTAN, O'CONNELL, PITT, PARNELL, and works there cited.

Union. See POOR-LAWS.

Union, a town of New Jersey, on the Hudson, opposite New York. Pop. (1890) 10,643.

Union College, situated at Schenectady, New York, was incorporated in 1795, and rose to prosperity under the long presidency of Rev. Eliphalet Nott, from 1804 to 1861. It has some admirable buildings, a good library, 200 students, and twelve professors. In 1873 a new charter enabled certain schools of law, medicine, and pharmacy at Albany to unite with the college to form Union University.

Unionidæ, a family of lamellibranchiate molluscs, whose metropolis appears to be in the western hemisphere, represented in Britain by two genera, Unio and Anodonta. The shell is regular, equivalve, and closed, the ligament external. In Unio the hinge is furnished with teeth. Pearls of a large size and considerable value are often found in *U. margaritifera*. At Perth an extensive fishery flourished in the river Tay until the end of the 18th century, and from 1761 to 1764 produced pearls to the value of £10,000.

Union Jack. See FLAG.

Unit. See UNITS.

Unitarians, a name applied generally to all who maintain that God exists in one Person only, and specially to a small Christian sect whose distinguishing tenet is the Unity as opposed to the Trinity of the Godhead. In the more general sense the name of course includes the Jews and the Mohammedans. From the middle of the 2d century to the end of the 3d century there was a succession of eminent Christian teachers—Monarchians—who maintained, against the ecclesiastical doctrine of the Logos, the undivided unity of God. There are said to have been two classes of them—those who taught that Christ was God in such a sense that it was the Father who became man (see PATRIPASSIANS, SABELLIANISM), and those who held that Christ was in nature a mere man, but exalted above all other prophets by the superior measure of Divine wisdom with which he was endowed. The latter class was represented by Theodotus, Artemon, and especially Paul (q.v.) of Samosata. The grand theological struggle which followed in the 4th century between the Arians and the Athanasians may be regarded as but another phase of the Unitarian controversy (see ARIUS, ATHANASIUS).

It is not strange that in the great stir of thought which accompanied the Reformation some should have been found bold enough to question the Catholic doctrine of the Trinity; such there were even before the Socini (see SOCINUS), such as Hetzer, Bassen, Denck, Campanus, and Servetus (q.v.). So widely, indeed, was the Unitarian doctrine diffused that it was thought necessary, in the first article of the Augsburg Confession, to condemn the modern Samosatans, who deny the personality of the Word and Spirit; and in 1527 Aithamer published a work against 'the modern Jews and Arians under a Christian name, who deny the deity of Christ.' Under the influence of the elder Socinus Unitarianism gained many adherents in Venetia; but Poland and Transylvania became its principal strongholds. In Poland the nobility, protected by their class privileges, proved favourable; the Unitarian refugees from other countries found here a ready welcome; and in the reign of Sigismund II. (1548–72) this party of reformers was strong enough to form itself into a separate church. Later Poland was the principal field of labour of the younger Socinus, and Unitarianism continued to flourish there till the middle of the 17th century, when, under John Casimir, it was extirpated by force. In Transylvania the Unitarians have succeeded in maintaining their existence, notwithstanding much opposition and persecution, from the Reformation to the present day. Led by George Blandrata (q.v.) and Francis Davidis (1565), large numbers, including the king himself, embraced the new opinions. But in 1572 the Unitarians were forbidden to make any attempts at propagandism, or even to print their religious books; after the incorporation of Transylvania with the Austrian empire (1690) they were robbed by the Roman Catholics of all their churches and church property, forbidden to build new churches without the permission of the emperor, and excluded from all government offices. On the accession of Joseph II. happier times returned. It was forbidden to seize their churches, and an indemnity was even paid them for the loss of their cathedral church of Klausenburg. The Unitarians of Transylvania number about 60,000. They have an organised system of

church government, with a bishop at its head. They have three colleges—that of Klausenburg, with twenty-four professors and about an equal number of assistant-professors and teachers; that of Thorda; and that of Szekely-Keresztur.

In England, as early as 1548, a priest named John Ashton was accused of Arianism, and escaped with his life only by recantation; and during the reigns of Edward VI., Mary, Elizabeth, and James I. a few suffered martyrdom on similar charges. In the reign of James I. continental Socinianism began to exercise considerable influence in England, and in 1665 Dr Owen wrote that 'the evil is at the door, that there is not a city, a town, scarce a village in England, wherein some of this poison is not poured forth.' But it was in the last decade of the 17th century that the controversy on this subject was most active, and at this time were published the anonymous 'Unitarian tracts.' Hitherto the Unitarians, with the exception of the society formed in London by John Biddle (q.v.), which did not survive its founder, had no organised existence. The first to use the term Unitarians (*c.* 1687) was the heretical mercer and philanthropist, Thomas Firmin (1632–97), a friend of Biddle's. The first preacher who described himself as Unitarian (*c.* 1704) was apparently Thomas Emlyn (1663–1741), a Presbyterian who was imprisoned and fined on the charge of blasphemy. After the passing of the Toleration Act in 1689 the way was prepared for that gradual change by which the orthodoxy of the English Presbyterians passed into Unitarianism. It was at this time that most of the old Presbyterian chapels were founded; and the trusts being 'open,' ministers and people were left free to adopt whatever new opinions should approve themselves to their conscience. Thus the Unitarians may be said to be the successors of the 2000 Presbyterian divines who in 1662 left the Church of England in consequence of their inability to comply conscientiously with the terms of the Act of Uniformity. The English Presbyterians were originally as orthodox as their Episcopal brethren; but having refused to commit themselves to any authoritative creed, they underwent a gradual change to Arian, and at length to Unitarian, views. Many preached such views without exciting attention or controversy, although, until 1813, the law which made it Blasphemy (q.v.) to speak against the Trinity was still in existence. During the later half of the 18th century Dr Priestley (q.v.) appeared as the champion of the humanitarian view of Christ's nature, and by the influence of his writings secured the more open advocacy of that doctrine. In 1773 Dr Lindsey resigned his charge in the Church of England, and became pastor of the Unitarian congregation of Essex Street, London. In 1813 the Unitarians were placed by law fully on a par with other dissenters. The Unitarians of England and Wales are purely congregational in their church government, their only organ for combined action being the British and Foreign Unitarian Association, which holds its meetings annually in London. Their principal place of education is Manchester New College, Oxford, which is, however, an unsectarian institution. They have also a missionary college in Manchester, and the Presbyterian College, Carmarthen, educates Independent and Unitarian ministers. They have at present about 290 chapels and a number of mission stations.

Towards the close of the 18th century there was a certain amount of Arianism among the Moderates in the Church of Scotland. Unitarianism, as a distinct system, was preached at Montrose as early as 1783; and at the beginning of the 19th century some attempts were made to diffuse it by means of missionary efforts. There are now nine congregations in Scotland. That at Edinburgh was originally a branch from the Cameronians (q.v.), but, having adopted the principle of free inquiry, its members gradually embraced Arian, and eventually (1812) humanitarian, views.

In Ireland the history of Unitarianism is intimately connected with that of Presbyterianism. It flourishes principally in the north of the island, and the 10,000 Irish Unitarians are Presbyterians in fact as well as in name.

After 1740 Arian views of the person of Christ were pretty widely diffused among the New England clergy; and in 1787 took place the first secession from the Episcopal Church. By imperceptible degrees many of the New England churches glided into Unitarianism; but it was not until about 1815 that the name began to be much used. At that time the influence of Dr Channing (q.v.) was thrown into the scale; and since then Massachusetts, and particularly Boston, has been the stronghold of Unitarianism in America. The Unitarians have about 400 societies in the United States, and upwards of twenty-five in Boston alone. Harvard University, Cambridge, is not a denominational institution; but it is at present in the hands of the Unitarians, and most of their ministers are educated either there or at the Meadville Theological School, Pa. Besides the Unitarians, properly so called, the Universalists and the Hicksite Quakers are understood to hold anti-Trinitarian sentiments, though they give no special prominence to the doctrine of Divine Unity. There are a few Unitarian churches in the principal colonies of Great Britain; and Unitarian sentiments, under the names of Liberal Christianity and Rationalism, are more or less widely diffused in France, Switzerland, Germany, and Holland.

The early Socinians assumed, as the fundamental principle of their theology, the sufficiency of Scripture, or rather of the New Testament, which, they held, had superseded the Old. Christ was a true man, but conceived of the Holy Spirit; and on account of the divine power which he has received from the Father, and his exaltation as head over all things, he is to have worship offered to him. The Holy Spirit is not a Person, but a Divine influence. Man was created with a mortal nature, but, by the special gift of God, was endowed with a conditional immortality. The gift of immortality he forfeited by disobedience. The fall of Adam, being a single act, could not deprave his own nature, much less that of his posterity; and in the latter death was not a consequence of the fall. Thus the actual consequence of Adam's fall was not any radical corruption of human nature, but rather a moral deterioration. Man, after the fall, retained his free will, and the power of abstaining from sin if he so pleased. Christ's merits did not consist principally in his death, but in his life, his teachings, and his example. Nor was his death regarded as an atoning sacrifice, or as having any vicarious efficacy whatever, but simply as a confirmation of God's will, and the seal of the new covenant. Not Christ's death, but his resurrection, is the central point of the Christian scheme. By this he confirmed his doctrine of immortality, and prepared for his ascension into heaven, where he now fills the office of our great High Priest. Predestination in this system means the decree of God, made before the foundation of the world, that they who believed and were obedient should be saved, and that they who believed not and were disobedient should be damned. Justification takes place when God pardons our sins and gives us eternal life. The Socinians regarded the sacraments as simply external signs testifying to Christian faith. Hence they held infant baptism

to be irrational as well as unscriptural, but thought that a custom so old and established should be tolerated.

With the early Socinians the English Unitarians have no very direct historical connection. They seem rather to have arrived at independent conclusions through their 'rational' interpretation of Scripture, and their consistent rejection of human authority in matters of faith. The Unitarians of the present day, like almost all Christian sects, must be divided into two classes—a conservative and a progressive class—an old and a new school. The former adopt the old rule of the sufficiency of Scripture, though with many such qualifications as the scientific criticism of the Bible has rendered indispensable. The most conservative Unitarians would not contend for the literal truth of the first chapter of Genesis, nor for the doctrine of verbal inspiration in any shape; the Bible *is not*, but it *contains*, the Word of God. They generally hold the simple humanity of Christ, and even reject the supernatural birth, thinking the portions of the gospels which record that event to be less authentic than those referring to the ministry, the death, and resurrection of Jesus. To the death of Christ they ascribe much the same kind of efficacy as the Socinians, regarding his teaching and example as the most essential part of his work, and his death as an attestation to the truth of his mission, and a preliminary to his resurrection. What, however, chiefly distinguishes the Unitarians of this school from those of the new or progressive school is the place which they give to the miracles as supernatural sanctions of the truth of Christianity. Christ is an ambassador from heaven to earth; the miracles he wrought are his credentials; and the moral and religious truths which he taught are his message. It is not indeed denied that many or all of those truths might be learned from the light of nature, but they have received from Christianity a sanction which gives them a greater degree of certainty than they could otherwise possess. The Unitarians of the progressive school, on the other hand, have abandoned the philosophy of Locke for more spiritual modes of thought. So far from regarding man as entirely dependent upon his reasoning powers for his knowledge of religion, they rather look upon him as standing in a living relationship with the one infinite source of all truth, and as having within his own nature the germs of the highest religious faith. Christianity, accordingly, they regard not as a *message* or a system of truth communicated and authenticated from without, but as the highest expression of the Divine in humanity—an expression not necessarily preternatural, but connected with the previous history of mankind by the natural laws of moral and spiritual development. To this view of Christianity the miracles are not felt to be essential as proofs; and the truths of the gospel are thought to be quite unaffected by any judgment regarding them. The Unitarians, however, of this school, while, from their point of view, they regard the question of the miraculous as one of critical rather than religious interest, do not necessarily reject the miracles as historical facts, though, undoubtedly, a considerable and perhaps increasing number would agree with Theodore Parker and many of the German critics in rejecting them on the twofold ground that they are intrinsically incredible, and that the evidence for them is conflicting and uncertain. Generally speaking, the Unitarians of this school are disposed to regard with favour the freest criticism of the Bible. Holding that inspiration is a quality which is not peculiar to the Bible, but common to all the most elevated religious literature, and that it in no case implies immunity from error, they maintain that the Scriptures must be subjected to the same rules of criticism and interpretation as any other book, and that each book of Scripture is to be studied not as a collection of infallible oracles, but as a record of the mind of the age in which it was produced. In this light, however, and also as a record of the grandest religious movements of the world's history, they hold the Bible in the highest estimation. Such is a statement of the peculiarities of the two Unitarian schools in their extremest divergence from one another; in fact they merge into each other by imperceptible gradations.

It will of course be understood that the Unitarians of all shades of opinion are agreed in rejecting the entire orthodox scheme—including the doctrines of the Trinity, the vicarious atonement, the deity of Christ, original sin, and everlasting punishment—as both unscriptural and irrational. They celebrate the Lord's Supper in their churches, not as a sacrament, but as a service commemorative of Christ's death, and expressive of spiritual communion with him. They also adhere generally to the rite of infant baptism, though there are a few Unitarian Baptist churches. Many object to the name Unitarian as one which might be held to imply a doctrinal bond of union, and to be, to that extent, inconsistent with unrestricted freedom of religious thought. When, at the meeting of the British and Foreign Unitarian Association in 1866, it was proposed to add to the rules a clause defining 'Unitarian Christianity,' the motion was almost unanimously rejected.

See the articles ATONEMENT, RATIONALISM, &c.; the works of Channing, Theodore Parker, and Dr James Martineau; J. R. Beard, *Unitarianism* (1846); J. J. Tayler, *Retrospect of Religious Life in England* (1845; new ed. 1876); Bonet-Maury, *Early Sources of English Unitarian Christianity* (trans. 1884); Dr J. F. Clarke, *Manual of Unitarian Belief* (1884) and *Modern Unitarianism* (1886).

United Free Church of Scotland, a body formed by the union of the Free Church (q.v.) and the United Presbyterian Church (q.v.); it was formally constituted on the 31st of October 1900 in the Waverley Market, Edinburgh, Principal Rainy being elected the first Moderator.

United Presbyterian Church, a religious body in Scotland, constituted in 1847 by the amalgamation of the 'Secession' and 'Relief' Churches, as described in the church history of Scotland (Vol. IX. p. 245). The dissatisfaction felt by the stricter Presbyterians with the Revolution Settlement is described at CAMERONIANS. The Marrow Controversy (q.v.) contributed to increase the discontent with the church; but the immediate cause of the formation of the Secession Church was the restoration in 1712 of the obnoxious Law of Patronage (for which see FREE CHURCH). Violent settlements, effected by the agency of dragoons, now became frequent, and greatly irritated the people; and finally, in 1730, the Assembly enacted that in future no reasons of dissent 'against the determinations of church judicatures' should be entered on record. This attempt to gag the mouths of congregations was more than some could bear, and in October 1732 the Rev. Ebenezer Erskine of Stirling, in a sermon delivered before the synod of Stirling and Perth, denounced the recent legislation and spirit of the church. A committee appointed to consider the matter reported at the ensuing meeting of synod; and Erskine, after three days' 'warm reasonings,' was found deserving of censure. He immediately protested (as did also twelve other ministers and two elders), and appealed to the next General Assembly, which sustained the decision of the synod. Erskine left with the Assembly a written protest, which was also signed by William Wilson,

minister of Perth; Alexander Moncrieff, minister of Abernethy; and James Fisher, minister of Kinclaven. The Assembly ordained that the four brethren should appear before the Commission in August and retract their protest, on pain of being suspended from their ministry. This they refused to do, and in consequence were declared 'no longer ministers of the church' (November 1733); whereupon they handed in a final written protest, in which they declared that they were obliged to make a secession from them, and appealed to the first free, faithful, and reforming General Assembly of the Church of Scotland.

At first composed of only four ministers, the 'Secession Church' rapidly began to gather strength. Little Christian societies were everywhere formed, which were gradually supplied with pastors either from the Establishment or from youths trained to the work of the ministry by Erskine and his friends. The 'four brethren' drew up a testimony declaring their reasons for separation. What they sought was the vindication of what they held to be evangelical truth, much more than of the mere right of popular election. So much popular indignation was excited by their deposition that it was thought desirable by the majority of the Moderate party to make certain concessions to the Evangelicals, or Marrow party. The General Assembly of 1734 passed some measures distinctly favourable to the latter party, and empowered the synod of Perth and Stirling to remove the censures from the four brethren, and to restore them to their respective charges; but Erskine declined to be 'reponed.' In December 1736 appeared the pamphlet commonly known as the Judicial Testimony, which is a sort of survey of the whole ecclesiastical history of Scotland from the Reformation downwards. In 1737 four other ministers joined the original four. In 1738 the commission of Assembly libelled the 'eight brethren,' and summoned them to appear before the Assembly of 1739, which they did; and after a year of grace the General Assembly of 1740 solemnly pronounced their deposition, and the connection between Erskine and the church of his fathers was for ever at an end.

In 1747 a rupture or 'breach' took place in the new body on the question of the burgess-oath, some affirming that this oath could not be taken by any consistent Seceder, and others insisting that it could, and that the question regarding it ought to be matter of mutual forbearance. The party condemning the religious clause in the burgess-oath formed the *General Associate Synod*, or, popularly, the *Anti-burgher Synod;* the party tolerating it, the *Associate* or *Burgher Synod*. Subsequently a second split occurred in each of these in regard to the province of the civil magistrate, and two other minor denominations were formed, the one assuming the designation of the *Constitutional Associate Presbytery*, or *Old Light Anti-burghers* (1806), and the other that of the *Original Burgher Presbytery*, or *Old Light Burghers* (1799). After holding aloof from each other for more than seventy years, the Burghers and Anti-burghers began to approximate once more, and finally, in 1820, the 'New Light' sections were solemnly reunited. The Old Light sections, amongst whom Dr M'Crie was the most notable man, united in 1842 as the 'Original Seceders,' of which, after union of part with the Free Church, a remnant still forms a separate but small communion. At the date of the 'breach' the number of Secession congregations was 32; when the reunion took place it had increased to 262. Henceforward the history of the Secession Church exhibits a course of uninterrupted prosperity. Ere long the Seceders came under the liberalising influences of the newborn enthusiasm for foreign missions, and started stations in Canada, Jamaica, Trinidad, Calabar, and elsewhere; and in 1847 the Secession maintained more than sixty missionaries. Further, the Secession Church began to assume an attitude more distinctly antagonistic to the Establishment. Though it has never formally avowed the *voluntary* principle (see VOLUNTARYISM, STATE RELIGION), yet the fact that it has maintained itself *ab initio* by voluntary effort has had the effect of determining the great majority of the pastors and people to adopt this principle. The 'Voluntary Controversy' (1829-34) between leading divines of the Establishment and of the Secession served to strengthen the voluntaryism of the Seceders, and brought them more closely into connection with the Relief Church, whose theoretical voluntaryism was perhaps still more pronounced. In the 'Atonement Controversy' both bodies adhered to the liberal evangelical theology of the Marrow. But the Rev. James Morison, for what were thought his extreme views, was separated from the United Secession Church in 1841, and founded the Evangelical Union (q.v.). The desire for union between the two denominations now became stronger than ever. Committees were appointed, and conferences held; and at length, on the 13th May 1847, in Tanfield Hall, Edinburgh, the union of the Secession and Relief was formally accomplished, and the two churches formed themselves into one body under the designation of the United Presbyterian Church.

After the expulsion of Erskine and his friends from the Church of Scotland the assemblies became more determinedly 'moderate' than ever. Never were forced settlements more frequent than about this period; but *relief* was felt to be a necessity, and relief came in the person of the Rev. Thomas Gillespie, minister of the parish of Carnock, near Dunfermline. In 1749 a presentation by the patron to the parish of Inverkeithing proved so extremely unpopular that the presbytery of Dunfermline refused to proceed with it. After various intermediate steps the Assembly of May 1752 ordered the presbytery to induct the presentee on Thursday the 21st. The presbytery did *not* meet on Thursday—at least a quorum did not; and on Friday six ministers of the presbytery, including Gillespie, handed in a 'representation,' explaining why they could not obey the commands of the supreme court. They were warned by the moderator, and informed that if they remained obdurate *one* of them should be deposed. Gillespie was ultimately fixed on as the most suitable sacrifice, and without libel or any formal process whatever, he was arraigned, condemned, and deposed. Out of 158 members present, only 56 voted.

The *Relief Church*, it will thus be seen, was founded simply on an assertion of the right of congregations to elect their own ministers. In 1758 Thomas Boston, minister of Jedburgh, son of the great Boston (q.v.), threw in his lot with Gillespie; in 1761 the congregation of Colinsburgh, in Fife, did the same. The Relief had now got a footing, and steadily increased. At the union in 1847 they numbered 113 congregations, while the Secession numbered 384 congregations; so that the United Presbyterian Church commenced with 497 churches, and a membership estimated at more than 140,000.

The career of the United Presbyterian Church as a corporate body has been one of uninterrupted prosperity. In point of doctrine it adheres (like all the other Presbyterian churches of Scotland) to the Westminster Confession of Faith, and the Larger and Shorter Catechisms. But in 1879 a Declaration Act was adopted, setting forth more

W & R CHAMBERS LIMITED LONDON & EDINBURGH

clearly and fully the view which the Synod takes of the teaching of Holy Scripture in reference to redemption, the divine decrees, man's depravity, salvation, the civil magistrate, the maintenance of the church, and liberty of opinion. Its form of church government is Presbyterian; but, unlike the Established and Free Churches, it has no intermediate courts between presbyteries and the supreme court, the Synod, really an assembly of the whole clergy, with one elder from each kirk-session. It has a Theological Hall and Library in Edinburgh, and a staff of professors. Although inferior in point of wealth to the Established and Free Churches, the United Presbyterian Church has honourably distinguished itself by its general liberality and occasional munificence. Negotiations for union between the United Presbyterian and Free Churches (see FREE CHURCH) failed in 1863–73, but were reopened in 1897, and finally resulted in union in 1900 (see UNITED FREE CHURCH). In 1875 about 100 congregations situated in England were transferred to the 'Presbyterian Church in England.' The church in Scotland had in 1900 594 congregations and 199,100 members.

Struthers (1848), and the *Lives of the Fathers of the United Presbyterian Church* (1849); the Rev. W. Mackelvie's *Annals of the United Presbyterian Church* (1873), and the short *Handbook* of the history and principles by the Rev. Dr Blair (2d ed. 1889).

United Provinces. See HOLLAND.

United States of America, the largest and most important republic of the world, embracing nearly one-half of the area of the North American continent, and about nine-tenths of its inhabitants. Its area is more than three-fourths that of all Europe: including Alaska, it is almost equal to it; but its population is less than one-fifth of that of Europe.

Copyright 1892 in U.S. by J. B. Lippincott Company.

GEOGRAPHY, PHYSICAL AND POLITICAL.

The United States consists of two detached portions of the continent of North America and the islands which are adjacent to these sections. The isolated territory of Alaska has been for convenience considered separately, and the reader may be referred to the article on it. The United States proper occupies the central part of the continent, extending from the Atlantic to the Pacific Ocean, and from the Great Lakes to the Gulf of Mexico. By natural and arbitrary boundaries it is separated from the Dominion of Canada on the north, and from Mexico on the south. It lies between the parallels 24° 30′ and 49° N. lat., and between the meridians 67° and 124° W. long. Its greatest length from east to west is about 2700 miles, and its greatest width from north to south about 1600 miles. Its total area is somewhat more than 3,000,000 sq. m. As compared with Europe, for example, the coast of the United States is relatively unbroken, and has few indenting bays or projecting peninsulas. The great indenting sea known as the Gulf of Mexico is of special climatic and commercial importance, but it is as much a geographical feature of Mexico as of the United States. On the coast of the New England states there are many indentations which, though small, furnish commodious harbours. Long Island Sound adds to the commercial importance of the harbour of New York, and farther south are Delaware and Chesapeake bays, Albemarle and Pamlico sounds, and several small indentations such as those which form the harbours of Charleston and Savannah. On the Pacific border, with the exception of Puget Sound, the Bay of San Francisco, and the harbour of San Diego, there is scarcely a noticeable break in the continuity of the coast-line. There are many small rocky islands along the coast of Maine, and on the southern New England coast is a group of islands to which belongs Long Island, the largest of the islands of the United States. Farther south, off the Atlantic coast, and also in portions of the Gulf of Mexico, are many low sand-spits lying parallel to the coast and having behind them shallow channels, lagoons, and swamps. On the Pacific coast there are no islands of importance except the Santa Barbara group off the southern coast of California.

The two great mountain-systems of North America, one along the western, the other near the eastern border, attain their fullest development in the United States, and form the framework or skeleton of its physical structure. The Appalachian system, in the east, though of secondary geographical importance, is the older of the two highland regions, and of primary interest when considered with reference to the history and development of the nation. It enters the country in the northern part of New England (in Maine without the appearance of regular ranges) and New York, and extends south-westward to Alabama and Georgia, being divided by the valley of the Hudson River and Lake Champlain, and that of the Mohawk River, into three distinct sections. The system is described in detail at APPALACHIANS. A coast-plain extends from its eastern base to the sea. It is narrow in Maine, where it terminates in a bold rocky coast indented by bays, and broken into projecting promontories and islands. South of Massachusetts Bay the coast becomes lower and more sandy, and the plain grows gradually wider, with the exception of a narrow belt at New York, until in North Carolina it attains a width of 200 miles. In the southern part of New England it is characterised by hills, and below New York by a distinct coast region and a more elevated slope. This higher region, which in Virginia and thence southward is marked by a somewhat abrupt terrace, varies in altitude from a few hundred to more than a thousand feet, and is known as the 'Piedmont Plateau.' The lower coast region is seldom more than 100 feet above the sea. It has a sandy soil, and in many places there are large swamps near the coast. Much of this swampy country is uninhabitable, but when reclaimed, as it has been in many parts of North and South Carolina, it makes valuable rice-land. Many acres of fertile agricultural land have also been secured in Florida by draining its swamps. The middle elevated region is diversified by hills and valleys, and has a productive soil. The dividing line between it and the low coast-plain marks the head of navigation of most of the streams, and also determines the sites of many important towns.

West of the Appalachian system and lying between it and the western highland is the Central Valley, forming part of the great continental depression which extends from the Arctic Ocean to the Gulf of Mexico. It is almost an absolute plain, rising gradually from the Gulf toward the chain of Great Lakes in the north, and toward the mountains on the east and west. The only important departure from its uniform level character is an elevation of from 500 to 2000 feet, running from southern Missouri through north-western Arkansas into Indian Territory, and known as the Ozark Mountains. This great valley occupies about one-half the entire area of the United States, and the fertile prairies and bottom-lands of the eastern and central portions make it the most important agricultural basin of the globe. From an irregular line west of the Mississippi River the

land rises in an almost imperceptible slope till it reaches the base of the western plateau. Much of this region, known as the Great Plains, has a light rainfall and is less favourably adapted for agricultural purposes than is the eastern portion, but it affords admirable and extensive pasturage.

The western or Pacific system of mountains forms a part of the vast elevation which extends from the northern to the southern extremity of the western continent. In the United States it is a great plateau of 4000 to 10,000 feet surmounted by a complex system of ranges, in its widest part more than 1000 miles broad. Of this Cordilleran region the Rocky Mountains form the eastern and the Sierra Nevada and Cascade Mountains and the Coast Ranges the western border. For the former, reference must be made to the article ROCKY MOUNTAINS. In the ranges of central Colorado alone nearly forty of the summits have an altitude of more than 14,000 feet. The culminating point of the Rocky Mountains is Blanca Peak (14,463 feet). In the Wind River Mountains, in Wyoming, are the head-waters of the Colorado, the Columbia, and the Mississippi, the three great river-systems of the United States; and in the north-western corner of the same state is situated the National Park, famous for its hot springs and geysers as well as for its magnificent scenery (see YELLOWSTONE). Between the Wahsatch Range and the lofty masses of mountains in Colorado is a region of peculiar interest, consisting of level plateaus, in which the changes of elevation from one plain to another are marked by abrupt descents and steep cliffs. It is furrowed by cañons or gorges, whose sides are nearly vertical; and the bed of the Colorado (q.v.) is in some places more than a mile and a quarter below the surface of the plateau. Between the Wahsatch Range and the Sierra Nevada lies the Great Basin (q.v.), an immense tract having at best but little rainfall, except upon the summits of the ranges by which it is traversed, and none of whose waters are drained to either ocean. Much of this region is at present an absolute desert, although within comparatively recent geological time the conditions were such that two great fresh-water lakes, one nearly as large as Lake Erie, the other more than twice that size, occupied the now arid area. The saline swamps, salt lakes, and sinks of Nevada indicate the former location of one of these lakes; Great Salt Lake is all that now remains of the other.

The Sierra Nevada (q.v.) and the Cascade Range (q.v.) are topographically continuous, and constitute a great mountain-wall which so far as the height of the peaks and the grandeur of the scenery are concerned is one of the most striking portions of the Cordilleran system. Most of the peaks of the Sierras are, however, of granite and metamorphic rock, while those of the Cascade Range are volcanic. The greatest altitude is attained between the parallels 36° and 37°, with Mount Whitney (14,898 feet) as the culminating point. The lofty character of the range is maintained throughout the greater part of California, and the sublimity of the scenery is justly celebrated (see YOSEMITE VALLEY). Between the parallels 39° and 40° the volcanic character of the peaks comes into prominence. From this point there extends northward one of the most remarkable groups of extinct or faintly active volcanoes to be found anywhere in the world: the lava overflows in this region cover an area of above 200,000 sq. m. The most prominent peaks are Mount Shasta (14,442 feet) in California and Mount Rainier (14,444) in Washington. In three separate places rivers have cut a passage through the volcanic portion of the range. The most notable is the passage of the Columbia River in a grand cañon more than 3000 feet in depth. The region which lies north of the Great Basin, between the Cascade Range and the Rocky Mountains, is known as the Northern or Columbian Plateau. Much of it is covered by material thrown out in volcanic eruptions, and has been eroded not only by the Columbia, but by its tributaries. The Shoshone Falls (q.v.) of the Snake River probably rank next to Niagara in grandeur. The Coast Ranges of Washington, Oregon, and northern California consist of numerous and approximately parallel chains, which as a rule pitch off abruptly toward the sea, leaving no coast-plain. Between the Coast Ranges and the Sierra Nevada and Cascade Range is a series of broad valleys, occupied mainly in Oregon by the Willamette River and in California by the Sacramento and San Joaquin. In southern California the mountains of the Coast Ranges diminish in height, but throughout their whole extent they are interspersed with picturesque and fertile valleys.

The drainage of the United States is determined by its physical structure, which is such as to make the country pre-eminent for the number and length of its navigable rivers, and for the abundance and size of its lakes. The lake region lies in the northern part of the country, forming a part of the great belt of lakes which sweeps in a broad curve around Hudson Bay as a centre, and extends from the Atlantic to the Arctic Ocean. Besides the chain of Great Lakes which forms a part of the northern boundary, there are thousands of lakes in the New England states and in New York, nearly ten thousand in Minnesota, and numerous mountain-lakes among the Cordilleras. The peculiar lacustrine character of the northern portion of the United States is undoubtedly a legacy of the glacial period, and it is also a fact worthy of notice that this belt of lakes lies mainly in the customary path of the great cyclonic storms. Most of the important rivers of the United States also have their origin in its northern sections. The drainage areas may be broadly classified as the Great Lake or St Lawrence, the Atlantic, the Pacific, and the Great Basin or interior systems of drainage. The tributaries of the Great Lakes and the St Lawrence within the United States are rather insignificant, but the Lakes themselves form a feature of obvious importance. In the Atlantic system is included all the drainage which ultimately reaches the Atlantic Ocean, but for convenience the rivers might be further subdivided into two classes, one comprising the streams flowing directly into the sea, the other comprehending those of the Central Valley which discharge their waters into the Gulf of Mexico. The rivers of the Atlantic slope rise in the Appalachian mountain region, and are shallow and rapid until they reach the terrace which divides the highland from the true coast region. In this latter portion of the course they are as a rule navigable. The upper courses of the streams furnish available water-power, and have played a conspicuous part in developing the manufacturing industries. The Penobscot, Kennebec, Merrimac, Thames, and Connecticut in New England, the Hudson with its original commercial importance greatly augmented by the Erie and Champlain canals, and farther south the Delaware, Susquehanna, Potomac, James, Roanoke, Neuse, Cape Fear, Great Pedee, Santee, Savannah, Altamaha, and St John's are the principal streams. The Mississippi-Missouri, with its tributaries the Ohio, Platte, Arkansas, and Red rivers, is the chief stream of the Central Valley. Its basin is second only to that of the Amazon, and in length and extent of navigable water it surpasses all other rivers of the world. East of the Mississippi are the Mobile and Appalachicola, and to the west the Sabine, Brazos, and Rio

Grande. The Colorado, the Sacramento and San Joaquin, the Willamette, and the Columbia are the important streams emptying their waters into the Pacific. With the exception of the Sacramento and San Joaquin, and the lower portion of the Colorado, the rivers of the Pacific coast are not navigable. The rivers of the Great Basin are uncertain in volume and of no great size.

Climate.—With its great extent and its diversified topography, the United States has every variety of climate characteristic of the temperate zone. The annual isothermal lines, except where they are influenced by the two great mountain-systems, pursue a fairly uniform east and west course across the country. They are somewhat deflected to the south by the Appalachian Mountains; but though the high mountain regions produce great local deflections of these lines, a vast elevated mass like the Cordilleran Plateau does not seriously affect the mean annual temperature. In the southern part of the plateau there is a slight general deflection toward the south, but in Montana and the north-western portions of the country the isotherms indicate a warmer annual mean than that prevailing farther east. A marked difference is, however, observable in the disposition of these lines on maps representing respectively the summer and the winter temperatures. The influence of the oceans

* Including 145,282 Indians on Reservations outside of the Indian Territory, and 84,000 persons abroad in the service of the United States. The Hawaiian Islands Territory, Porto Rico, the Philippine Islands, Guam and Samoa, are also, more or less intimately, parts of the United States. Cuba (q.v.) is at most a protectorate.

and of the Great Lakes is at once apparent. Both the heat of summer and the cold of the winter season are greatly modified, whereas in the interior and in the region of the Cordilleras the extremes of heat and cold are both abnormally great. The warm ocean current of the Pacific, which bathes the western coast, produces a more uniform temperature than that which is found on the Atlantic seaboard, along which flows a cold polar current. The annual range of temperature is very great. In winter there sometimes exists at the same instant between the northern and the southern borders a difference of 120°. In summer the diurnal variation of a single locality is in some instances from 40° to 50°. A narrow strip in the south, including the southern portions of Florida, New Mexico, and Arizona, has what may be called a tropical climate. Northern Florida, southern Louisiana, southern Texas, and portions of New Mexico, Arizona, and southern California have a subtropical climate. The sugar and rice regions have a mean annual temperature above 70°. The tobacco region lies between the isotherms of 50° and 60°. The annual temperature of the great cotton region ranges from 60° to 68°, and the prairie regions devoted to the raising of wheat and other hardy cereals seldom have an average temperature above 55°. On the wheat fields of the

Dakotas the annual mean does not exceed 45°. The rainfall of the United States varies greatly in different sections, not only as to quantity, but as to distribution throughout the year. The eastern part of the country is well watered, having not only an ample supply, but an average rainfall for any month which in the long run does not vary much from that of any other month. The requisite moisture is furnished by the Gulf of Mexico and the Atlantic Ocean. The western portion, excepting the strip between the Sierras and the Cascade Range and the Pacific Ocean, and a few limited areas favoured by some peculiar features of topography, has an insufficient supply, and agriculture is dependent for success upon Irrigation (q.v.). Between the two regions is a belt approximately following the meridian of longitude 100°, in which agriculture may sometimes be carried on without recourse to irrigation, but which in any season is liable to suffer from drought. The rainfall of the Pacific coast is peculiar. The westerly winds crossing the warm oceanic current are laden with moisture, which is precipitated whenever the air is sufficiently cooled to lower the dew-point. In Washington, where the land is relatively cooler than the sea for the greater part of the year, rains are frequent, but heavier in winter than in summer. Farther south the land is warmer than the sea in summer, but cooler in winter, so that in northern and central California, for example, there is a wet and a dry season. In southern California, where the land is, as a rule, warmer than the sea, there is little or no rain, and an arid climate prevails.

The eastern portion of the United States is in the main well wooded. Forests also occur in northern California, Oregon, Washington, and in northern Idaho and Montana. The Cordilleran region and the Great Plains are treeless, except upon high plateaus and mountains. The limit of the growth of trees in the east is approximately marked by the same line which separates the region of ample from that of insufficient rainfall. In fact the distribution of forests very closely follows the distribution of rainfall. There is, however, a tract in the central portion of the country, between the parallels 39° and 43°, which at the time of the advent of the white man was a prairie region with very little woodland. The conditions of rainfall and evaporation, together with the prevalence of prairie fires in this area, were such that apparently trivial circumstances turned the tide against forests. With a modification of these conditions by the increase of civilisation, the prairie regions are disappearing and wooded tracts are increasing.

Political Divisions.—Under its present organisation the United States comprises fifty different political divisions besides its Arctic province of Alaska. Of these forty-four are states enjoying the full privileges afforded by the federal constitution; four are organised territories not yet admitted to statehood; one is an unorganised territory set apart as a home for Indian tribes, and one is a special district containing the capital of the nation. By reference to the table (page 373) the name of each of the divisions, its capital, its area, and its population in 1900 may be seen. Both the land and the water area are given in accordance with the computations of the census of 1890. The chain of Great Lakes is excluded from the calculations of enclosed water surfaces. It is worthy of remark that the centre of population has advanced westward during the ten decades since 1790 in a nearly uniform line along the 39th parallel of latitude. It has progressed during the century from a point 23 miles east of Baltimore, a distance of 505 miles, to a point 20 miles east of Columbus, Indiana. Of the total population 96 per cent. of the inhabitants live in that part of the country which is drained to the Atlantic Ocean, and more than one-half live in the region drained by the Gulf of Mexico. The greatest density of population is in the region having a mean annual temperature of from 50° to 55°, rapidly diminishing with the increase or decrease of temperature. In 1900 three cities, New York (over 3,000,000), Chicago, and Philadelphia, had a population of over 1,000,000. St Louis, Boston, and Baltimore had each over 500,000. Five cities had over 300,000; eight cities between 200,000 and 300,000; nineteen between 100,000 and 200,000; forty between 50,000 and 100,000; eighty-one over 25,000 and under 50,000; in all there are 159 cities of over 25,000, aggregating 19,694,625. See also the articles on the states, territories, rivers, lakes, &c.

GEOLOGY AND MINERAL RESOURCES.

The continent of North America began to be developed in the earliest time of which we have as yet any knowledge. It is evident that this part of the world was the seat of certain land areas in the Laurentian age, though we cannot as yet determine the form or position of these ancient islands. In the period of the Lower Cambrian we know that there were dry lands in the Rocky Mountain district, in the region to the south and east of Hudson's Bay, extending as far south as northern New York and along the Atlantic coast from Labrador to Georgia and Alabama. These islands, probably in area small as compared with the present surface of the continent, in a general way outlined the form of the great land. Its subsequent development has been in the main on the lines which were thus traced, the islands of the ancient archipelagoes having become united and extended as the continental elevation has been gradually uplifted above the level of the sea. During the Silurian and Devonian periods not only were the lands enlarged, but the seas lying between them were shoaled, so that the great Mediterranean included within the eastern, northern, and western groups of islands was converted into shallow water.

In the early stages of the Carboniferous period a great portion of the continent, which had gradually been rising from the depths of the sea, was uplifted above the ocean's level and converted into low marshy plains upon which developed the luxuriant swamp vegetation from which the deposits of coal were formed. These plains of the coal-making age were mainly developed within the limits of the United States, occupying a broad field to the west of the ancient mountain-ranges of the Blue Ridge, stretching thence for the greater part of the distance across the valley of the continent to the westward. A fringe of similar lowlands lay along the Atlantic coast from Labrador to the southern part of New England. In this age the continent, which has always been subject to oscillations of level, appears to have been peculiarly unstable, so that from time to time the swamps which were formed on these plain lands were lowered beneath the waters, and their accumulations of peaty matter were buried beneath layers of sand, gravels, and mud, after a while to be again elevated and reconverted into swamps. By these successive movements the peaty matter, which has gradually been converted into coal, was imbedded in the rocks of the Carboniferous period. In the time when the Triassic rocks were formed there came one of the greatest periods of mountain-building which the continent has experienced. The ranges of the Alleghany system, extending from near New York to Alabama, were uplifted, and about the same time the region of the Cordilleras or Rocky Mountains underwent extensive elevation. Coincident with these movements the great central trough of

the continent, now occupied by the rivers of the Mississippi system, rose so far above the level of the sea that North America took on something like its present outline.

Until the close of the Carboniferous time the central portion of the continent, though occasionally and in parts above the level of the sea, had never been brought for any length of time above the ocean's level. With possible exceptions there appears always to have been a sinus or strait connecting the waters of the northern and eastern ocean with the Gulf of Mexico. During the Jurassic and Cretaceous periods a northward extension of the Gulf of Mexico more or less constantly occupied a portion of the continent lying to the east of the Rocky Mountains, and perhaps extending to near the Mississippi River. It is not certain that this sea extended to the Arctic Ocean, but it probably united the waters of the north and south for a portion of these ages. A further elevation of the continent occurring in the later Cretaceous time reduced this great central bay to the state of very extensive fresh-water lakes, which formed a fringe along the eastern border of the Rocky Mountains. These basins were gradually filled with the waste from the neighbouring highlands; and, with the slow uprising of the continent which occurred in the later Tertiary time, the rivers which drained them carved their ways to such depths that these remnants of the continental seas disappeared. · To these same relatively recent elevations we owe the uplift of the great southern plain about the Gulf of Mexico which reduced the old American sea to its present narrow limits in the gulf just named.

The elevations which took place during the Tertiary period were in the eastern part of North America unattended by any considerable crumpling or folding of the rocks, such as produces mountains. In the western portion of the continent, however, the mountain-building forces, from the beginning more constantly active than in the eastern district, profoundly affected the topography of the surface. This greater intensity of mountainous growth in the western portion of North America was attended by a development of volcanic activity in that part of the continent. In the region east of the Mississippi this form of geological activity has not been distinctly manifested since the Triassic time.

The last great geological accident of North America consisted in the wide-spread extension of glaciers, which in a relatively very recent time occupied the surface of the country from the high north to the central portions of the United States, covering the greater portion of the land as far south as the parallel of 40°. Although this visitation of the ice occupied a relatively brief period, it greatly affected the surface of the country, and has had a profound influence upon the character of its soils. During the glacial period the surface of North America appears to have been subjected to remarkable oscillations of level—at least in the district east of the Mississippi River—the northern portions having sunk down, probably in consequence of the burden of ice laid upon them, while the southern parts were correspondingly elevated. At present, the ice having recently passed away, the form of the continent appears to be undergoing some readjustment, a considerable portion of the Atlantic coast in the region south of New York being in process of down-sinking.

The geological resources of the United States include a greater variety of economically valuable substances than has as yet been found within an equal area in the other parts of the world. Most of these may for convenience be classed as carbonaceous materials, metalliferous substances, and architectural materials. The first group includes the varieties of coal, petroleum, and the burnable rock gases. These three classes of substances exist in remarkable quantities in the United States, particularly in the region to the east of the Mississippi River. Probably nine-tenths of the workable deposits of carbonaceous material contained in North America lie in the district between the Blue Ridge Mountains and the Mississippi River. As there are no considerable coal-fields in the Canadian Dominion or in the countries which lie to the south of the Federal Union, it follows that the United States possesses by far the greater part of the subterranean fuels which the continent contains. The Appalachian coal-field, together with the somewhat detached area lying in western Kentucky and the southern parts of Indiana and Illinois, contains over 60,000 sq. m. of workable coal-deposits. In the western portion of the country there are a number of small coal-basins, mostly formed in later ages than the Carboniferous, which afford fuels of lower grade than those obtained from the true coal-measures, and which are of only local importance. On the Atlantic coast to the east of the Appalachian Mountains there are several small coal-fields, of which those about the Gulf of St Lawrence and about Narragansett Bay in the states of Rhode Island and Massachusetts are of Carboniferous age, while those near Richmond, Virginia, and in the valley of the Dan River, North Carolina, were formed in the Triassic time. By far the larger part of the fields have the fuel in the ordinary bituminous state. Some small areas in the mountain-built districts afford anthracites varying in quality from excessively anthracitic coal, such as is found in the Narragansett district, to materials which verge on the bituminous state. The coals found in the Cordilleran region, especially those deposited in the later geological ages, generally belong to the group of lignites. The coals of the United States possess the advantage that they are prevailingly of excellent quality, being especially well suited for use in smelting ores, and they generally lie in positions where they may be mined by means of horizontal galleries penetrating from the neighbouring valleys.

The strata containing economically valuable deposits of petroleum lie in the rocks between the Cambrian and the Carboniferous, though there are some small basins which afford rock-oils in the more recent beds of the Cordilleran mountain district. The greater part of these burnable fluids is obtained from the horizontally stratified rocks lying in the valley of the Ohio River. In this field the product is obtained from a number of distinct areas, where the decomposition of the organic matter buried in the rocks at the time of their formation has produced the petroleum, and where the physical condition of the strata has led to the safe storage of the material in the strata. The range in quality of the American petroleum is great, some of the fields yielding oils of a light nature, others producing forms of the substance suitable for lubricating machinery.

The rock gases of a burnable nature, which were formed under substantially the same conditions as those which led to the production of petroleum, are somewhat more widely distributed than the fluid materials. They occur wherever rocks rich in organic matter, and in which the gases are produced, are overlaid by impervious strata. The beds where these gases have been proved to exist in economically important quantities extend, though not in a continuous way, from central New York southward and westward through the Ohio valley. Similar deposits, though as yet of unknown value, exist in the more western portions of the country. The utilisation of natural gases for lighting and heating is an industrial feature which is almost peculiar to the United States.

The most important metallic resources of the United States are found in its iron ores. These exist in great quantities in various parts of its territory. On the Atlantic slope north of New York City the only important deposits lie in the valley of the Hudson, and are mainly magnetic oxides. In Virginia, and thence southward in the Appalachian mountain-system to central Alabama, there are very rich beds of limonite ores which lie in the horizons of the Cambrian. Farther to the west the rocks of the Clinton epoch in the Upper Silurian age contain some layers of limonites and hematites, which are remarkably continuous deposits extending with few breaks from Lake Ontario to Alabama. In the northern part of the field these deposits rarely exceed a foot in depth, but they thicken to the southward until, in the region beyond the Tennessee River, they often have a depth of from 10 to 20 feet. The portion of the Appalachian iron-field from the Potomac southward has the advantage that the ore-beds lie near to coals which afford excellent coke, and are in the immediate vicinity of limestones which are well suited for fluxing purposes. It is characteristic of these southern ores of iron that they are rarely in the form of magnetic oxides, and that they are prevailingly too phosphatic for the manufacture of steel by the Bessemer process, though they are well suited to conversion by means of the basic method of reduction. In the region about the western extremity of Lake Superior, particularly in the states of Wisconsin, Minnesota, and Michigan, there are very extensive deposits of high grade iron ores, principally magnetites, which, though occupying a much smaller field than those of the Appalachian district, have been for years the seat of the most extensive production of iron ore in the country. These beds appear to be in strata lying between the true Laurentian and the Cambrian deposits. Owing to the fact that coal is lacking in this district, almost all the ores are shipped away to the regions in the south and east where coke from the Appalachian coal-fields may be had. Most of the ores from the Lake Superior district are used for the manufacture of iron which is to be converted into Bessemer steel, while the ores from the Appalachian field serve in the main for the qualities of iron used for ordinary castings. In the region of the Cordilleras there are very great deposits of iron ore which occasionally, as at Leadville, are associated with the precious metals; but as yet these iron-fields have been but little explored.

The next most important metal in the United States is copper, which is widely distributed both in the metallic state and in that of ores. In the older rocks of the Appalachian Mountains it occurs in mineable quantities at a number of points from central New Hampshire to eastern Tennessee. Formerly the production from these mines of the eastern mountain-system was considerable; but the copper district of Lake Superior, which is limited to a small field in northern Michigan, has since the decade 1860–70 been the principal seat of production of this metal in North America. It is an eminent peculiarity of the mines in this region that they afford the substance in the metallic state: sometimes it occurs in the form of very great sheets of an indistinctly lens-like form, each of which may contain scores or even hundreds of tons of the metal. The deposits occur in rocks which were formed in Cambrian or perhaps in earlier times, and they lie in beds of conglomerate, or in accumulations of volcanic ash. At various points in the Cordilleran region, particularly in Montana and Arizona, there are deposits of copper ores which have been accumulated in wide veins, and which contain small amounts of gold and silver. Although the production of the metal from these ores is more costly than in the case of the mines of Lake Superior, these fields of the Rocky Mountains are very productive, and vie with those of Michigan in their contributions to the market.

Lead ores, mainly in the form of galena, occur in great quantities and with a wide distribution in the United States. The easternmost region which has yielded a considerable supply is in Iowa and Illinois, where the mines of this metal were in the middle part of the 19th century of much importance, though they have been rendered almost valueless by the cheaper production in the more western states. In Missouri galena occurs in large quantities commingled with zinc blende, and is produced in considerable quantities. But the present source of supply is mainly from the silver-bearing lead ores in the Rocky Mountains. Many great vein deposits in that district consist of lead ores which contain a sufficient amount of silver to make them profitable for the precious metal alone, so that the lead is produced as a by-product and practically without cost. The ores of zinc occur in economically valuable quantities in the Appalachian district south of New York, in Missouri, and at various points in the Cordilleras.

We have now noted the most important of the grosser metals which occur in economically valuable quantities in the United States. The following named, however, deserve mention because of their incidental value in the arts. Oxide of manganese is found in workable quantities at various points in the southern Appalachian district, in western Arkansas, and at various places in the Cordilleran region; iron pyrites in numerous large veins in the Appalachian and Rocky Mountain districts, the ore commonly containing a share of copper, and not unfrequently some gold; and the ores of tin at many points in the older rocks of the eastern and western mountain-systems, but so far not in conditions to have any commercial value—although recent discoveries appear to indicate that the metal may occur in quantities sufficient to repay mining in the Black Hills of South Dakota. Nickel has been mined in Pennsylvania and in Oregon, the last-named region giving promise of a considerable production. The country has a full share of the world's gold and silver, and platinum occurs, though it is not yet economically valuable. In the Appalachian region ores containing silver in quantities to profit the miner are unknown. Gold-bearing rocks are there widely distributed, but the veins containing the metal are commonly lean, and the mines opened on them have been unremunerative except in the region south of the Potomac, where during the slave-holding time a considerable amount of gold was produced by the use of this cheap labour. Gold and silver occur in conditions to tempt the miner in the region about the west end of Lake Superior; but, though some of the deposits have been temporarily productive in former years, the efforts to win these metals in this district have on the whole been unremunerative. From the eastern face of the Rocky Mountains westward to the Pacific coast deposits of varied character containing silver and gold are extremely abundant. In fact this portion of the Cordilleran region appears to be the richest in precious metals of any equal area in the world. The silver of this district generally occurs in combination with galena, and has thus been won so cheaply and in such quantities as greatly to lower the price of the metal in the world's markets. The gold of this region occurs partly in ordinary lodes of varied character, and partly in deposits of gravel, sand, and clay, which occupy extensive areas in the river-valleys, especially in the state of

California. Although in all countries where gold has been mined more or less considerable portions of the metal have been won from alluvial deposits, these auriferous gravels of the Cordilleran district have attained an economic importance unknown in any other country, and have become the seat of a peculiar kind of mining known as the hydraulic process (see GOLD). So extensively was this hydraulic mining carried on that the beds of the rivers in the lowlands became filled with the debris which was thus washed into them, and the sands overflowed wide areas of tilled land. On this account it has been found necessary in California to limit its practice by law.

Not only the existing river-valleys of the Cordilleran region contain gold-bearing gravels, but many ancient stream beds, which were filled with lava by volcanic eruptions and have since been left by the down-wearing of the country high above the drainage level, also contain deposits of the precious metal commingled with alluvial material. The precious metal deposits of the Cordilleras differ in an interesting way from those of other countries. The Comstock lode of Nevada is not only remarkable for its great width and the surprisingly rich though widely separated pockets of ores of gold and silver which it afforded, but also for the extraordinarily high temperature which is encountered at from 1000 to 2000 feet below the surface. Although this heat is variable in different parts of the mine, it occasionally amounts to more than 120° F., making the work of mining extremely costly. In Nevada and elsewhere ores of silver, and less commonly of gold, are often found deposited in caverns originally excavated by the waters of hot springs, and since more or less completely filled with deposits bearing those metals.

The architectural stones of the United States, though on the whole less varied and ornamental than those of the Old World, are abundant and well suited to the needs of construction. In the eastern part of the Appalachian district, particularly in New England, granitic and other related rocks of excellent quality for building plentifully occur. The marbles of Vermont are the seat of a great quarrying industry, and are excellent for the builder's use. Similarly extensive deposits occur in north-western Georgia. In this Appalachian section also occur many deposits which afford good roofing slates, and the sandstones of Triassic age are well suited for architectural work. In the central parts of the Mississippi valley the unmetamorphosed strata of Palæozoic age afford many varieties of limestone and sandstone which are serviceable for building purposes. In the Cordilleran district we find the richest field for the quarrymen which the continent affords. In addition to the more ordinary varieties of building stone, there are many species of volcanic rock which are admirably adapted for constructive purposes, being easily worked, enduring, and of pleasing colours.

The varieties of clays used for making bricks of various kinds, and for pottery purposes, abound throughout the districts between the western portion of the Mississippi valley and the Atlantic seaboard. Certain clays found near Milwaukee produce, under skilful burning, brick of a very delicate buff colour. The refractory clays suited for resisting high temperature are very abundantly developed, especially in the rocks of Carboniferous age. Their frequent occurrence in this formation is due to the fact that the earth had the lime and other basic materials which cause ordinary brick to melt removed by the action of the roots belonging to the species of plants which form the coal-beds. Rocks affording cements abound in almost all parts of the country; but the product of the quarries is on the whole not as good as that obtained from similar deposits in England and Germany.

Among the most important mineral deposits of North America, and particularly of the United States, must be reckoned the phosphatic rocks which are used in the manufacture of agricultural manures. These accumulations in quantities sufficient to have a great commercial value are found in the district about Charlestown, South Carolina, and in a field having an aggregate area of about 1000 sq. m. in western Florida, bordering upon the Gulf of Mexico.

Although certain precious stones have been found within the limits of the United States, none of the prized species occur, so far as is known, in quantities sufficient to have distinct economic value.

The mineral springs of the eastern part of the United States do not exhibit a great variety, and, except in Virginia and North Carolina, none of them are sufficiently warm to be prized for their temperature. Hot springs of much medicinal value occur at Little Rock, Arkansas. Their waters have a higher temperature than those of any other part of the continent east of the Rocky Mountains. In the Cordilleran district the number of mineral springs and those of high temperature is exceedingly great. As yet their therapeutic value is imperfectly known, but it seems certain that ultimately they will prove to be of much value.

EDUCATION.

Introductory.—The country at large has no national system of education. By the constitution of the United States only such powers are vested in the federal government as concern the whole people. Education is left to the states. The central government has contributed greatly and in many ways to the encouragement of schools and the integration of systems, and toward unifying the educational policies of local authorities. It has influenced the direction of educational thought, and fixed the character of educational institutions. It possesses, however, neither legislative nor administrative power to improve schools directly. The schooling of the Indians and special education to fit for service in the army and navy only have been made a charge of the nation. There is maintained at the capital, however, as a division of the department of the interior, a 'Bureau of Education,' whose twofold function is to collect statistics and to diffuse information. Based upon the information voluntarily returned to it by local and state authorities, it issues an annual report, special reports upon educational questions, and numerous minor bulletins and 'circulars of information.'

By the general government also there is administered at Washington the Smithsonian Institution (q.v.); and still further, the federal government liberally supports special scientific inquiry, through the coast, geographical, and geological surveys, the Signal Service (or weather) Bureau, frequent naval explorations, and a national observatory, besides numerous publications of a scientific or historical character, incidentally connected with one or another of the several departments. And finally, under the provisions of the 'Ordinance of 1787,' granting to each state organised thereafter section 16 in every township for school purposes; and by an Act of 1849 setting off 500,000 acres to each of certain specified states; and again by an Act of 1862 giving to each state 30,000 acres of land for every representative in congress, to be used in establishing schools of agriculture and the mechanical arts, land has been appropriated by the national government for purposes of education in the states, aggregating nearly 80,000,000 acres.

All educational systems in America are relatively recent. Except for some New England

attempts made in Massachusetts by the law of 1647, and under the Connecticut Code of 1650, no effective movement for general education was inaugurated in the United States prior to the 19th century. In a few states permanent educational funds (hinting at centralisation and state control) were begun just after the revolution. But not until 1812 (in New York) was any law passed that could be construed as contemplating a uniform system for an entire commonwealth. That of Massachusetts, as now in force, dates from 1837. The Michigan system is a year older. Connecticut organised in 1838, and Rhode Island in 1843. But for the country at large the period of growth and the integration of systems, and the centralisation of control, includes little more than the years since 1870. Closer supervision, the improvement of teachers, the revision of school courses, the introduction and multiplication of technical and trade schools, the adoption of the Kindergarten, and the marvellous development of free schools in the southern states belong wholly or chiefly to this period.

The public school system now is practically co-extensive with the nation. Theoretically, the state agrees to furnish schooling for all who seek it (restricted as to age only), schooling of any grade to any class, with free tuition in some states even through the university. But other agencies also have the right to conduct schools, with or without the sanction of the state authorities. Their management (whether private or parochial) is free from state oversight; it passes upon the qualifications of, and employs, its own teachers; it determines its own courses and textbooks: it is required to make no reports; in short it is regarded in every respect by the civil authorities as a private enterprise, and treated accordingly.

Denominational Schools, &c.—Among the earliest of educational agencies in every section has been the church: not unfrequently the first schools among the pioneers have been veritable home missions. But now elementary denominational schools are neither numerous nor largely attended. Most Protestant sects patronise the public system; five-sixths of all the 700,000 children attending the parochial schools of all the states are Catholics. Of 1324 non-public secondary schools reporting to the National Bureau 548 are church controlled, and enrol nearly 90,000 pupils. But as an educational agency the church shows greatest zeal in establishing higher institutions of learning: of 506 colleges entitled to grant degrees 382 are avowedly denominational. There are also (approximately) 200 superior institutions, independent of both church and state, some of them endowed, varying greatly both as to quantity and quality of work, empowered to grant degrees. Of the eight colleges of the first class for women seven are private foundations, and enrol more than 2000 students. Of the 114 degree-giving institutions for women included in the second class 59 are private organisations, and have an attendance of about 9000 students. Of the 12 university foundations five are independent corporations having 6000 students. Sixty-one of the 384 colleges for men alone or co-educational for the sexes are private, and enrol 10,000 students. In addition to these still, there are 32 independent schools of science with 8000 students. In the aggregate the private institutions for superior instruction number 164, with an annual membership of 35,000 students.

Public (State-controlled) Schools.—The schools of all grades enrol approximately 14,000,000 pupils. Of this number nearly 12,500,000, or 90 per cent., belong to public institutions; the remaining 10 per cent. to denominational and private schools. Moreover of those in the public schools 96 per cent. are in the elementary grades (six to fourteen years of age); 31·2 per cent. in the public high schools, or preparatory departments; and about one-fourth of 1 per cent. in the state colleges and universities, including students in the public technological schools. The first two of the grades mentioned constitute the 'Common School System' of the states, tuition in both of which is free. In most states admission to classes beyond high school involves the payment of a small fee, though most of these institutions have some endowment, and, in addition, most receive periodical appropriations from the legislatures that created them. The total appropriations average perhaps not less than a million dollars annually; the income from all other sources being about twice that amount. The endowment for all such institutions organised since 1800 began in the Federal Act, 1785, granting out of the public lands one full township (later two) to each state for the establishment and maintenance of a 'Seminary of Learning.' This as a nucleus has been variously managed by the different states, and sometimes increased through special appropriations, &c. Although the schools of this group comprise but one-fifteenth of all the superior institutions of the country, they enrol one-sixth of the students. The state agricultural and mechanical schools have all grown up since 1865, taking their rise in the grant of land by congress in 1862, supplemented by that of money in 1890. Institutions so aided are found in all the states and territories except Alaska, to a total of 64, in 61 of which agricultural courses are maintained; some of the states also make appropriations for the support of such institutions.

Professional Schools.—Among the professions medicine ranks first in number of schools (188), theology second (141), and law last (52). The schools of theology have nearly 7000 students, and represent 27 different denominations. In the 52 schools of law are 4000 students, and in medicine (including surgery, dentistry, pharmacy, and veterinary science) there are as many as in theology and law combined. Of the 52 law schools 18 are state supported, and of the medical schools 37. There should also be mentioned 33 schools for nurses, representing fourteen states, twenty-two cities, and 1248 students. The courses average two full years in length, from which are graduated annually over 400 nurses.

Supplementary Institutions.—There are 74 schools for deaf-mutes, with 8156 students; 33 schools for the blind, having 3134 students; 26 schools for the feeble-minded, with 4784 pupils; and 50 reform schools, with 19,790. These schools for the defective and wayward classes are found in almost every state, are generally public, and represent an aggregate annual expenditure of five and a half million dollars. Evening schools are maintained more or less regularly and successfully in 150 cities. Half as many cities sustain Kindergartens, public or private. The support of these latter is, in most cases, an experiment only, though Boston, Philadelphia, St Louis, and a few other cities include them in the common school system, and provide for all alike. Here, as in so many other educational interests, private enterprise and church zeal have taken the initiative. For university education, see UNIVERSITIES, p. 400.

Common School Statistics.—The lowest minimum age is 4 years, the highest 8, the average 5·5 years; the lowest maximum age 15 years, the highest 21, the average 19·7 years; the average school period 14·2 years. The highest ratio of school census to population is 22·9 per cent., the lowest 11·4 per cent. The accompanying table presents the population of the United States for the three census years 1870–80–90, together with the school enrolment for

each year, its ratio to the total population, and the school attendance:

Year.	Population.	Enrolment.	Per cent.	Attendance.
1870	38,558,371	6,871,522	17·8	4,077,347
1880	50,155,783	9,867,505	19·7	6,144,143
1890	62,640,335	12,697,196	20·3	8,144,938

The brief period in the year during which the schools are open detracts greatly from an otherwise efficient system. The average for the entire country is a little less than 136 days—i.e. between six and a half and seven months. The shortest state average is 63·4 days; the longest, 189 days. The unsatisfactory condition of many rural schools may be inferred from the fact that the average length of term in 638 cities of the country is a fraction over 188 days. The general average attendance for all the states is 87·6 days. This means that the real efficiency of the system is diminished by nearly fifty days. The lowest average attendance for any state is 39·2 days; the highest, 139·4.

Finances.—The funds necessary for the support of public schools are raised from several sources, state and local taxation being the chief. Permanent funds, of which the interest only is used, are provided by the sale of certain 'sections' of public domain set aside for the purpose in the townships of the newer states. There are also endowments by private gift or bequest. In 1896-97 the total amount expended on elementary and secondary public schools was $187,320,602. The 472 universities and colleges had, from invested funds and federal, state, and municipal appropriations, $18,972,414. The income of the 48 technical schools was $3,550,000, and that of 157 colleges for women, $3,135,842. In 1896-97 the number of pupils in public common schools was 14,652,492, while the number of teachers was 403,333 (131,386 male and 271,947 female).

CONSTITUTION.

The constitution of the United States seeks at once to maintain, by its federal structure, a strong national government, and yet fully recognise the claims of separate and in a sense sovereign states. All powers not expressly given to the federal government remain with the several states or the people; and every state has the right of self-government in all ordinary matters of legislation and administration. The constitution of the federal government, like that of the separate states, was framed on the English model, with an executive head and a legislature in two houses.

The head of the executive of the United States is a president, who is commander-in-chief of the army, navy, and militia, and exercises a veto on the decisions of Congress. In the republic he wields the executive power—political, diplomatic, and military—that in a monarchy appertains to a king. President and vice-president are chosen, for four years, by electors appointed by the several states of the Union. The powers of president and vice-president are treated in a separate article in Vol. VIII. on the PRESIDENT OF THE UNITED STATES. The president chooses a cabinet of eight members, each having charge of an administrative department, but none of them having a seat in Congress; cabinet government being thus precluded, and a very different complexion given to the parliamentary system as compared with the English plan. The Senate must approve the president's choice. Instead of a ministry responsible to the legislature as in Britain, in America the ministry is independent of the legislature, and cannot be removed during the four years which is its natural term of existence. The legislative power belongs to the Congress, which comprises a Senate and a House of Representatives. The powers of the two Houses, jointly and severally, are discussed in the article CONGRESS, in Vol. III. Instead of the control inherent in the British plan, by which ministers sit in parliament, America has controlling committees nominated in the House of Representatives by the Speaker, who is thus not merely the chairman of the House, but the party leader. Party government in the English sense would seem not to have been contemplated or provided for. The history of the political parties known as DEMOCRATS and REPUBLICANS are dealt with in separate articles; and further information about the constitution is given in the section below at pp. 381–389 on the history of the United States. The federal Senate and the national House of Representatives were a balanced compromise between the states and the nation; and the clauses on slavery were a compromise between the principles and feelings of the North and the South. Senators are chosen, two from each state, by the several state legislatures, and hold office for six years. The Senate has the power of confirming or rejecting treaties with foreign powers. The House of Representatives is composed of members elected biennially by the citizens of the several states, the laws as to franchise, &c., not being precisely similar in all the states. Usually the electors are all male citizens of twenty-one years of age. Wyoming, Colorado, Idaho, and Utah give women the privilege. The number of representatives for each state is proportional to population (after the census of 1890, one for 173,900 inhabitants). The territories send delegates who may speak but do not vote. Senators and representatives have a salary of $5000, with travelling expenses. Each state in the Union has its own constitution, which provides for a governor, legislature of two houses, and distinct judicial system. The details vary considerably in the various states, but are analogous to the constitution of the Union. The state legislature is supreme in all matters except those reserved for the federal government. The states are prohibited from laying import or transit duties on each other's goods, internal free-trade being thus secured. For the amendment of the constitution two plans, both difficult to work, are provided; initiative may come from two-thirds of both Houses of Congress, or from the legislatures of two-thirds of the states. The interpretation and legal guardianship of the constitution is vested in the Supreme Court, whose judges are appointed by the president, with the consent of the Senate.

STATISTICS.

Population.—The first census of the Union was taken in 1790, when it comprised thirteen states; in 1820 there were twenty-three states and three territories; in 1860 thirty-three states and five territories; in 1880 thirty-eight states and nine territories; in 1900 forty-five states and five territories, not including Alaska or island dependencies. The following table shows the population of the republic at intervals from 1790 till 1900:

Year.	White.	Free Coloured.	Slave.	Total.
1790	3,172,006	59,527	697,681	3,929,214
1820	7,862,166	233,634	1,538,022	9,633,822
1860	26,922,537	488,070	3,953,760	31,443,321
1880	43,402,970	6,580,793	....	50,155,783
1890	54,983,890	7,470,040	....	62,622,250
1900	....	....	....	76,358,501

The Indian Territory and other Reservations have 537,242 inhabitants, of whom 201,315 are Indians; Hawaii, 154,001; Porto Rico (1899), 953,243; the population of the Philippines is estimated at about 8,500,000, of Guam and Samoa at 13,000. Of the population in 1890, 14·7 per cent. were foreign-born; from the United Kingdom, 4·86 per cent. (two-thirds from Ireland); Germany, 4·41; and from Scandinavia, 1·47. (See table at p. 373.)

Religion.—There is no state church in the United States. In 1890 the Roman Catholics claimed to have over 6,250,000 of the population; the Methodists, nearly 5,000,000; Baptists, 4,300,000; Presbyterians, 1,230,000; Jews, 1,200,000, of whom about a third are in New York; Lutherans, 1,086,000; Disciples of Christ, 641,051; Congregationalists, 492,000; the Episcopal Church, 480,000; Reformed Church (German and Dutch), 309,000; besides Friends, Mormons, United Brethren, and others.

Agriculture.—Nearly one-seventh of the people are actively engaged in agriculture. In 1890, 4,767,179 families occupied farms, of whom 3,142,746 owned their farms, and 1,624,433 had hired farms; and the total acreage of these farms was over 630,000,000. There were 134,489,286 acres under cereal crops (maize, wheat, oats), and the value of these was $1,311,255,609. The production of wheat is growing rapidly in importance; the chief states growing it are California, Kansas, N. and S. Dakota, Indiana, Ohio, &c. In 1898 the wheat crop was the largest ever produced, the value being $675,000,000, an increase of $145,000,000 over 1897. In 1897, 22,100,000 acres were under cotton, which produced a crop of 8,532,705 bales. The other principal crops were: corn (maize), 1,902,968,000 bushels; oats, 698,768,000 bushels; potatoes, 164,015,964 bushels; barley, 66,685,127 bushels; rye, 27,363,324 bushels; buckwheat, 14,997,451 bushels; sugar, 287,578 tons; hay, 60,664,876 tons; tobacco, 403,000,000 lb.; besides rice, hemp, flax, hops, &c. (See the articles on WHEAT, MAIZE, COTTON, TOBACCO.) The numbers of live-stock in 1898 were: cattle, 45,105,083; sheep, 37,656,960; swine, 39,759,993; horses, 13,960,911; mules, 2,190,282. The total value of farm animals exceeds 1888 million dollars. In 1897 over 42,000,000 gallons of wine were produced in the San Francisco district, besides 2,000,000 gallons of brandy. Large quantities of apples, plums, raisins, &c. are also grown.

Manufactures, Mines, and Railways.—Manufactures in the United States have made great progress in recent years, and continue to grow in importance. The production of pig-iron, which in 1885 amounted to 4,044,526 long tons, was in 1897 9,652,680 long tons, and of the value of $95,122,299; and in 1898 the quantity had risen to 11¾ millions of tons. In the same years the steel rails produced were 963,750 tons and 1,645,020 tons respectively. Steel ingots and castings were respectively 1,711,920 tons and 7,156,957 tons. The production of cotton in 1880 was 2,771,797,156 lb., and in 1898, 5,677,276,159 lb. Cotton goods to the value of $17,024,092 were manufactured for foreign exportation. There are also large manufactures of woollen goods, the annual value being about $350,000,000. The value of the gold production (mainly in California) was in 1893 $35,950,000, and in 1898 $65,000,000. Silver in 1897 was $69,637,172, and copper $54,080,180. The other metals produced are lead, zinc, quicksilver, nickel, aluminium, and antimony. Non-metallic products, consisting of coal, anthracite, building stone, petroleum, salt, limestone, cement, mineral waters, &c., had a total value of $329,113,395 in 1897. In 1897 446,982,063 lb. of tin-plates were produced, as against 307,228,621 lb. in 1896. In 1898 there were in the United States over 2500 miles of canals; of railways, 187,500 miles; of telegraphs, about 250,000 miles; and of telephones, 951,283 miles of wire. (See RAILWAYS, TELEGRAPHS. For the system of reckoning time in the various sections, see TIME.) The value of lumber is about $600,000,000 a year; of the fisheries, $45,000,000.

Imports and Exports.—The imports and exports also show the extraordinary development of trade in the United States. Prior to 1876 the imports, except on rare occasions, exceeded the exports. Since that time, however, a gradual change has taken place. In 1870 the imports of merchandise were $435,958,408, and the exports $392,771,768; in 1890 the figures were $789,310,409 and $867,828,684; while in 1898 the imports were only $616,049,654, and the exports had reached the enormous amount of $1,231,482,330. The principal heads of exports were (1898): manufactures, $290,697,354; agriculture, $853,683,570; mines, $19,410,707; forests, $37,900,171; fisheries, $5,455,483; and the chief details: bread-stuffs, cotton (raw and manufactured), meat and dairy produce, mineral oils, animals, iron and steel, iron manufactures, wood and wood manufactures, tobacco (raw and manufactured), copper manufactures and ore, leather, oil-cake, &c. The principal heads of imports were: food and animals, $181,480,011; raw materials, $204,543,917; manufactured articles, $82,570,687; partly manufactured articles, $69,957,983; luxuries, &c., $77,452,561; and comprised coffee, sugar, silk (raw and manufactured), chemicals, wool (raw and manufactured), cotton manufactures, other textile fibres and manufactures, iron and steel ore and manufactures, hides and skins, indiarubber and gutta-percha, tea, &c. The chief trade is with Great Britain, which in 1898 took 43·93 per cent. of the exports, and sent 17·67 per cent. of the imports. In 1898 there were registered 13,666 sailing-vessels of 1,835,827 tons, and 6712 steam-vessels of 2,371,923 tons. In 1897–98 the total tonnage entered at United States ports was 25,344,834; and cleared, 25,594,201. Of the total foreign trade only 11 per cent. was carried in United States vessels, the bulk being carried in foreign bottoms, of which by far the greater proportion was British. Strong efforts are being made to remedy this state of affairs.

Revenue, Debt, and Currency.—The federal revenue ranged in the years 1890–98 from $403,080,982 to $405,321,335, and the expenditure from $297,736,486 to $443,368,583. These figures are exclusive of postal revenue and expenditure, which about balance each other. The principal items of revenue are (1898): internal revenue, $170,900,641; customs, $149,575,062; sale of Kansas and Union Pacific Railroads (accidental to this year), $64,751,224; and miscellaneous. The chief expenditure comprised: civil list, $96,520,505; military, $91,992,000; naval, $58,823,985; interest on debt, $37,585,056; pensions, $147,452,369; Indian service, $10,994,668. In the same period the public federal debt ranged from $1,552,140,205 to $1,796,531,996. The separate states raise the revenues necessary for their administration principally by a tax on real and personal property. At the census of 1890 the total value of assessable property was $25,473,173,418, and the taxation amounted to $470,651,927, of which $125,168,134 was expended on schools and $345,483,793 for general purposes. The total state debt was at the same period $1,135,351,871, and the annual interest charge $65,541,776. The unit of currency is the silver dollar of 100 cents, having a value equivalent to 49·32d. English. The gold coins of 10 and 5 dollars, *eagles* and *half-eagles*, are also commonly in use, and both silver and gold are legal tender, the monetary system being theoretically bimetallic. The Treasury, however, issues legal tender notes, and silver certificates circulate freely.

See the articles on Bimetallism, Canal, Census, Cotton, Great Britain and statistics there, Iron, National Debt, Patents, Pensions, Protection, Railways, Shipping, Steel, Sugar, Telegraph, Timber, Tobacco, Wheat, Vine, Wool, &c.; the United States Census Reports from 1850 to 1900; the annual *Statistical Abstract of the United States*, and the other exceptionally copious reports of the Statistical Bureau in Washington; the publications of the American Academy of Political Science, the Johns Hopkins University Studies in Historical and Political Science, the American *Questions of the Day* series, as well as innumerable annual handbooks.

NAVY AND ARMY.

The navy of the United States has been greatly enlarged and to a great extent reorganised in recent years; and the result of the war with Spain in 1898 caused a still further development. A bill which passed in 1899 raised the legal establishment of 12,500 men and 1500 apprentices to 17,500 and 2500 respectively, with 18 rear-admirals, 70 captains, 112 commanders, 170 lieutenant-commanders, 300 lieutenants, and 350 junior officers, and the executive and engineering branches were amalgamated. In 1900 there were 149 vessels of all classes fit for service, including 1 second-class and 5 first-class battle-ships, cruisers, monitors, gunboats, torpedo-boats, &c., and extensive additions were under construction or have been planned. The standing army has always been strictly limited in numbers, and in 1875 the maximum limit was fixed at 25,000 enlisted men. As in the navy, the Spanish war of 1898 caused a change, and the bill reorganising the army passed in 1899 provides for a maximum enlisted strength of 65,000 men. Besides the regular army, each state is understood to have a militia force in which all men from 18 to 44 capable of bearing arms are supposed to be enrolled. The actual organised militia amounts to about 115,627 men, with 9376 officers, but the number who in case of war may be enrolled is over 10,000,000.

FOREIGN DEPENDENCIES.

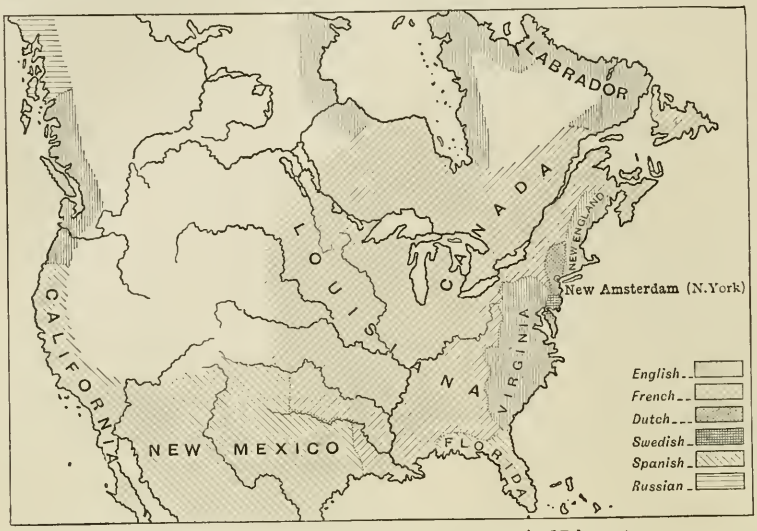
Since 1898 the national energies have been directed into a new channel, the States having definitively accepted the principle of colonial expansion. Heretofore the acceptance of the Monroe doctrine (see MONROE), excluding European occupation of any new areas on the American continent, was held as implying the converse doctrine that the United States did not propose to occupy territory outside the North American continent. Thus under the constitution there were obvious difficulties in the way of holding lands whose inhabitants were not to be admitted to political privileges as citizens of the republic. Hawaii was definitively annexed in 1898, and finally admitted as a territory in 1899. The result of the war with Spain in the same year, arising out of the Spanish misgovernment of Cuba, left Cuba (q.v.) temporarily an American dependency, its status being substantially that of a military protectorate. The war with Spain led also to the United States (on payment of $20,000,000 to Spain) assuming authority over the Philippine Islands (q.v.), in spite of the strenuous opposition of the native armies under Aguinaldo, who in 1901 still aimed at complete independence. Porto Rico (q.v.) was made over by Spain in 1898; Guam, the largest of the Ladrones (q.v.), was ceded at the same time, the rest of the Ladrones, Pelews, and Carolines being sold by Spain to Germany. And in 1899 Samoa, since 1889 recognised as neutral and independent under the joint protection of Great Britain, Germany, and the United States, was divided between the two latter, Great Britain withdrawing. Colonial expansion presents many problems of administration, necessitates the creation of a new civil service, and involves permanent and large extension of the army and navy of the United States.

HISTORY.

England claimed the greater part of North America by right of the discovery of John Cabot in the summer of 1497. The first permanent settlements, however, were made by the Spaniards in Florida, and by the French on the banks of the St Lawrence. The later half of the 16th century witnessed a great and sudden expansion of England's sea-power. The defeat of the Armada made the seas vastly safer for the navigator, and rendered improbable another Spanish attack like that of Menendez (1565) on the French Huguenots in Florida. A sudden plunge into speculative ventures brought disaster in its train, and it is to this commercial distress of the early years of the 17th century that the planting of the first permanent English colony was due. Sir Walter Raleigh (q.v.) sent out colonies in Elizabeth's time, but the name Virginia is all that remains to remind one of his vast schemes. In 1603 his rights reverted to the crown, and in 1606 the Virginia Company was chartered to make good England's claims to the American land. Virginia, as defined in this charter, extended from 34° to 45° N. lat. Two sub-companies were provided—one, with headquarters at Plymouth, to settle the northern part; the other, with an official residence at London, to settle the southern portion. In April 1607 the London company founded the first permanent English colony at Jamestown, on the James River, near Chesapeake Bay. The English were then only learning the art of colonisation, and most of those who came to Virginia during the first half-dozen years of its existence starved to death. But others took their place, and the success of the plantations was ere long assured. There are few more astonishing phenomena than the rapid spread of the tobacco habit; before 1615 the demand was sufficiently great to ensure the permanence of Virginia. The early colonists were men, but the company encouraged the immigration of marriageable girls, and soon the settlers were bound to the soil by ties of family responsibility. Labour was still scarce, but in 1619 that problem was solved, for the time at least, by the introduction of negro slavery; though as a commercial venture the company was a complete failure. In 1619 the London company inaugurated a new era by granting a modified form of self-government to the colonists.

The next permanent settlement was made farther north by a band of honest, religious folk, who brought their wives and children with them. Some of them had passed a few years in the Netherlands, and they all are usually known as the Pilgrims (see PILGRIM FATHERS). They settled in 1620 on the shores of a wretched tidal harbour, which was called Plymouth (q.v.). Ten years later the colony of Massachusetts (q.v.) was founded by the English Puritans, to provide an asylum for themselves and their friends in the event of the struggle in England going against them. The council for New England, as the successor to the Plymouth end of the Virginia Company was called, gave them a grant of land, which the king confirmed, whilst giving them in addition very extensive powers of government. For ten years (1630–40) a constant stream of immigrants poured into New England. It could hardly be expected that all these Puritans should think alike. Some of them, regarding Massachusetts as too liberal, settled at New Haven; while others, thinking it not liberal enough, founded the colony of Connecticut (q.v.). In 1662 Charles II. granted a charter to the people of Connecticut, including the New Haven colony. Other Puritans, whom the Massachusetts people did not like, settled Providence and the island of Rhode Island (q.v.); and these settlements were united and incorporated by charter in 1663 (see WILLIAMS, ROGER). The two last-named charters gave, in effect, self-government to the people of the two colonies. They were so liberal that the Connecticut charter remained the fundamental law of Connecticut till 1818, while the Rhode Island charter was not superseded by a state constitution until 1842. Other settlements were made by Puritans and others along the Merrimac River and the

seaboard north of Massachusetts. The former were known as New Hampshire. The latter were within the province of Maine, and the rights of the original grantees were purchased by Massachusetts in 1677. Maine remained under the government of Massachusetts until 1820. In 1643 four of these colonies, Massachusetts, New Plymouth, Connecticut, and New Haven, joined together for mutual convenience and defence, under the name of the United Colonies of New England.



Appropriation of North America by Europeans in 17th century.

In 1624 the Virginia charter, by one of those arbitrary acts common during the Stuart period, was annulled, and the colony thus became a royal province. Little change seems to have been made in the government of the province, but one king after another granted away land which had been included within its charter limits. The first of these grants in point of time was made by Charles I. to his former secretary, George Calvert, first Lord Baltimore, who was a Roman Catholic. Before the patent was actually issued George Calvert died, and it was issued to his son Cecil, Lord Baltimore (see MARYLAND). Calvert's design seems to have been to found a landed estate for his family and an asylum for his fellow Roman Catholics. In both these designs he was successful, and the Baltimore family derived revenue from the province until the time of the American revolution. A toleration act for Maryland, the first in the history of the English race, was passed in 1650 by an assembly composed of both Protestants and Catholics.

During the great Civil War and Commonwealth periods immigration into the Puritan colonies almost ceased; indeed, at times the movement seems to have been the other way. Beyond requiring an acknowledgment of allegiance and obedience to the navigation ordinances, the Puritan rulers of England left the colonies to themselves, and for some half-dozen years all the colonies enjoyed self-government.

With the restoration of the Stuarts there came a revival of the colonising spirit. In 1663 Charles II. granted to Clarendon and other courtiers a vast tract lying south of the settled portions of Virginia, under the name of Carolina. The grantees attempted to introduce a fantastic form of feudalism (see NORTH CAROLINA), but the colonists would have none of it. Early in the 18th century the crown purchased the rights of all but one of the grantees, and assumed the government of the whole, the province being divided (1729) into two governments, North Carolina and South Carolina. Before long South Carolina became very prosperous, her rice supplanting that of Egypt in many markets of Europe.

The government of the Restoration adopted the colonial policy of its predecessors, and restricted colonial trade as much as possible to England and to subjects of the English crown; thus, certain goods could be exported only to England in English or colonial ships. The country bordering on the Hudson and Delaware rivers had been settled by the Dutch and Swedes, and was now in the hands of the Dutch. It was impossible to enforce these navigation laws under the circumstances, and the conquest of the Dutch colonies was resolved on and accomplished in 1664—though for a few years they again came under Dutch control. They were finally surrendered to England in 1674. Even before the conquest Charles II. granted these Dutch colonies to his brother James, Duke of York and Albany; and James, with the Stuart love of giving, re-leased a valuable portion of it to two of his friends, Berkeley and Carteret, who were also among the grantees of Carolina. In honour of James, the Dutch settlements, when conquered, were called New York; while in commemoration of the fact that Carteret had held the island of Jersey for the Stuarts during the Civil War the portion given to him and Berkeley (1664) was called New Jersey. In 1674 these grants were renewed. New York was thus a conquered province, and the people there had none of the privileges enjoyed by the people of the colonies which had been originally colonised by Englishmen.

The governors of New York, sensible of the grave error of the grant of New Jersey, placed all possible obstacles in the way of the grantees, and before long the property came into the hands of a syndicate of Quakers, at the head of which was William Penn. Trouble continued with New York, and the Quakers became involved in innumerable disputes about land and matters of local government. To avoid further complications the jurisdiction was surrendered to Queen Anne (1702). For a time New York and New Jersey had the same governor, though separate legislatures. In 1738 a governor was appointed for New Jersey, and thus it became a separate colony, remaining so until the revolution. William Penn does not seem to have been disturbed by the disputes of the New Jersey Quakers. He obtained from the king, in 1682, a large tract of land on the west side of Delaware, under the name of Pennsylvania (see PENN). He also obtained from the king and the Duke of York the Swedish-Dutch settlements on the western side of Delaware Bay, south of Pennsylvania. There was a long and bitter dispute between Penn and his heirs and the Baltimores as to the boundary between their possessions. A compromise was made in the middle of the 18th century, the present boundary line being run for some distance by two English surveyors, Mason and Dixon (see MASON AND DIXON'S LINE). For a century this line, known by their names, was regarded as the boundary between the north and the south. As the matter was finally determined in 1703, Pennsylvania and the lower counties on Delaware Bay had each its own legislature, but one governor. At the revolution, however, the counties set up for themselves as the state of Delaware.

The last colony to be planted was Georgia (1732). It had its origin in the philanthropic instincts of Oglethorpe, and the desire of the English government to push the southern boundary against the Spaniards. The philanthropists, however, were not good governors; one by one their schemes failed, and in 1751 they voluntarily surrendered the colony to the crown.

Toward the end of the Stuart period a scheme of colonial consolidation was set on foot. The idea seems to have been to form two or three strong colonies, governed directly from England, out of the thirteen free, weak, self-governing colonies. Charters were annulled, and all the colonies north of 41° N. lat. were formed into the dominion of New England, with a capital at Boston. Andros was appointed governor, with executive, judicial, and legislative powers, the people no longer having any political power. But the arrangement did not long continue; on the news of the landing of William of Orange at Torbay the people of Boston rebelled, captured Andros and other officials, and sent them to England for trial. Rebellions occurred also in New York (Leisler's rebellion) and in Maryland (Coode's Association).

The new English government adopted a policy of compromise. The old forms of government were generally restored, except in Massachusetts; but as an offset to these concessions the trade of the colonies was still further restricted to England. Massachusetts, which now included New Plymouth, was given a modified charter government. Under this new charter the governor was to be appointed by the crown, the House of Representatives elected by the people on a property qualification, and the council appointed by the two jointly. The governor's salary, and the salaries of the other officials, were to be paid by the Assembly. Thus the Assembly really ruled; but there were always so many disputes of one kind or another that the Massachusetts people became accustomed to opposition and schooled in political methods.

The colonies shared in the good and evil fortunes of England in the great struggle with France, which began in 1690 and continued until 1763. The earlier conflicts have little interest at the present time. But in 1745 the New Englanders, with some slight assistance from the English, besieged and captured Louisburg, on Cape Breton Island. At the close of the war, however, Louisburg was given up to France. In 1754 trouble began anew; the French endeavoured to connect their possessions in the St Lawrence valley with their settlements on the Mississippi by a chain of posts and towns on the Ohio River and its affluents. This brought France into contact with Pennsylvania and Virginia. The governor of Virginia at that time was a Scot named Dinwiddie. He sent a formal protest against the French occupation of Fort Duquesne, at the confluence of the Monongahela and Alleghany rivers. The French paying no regard to this protest, Dinwiddie attempted to drive them out by force; but the campaign ended in disaster, Washington, the Virginia commander, and his little army being obliged to surrender at Fort Necessity. The war begun in this way soon spread over the whole frontier, and before long nearly all the nations of western Europe became involved in the struggle. In 1755 General Braddock was defeated near Fort Duquesne by the French and their Indian allies. Later, though, the fort was captured. But the principal interest in this war was in the north, where the English attempted to invade Canada by the line of Hudson River, Lake Champlain, and Lake Ontario, and towards the north-east by way of the lower St Lawrence. In 1758, after serious resistance, Louisburg was again taken from the French, this time by an English army commanded by Amherst and Wolfe. The next year Wolfe, with a strong fleet and army, sailed up the St Lawrence, and after a long investment placed his army on the Plains of Abraham, on the northern side of Quebec, just outside the walls, and there defeated the French under Montcalm. Both Wolfe and Montcalm were mortally wounded during the action. After many defeats the English penetrated by the line of Hudson River, and in 1760 captured Montreal, and thus secured the safety of Quebec. In 1763, by the peace of Paris, France gave up Canada and all her claims to lands east of Mississippi and north of Florida to England, with the exception of some small islands in the Gulf of St Lawrence and the island of New Orleans at the mouth of the Mississippi. At the same time she ceded to Spain, as the price of her unavailing assistance in the war, all her claims to lands west of the Mississippi and to New Orleans and the island on which it stands. Spain ceded to England all her claims to lands east of the Mississippi, with the exception of New Orleans; and England, on her side, restored what she had conquered in the West Indies to France and Spain, and relinquished whatever claims she might have had to lands west of the Mississippi. By a proclamation issued in the same year the king still further restricted the limits of those colonies to the Alleghanies. The Indians, formerly subject to France, proved hard to manage; a rebellion, led by Pontiac (q.v.), in 1763, convinced the English government of the necessity of keeping on foot in the colonies a force of regular troops. It seemed right that the colonists should bear a part of the burden their support entailed; and by act of parliament, therefore, a stamp-tax was laid on all the American colonies (1765). The tax was equitable enough, and it was fair that the colonists should bear a part of the burden of their protection. It did not seem right, however, that they should be taxed by an assembly 3000 miles away, in whose election

they had had no voice, and whose members were not in any way responsible to them. At about the same time parliament also amended the Trade Laws in the direction of efficiency and simplicity, making them easier of enforcement. The points in dispute are illustrated by the arguments of James Otis of Massachusetts against Writs of Assistance (warrants authorising the holders to search for smuggled goods), and of Patrick Henry of Virginia on the legality of the king's veto of an act of the Virginia Assembly. Neither had any law whatever on his side; they based their arguments on the broad rights of the colonists as men and subjects of the English crown. Resolutions embodying the same ideas were passed by the Virginia Assembly during the Stamp Act troubles and at Henry's suggestion. So general was the opposition to the act that when the day arrived on which it was to go into operation not a stamp could be anywhere purchased. The judges even were obliged to proceed without stamps, and the customs officers to give clearances which were unlawful on their very faces. There was a change of government in England at this time, owing to the king's dislike of George Grenville, and the Rockingham Whigs came into office. Partly to discredit their predecessors, partly to conciliate Pitt (the elder), and partly because they could not help it, the Stamp Act was repealed. Pitt had a whimsical notion that parliament, though unable to levy direct taxes on the colonies, possessed nevertheless complete legislative power, and a declaratory act to that effect was passed. The colonists soon saw the futility of this distinction, and opposed the Townshend duties on glass, tea, and paints imported into the colonies. Finally, when an attempt was made to force the tea upon them, they threw it overboard or stored it in damp cellars. Parliament then suspended the charter of Massachusetts, and closed the port of Boston (q.v.).

The other colonies took up the cause of Boston and Massachusetts. The contest was really for self-government for America; the Americans maintaining that they were the equals of Englishmen living in England—not their subjects. Furthermore, they said they were not and could not be adequately represented in parliament, and hence could not be bound by its votes; the colonial assemblies represented them. These and other reasons for taking up arms were embodied in a Declaration of Independence, July 4, 1776, which was in reality the platform of the Radical party. The English view, on the other hand, was that parliament was the supreme legislative body of the whole empire, while the colonial assemblies were merely subordinate legislatures.

The contest began with the skirmishes at Lexington and Concord on April 19, 1775, followed by the battle of Bunker Hill on 17th June of the same year. From that time until March 1776 the English army was blockaded in Boston by the New England farmers, before long headed by Washington (q.v.). Finally, however, the English were obliged to evacuate Boston, and the war drifted away from New England. The British plan was to conquer and occupy important towns like New York and Philadelphia. Washington's idea, on the contrary, was to preserve his army. This he accomplished in a manner to arouse the admiration of the world. The capture of a Hessian detachment at Trenton, New Jersey, in December 1776, saved the revolution from ignominious failure, and was the turning-point of the war. The next year Howe captured Philadelphia, retaining control of New York City and the lower Hudson. Washington was obliged to retire inland to a strong position among the hills named Valley Forge. In 1776 General Burgoyne attempted to seize the line of the Hudson River, marching southward from Canada. From a military point of view this plan was an admirable one, but it left out of account the unanimous resistance of the inhabitants of New England and the people of northern New York. Burgoyne's advance was delayed in every possible way, and by the time he reached Saratoga his light troops had been destroyed at Oriskany in western New York and at Bennington in Vermont. Surrounded by the farmers of New England and New York, unable to go forward or to go backward, he surrendered, October 19, 1777.

The French, now convinced that the colonies could hold their own, entered into an alliance with them in 1778. In 1780 Clinton with a strong army sailed southward from New York, landed on the South Carolina coast near Beaufort, besieged Charleston on the land side, captured it, and overran the seaboard. He then returned north, leaving Cornwallis to continue the subjugation of the south. An army sent by Washington to oppose him was defeated at the battle near Camden in the same year, the commander of the Americans being the same Horatio Gates who had commanded the Americans during the Saratoga campaign. In the autumn of the same year, however, General Nathanael Greene took command of the American resistance to Cornwallis. In October 1780 the English irregular troops were routed at King's Mountain by the frontiersmen of Kentucky and Tennessee. In January 1781 Greene's lieutenant, Daniel Morgan, destroyed or captured Cornwallis' light troops, under Tarleton, at the Cowpens, and escaped with his prisoners. Cornwallis then pursued Greene across North Carolina to the Virginia line, but on March 15 Greene and Cornwallis fought a bloody battle at Guilford Court-house, in which Greene was defeated. Cornwallis, however, leaving his sick and wounded to the care of the Americans, repaired to Wilmington on the seaboard, while Greene, after following him for some distance, marched to South Carolina, and in two campaigns cleared the interior of that state and of Georgia of English troops. Unsuccessful as he was at Guilford Court-house, nevertheless Greene won the southern campaign. Cornwallis from Wilmington marched northward into Virginia, and fortified a strong position on the York River at Yorktown.

Clinton, called back from his southern conquest by the arrival of a French fleet and army at Newport, accomplished little except to hold that army at Newport. In 1781, however, a strong French fleet under Comte de Grasse came north, bringing with him another strong French force. Washington and Rochambeau, the French commander, had agreed to co-operate with De Grasse, and a few days after De Grasse's arrival at the Chesapeake the allied army reached the head of that bay, and before long closely besieged Cornwallis at Yorktown, De Grasse with his fleet preventing reinforcements reaching Cornwallis from New York. He surrendered on October 19, 1781. In England the Whigs again came into power, and in September 1782 the preliminaries of peace were concluded at Paris, although the definitive treaty was not signed until a year later.

The colonists were then living under a constitution known as the Articles of Confederation. The government of this confederation could exert no pressure on individuals; it dealt only with the states, and was at their mercy. This marks the farthest limit of the particularist movement. The old western boundary of the colonies had been the Alleghanies; but the United States by the treaty of 1783 acquired all the land to the Mississippi. Did this land belong to the nation as a whole, or to the states to whom the king might at one time have granted it when they were colonies?

The whole future of the country rested on the decision of this question. If the management of this splendid domain was undertaken by the United States as a whole, nationality and union were inevitable. The states having claims to these lands gave them to the United States. In 1787 congress passed an ordinance for the government of the territory of the United States north-west of the Ohio. By this it was provided that the settlers of this territory should possess all the rights of the people of the older states, and should have and exercise self-government as soon and to as great an extent as convenience permitted. As soon as any portion of this territory should have a population of sixty thousand it might be admitted to the Union on the same terms as the older thirteen states. These new states were to be admitted as of right to a position of equality with the older states. Thus, for the first time in the world's history, a nation resolved to treat its colonists on equitable terms, giving to them the rights it had claimed for itself. As territory after territory was acquired by the United States the same principles of right were applied, and now the United States comprises forty-five equal co-ordinate states, living peaceably together as one nation.

The Articles of Confederation were inadequate to these new problems. A convention of leading men was held at Philadelphia in 1787, which drew up a constitution. After much opposition it was ratified, and went into force in 1789, and is still the organic law of the United States. The constitution has lived long and worked well because it is based on the experience of the thirteen colonies in self-government, and is elastic enough to be able to adapt itself to changed conditions to almost any extent. It is elastic because the expressions used to define the powers granted by the people to the central government are so vague that their meaning really depends on the decision of the Supreme Court; and experience has shown that that court will ultimately interpret the constitution as the people wish. In addition, the constitution contains a provision for its own amendment; but the process is very cumbersome, and, as a matter of fact, out of over seventeen hundred amendments formally proposed only fifteen have been adopted.

A contest between the large states which wished apportionment based on population and the small states which wished the states to have an equal vote ended in a compromise, by which each state has an equal vote in the Senate, while representation in the House of Representatives is based on population. The House is newly chosen every second year, while only one-third of the Senate is changed each second year. It thus may take six years to change the majority in the latter body. The senators are chosen by the state legislatures, the representatives in districts by the direct vote of those who have the right to vote for the members of the lower house of the state legislature. The House has control of money bills, while the Senate acts in many ways as an advisory council to the president. These arrangements have resulted in the preservation of state lines and local self-government, and also in the representation of wealth and position on the one hand, and of the mass of the people on the other. Furthermore, the House yields readily to the popular will, while the Senate remains firm for a sufficient length of time to allow the people to think the matter over. If the people wish anything for four or six years, the majority of the Senate will change to conform to the will of the majority of the people. The president is elected for an intermediate period of four years. In this way it often happens that the president and one House will be on one side of a question, the other House being on the other. So far all these things have made for stability.

The provision of the constitution which has attracted most attention is that providing for a supreme court, composed of judges who hold office during good behaviour, and whose salaries cannot be diminished while in office. The jurisdiction of this court is almost all appellate. It has almost no dealings with the other branches of the government. If a case involving the constitutionality of a law comes before it, it decides the matter, and if the act is declared to be unconstitutional the federal courts will not enforce it. The Supreme Court can also by writ bring before it any decision of a state court denying the validity of a federal law.

George Washington was unanimously elected first president, with John Adams as vice-president. The American Revolution is ordinarily regarded as ending in 1783. But a far greater revolution than the overturning of the power of England and the substitution of a federative form of government now took place. American society in 1789 was essentially aristocratic, and so were politics. In every state there was a property qualification, and, as the right to vote for national officers depended on the right to vote for state officers, it followed that only those possessing property could vote for national officers. And so with everything else, American society and institutions were still essentially English. But the opening up of new countries beyond the Alleghanies, the feeling of independence to which the cutting loose from England gave rise, and, above all, the confidence in the future which the new government inspired, all combined to turn the thoughts of the people toward greater rights for the individual.

This great movement was led by Thomas Jefferson, the Secretary of State, who as far back as 1774 had asserted that governments are founded on truth and justice, and on the rights of men. Jefferson now proposed to give practical effect to these views of the early revolutionary period, and to found, in fact, a government by the people, of the people, and for the people, based on truth, justice, and confidence. At the other extreme was Alexander Hamilton, Secretary of the Treasury, who distrusted men in the mass, looked on them as reasoning not reasonable beings, and wished to found a strong national government to which all of what seemed to him the stronger elements in society should turn. For the time being Hamilton and the Federalists were in the ascendant, Jefferson and the Anti-Federalists being discredited by their opposition to the constitution. There was nothing incompatible between nationalism and democracy. Indeed a strong government based on democracy was and is the only possible government in the United States. But Hamilton was not broad enough to see this, and Jefferson was perforce obliged to use the opposition or particularist party as his ally.

In order to attach the moneyed classes to the national government Hamilton and the Federalists introduced scheme after scheme for the advantage of capital. A protective tariff bound the manufacturers to the central government, while a United States bank bound moneyed interests to it; the funding of the debt and the assumption of the state debts created a large national debt, enriched the speculative classes, and bound the holders of the debt to the central government. For the rest, Hamilton and the Federalists organised the working departments of the government essentially as they exist to-day.

Probably no other man could have given the new government so good a start as Washington. His very presence at its head gave to it a dignity and stability which only years of successful administration could otherwise have secured. Washington

saw clearly that his most useful work would be to give the country a strong, quiet government, thus gaining time for the constitution to acquire a place in the hearts and traditions of the people. Therefore he endeavoured to keep the country out of all foreign complications, while at the same time he secured the navigation of the Mississippi from Spain, and commercial privileges from England. The French Revolution, however, forced him, as well as other rulers, to take sides.

Like Charles James Fox and other liberal-minded Englishmen, Jefferson sympathised warmly with the ideas and aims of the early leaders of the French Revolution, and underestimated the fickleness and instability of the French people. When the Revolution assumed its propagandist character, and war with England followed, the revolutionists expected to gain sympathy and assistance from the Americans, whom they persisted in regarding as owing France a debt of gratitude for aid in the American Revolution—the fact being that France had then used America as a cat's-paw, and had deserted her at the time of negotiations for peace. The sympathies of the people were with France, but it was a question which divided parties as to how far this feeling should guide the country's policy. Washington decided that the only safe policy for the new nation was one of strict neutrality, and time has justified his conclusion. But Jefferson retired in disgust from the government, and the Federalists soon obtained full control. At the end of his second term Washington declined re-election, and John Adams was chosen president. He inherited not only Washington's policy but his official advisers, who looked to Hamilton, though he was no longer in the cabinet, as the head of the party. Washington's firm hand withdrawn, the country rapidly drifted toward war with France, whose government insulted the Americans by demanding money as the price of peace. A provisional army was set on foot with Washington at its head. But an opening presenting itself, Adams renewed negotiations for peace, and Napoleon, now at the head of the French government, concluded them. This was perhaps the most high-minded and patriotic act of John Adams' whole career; but it lost him the support of his party.

Among the acts of the Federalist majority at this period were the Alien and Sedition Laws, giving the government for a limited period power to deal with foreigners resident in the country, and with those who publicly opposed the acts of the government. It happened that most of the Republican (q.v.) or Jeffersonian journalists were foreigners, and the Republicans, declaring these acts aimed against themselves and their friends, caused the legislatures of Kentucky and Virginia to pass resolutions setting forth the particularist theories as opposed to the nationalist theory of the Federalists. But there the matter rested.

In the election of 1800 the nominees of the Republican party obtained the majority of the electoral vote. Each elector then voted for two persons without specifying which was his choice for president, and Jefferson and Burr had an equal number of votes. No man ever doubted that Jefferson was the person intended to be president. It became the duty of the House of Representatives, in which the Federalists had a majority, to designate which should be president. In their desperation and hatred of Jefferson they determined to elect Burr. In this they failed; but by thus attempting to thwart the will of the people the Federalist party lost the confidence of the people and sank into comparative insignificance. The contest also resulted in an amendment of the constitution, empowering the electors to vote for one man as president and another man as vice-president. Jefferson once in power immediately did away with the ceremonial of official intercourse which had meant so much to Washington and Adams. The one great accomplishment of his two administrations was the purchase of Louisiana, or the western part of the basin of the Mississippi, from France (1803) for about 15 million dollars. This purchase was plainly not authorised by the constitution; and, indeed, for a time Jefferson thought an amendment would be necessary. In 1812 the southern end of this great acquisition was admitted to the Union as the state of Louisiana.

With the renewal of the war between England and France in 1803 came a renewal of the troubles of the United States, now the only neutral nation possessing ships. In the course of time England declared the ports of western Europe blockaded, while Napoleon on his side issued decrees declaring the ports of the Continent closed to English ships and produce, and to ships which had touched at English ports (see CONTINENTAL SYSTEM). To these restrictions Jefferson opposed only counter restrictions, so that the carrying trade was attacked from three directions at once. Portions of the country were ruined, and Jefferson closed his second term, in 1809, amid difficulties of the most serious kind at home and abroad.

James Madison of Virginia, long Jefferson's right-hand man, succeeded him, and was re-elected in 1812. The irritation against the foreigners now increased rather than diminished. With England there was still another cause of dissatisfaction. England claimed and exercised the right to search American vessels for deserters from the English navy and for other British subjects. There were without doubt many deserters, but the right of search was founded on a wrong principle, and besides it was impossible to distinguish between an American and an Englishman. Thousands of Americans were seized and forced to fight for England. Congress was now in the control of a party eager for war with England, and war was begun in 1812. The Americans attempted to invade Canada by the line of Lake Champlain and of the St Lawrence valley, and were driven back. On the water, however, the Americans were almost uniformly successful, the frigates *Constitution*, *President*, and *United States* capturing English vessels of their own class. On the other hand, an English ship, the *Shannon*, captured the American frigate *Chesapeake* off the harbour of Boston. In August 1814 the British captured the city of Washington, burned and destroyed the public buildings there, and attacked the city of Baltimore, but were driven back. In December 1814 this war was concluded by the treaty of Ghent, which was signed twenty-five days before General Jackson repelled a most gallant attack of the British on New Orleans. No mention was made of the right of search, or of impressment in the treaty, but they were given up. On the whole, this 'Second War of Independence' was a good thing for the United States, as it made strongly for nationality, and convinced even the most ardent friend of England of the undesirability of an English connection.

Madison's successor was James Monroe, another Virginian, of moderate abilities, but well fitted to lead the country at a time of complete cessation of party strife, known as the 'era of good feeling.' In 1819 the United States acquired East and West Florida, or all of Spanish America east of the Mississippi, at the same time abandoning whatever claims she had to Texas, California, and New Mexico. Monroe's name is also associated with the formal announcement to foreign powers of the American idea of the separation of American and European politics. This was not a new idea in any

sense, but the first complete enunciation of it was by Monroe, and it is hence known as the 'Monroe Doctrine' (see MONROE).

With the end of Monroe's administration came an end to the good feeling. The Democratic party became split into factions, each following a leader, John Quincy Adams, Jackson, Clay, or Crawford. No one received a majority of the electoral vote, though Jackson received more than any one else. Nevertheless the friends of Adams and Clay in congress united and elected Adams, who now appointed Clay Secretary of State; and charges of corrupt bargains between 'the Puritan and the Blackleg' were freely made. There is no evidence of corruption, and the House of Representatives had a perfect right to elect Adams; nevertheless he began his term of office under many disadvantages. This was the period of the so-called American system of a high protective tariff, combined with internal improvements, such as the Chesapeake and Ohio Canal, begun at this time. Adams, who was cold and conscientious, refused to use the federal patronage to build up a party devoted to his interests. On the other hand, General Jackson was the idol of a majority of the people. He promised to give a good office to any one who should work for his interests; and in 1828 he was elected president by a vast majority. With the exception of the introduction of the 'spoils system' there is much to be admired in Jackson. He stood for the nation against the state, as in the case of Nullification (q.v.); for the people against the moneyed classes, as in the case of the United States Bank; for the country as against foreign aggression, as in the case of France. During Jackson's time the steam-locomotive was introduced into America, one thousand miles of railroad were built in five years, and American life began to show its tremendous expanding powers.

After Jackson there came a succession of presidents whose names are scarcely worth remembrance. The interest now turns slowly but surely toward the struggle between the North and the South, which led ultimately to war, and to the destruction of the 'Old South.' The sole cause of this divergence was negro slavery, or better perhaps the belief that the cultivation of cotton required unfree black labour. Slavery had existed in all the original thirteen states from the early times. In the North it was not profitable, except in one or two places, and was dying out in 1780. In the South, by which is meant the country south of Mason and Dixon's line, slavery had not been of very much account, except in South Carolina and Georgia, where the malarial rice swamps seemed to require negro labour. The Virginia leaders were against slavery, and expected to see it disappear in the South as it was disappearing in the North. It was unfortunate that the constitutional convention of 1787 did not hold out on these points, and provide for the extinction of slavery whenever the majority of the people of the whole country desired. But what seems plain now was not plain then; slavery was favoured in the constitution, and the slave-owner given more than his proportion of the representation in the House of Representatives. In 1794 Eli Whitney discovered a way by which the cotton fibre and seed could be separated by machinery. This alone made the cultivation of cotton on a large scale profitable, and, combined with great inventions in the art of spinning and weaving in England, enormously stimulated its production, and negro slavery was fastened on the country. As time went on the North became a great manufacturing as well as an agricultural country; cities multiplied, population became denser, and the whole mode of life of pre-revolutionary days underwent a complete and radical change. In the South the old life was in many ways intensified. The two sections thus grew apart.

At first the South, and South Carolina most of all, was very nationalistic. But as time went on and a protective tariff was framed to stimulate manufactures, the South turned completely round. It had no manufactures, and would receive no benefit from this tariff, and many things would be increased in price. It was therefore proposed, somewhat in line with the views of the early Republicans and of the New Englanders during the war of 1812 (see HARTFORD CONVENTION), to declare the disliked law null and void so far as South Carolina was concerned—that is, to nullify it. Jackson, who was then president, met this issue squarely, and an act authorising him to use force was passed. The nullification was suspended, and the whole matter was compromised.

The ordinance of 1787 prohibited slavery in the new territory north of the Ohio, and as states came into existence there this prohibition was carried out, slavery being the custom in the territories and states south of that river. When Louisiana was bought a new element at once came in. Slavery existed in the regions around New Orleans and St Louis. Louisiana and the country around New Orleans was admitted as a slave state in 1812. But when Missouri or the country dependent on St Louis applied for admission, the case was somewhat different. Finally a compromise was made to the effect that Missouri should be a slave state, but the remainder of the Louisiana purchase north of its southern boundary (36° 30′) should be forever free. This was the Missouri Compromise of 1820, and for twenty years it postponed the inevitable conflict.

The United States had acquired by the Louisiana purchase some vague claim to that territory lying between the Sabine, Rio Grande, and Arkansas rivers. This territory, or at all events a portion of it, was known as Texas, and was sparsely settled, mainly by adventurers from the southern states; but slavery was not allowed there by the constitution of Mexico. In 1836 Texas revolted from Mexico, and established a republic. The South cast longing eyes on Texas—the Texans to a great extent were their own folk, and their country would add to the territory suited to slavery. In 1845 Texas was annexed or re-annexed to the United States, and admitted as a state. A dispute with Mexico at once arose as to its western boundary. General Zachary Taylor was ordered to seize the territory in dispute, and war with Mexico followed. In May 1846 he crossed the Rio Grande, and won the battle of Buena Vista. Frémont and others seized and held during the war the country on the Pacific slope now known as the state of California, to which the United States had no claim whatever. In March 1847 General Scott landed on the Mexican coast near Vera Cruz, captured that fortified seaport, and placed his army on the high lands toward the interior. In the autumn he marched towards the city of Mexico, defeating the Mexicans under Santa-Anna in battle after battle, the most important being Cherubusco and Chapultepec, and capturing the city of Mexico. By the treaty of Guadalupe Hidalgo (1848) this war was ended, Mexico ceding to the United States all that the latter had claimed or had seized, comprising the southern and western portion of the state of Texas, New Mexico, the lower part of Arizona, and California. The United States agreed to pay Mexico over fifteen million dollars, and to pay in addition about three million dollars due from Mexico to citizens of the United States. In 1853 this acquisition was rounded out by the 'Gadsden Purchase' of a small strip on the south-western line. The

North was in part compensated for this great increase of probable slave territory by the acquisition of that part of Oregon lying south of the 49th parallel, to which the United States had various claims. It was decided to let the people of each portion of the territory acquired from Mexico settle the question of slavery for themselves: this was called 'squatter sovereignty,' though the phrase may not have come into common use until about 1854. In 1850 California, to which the discovery of gold had attracted a rush of immigrants, was admitted as a non-slave state. To pacify the South, the Fugitive Slave Law (q.v.) was passed, which directed the Federal authorities to return slaves who had escaped to the North. The execution of this act first awakened the people of the North to the gross evils of slavery, and the abolitionists, who had been in existence since 1830, now began to make converts.

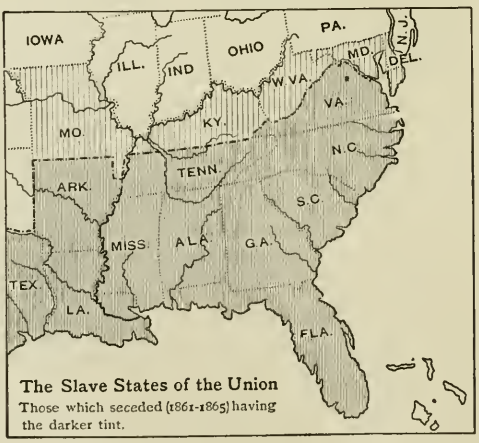
In 1854, in defiance of the Missouri Compromise, the principle of 'squatter sovereignty' was applied to the two great territories lying north of 36° and as far as 30°—Kansas and Nebraska. The spirit of the North at last was aroused, anti-slavery men poured into Kansas (q.v.), waged war against the slave party there, and organised the state on a non-slave basis—though it was not admitted as a state until 1861. This struggle led to the formation of a new party in the North opposed to slavery, with democracy at the bottom and nationalist in spirit. This party adopted as its name that of Jefferson's old party, Republican, and grew with marvellous rapidity. In 1856 a presidential election was held; the Democratic candidate Buchanan was elected by a majority of the electoral vote, but Frémont, the Republican candidate, had a large popular vote. In 1856–57, in his opinion on the Dred Scott Case (q.v.), Chief-justice Taney stated, among other things, that a slave, or the descendant of a slave, could never be a citizen of the United States, and that the Missouri Compromise was unconstitutional. In 1860 the Democratic party was split into two sections, the southern or ultra-slavery Democrats and the northern or conservative Democrats. The southerners demanded the recognition by the party of the duty of congress to protect slavery; the northern Democrats could not possibly agree to this. In the face of a divided party, the Republicans elected their candidate, Abraham Lincoln, president. The North was now much stronger in population and wealth, and growing stronger every day. If the South remained in the Union it would soon be at the mercy of the North. The extreme southern states determined to secede; hoping, no doubt, that the North-west and California would either join them or remain neutral. But the newer states had been largely settled by foreigners, to whom the United States had been a star of hope for many years, until frugality enabled them to emigrate thither. They had no state pride, but were intensely loyal to the country which had received them and given them a chance in life.



The Slave States of the Union
Those which seceded (1861-1865) having the darker tint.

The North-west, California, and after a struggle Missouri, Kentucky, and Maryland cast in their lot with the North and East: about eight or nine millions in the South stood against twenty or twenty-two millions in the North, with the resources of wealth and increased production on the side of the latter. The people of the South, however, were bred to command and to the handling of arms. From the first the government of the southern confederacy was despotic in practice. Such resources as it possessed were, therefore, at once used with effectiveness, while the North, unused to arms, and accustomed to do everything by committees or boards, and comparatively ignorant of war, was unable to make good use of its resources for at least two years. At first everything went against the North, and for a while it seemed as if it would be obliged to fight England and the South at the same time. This was due to the seizure and removal from a British vessel of two southern political agents on their way to Europe (see TRENT AFFAIR).

In the beginning the sympathies of France, and still more of England, were on the side of the South. This was due in some measure to political and sentimental reasons, but in the case of England, at least, it was due partly to the cotton famine which followed the closing of the southern ports by the northern naval forces. In January 1863 President Lincoln, by proclamation, declared the slaves in the part of the South then in rebellion free. The character of the struggle was at once changed in the eyes of foreigners, and the sympathy of the outside world turned gradually to the North. Nevertheless the southern agents in England were able to fit out a vessel, the *Alabama* (q.v.), to destroy the northern shipping interests.

In April 1862 Admiral Farragut captured New Orleans on the Lower Mississippi, and on July 4, 1863, General Grant captured Vicksburg, which commanded the navigation of the middle course of the river. In this way the Confederacy was cut into two parts, and the control of the great stream was in the hands of the North from source to mouth. After the defeat of the Army of the Potomac at Chancellorsville, May 3, 1863, the Confederates attempted for a second time an invasion of the North. The Union army, now commanded by George G. Meade, met them at Gettysburg in south-western Pennsylvania, and on July 1, 2, and 3, 1863, after a most stubborn and bloody conflict, forced them back. Gettysburg and Vicksburg were the turning-points of the war. Soon after Grant was placed in command of all the armies of the United States, and for the remainder of the war operations were conducted on a systematic plan. General Meade retained command of the Army of the Potomac, to Sherman being confided the operations in Tennessee and Alabama. On September 2, 1864, Sherman entered Atlanta, Georgia. Sending a portion of his army back under General Thomas, he marched from Atlanta to Savannah on the Atlantic seaboard, and then turning north carried his army to Goldsboro. Thomas performed his work admirably, destroying the last army of the Confederates in the west at the battle of Nashville in December 1864. Meantime Grant with the Army of the Potomac, under the direct command of Meade, advanced towards Richmond, fighting the terrible battles of the Wilderness, Spottsylvania, and North Anna, and besieged the Confederate army in the lines of Petersburg. The siege lasted through the winter of 1864–65. Grant continued to extend his lines towards the south and west, thus cutting the Confederates off from their source of supplies. On the 2d of April the Confederates broke out through Petersburg, and attempted to escape towards the south and west. By almost superhuman endeavours Sheridan placed his cavalry and an infantry corps across their track, and on April 9, 1865, the Confederate army of North Virginia surrendered at Appomattox Court-house, and about two weeks later the last Confederate army which had been confronting Sherman surrendered. President Lincoln was assassinated during the closing days of the war. The war had cost the nation some $10,000,000,000 and the lives of some 600,000 men, besides perhaps as many more wounded. But it had settled the question whether the United States was a nation or merely an aggregate of nations, and had rescued the South from the incubus of slavery. The seceded states were again taken into the Union, on conditions contained in the 13th, 14th, and 15th amendments to the constitution, abolishing slavery, and giving the negro the right to vote. It cannot be said that these conditions have accomplished their object, as the negro vote is in one way or another completely neutralised, while at the same time the South retains a representation in the House of Representatives based on its total population.

In 1867 the United States purchased Alaska from Russia, the principal result of which up to the present time has been recurring complications with Great Britain as to the right to capture Seals (q.v.). The nation found it difficult to settle down to peace after the war. The army was easily disbanded, although an organisation known as the Grand Army of the Republic was formed, and the 'soldier's vote' is an element with which the politicians annually reckon. Enormous sums of money have been paid for pensions—about 150 million dollars in one year (1891). Another legacy of the war was the tendency towards corruption and the formation of 'rings' throughout the states and cities, as well as in the national government. The South is rapidly becoming a prosperous manufacturing community. A great reform has been made in the civil service towards the overthrow of the spoils system of Jackson; and the greater part of the national debt has been paid off. From Lincoln onwards till 1884 the presidents (see list at PRESIDENT) had all been Republicans—Johnson, Grant, Hayes, Garfield, and Arthur. In 1884 the reconstituted Democratic party elected Cleveland over Harrison. In 1888 the Democrats made the campaign on a basis of a reformed tariff, in the direction of less protection. The Republicans won, Harrison becoming president; and by the McKinley Bill and other measures reformed the tariff in the direction of greater protection. Trusts and combinations of capitalists everywhere resulted; while the relations of labour to capital became strained. Laws were passed excluding Chinese labour and rendering difficult the landing of paupers and of aliens under contract. In 1891 a House overwhelmingly Democratic was elected. In 1892 the contest again turned on tariff, and the elections resulted in the return of the Democratic candidate, Cleveland, by a very large majority over Harrison. The Sherman Silver Act (superseding the Bland Act) was repealed in 1893; in the same year the Behring Seals Arbitration promised the settlement of a persistent source of difficulties with Britain. A commercial crisis was marked by the rise of the 'Populists' (see GRANGERS), and a great march on Washington of the unemployed, as also by labour riots in Chicago. President Cleveland's intervention in the dispute between Britain and Venezuela (December 1895) implied an extension by Mr Olney of the 'Monroe Doctrine,' and threatened trouble, obviated by arbitration. A scheme for settling all difficulties between Britain and the United States by arbitration was agreed on by the President and Lord Salisbury, much altered in the House of Representatives, and rejected by the Senate (1896–97). In 1896 the contest, largely on the Silver question, resulted in the election of McKinley (q.v.), supported by many Democrats, over the silverite and Democratic Bryan (q.v.). McKinley's presidency was rendered notable by an increased tariff, the raising of the Behring and the Venezuela questions, the war with Spain, and the colonial expansion dealt with above (at p. 381), and the temporary settlement of the Alaska boundary (see ALASKA). McKinley was elected for another term in 1900.

The notices in this work of the various presidents and many of the leading statesmen (Webster, Seward, &c.), soldiers (Gates, Greene, Grant, Sherman, Lee, &c.), sailors (Decatur, Farragut, Porter, &c.; also Ericsson), as well as the several states and the leading cities, may be referred to, and the following articles among others:

The best compendious history is Gay's '*Bryant's United States.*' On the earlier period the histories of Bancroft and Hildreth remain the most important connected works. For the later period the works of Henry Adams, McMaster, Schouler, Hildreth, and Von Holst should all be consulted. The historical works of Francis Parkman, Doyle, Frothingham, Brown, and Fiske may also be named; while the accounts in Lecky's *England in the Seventeenth Century* and Mahon's *History of England* are of great value. For the documents, see *Federal and State Constitution, Colonial Charters and other Organic Laws*, and *Treaties and Conventions between the United States and other Powers*, issued by the United States government. The leading works on the constitution are those of Story, Kent, Wharton, Curtis, Cooley, De Tocqueville, and Bryce. For the innumerable special works, biographies, and bibliographical details, see Winsor's *Narrative and Critical History of America*. And there are recent works on the history, parts of it, or on the constitution, by E. J. Payne (1892), Goldwin Smith (1893), Henry Adams (1890–92), W. M. Sloane (1894), J. C. Ropes (1894), C. Ellis Stevens (1895), E. B. Andrews (1895 and 1897), J. W. Moore (1895), Roger Foster (1896), and Professor Channing (1896).

AMERICAN LITERATURE.

In the absence of populous centres and of leisure for the æsthetic arts, the American colonist was as dependent upon the mother-country in letters as in politics. And although from the Stuart restoration there are indications of a divergence in social and political temper, which in the long-run must find expression in a distinct American literature, yet the literary emancipation of America was much slower than the political.

I. Before the middle of the 18th century there was in the colonies no literature worthy of the name. Massachusetts and Connecticut had some vigour of intellectual movement, which was controlled by men who had enjoyed the academic advantages of the English universities, or of the substitutes for these they had established in America in Harvard (1638) and Yale (1700) colleges. But it is rare that moral and spiritual earnestness have the wisdom to enlist beauty of form in their service. These good men had no perception of intimate relations between goodness and beauty. This is especially evident when they attempt verse. Their *Bay State Psalm-book* (1640; rev. ed. 1650) takes rank among the worst and most tasteless books of a class which abounds in such. Mrs Anne Bradstreet (1612–72) was greeted as 'the tenth Muse,' in recognition of verses which exhibit some of the faults but none of the excellences of the fanciful school of Donne and Cowley.

The influence of the new English prose of Steele and Addison made itself felt slowly. It did very little for the style of Jonathan Edwards (1703–58), who was notable as a naturalist, metaphysician, and divine. Much better in point of literary form, although with just as little purpose of achieving it, is the Quaker John Woolman (1720–73), whose *Journal* (1774; ed. by Whittier, 1871) delighted Lamb and Edward Irving. A better representative of the prevalent temper of the colonies, and more ambitious of literary distinction, is Benjamin Franklin (1706–90). In him the thrift and shrewdness of that later day displaces the Puritan enthusiasm; and we learn from his *Autobiography* (1817; ed. by Bigelow, 1868) that he formed his style on the accepted models of the new English prose.

II. From the rise of Franklin into influence until the close of the second war with Great Britain Philadelphia was the intellectual and literary centre of the country, as it was the largest and most thriving centre of population. The pseudo-classic school dominated American taste, and Pope was reckoned the greatest of poets. The ambition of the most patriotic American writer was to rival the authors of the mother-country in the forms then accepted by both; and America lingered far behind in the movement for the introduction of more delicate and melodious cadences of verse.

The struggle for independence was the occasion of some strong and able writing on political topics, but of nothing whose literary quality entitles it to a place beside the speeches of Chatham and the pamphlets of Burke. Thomas Paine (1737–1809) showed himself a master of popular English to an extent which gives him rank close to Defoe and Cobbett. His style has vitality, and has done much to keep his writings on politics and religion from oblivion, in spite of their shallowness and frequent coarseness. The war did not produce a single respectable song. Philip Freneau (1752–1832) is the only patriotic lyrist worthy of mention; but his fluency and his occasional felicities have not secured him any continuous popularity. Francis Hopkinson (1737–91) wrote 'The Battle of the Kegs,' and other clever satirical skits; and his son, Judge Joseph Hopkinson (1770–1842), wrote in 1798 the first national song, 'Hail Columbia!' John Trumbull (1750–1831) applied the metre and manner of *Hudibras* to the chastisement of the Tories in his *M'Fingall* (1782), and won great popularity. The struggle over the adoption of the national Constitution in 1787–89 brought into play more ability in political writing than did the war. The first political classic of America, *The Federalist*, is a series of papers in which Hamilton, Madison, and Jay advocated and explained the new scheme of government. To Hamilton also is ascribed President Washington's 'Farewell Address' (1796), another political classic.

Philadelphia for a time was the seat of the new government. She had the most enterprising publishers, the best periodicals, the widest circle of readers; and her people loved to speak of her as the 'Athens of America.' Authors from other parts of the country made her their home, or sent their books to her publishers, and their contributions to her magazines. Dr Benjamin Rush (1745–1813) may be said to have continued the Franklin tradition in the same practical and tolerant spirit, and with the same regard for public utility, but with far less literary faculty. The first professional man of letters, Charles Brockden Brown (1771–1810), wrote a series of novels—*Wieland* (1798), *Ormond* (1799), *Arthur Mervyn* (1799–1800), and *Edgar Huntley* (1801)—which were republished in England, and are known to have exerted a great influence over Shelley. They belong to the dominant school of 'Monk' Lewis and Mrs Radcliffe, but are sufficiently individualised by their clear, nervous style, rising at times to eloquence, and by their power of imaginative portraiture, to claim recognition. That they were written with great rapidity explains their lack of symmetry and their defective method.

Outside of Philadelphia New England was most productive. She gave that city Joseph Dennie, editor of the *Portfolio*, the most important literary periodical of the time. It was in Dennie's group that Tom Moore found a congenial welcome. Dr Timothy Dwight of Yale College wrote forgotten epics, and the hymn, 'I love Thy kingdom, Lord.' Joel Barlow (1775–1812), also of Connecticut, is not remembered through either his epic of 7000 lines, *The Colombiad* (1808), or his humorous poem on 'Hasty Pudding.' Thomas Green Fessenden of New Hampshire (1771–1837), in his humorous idyll, 'The Country Lovers,' struck a note which may have suggested Lowell's verses, 'The Courtship.'

III. About the year 1816 pre-eminence in literature began to pass from Philadelphia to New York, just about the time when the completion of the Erie Canal put that city in the way of benefiting by the growth of the west. But the cause of the transfer is found in the superior susceptibility of a

group of New York authors to the new literary influences represented by Wordsworth, Byron, and Scott, which the critics of the rival city treated with contempt.

Washington Irving (1783–1859) had already written *Knickerbocker's New York* (1809), the most American of his books, and the first classic piece of American humour. His residence in England in 1815–32 brought him into contact with the Romantic movement in literature. In *The Sketch Book* (1819), *Bracebridge Hall* (1822), and *Tales of a Traveller* (1824), he showed the new influence; and he transplanted this Romantic tendency to the New World in his tales of colonial life on the Hudson. A subsequent residence in Spain awoke his interest in the popular traditions of that country, and its history during its period of American discovery. But history and biography were not his proper work, and only his *Life of Goldsmith* (1849) can be called successful, while his elaborate *Life of Washington* (1855–59) never won a place for itself. His works widened the horizon of American literature, and raised the conception of literary form and method, but they had not the vigour required to give it permanent direction. They still delight those who appreciate the quiet beauty of their style, the lambent Addisonian humour, and their genial spirit; but they lack robustness and sympathy with the age.

No want of the American quality can be charged upon James Fenimore Cooper (1789–1851), although he also received the literary impulse from Scott. His novels, *The Spy* (1821), *The Pioneer* (1823), and *The Last of the Mohicans* (1826), laid the foundation of a new literature by showing the imaginative interest which attaches to the pioneer life and to the Indian character; and his naval tales, beginning with *The Pilot* (1823), made an impression equally vivid. He wrote too much, however, to write well, and to avoid repeating himself; and he unduly idealised both the sailor and the red man. Among his contemporary imitators are James Kirke Paulding (1779–1860), in the mass of whose satirical and whimsical works are found *The Dutchman's Fireside* (1831) and *Westward Ho!* (1832); John Pendleton Kennedy of Baltimore (1795–1870), whose *Swallow Barn* (1832), *Horse-shoe Robinson* (1835), and *Rob of the Bowl* (1838) show him a student also of Irving's humour, thus supplying an element lacking in Cooper himself; and William Gilmore Simms (1806–70), a South Carolina planter, who cultivated literature in an uncongenial atmosphere, with fair success.

William Cullen Bryant (1794–1878), before he made New York his home in 1825 had already done much of his best work as a poet, and had illustrated his passage from the school of Pope to that of Wordsworth. He has the English poet's contemplative sympathy with the greatness and the calm of nature; but his first-hand intimacy with her subtlest moods, his almost uniform loftiness of imagination, and his severe self-restraint forbid us to class the author of 'Thanatopsis' and 'To a Water-fowl' as any man's disciple merely. He lacked only warmth of passion and continuous growth to become the greatest of American poets, and the last he missed by making poetry only one avocation of a busy life. Less of a voice and more of an echo is Fitz-Greene Halleck (1790–1867), who imitated Byron's lighter manner in *Fanny* (1821), and reminds us of Scott's best verse in *Marco Bozzaris* (1827). Joseph Rodman Drake (1795–1820) transferred fairyland to the banks of the Hudson in his *Culprit Fay* (1816), and justified Halleck's fine dirge over his untimely death.

Contemporary are two groups of hymn-writers. Of those who contributed to Dr Nettleton's *Village Hymn-book* (1824) Mrs Lydia Huntley Sigourney (1791–1865) was a facile writer, recalling Mrs Hemans, and like her possessed of a thin vein of true poetry. To the prayer-book collection of the Protestant Episcopal Church (1826) Bishops George Washington Doane and Henry Ustick Onderdonk, Dr William Augustus Muhlenberg, and Francis Scott Key furnished original hymns of merit. The last had already (1814) written 'The Star-spangled Banner,' the florid national anthem of America.

IV. A new period begins about 1838, with the transfer of literary pre-eminence to New England, and especially to Boston, and lasts until the war for the Union. America now came into contact with other literatures than that of England, and the broader culture thus attained was accompanied with a more vigorous independence. A literary class arose, so that letters no longer were the ornament of a learned profession or secondary work of an editor. The first impulse to better things came from the study of Coleridge, which led on to that of the poets, critics, and philosophers of Germany, and thus put an end to the dominance of the sensualistic 'common-sense' philosophy of Locke. Dr James Marsh of Middlebury, Dr Channing, and Emerson were the first to show this new influence.

Like Channing, Ralph Waldo Emerson (1803–82) is more important as a personal influence and inspiration than as a man of letters. His doctrine of the sovereignty of the individual conscience met the needs of a time of general revolt against the social and intellectual traditions. He denied the validity of any lines the conscience did not draw for itself; and, although he combined with this the recognition of an Over-soul, this phase of his teaching made less impression, as the Over-soul is an impersonal something, which is at once identical with and different from the individual. After the appearance of *Nature* (1836) and his *Essays* (1841–44) his home at Concord was the centre to which pilgrims came to find his secret of lofty serenity in full view of the puzzles of the universe. His prose is vastly more important than his verse, which is uneven and often faulty in structure, but with many fine lines and felicitous phrases. His prose has been called a 'difficult staccato;' the sentences do not fuse into paragraphs, but read as if there were at the end of each a pause for a reply. Under his audacities lies the shrewdness of New England, and the homely mother-wit of his own people.

The group around Emerson, called the Transcendentalists, were of various magnitudes and qualities. Henry David Thoreau (1817–62) found in intimacy with nature an escape from the pettinesses of men; Amos Bronson Alcott (1797–1888) undertook the reform of education on the principle that all important truth was to be found in the intuitions of children; Margaret Fuller-Ossoli (1810–50), the 'Zenobia' of Hawthorne, made most impression by her conversational faculty; Jones Very (1813–80) wrote poetry 'by inspiration' during the years 1836–39. His poems, which Emerson edited, are narrow in range, but have a delicate wild-flower beauty of their own. These and others contributed to *The Dial* (1840–43), and most of the group took part in the famous Brook Farm (q.v.) experiment in communism.

On the outskirts of the group, as an interested and curious spectator, stood Nathaniel Hawthorne (1804–64), a religious and social conservative, with a passion for the study of the abnormal, which we may trace to his early environment at Salem, where one of his ancestors had been judge in witchcraft time. His works give us life as seen in 'the moonlight of romance,' and stand in curious contrast to his own life as office-holder and man of affairs in a world he really held at arm's length while attending to its routine. His *Twice-told*

Tales (1837–42) already surpassed all previous American writing in the field of prose fiction; and *The Scarlet Letter* (1850) secured his position as the greatest of American prose writers. His art is thoroughly idealist—character, incident, and situation being subordinate to the haunting idea of the story he is telling. His style is one of exquisite purity, delicate humour, and a genuine pathos.

Hawthorne stands almost alone as a great master of fiction at this time. Miss Susan Warner (1819–85) wrote tales which gave pleasant glimpses of life in central New York, but overburdened them with didactic elements. Mr Edmund Quincy (b. 1808) in *Wensley, a Story without a Moral* (1854), gave a promise which was not kept. The Rev. Sylvester Judd (1813–53) made a display of ill-regulated power in *Margaret* (1845), which explains Lowell's encomium of the book and the public neglect. The Rev. Robert T. S. Lowell (1816–91) in *The New Priest in Conception Bay* (1858) shows a command of both pathos and humour, but the polemic purpose detracts from the general interest. This is not true of a still more polemic novel, *Uncle Tom's Cabin* (1852), by Harriet Beecher Stowe (1812–96), which struck at slavery at its most vulnerable point, and rendered the greatest service that a single book ever did to any great cause. But as works of art *The Minister's Wooing* (1859) and *Oldtown Folks* (1869), two of her stories of New England, are superior. George William Curtis (1824–92) shows keen satiric power in *The Potiphar Papers* (1854), and equal beauty of fancy in *Prue and I* (1856).

Of the poets of this period Henry Wadsworth Longfellow (1807–82) filled the largest space in contemporary attention, and thus rendered the greatest service to his countrymen in awakening the love of beauty, and extending the taste for pure art to a wider circle than was reached by any other American. He is the first and chief representative in American verse of that great Romantic movement which Irving in a different way reflects in his prose. As such he was drawn to the past and the distant for his favourite themes, and echoes but faintly the life of the present. *The Golden Legend* (1851), a study of mediæval life, is his most perfect poem; and his version of Dante's *Divine Comedy* (1867) is that to which he gave longest and most loving labour. His *Poets and Poetry of Europe* (1845) amplified the resources of American thought and taste, while exhibiting his own cosmopolitanism. It is not surprising to find that in *Kavanagh* (1849) he belittles the idea of a national literature, preferring Goethe's conception of a world-literature. Even in handling American subjects he turns to Europe for metrical forms and for illustrations. But his artistic grace, and an undefinable winningness in his verse as in his temper, made his countrymen uncritical of any defects.

A greater poetic force and a wider range of movement is seen in James Russell Lowell (1819–91). A scholar of wide learning, and a luminous critic of other men's work, he yet was free from the bookish tone of Longfellow. He wrote of man and of nature at first-hand. His poetry reflects the deepest life of his time, especially of the great struggle with slavery; and it covers the widest range of tone, from the pure æstheticism of his first work to the intensity of 'The Present Crisis' (1845) and the 'Harvard Ode' (1865), and again to the racy fun of *The Biglow Papers* (1848 and 1867). These last mark the highest point reached by American humour, and they also open the series of dialect-writing.

With more monotony, but inferior to none in poetic passion and affluence of imagination, John Greenleaf Whittier (1807–92) takes his place as a lyric and idyllic poet. Burns's poems early gave direction to his genius, and helped him to become the poet-laureate of abolitionism, so that much of his verse is its battle-cry. But like Burns he was at his best in the idyll, and his *Snow-Bound* (1866), although pitched in a key somewhat too high, is full of true and tender beauty.

Oliver Wendell Holmes (1809–94), the last survivor of the group, made his reputation as the wittiest and one of the most polished of American poets, and then, in his forty-eighth year, entered upon a new field of prose writing in his *Autocrat of the Breakfast-table* (1858), with a success which all but eclipsed his poetry. In both he displays those lasting excellences of 18th-century writing which have won admirers and imitators among younger American writers and critics. His verse is characterised by epigram and sparkle, but seldom rises to passion.

Lesser poets of New England are Dr Thomas Williams Parsons (1810–92), whom the study and translating of Dante led into the Roman Catholic Church, and whose lyric gift was of the rarest; the Rev. Charles Timothy Brooks (1813–83), who laboured chiefly in translation from the German; Julia Ward Howe (b. 1819), an ornate and impassioned lyrist; Richard Henry Dana (1787–1879), a gifted nature, whose delicate reserve prevented his making the impression he might.

Notable poets were not confined to New England. Edgar Allan Poe (1809–49) represented in his verse, and maintained in his critical writing, the principle, then a novelty, of 'Art for Art's sake,' against the didacticism of his contemporaries. From Coleridge and Shelley he had learned the possibilities of melodious cadence, and put the lesson to use in verse that is perfect in its rhythmic flow. His weird tales, in which a powerful imagination and a fine artistic sense deal with motives of horror and melancholy, have exerted a wide influence in European literature (Baudelaire).

Yet Walt Whitman (1819–92) has attracted nearly as much attention in Europe for the opposite reasons. In his *Leaves of Gruss* (1855) he carried Emerson's sovereignty of the individual into art and morals, casting aside the restraints of rhyme and rhythm as 'feudal,' and glorifying mere animalism. It is natural for those who think democracy a milder form of anarchism to recognise in his work the peculiarly American form of verse. In single lines, and in a few whole poems, he shows that he had a poetic gift which might have got him a lasting recognition if it had been put to wiser use.

Bayard Taylor (1825–78) is best known as a writer of travels, but he carried with him the poet's eye. His greatest work is his scholarly rendering of Goethe's *Faust* in the metres of the original (1870–71). Other notable translators are F. H. Hedge, *The Prose Writers of Germany* (1847); William H. Furness, *Schiller's Song of the Bell* (1849); and Charles G. Leland, *Pictures of Travel* (1855), *The Book of Songs* (1863), and other works of Heine. Mr Leland is a literary virtuoso, finding delight in all the byways of letters—Pidgin-English, Hans Breitmann's Teutonic English, the Gypsies, &c.

Theology in the hands of its best writers resumed something of its earlier relations to literature. William Ellery Channing (1780–1842) carried the gentle spirit of a Protestant Fénelon into the polemic time of the severance of Unitarian from Orthodox, and taught men that 'God is Love.' Theodore Parker (1810–60) applied hard-headed logic and resonant rhetoric to the compromises of both church and state, sharing with Channing in the honours of the anti-slavery struggle. Horace Bushnell (1802–76), 'the Tennyson among the theologians,' laboured as a devout and original thinker to bring the Puritan divinity into harmony

with the humaner thought of our age; a mission undertaken in a different way and with less depth of insight by Henry Ward Beecher (1813–87) as a popular preacher and essayist.

Political eloquence as early as Fisher Ames (1759–1808) sought to win by beauty of form. That of Henry Clay (1777–1852), Daniel Webster (1782–1852), and John C. Calhoun (1782–1850) belongs to an era before that which we are considering. But the succession of political orators was ably sustained by Charles Sumner (1811–74), Wendell Phillips (1811–84), Anson Burlingame (1820–70), Edward Everett (1794–1865), Robert Toombs (1810–85), and Alexander H. Stephens (1812–83). It used to be said that 'eloquence was dog-cheap with the Abolitionists,' and it also might be said of poetry. But the movement has not left much prose of lasting merit. Channing, Emerson, Parker, Beecher, Phillips, and Garrison were its best-known writers. Mrs Lydia Maria Child (1802–80) sacrificed her literary career by her *Appeal in Behalf of that Class of Americans called Africans* (1833).

Thanks to the influence first of Coleridge and then of the Germans, literary criticism entered upon a new phase, learning to contemplate every work of art as an organic whole and in the light of its leading idea. Poe and Margaret Fuller did excellent work in exposing the weakness of mere literary pretenders, and even the faults of the strong. Henry Reed (1808–54), the friend and editor of Wordsworth, studied Shakespeare and other English poets. Henry Norman Hudson (1814–86) worthily opens the series of American Shakespearian specialists. Francis J. Child (1825–96) edited the Boston collection of the British poets, and, in the *English and Scottish Ballads* (1857–59) with which it opens, laid the foundation of his fame as the chief master of that subject.

In history the achievements of the period have great merit. The spirit of research in both American and related fields was stimulated by contact with German scholarship. With George Bancroft (1800–91) American history puts on a thoroughness and a dignity worthy of the subject; but his *History of the United States of America from the Discovery of the Continent* (1834–82; revised ed. 1883–84) is florid in style, and not always free from prejudice. Richard Hildreth (1807–65), in contrast to Bancroft's optimism, writes the *History of the United States* (1849–52; revised ed. 1854–55) in a tone of severe criticism, and with leaning toward the Federalists. John Gorham Palfrey (1796–1881) has written a *History of New England* (1858–90) of solid but not brilliant merits. Charles Wentworth Upham has made a special study of *Salem Witchcraft* (1831; enlarged ed. 1867), which is exhaustive if not judicial. William Hickling Prescott (1796–1859), following the example of Irving, devoted himself to the Spanish side of American history, and that of Spain in the period when her relations with the American continent were most intimate, beginning with *Ferdinand and Isabella* (1837). He has a clear, graphic style, and is master of the art of lively and picturesque narrative; but, in spite of his scrupulousness in research, later scholarship has called in question many of his conclusions. His friend and biographer, George Ticknor (1791–1871), was past the prime of a life of scholarly research when he published his *History of Spanish Literature* (1849), which European scholarship recognises as the best. John Lothrop Motley (1814–77) took as his theme the heroic age of the Dutch nation, throwing himself into the struggle with Spain so fervently as at times to obscure his judgment; but the vigour this imparts to his histories makes up somewhat for lack of simplicity. Francis Parkman (b. 1823) published two works in this period.

In biography America abounds, but the art of writing a good book of this class seems to be the last her authors have acquired. Mr Ticknor's *Life of Prescott* (1864) and Mrs L. M. Child's *Isaac T. Hopper, a True Life* (1853), seem to deserve mention for their literary quality. The *Memoirs of Margaret Fuller-Ossoli* (1852) are disappointing, although in part by Emerson, J. F. Clarke, and W. H. Channing, and have been superseded by Colonel T. W. Higginson's briefer work. The *Autobiography of Peter Cartwright* (1856), a frontier circuit-preacher, was a favourite with Mr Lowell.

In the literature of travel Richard H. Dana, junior (1815–82), takes the first place with his *Two Years before the Mast* (1840). Longfellow's *Outre Mer* (1835), Emerson's *English Traits* (1856), Bryant's *Letters of a Traveller* (1859–60), and Mrs Stowe's *Sunny Memories of Foreign Lands* (1854) are not the best work of these authors. George William Curtis (1824–92) in his books on Egypt and Syria (1851–52) gives us travel pictures full of feeling and fancy. Frederick Law Olmsted (b. 1821) writes with genuine charm in his *Walks and Talks of an American Farmer in England;* and his books describing his tour through the southern states on the eve of the war are of permanent value as by 'a credible person with eyes.' J. Lloyd Stephens' *Travels in Yucatan* (1849), Elisha Kent Kane's *Arctic Explorations* (1854–56), Dr Edward Robinson's *Biblical Researches in Palestine* (1841–56) are valuable for their contents rather than their literary art. The last opened a new era in its department. George Stillman Hillard (1808–79) is the author of a fresh and readable book on a much bewritten country, *Six Months in Italy* (1853); and beside it may be placed H. T. Tuckerman's *Sicily* (1852). Hawthorne's writings of this kind belong to the next period. But the most prolific and in many respects the best traveller is Bayard Taylor, whose first work was *Views Afoot* (1846).

V. The year 1860 is a dividing line in the history of American literature, as of politics. The great social convulsion it ushered in had a powerful effect on the intellectual development of the country; and the intense sense of nationality then awakened has been reflected more adequately in literature than in any other form of art. On the other hand, the war showed the Americans the variety as well as the magnitude of their country, and thus awakened an interest in local peculiarities of character and speech which are seen to give colour and flavour. At the same time it destroyed the pre-eminence of the former literary centres by arousing in new communities the ambition to excel in literature as in other forms of art. Although many of the great writers of the Boston circle lived on and wrote, they opened no new vein; and the younger attained no marked superiority over their rivals elsewhere. New York, by virtue of its advantages as a distributing centre, has attracted men of letters to residence, but has not created any distinct public interested in their presence.

The new scientific spirit, which dates from the appearance of Charles Darwin's *Origin of Species* (1859), has affected literature in many ways, but especially in teaching to view life as a whole and in its complexity, and in showing that every object of study represents a stage in a development and must be understood in the light of its past. Along with this there has been an increased love of prose fiction—the form of imaginative art that most easily complies with these scientific demands.

In poetry there is no name of the new age that can be put beside the group which begins with Bryant and ends with Holmes. Yet every part of the national area has made an important contribution. The north Atlantic states, the first home of American culture, keep the lead with

Henry Howard Brownell (1820–72), George H. Boker (1823–90), Richard Henry Stoddard (b. 1825), John T. Trowbridge (b. 1827), Edmund Clarence Stedman (b. 1833), Thomas Bailey Aldrich (b. 1836), John White Chadwick (b. 1840), Edmund Rowland Sill (1843–87), Samuel Willoughby Duffield (1843–87), John Boyle O'Reilly (1844–90), Richard Watson Gilder (b. 1844), George Parsons Lathrop (b. 1851), Henry Cuyler Bunner (b. 1855), Richard Burton (b. 1859), Frank Dempster Sherman (b. 1860), Clinton Scollard (b. 1860), and Charles Henry Lüders (1869–91). The south offers Theodore O'Hara (1820–67), Henry Timrod (1829–67), Father Abram J. Ryan (1839–86), Paul H. Hayne (1840–87), Sidney Lanier (1842–81), and A. C. Gordon (b. 1855). In the inland states we find John James Piatt (b. 1835) and his gifted wife, John Hay (b. 1838), Bishop John L. Spalding of Peoria ('Henry Hamilton,' b. 1840), James Maurice Thompson (b. 1844), William Carleton (b. 1845), Eugene Field (b. 1850), and James Whitcombe Riley (b. 1854). The Pacific coast is represented by Francis Bret Harte (b. 1837), Joaquin Miller (b. 1841), and John Vance Cheney (b. 1848).

It is noteworthy that the better education of women begins to furnish its results in the increase of writers of that sex. As poets they take almost an equal rank with their brethren singers. Phœbe Cary (1824–71) and her sister Alice Cary (1820–71), Adeline D. T. Whitney (b. 1824), Margaret Junkin Preston (b. 1825), Lucy Larcom (b. 1826), Rose Terry Cooke (1827–92), Helen Hunt Jackson (1831–85), Harriet Elizabeth (Prescott) Spofford (b. 1835), Mary Emily Bradley (b. 1835), Celia Thaxter (b. 1836), Edna Dean Proctor (b. 1838), Sarah Channcey Woolsey ('Susan Coolidge,' b. 1845), the Jewess Emma Lazarus (1849–88), Edith Matilda Thomas (b. 1854), Louise Imogen Guiney (b. 1861), and the Goodale sisters, who wrote good verse in their teens, constitute a group of genuine achievement and lofty promise.

The new poetry has less of the passion of humanity than that which preceded, the tension of the war having been followed by a reaction. It studies nature more closely, and almost with the naturalist's eye. It exhibits superior technical finish. It generally contemplates the problems of existence in a less hopeful spirit, and with a new sense of their complexity. To designate the ablest is not an easy task, but Lanier, Riley, and Sill, Miss Larcom, and Mrs Jackson certainly are not the rearmost. Mr Lanier aimed at musical effects in verse to which he did not entirely attain. Mrs Jackson loves riddles, but they are worth the solving. Mr Sill inspires regret that his rare genius closed its career just as its best became possible. Miss Larcom, who began her career in the measuring-room of a Lowell factory, shows the influence of her friend Whittier on an original imagination. Mr Riley touches the popular heart by the humanity of his varied verse.

In America, as elsewhere, prose fiction has wrested from poetry the place of pre-eminence, and by its popularity has enlisted the pens of many who are better fitted for other work. The first American novelists are William Dean Howells (b. 1837), Francis Marion Crawford (b. 1845), Frances Hodgson Burnett (b. 1849), Henry James (b. 1843), George W. Cable (b. 1844), F. Bret Harte (b. 1839), Mary Noailles Murfree ('Charles Egbert Craddock,' b. 1850), Frank Stockton (b. 1834), and Louisa May Alcott (1832–88). Mr Howells has portrayed American life with a fidelity to both its brighter and its duller sides which has led others as well as himself to class him with the Realists; but he never gives us photography in the place of art. In brief, half-dramatic sketches he is incomparable. Mr Crawford shows a much greater range, grasping with a firm hand the most varied forms of old-world life, making both situation and character vivid in interest, but avoiding American subjects. Mr James, like Mr Howells, sometimes writes of 'those who delight to dwell in Boston,' but hardly in an American spirit. His strength is in psychological analysis. Mrs Burnett, an American by adoption, writes with equal power and pathos of life on both sides of the ocean, and passes with firm step from the political coteries of the capital to the mountaineers of North Carolina. Mr Cable and Miss Murfree discovered to literature the picturesque life of the Louisiana creole and the east Tennessee mountaineer. Mr Stockton carries American humour into story-telling with distinguished success. Miss Alcott lifted the art of writing stories for the young to a higher level.

The tendencies thus illustrated run through American fiction. From the life of the city to that of the frontier, from the brightest fun to the gravest humour, from philosophic analysis to story-telling for childhood, it covers the whole life of the nation. New England in stories of local colour still holds the first place, especially through the short tale created by the demand of the magazine, and endowed with a larger choice of motives than is the elaborate novel of love and marriage. Rose Terry Cooke (1827–92), Annie Trumbull Slosson (b. 1838), Elizabeth Stuart Phelps-Ward (b. 1844), Sarah Orne Jewett (b. 1849), and Mary E. Wilkins are of this class. The cities other than Boston fare worse, although New York has Richard Burleigh Kimball (b. 1816), Henry Cuyler Bunner (b. 1855), Henry Harland ('Sidney Luska,' b. 1861), and Constance Cary Harrison (b. 1835). The south offers us Thomas Nelson Page (b. 1853) and Joel Chandler Harris ('Uncle Remus,' b. 1848); and the interior, Edward Eggleston (b. 1837), Mary Hallock Foote (b. 1847), and Edward W. Howe (b. 1834), who draws with hard and faithful lines the harsh life of the prairie town. In the group headed by Miss Alcott, the writers for the young, Adeline D. T. Whitney (b. 1824), Rebecca Sophia Clarke ('Sophie May,' b. 1833), Sara Jane Lippincott ('Grace Greenwood,' b. 1823), Sarah Channcey Woolsey ('Susan Coolidge,' b. 1845), Mary Mapes Dodge (b. 1840), Louisa Chandler Moulton (b. 1835), and George Cary Eggleston (b. 1837) are noteworthy.

Humour is an element almost universal in American fiction, but its especial representatives are Charles Dudley Warner (b. 1829), Charles Farrar Browne ('Artemus Ward,' 1833–67), Samuel C. Clemens ('Mark Twain,' b. 1835), Mary A. Dodge ('Gail Hamilton,' b. 1838), and Robert J. Burdette (b. 1844). Edward Everett Hale (b. 1822) shows equal power to provoke tears in 'The Man without a Country' and laughter in 'My Double and How He Undid Me.'

History and biography have profited through the popularity of the evolution theory, the growing interest in sociological problems, the patriotic impulses stirred by the war, and the diffusion of the literary culture which fits to undertake a work of this class. In many cases contact with German methods has been helpful. Of the picturesque school, Motley and Parkman continued to write after 1860, the latter doing most of his best work since that date. His books on the struggle between France and England for the New World, by their vividness of description, their grasp of the leading issues at stake, and their soundness of judgment, have put him at the head of American historians. Writing on the period of the independence of the republic, James Schouler and Henry Adams fix attention most upon government and politics, while John Bach Macmaster gives much space to social life and usages, showing how picturesque and interesting literary art may

make the everyday annals of a democratic people. The *Narrative and Critical History of America*, in eight large volumes (1886–89), edited by Justin Winsor (b. 1831), covers the whole continent. Like the *Memorial History of Boston* (1880–82), edited by the same writer, it aims at expert discussion of each branch and phase of its subject, and dispenses with literary unity. John Fiske's *Critical Period of American History, 1783–89* (1888), and his *Discovery of America* (1892) exhibit scientific thoroughness and clearness. Local history, especially that of New England and of the separate commonwealths of the Union, has come to be a branch of literature; and various series of biographies of statesmen, men of letters, religious leaders, &c. have shown that this difficult branch of literary art is at last naturalised in America.

The war for the Union naturally produced a deluge of books of very various degrees of merit. The first place may be assigned to the *Personal Memoirs of Ulysses S. Grant* (1885), in which the great captain narrates with modesty and candour the events in which he played so notable a part. The memoirs of Generals Lee and Sherman, the monumental biography of President Lincoln by his secretaries, the Life of William Lloyd Garrison by his sons, and James Gillespie Blaine's *Twenty Years of Congress* are of prime importance to the student of the time; and beside them stand the formal histories of the war by Henry Wilson, John W. Draper, Horace Greeley, and the Comte de Paris.

John Foster Kirk's *Charles the Bold* (1864–68), Eugene Schuyler's *Peter the Great* (1884), Lea's *Sacerdotal Celibacy* (1867; rev. ed. 1884) and *Inquisition of the Middle Ages* (1887), Hosmer's Life of Sir Harry Vane (1888), Herbert Tuttle's *History of Prussia* (1884–88), Ropes's biography of Napoleon I. (1885) and that by Prof. W. M. Sloane (4 vols. 1895–97), Mahan's books on the influence of sea-power on history, especially France and England (1890–97) and his Life of Nelson (1897), and Stillman's *Union of Italy* (1898), are contributions by Americans within this period to the history of countries other than their own.

In church history, besides the voluminous work of Philip Schaff, we have two well-written handbooks by George Park Fisher and William M. Blackburn. American church history is greatly neglected, there being no general work that has either historic worth or literary merit, and hardly a readable denominational history. That of the Protestant Episcopal Church, by S. D. McConnell, is an exception. The best work in this field is biographical, and even here the application of literary method is exceptional.

In the literature of travel America wins most honour from the work of her adopted citizens, Henry Morton Stanley (b. 1840) and Paul Belloni Du Chaillu (b. 1835). Lowell, Howells, Lathrop, Mrs Jackson, Hawthorne and his wife, James, Aldrich, Hale, Miss Procter, Story, Warner, Clemens, Hay have all been contributors to this branch. American travel turns with most affection to England —James Mason Hoppin, *Old England* (1867); Richard Grant White, *England Without and Within* (1881); William Winter, *Shakespeare's England* (1886); or to Italy—C. Eliot Norton, *Travel and Study in Italy* (1860); W. D. Howells; W. W. Story, *Roba di Roma* (1862); James Jackson Jarves, *Italian Rambles* (1883); or to Palestine—William McClure Thomson, *The Land and the Book* (1860 and 1880–85); William Cowper Prime, *Tent Life in Palestine* (1859); Henry Clay Trumbull, *Kadesh-Barnea* (1884). Out of these beaten tracks lie Eugene Schuyler's *Turkestan* (1877), Raphael Pumpelly's *Across America and Asia* (1870), William Eliot Griffis' *The Mikado's Empire* (1876), Franz Hassaurek's *Four Years among the Spanish Americans* (1866), Percival Lowell's *Chosön* (1886) and *The Soul of the Far East* (1888), and Julian Hawthorne's *Saxon Studies* (1876). In the closely related field of nature-study, John Burroughs (b. 1837), Charles Conrad Abbott (b. 1843), Harriett (Mann) Miller (b. 1831), and Elaine Goodale (b. 1863) have done admirable work.

In philology George Perkins Marsh (1801–82), William Dwight Whitney (1827–94), Basil Lanneau Gildersleeve (b. 1839) are but the most eminent names in a group which commands European respect by its achievements in oriental, classical, Romance, and Teutonic fields. Scientific works generally do not fall within the scope of this sketch.

The literary quality of theological writing has been benefited by contact with the Oxford and Broad Church movements of England, and with German masters both in this field and in those of philosophy and philology. From Oxford came the recognition of the intimate relations of beauty to truth and goodness, and disgust for sordidness and meanness in worship. Its influence is seen even in men like Philips Brooks, the first of American preachers, who have no sympathy with the ideas of the Tractarians, and in the general improvement of the hymnals of the American churches. In writers like Elisha Mulford, *The Nation* and *The Republic of God;* Newman Smyth, *Old Faiths in New Light*, *The Orthodox Theology of To-day*, and *Christian Ethics;* James Freeman Clarke, *Orthodoxy, its Essential Truths and Formal Errors*, and *Ten Great Religions;* Samuel Johnson, *Oriental Religions;* Henry Clay Trumbull, *The Blood Covenant* and *Friendship the Master Passion*, are seen the broadening influence of modern philosophy and sociology on religious thought. In philosophy the era has been notable for naturalisation of the most various schools of thought in America, that of Hegel having the most vogue with the specialists in philosophy, and that of Herbart with the educators. Plato, Berkeley, Schopenhauer, Trendelenburg, Lotze, Wundt, Ulrici, Rosmini, and Spencer have each their following, the last being represented by John Fiske (*Cosmic Philosophy*) and E. L. Youmans. But in most cases these writers care but little for the literary quality of their work, Elisha Mulford, Francis Bowen, Noah Porter, James McCosh, Josiah Royce, and Thomas Davidson (the exponent of Rosmini) being exceptions.

In literary criticism America has made great advances in the arts of just appreciation. Of Mr Lowell's later work in this field it might fairly be said that every new essay was an event. Edward Percy Whipple (1819–86), Edmund C. Stedman, W. D. Howells, Thomas S. Perry (b. 1845), Fred H. Hedge, Richard H. Stoddard, Moses Coit Tyler (b. 1835), Charles F. Richardson (b. 1841), Thomas R. Lounsbury (b. 1838), are only the most prominent names in this field. William John Rolfe (b. 1827) and Horace Howard Furness (b. 1833) have taken high rank as Shakespeare critics.

The present age is one of golden mediocrity in nearly every department. There is danger that it may degenerate into an era of narrow specialists, and to that foreign influences, especially that of Germany in the universities, are tending. There is room to hope that the national energy is but resting and gathering strength for a greater and more productive era.

See M. C. Tyler, *History of American Literature* (2 vols. 1878; new ed. 1881); John Nichol, *American Literature* (1882); C. H. Richardson, *American Literature* (2 vols. 1887–88); Stedman's *Poets of America* (1885); the 'American Men of Letters' series; the *Cyclopædia of American Literature*, edited by Duyckinck (2 vols. 1856; new ed. 1888); and the *Library of American Literature*, by Stedman and Hutchinson (11 vols. 1887–89).

Units, in scientific language, are the arbitrarily chosen standards in terms of which different quantities are expressed. The idea is familiar in common life. No commercial transaction can be carried out without a clear understanding as to the units employed. The pound, the yard, the mile, the acre, the gallon, the hour, the dollar, and so on, are examples of ordinary units, which have become more and more definitely fixed as civilisation advanced. In these days of scientific exactitude great care must be taken in fixing the units of commerce and in determining the ratios of the units used in different countries for the same commodities. Thus the English pound has a definite relation to the French kilogramme, and the yard to the metre. The relations between money units vary, however, for the reason that the value of money depends on fluctuating commercial conditions. See WEIGHTS AND MEASURES, MONEY, EXCHANGE, BIMETALLISM, CURRENCY.

In science we distingnish fundamental and derived units. The fundamental units are so named because in terms of them all other physical units can be expressed. It has been found convenient to take the units of length, mass, and time as the fundamental units; and the centimetre, gramme, and second have been accepted in this sense by the whole scientific world. As thoroughly scientific a system can of course be based on any other chosen units, such as the foot, pound, and second. From these fundamental units all others are derived by definition. Thus the scientific unit of surface is the square, and the unit of volume the cube, whose side is the unit of length. The English acre and gallon, which have no simple relation to the inch, foot, yard, or mile, are essentially unscientific. Other scientific units, such as those of velocity, force, work, involve in their definitions two or all of the fundamental units. Then a growingly important set of derived units are those of electrical and magnetic quantities, such as the ampere, the ohm, the volt, the watt, and so on. In the accepted scientific system, called for brevity the C.G.S. (Centimetre, Gramme, Second) system, one great merit is its purely decimal character. By an extension of the French method of prefixes (*centi*, *deci*, *kilo*, &c.) we are supplied with an unlimited stock of unit-names. Thus the microfarad is an electric capacity which is one-millionth of the farad, and the megadyne a force equal to one million times the dyne or C.G.S. unit of force. Without such prefixes we should have to use at times either very large or very small numbers; they serve, indeed, the same function as a change from inches to miles, or tons to pounds. A general discussion of the significance of units is given in all our best modern text-books on the various departments of physics. See also Everett's *Units and Physical Constants* (3d ed. 1891); and see ELECTRICITY, FORCE, WATT.

Univalves, in Conchology, molluscs having a shell in one piece, like the Gasteropoda (q.v.), as opposed to Bivalves (q.v.). See also MOLLUSCA.

Universalists, a body of Christians whose distinctive peculiarity consists in their belief that evil will ultimately be eradicated from the world, and that all erring creatures will be brought back to God through the irresistible efficacy of Christ's divine love. This doctrine of Universalism, Restoration, or the Larger Hope is already discussed in the article on HELL (at Vol. V. p. 631), and the names of some of its chief representatives given. The communion bearing this name is mainly an American development, though its foundation is mainly due to the Rev. John Murray (1741–1815), who, having come successively under the influence of Wesley, of Whitefield, and of James Relly, a Universalist preacher in London, arrived in the United States in 1770, and ultimately established a congregation at Gloucester, New Jersey, in 1774. The Tunkers (q.v.) were also Restorationists. But the greatest influence in establishing the Universalist Church was exerted by the Rev. Hosea Ballou (1771–1852), originally a Baptist, born in Richmond, N. H., who taught successively at Dana, Mass., Barnard, Vt., Portsmouth, N. H., Salem, and Boston. Most of these Universalists are also Unitarians, and they hold what are commonly called Pelagian views of sin. The church government is congregationalist. There are between 700 and 800 ministers and about 40,000 members, with four colleges and three theological schools.

See Ballou, *Ancient Universalism* (new ed. 1872); Whittemore, *Modern Universalism* (1830); Thayer, *Theology of Universalism* (1864); and Eddy, *Universalism in America* (2 vols. 1884–86).

Universal Language, a language long dreamt of but as yet uninvented, which should serve as a medium of communication throughout the world for commercial purposes, or for educated men, and which should ultimately supersede the existing languages. Such schemes have been suggested or partly worked out by many ingenious theorists, as by Urquhart (q.v.), Dalgarno (q.v.), Bishop Wilkins (q.v.), Leibnitz (in *De Arte Combinatoria*, sect. 1666), Condorcet (1794), Burja (1818), Stethy (in *Lingua Universalis*, Vienne, 1825), and Steiner (in *Pasilingua*, 1886); and for a time was believed by many to have been realised in Volapük (q.v.). Pigeon-English (see Vol. III. p. 195), and the *Lingua Franca* of the Mediterranean, are partial but spontaneous and actual efforts in the same direction.

Universals. See NOMINALISM.

Universities. Though analogous institutions may be found in classical times, universities to all intents and purposes may be regarded as the distinctive product of the Christian civilisation. As institutions that grew naturally out of the needs of society, indeed, they date from no special moment, and in their earliest developments are without the domain of history. Even when they had assumed a more or less definite form in the different countries where they sprang up, the fluctuating terms by which they were designated prove the gradual and tentative nature of their growth. Even the best-known designation, university (*universitas*), itself varied in meaning, though in prevailing usage it implied simply a corporation of students and teachers. Other terms, such as 'the schools' (*scholæ*), *studium*, *studium generale*, showed a similar tendency to fluctuate in meaning. Thus *studium generale* was variously used to mean a great central school, a school open to all the world, and a school of all knowledge. As was the case with every important institution of the middle ages, the universities looked to the pope as their great head. The right of founding universities, however, was equally claimed by the emperor; and within their own dominions kings enjoyed the same privilege, though royal foundations did not possess all the advantages of such as held papal or imperial charters. Still, the essential distinction between the mediæval and the modern university is that the former was essentially an ecclesiastical institution, whose aims, studies, and privileges were regulated in strict accordance with the temporal and spiritual interests of the church.

At every period of their existence it may be said that universities have fulfilled a double function in the social order. They have been the great training-schools for the different learned professions,

and they have been the custodiers and exponents of the ideal elements on which society ultimately rests. As the condition of their being, therefore, is to respond to the needs and aspirations of society, the history of universities has of necessity been determined by the revolutions of the human spirit and the changing ideals which men have set themselves to follow. With the Renaissance and the Reformation began a new period in their history; and from the developments of modern science and the increasing complexity of modern life a third period began when a fresh adjustment was needed to meet the ends for which they exist. In these three distinct stages of their development they may be conveniently treated in the following survey.

Though the statement has to be made with certain reserves, it may be said that Italy was the birthplace of the mediæval university. At Salerno in the 9th century there grew up a school whose origin is totally unknown, but which as early as the 11th century was famed throughout Europe for the teaching of medical science. In the 12th century a school of law at Bologna drew crowds of students from every country in Christendom. In the case of both of these schools it would appear that teachers and students drew together solely on the principle of supply and demand; and it remained a distinctive characteristic of the Italian universities that they followed professional as opposed to purely scientific ends. Through certain privileges granted by Frederick Barbarossa in 1158, however, Bologna acquired a definite existence which greatly favoured its prosperous development. In the early middle ages its only rival was the university of Paris; and not even Paris had a greater influence in determining the character of subsequent schools. In aims, studies, organisation, indeed, Paris and Bologna present two distinct types of the mediæval university. Though other disciplines gradually defined themselves into *faculties* at Bologna, its specialty always remained the teaching of the canon and the civil law, while Paris, as we shall see, was identified with another subject, equally one of the great concerns of the middle ages. At Bologna the prevailing aim of the students was to acquire the technicalities of a profession which through the complex municipal life of the Italian cities assured to them both riches and honour. The students who came to Bologna were for the most part men in mature life, and the organisation of the university was largely determined by this circumstance. Coming from all parts of Europe, they in time formed themselves into unions, which eventually became the governing element in the university. By the end of the 12th century these unions may be distinctly traced; and by the middle of the 13th they formed two corporations, known as the *ultramontani* and the *citramontani*, with *rectors* chosen from among themselves and by themselves as their representative heads. As definitively arranged, the external administration of the university was in the hands of the corporations, while the professors directed all matters relating to actual study. In Bologna, as at Paris and Oxford, colleges do not make their appearance till the 14th century, by the later half of which, however, they were already in full bloom. Here we may specially mention the great Spanish college (1364) at Bologna, as being the single specimen of a mediæval college now existing on the Continent. Throughout the middle ages, as has been said, Bologna was one of the two great models which determined the character of later universities. In France, with the exception of Paris, Montpellier, and Perpignan, all the universities (eight in number) were fashioned after the type of Bologna. In the pope's bull which founded it the university of Glasgow is expressly said to be modelled on Bologna; and in Germany, though Paris was mainly kept in view, the Italian university had also its imitators. Before the close of the middle ages Italy possessed as many as twenty-one universities, the majority of which had their origin as late as the 14th century. Modelled on Bologna for the most part, none of them, except perhaps Padua, attained the European reputation of their prototype. As Italy had been the birthplace of the mediæval universities, it was from Italy that the forces came which sapped the foundations on which they had arisen. Out of the Renaissance movement generated in Italy sprang the modern spirit with other aims and needs than mediævalism could meet. During the 14th and 15th centuries, accordingly, the intellectual life of Italy was mainly outside its universities.

The university of Paris sprang up as spontaneously as that of Bologna. As Bologna owed its existence to the study of law, Paris was born of the movement known as Scholasticism (q.v.), which in the 12th century was the absorbing pursuit of the best minds of France. In the opening years of that century the lectures of Abelard, the most famous teacher of his generation, drew to Paris such crowds of hearers that men came naturally to associate that city with the study in which they were most deeply interested. The school attached to the cathedral of Notre Dame appears to have been the nucleus round which the university grew up. It was the chancellor of the cathedral who granted the license to teach, and who remained head of the university till the close of the 13th century, when he was displaced by the *rector*, chosen by a section of the university itself. In contrast to Bologna, the university of Paris was essentially the union of the professors of the different subjects that came to have a place in its studies. In time these disciplines gradually defined themselves into the four *faculties* of law (1213), medicine (1213), arts, and theology—the last being by far the most important of the four, while for two centuries (the 13th and 14th) canon law had no place in the university. The *Nations* of the university also came to make part of its organisation. Originally held together simply by common ties of birth and language, by the middle of the 13th century the students of arts formed four legally constituted bodies known as the nations of France, Normandy, Picardy, and England (afterwards Germany). These four nations, together with the three higher faculties (law theology, medicine), formed what were known as the seven 'companies' of the university; and it was the procurators of the nations and the deans of the faculties with the rector as their president who constituted the university tribunal. As in Bologna, it was not till the 13th century that the system of colleges grew up in Paris. The earliest, as it was by far the most famous, was the Sorbonne (q.v.), founded in 1253. By the end of the 14th century as many as forty colleges, more or less fully equipped, had been founded; and by 1500 there were as many as fifty. The fame of Paris rested on its scholastic theology; with the decay of that study, therefore, it gradually lost its place as the first school in Europe. By the middle of the 14th century it was already noted that she no longer produced the most famous thinkers, or published the most famous books; and when in the opening years of the 16th she rejected the new studies of the Renaissance she alienated all the men with whom the future lay. In the great schism, also, by giving her support to the popes at Avignon, she eventually forfeited the favour of Rome, which thenceforward did its best to encourage rivals even in France itself.

There were other mediæval universities hardly inferior in repute to Paris and Bologna. Sala-

manca, founded in 1243, was the glory of Spain for nearly five hundred years, though in the peninsula itself it had several competitors, such as Seville, Alcala, Madrid, and Coimbra (or Lisbon). The university of Oxford, however, was the most formidable rival of Paris, and in that very branch of study to which Paris owed its fame. Like the great French and Italian universities, Oxford was a spontaneous growth, whose beginnings cannot be determined with precision, for the story of its foundation by Alfred the Great is now set aside as a legend. In the 12th century, however, Oxford certainly possessed a school, which by the middle of the 13th disputed the palm with Paris both in reputation and in the number of its students. Though to a certain extent standing outside the line of development of the two great continental universities, in its aims, the character of its studies, and its organisation it was essentially formed on the type of Paris. In the same century as they grew up in the French university colleges also arose in Oxford, University College being founded in 1249, Merton in 1264, and Balliol about 1268. Though of later date as a school than Oxford, Cambridge had all the characters of a university as early as 1233. Unfortunate in its earlier developments, however, it was not till a later date that it held its own with its sister university. As was the case with the other universities, the prosperity of Cambridge was materially increased by the growth of colleges, of which the first, that of Peterhouse, was founded by 1286. According to Döllinger, it is an illustration of the practical talent and the political freedom of England that she did not squander her resources in founding other universities besides these two, thus avoiding the needless multiplication of schools which we find in the various continental countries. During the middle ages three Scottish universities, and an abortive one in Ireland, complete the list of schools in the British Islands. The attempt to found a university in Dublin in 1312 came to nothing, for the modern university dates only from 1592. Of the three Scottish universities, St Andrews, Glasgow, and Aberdeen, founded respectively in 1411, 1450, and 1494, St Andrews and Aberdeen attained a prosperity fully proportioned to the resources of the country; Glasgow, on the other hand, was a failure for fully the first century of its existence. Germany, whose universities have held the first place during the 19th century, played only a subordinate part in the development of studies during the middle ages. The oldest university within the empire, that of Prague, founded in 1348 on the model of Paris, at first gave promise of a brilliant history; but the religious wars of Bohemia in the first half of the 15th century proved disastrous to its continued efficiency. Next in date comes Vienna, but, bound as it was to the old ways of scholasticism, at too late a period (1365) to attain the vigour of the earlier universities. Before 1500 there were as many as fourteen German universities, but mostly organised on the model of Paris, which by the 14th century, as we have seen, was already an outgrown institution. The university of Cracow in Poland (1364) grew to such fame during the 15th century that it may be fairly classed among the greater mediæval institutions. Louvain (1426) and Cologne (1388) were also schools of high importance, the former especially from the fact that it was one of the first institutions north of the Alps where the new studies of the revival of learning found a home.

It is from the middle ages that all those terms come—bachelor, master, doctor, rector, chancellor, &c.—which still form part of the academic vocabulary. The origin of the terms *rector* and *chancellor* has already been explained; the import of the others may here be briefly noted. Entering first the faculty of Arts, the student after a three years' curriculum took his *diploma* of *bachelor*, and after continuing his course was at the age of twenty-one in a position to take the degree of *master*, which entitled him to the privilege of teaching in the university. The period of study for *license* in the other faculties varied at different times and in different universities, the longest curriculum of all being that of the doctorate in theology, which could not be taken before the candidate's thirty-fifth year.

With the 16th century begins a new epoch in the history of the human spirit. The end of feudalism, the revival of classical antiquity, the breaking away from Rome of a large section of the Christian society were events that went so deeply into the life of Europe that the ancient universities could not be left untouched by the revolution. But great historical institutions do not readily respond to new aspirations or adapt themselves to novel conditions. To change their subjects of study and reorganise their constitutions meant for the universities the transformation of their very being. As it happened, few of them consented to the transformation, while others made such partial concessions as utterly failed to meet the new conditions. Thenceforward the universities no longer filled their former place in the mind of Europe. Through the rending of the peoples that came of the Protestant revolution they could no longer be metropolitan schools such as Bologna and Paris had been in the middle ages. But even in their respective countries the universities were no longer the exclusive homes of serious intellectual effort. In certain countries, indeed, their course of study remained what it had been from the beginning, and the most important work was done outside their walls. A brief sketch of the history of the universities since the close of the middle ages will bring this very clearly before us.

In Italy the religious revolution was never a serious menace to the authority of Rome. On the other hand, by the beginning of the 16th century the movement of the Renaissance threatened her with moral disintegration and the substitution of the pagan for the Christian spirit. In the second half of the century, however, came the Catholic reaction; the spirit of humanism was sternly repressed; the universities passed completely under the control of the church, and till the last years of the 19th century have remained institutions without any real life, unstirred by any breath of enthusiasm, and powerless to influence the development of the people. A similar history has to be told of the university of Paris. In the first half of the 16th century it rejected the new studies of the Renaissance, and thus fell behind at the very opening of the new era. In the second half the wars of religion brought such disaster to its schools as could never again be wholly repaired. During the following centuries the successive kings of France dictated her studies, controlled her administration, and brought her to such a pass that the Revolution swept her away with other effete institutions.

The universities of England gave a better welcome to the new studies; but to both of them the Reformation, and specially the religious changes under Edward VI., brought such loss of prestige and efficiency as affected their standing throughout all their subsequent history. With the exception of Sir Thomas More, England had no scholar of European importance throughout the 16th century. In the century that followed it was as political rather than educational centres that the universities influenced the movement of things in England; and to what estate they had come in the 18th century the testimony of Gibbon as to Oxford, and the poet Gray as to Cambridge, leave us in no

manner of doubt. Throughout the same period the universities of Scotland, in proportion to their humbler scale, served far more efficiently their purpose as national institutions. The Scottish reformers set about the work of organising public instruction in a more serious spirit than their contemporaries in England. Many of their schemes miscarried; but they left a stamp upon the universities which for good and evil they have retained ever since. Under Andrew Melville during the later half of the 16th century Glasgow attained a reputation which drew students in considerable numbers from different parts of the Continent. The college of Edinburgh, founded by James VI. in 1582, steadily grew in importance through all the following century. In the first half of that century, however, the university of Aberdeen produced a succession of scholars, 'the Aberdeen doctors,' who for the time made it the first of the four institutions which Scotland now possessed. During the 18th century the lustre of her mathematical school under the Gregorys, and her medical school under the Monros, won the precedence for Edinburgh, and made her known wherever intellectual interests flourished. But the special service of the universities of Scotland has been to supply the want of those secondary schools which the reformers sought to make part of their national system of education, but failed to achieve through the poverty of the country and the selfishness of the leading nobility. Under the existing circumstances this was the highest service the Scottish universities could have done to the country; but with the growth of knowledge during the 19th century this function has gradually disabled them from adequately meeting the modern conception of a fully equipped university.

As we should expect, public instruction was nowhere more radically influenced alike by Reformation and Renaissance than in Germany. The result of the Lutheran revolt was the establishment of a succession of universities, such as Wittenberg (1502), Marburg (1527), Königsberg (1544), Jena (1558), and Altorf (1578), where the new religion as well as the new studies should find a home, and form centres of instruction for the Protestant communities. But the religious controversies issuing in the Thirty Years' War proved fatal to Protestant and Catholic schools alike; and till the close of the 18th century the universities of Germany gave but little promise of the splendid future before them. Since the period of the Reformation the universities of Spain have shared the inanition of the people, and till recent years have pursued the methods and studies of mediævalism with a dogged obscurantism through which no ray of light could penetrate. A notable product of the Reformation was the university of Leyden, founded in 1575 by William of Orange to commemorate the successful defence of the town against the Spaniards. During the 17th and 18th centuries Leyden boasted a line of scholars without a parallel in any other country of Europe.

During the centuries that followed the Reformation the universities, even those that owed their birth to it, continued to retain the character originally impressed upon them. The essential difference between the typical mediæval university and the university formed by the Renaissance was that, while logic formed the educational staple of the one, the Latin and Greek classics took its place in the other. Through the comparative study of other civilisations men were trained to the bolder handling of tradition, and the scientific spirit gradually displaced that of docile submission to authority. With the growth of the new spirit begins a new epoch in the history of universities, which sooner or later must respond to the needs of the society for which they exist. The characteristics of the modern period are the subdivision of studies necessitated by the widened limits of knowledge, the extraordinary developments of physical science, and the increased complexity of the conditions of modern life. Though more gradual in its working, the modern revolution has affected men's aims and interests more powerfully than the religious revolution of the 16th century. If any proof of this were needed, it would be found in the transformations which the universities have undergone to meet the conditions of the modern time.

Germany, which in respect of its universities took the last place in the middle ages, has in the modern period led the way from the first—the conclusive attestation of its pre-eminence being that its schools alone can now be called cosmopolitan. With the foundation of Halle in 1694, and of Göttingen in 1737, their new start seems to have been made, as both of these schools initiated a movement which gradually made itself felt throughout the whole of Germany. Yet, as has been said, the German universities have no brilliant record for the greater part of the 18th century; and it was only towards its close that they decisively took the lead of those of other countries. From the settlement of Friedrich Wilhelm Wolf at Halle in 1783 dates the classical teaching which is one of Germany's special claims to honour. Kant at Königsberg, and Fichte and Schelling at Jena, at the close of the 18th and the beginning of the 19th century, revived that application of dialectics to abstract thinking which was the distinguishing characteristic of the middle ages. But above all the foundation of Berlin University (1810) by Wilhelm von Humboldt made an epoch in the history of universities, from which we may date the ideal of a national school organised to meet the highest aims of the modern spirit. At present Germany possesses 21 universities with an average attendance of nearly 1400 students. Of their expenditure 72 per cent. is contributed by the state, 9·3 by students' fees, the remainder being met by endowments. For every teacher in the German universities the average number of students is 11, while in Scotland the proportion is 1 to 40. The professors are appointed by government, and are of three grades, full professors, extra-ordinary professors, and *privatdocents*. It is in virtue of their splendid organisation, based as it is on an equally comprehensive system of secondary schools, that the universities of Germany have left all others behind in the fame of their teachers and their contributions to the sum of knowledge.

In France, from the abolition of the university of Paris at the Revolution till steps were taken in 1896 for its restoration, the organisation of higher education has been peculiar, and the term 'university' has been used as synonymous with the national system of higher education. Controlled by the minister of Public Instruction, this system includes the faculties of theology, law, medicine, science, and letters, for instruction in which twenty-seven *académies*, variously equipped, are established in the leading cities of the country. In Paris especially there is the most ample provision for all the higher departments of study at the *Facultés libres*, *Collége de France*, *Ecole pratique des hautes Études*, *École spéciale des Langues orientales vivantes*. Of Spain it has only to be said that during the 19th century it has followed the example of France, and that its universities have played no part in the developments of modern thought. In connection with the universities of Italy, of which it is specially noteworthy that the mediæval system of colleges is completely extinct, it now holds good

in modern times as of the middle ages, that the professional aim prevails over that of pure science. To complete this survey of the continental universities, it may be added that Holland and Russia follow the German model, and that the Russian universities have now decisively taken their place among the schools of Europe.

Like that of other countries, university education in the British Islands has been powerfully influenced by the new forces of the 19th century. The two historic universities, Oxford and Cambridge, have responded to modern needs by such changes as the abolition of religious tests, the diversion of a certain proportion of their endowments to physical science, the system of local examinations, and university extension lectures. The foundation of colleges and universities in certain of the large towns of England are the result of the same tendencies. Durham University (1837), with its physical science college at Newcastle; Victoria University (comprising Owens College, Manchester; University College, Liverpool; Yorkshire College, Leeds); Mason's College, Birmingham; with the Welsh colleges of Cardiff, Bangor, and Aberystwith (organised in 1894 as the university of Wales), sufficiently prove how the pressure of modern life has created a new departure in the life of universities. Dundee has a University College. London University (separately dealt with) is mainly a degree-granting body. In the later history of the Scottish universities the Universities (Scotland) Act of 1858 is specially noteworthy as having assigned a common constitution to all of them. The result of the Commission on the Scottish Universities, however, will be the most drastic step yet taken to adapt them to the needs of the time. The multiplication of lecturers, as distinct from the professors, the recasting of the curriculum, the admission of women, the choice of subjects permitted to the student are among the most important changes that will give a new character to their future. In Ireland the wants of the country are met by the university of Dublin, the Royal University of Dublin (purely an examining and degree-giving body), and the colleges of Belfast, Cork, and Galway, a Catholic university endowed by the state being as yet only under discussion. Advocating a teaching university in London, in addition to the institutions the city already possesses, Professor Huxley has thus expressed the difference between the modern and the mediæval ideal of the university. 'The student to whose wants the mediæval university was adjusted looked to the past and sought book-learning, while the modern looks to the future and seeks knowledge of things.' The distinction here made is more trenchant than just, but it suffices to show the distance that has been travelled since Paris with its scholastic theology was the first school in Europe.

The university extension movement for providing the means of higher education for persons of all classes and of both sexes, engaged in the regular occupations of life, is conducted by lecturers giving courses in various populous centres, conducting examinations, and granting certificates. The movement began with Cambridge in 1872, and soon extended to other universities; Chautauqua (q.v.) maintains a somewhat similar system. For University Settlements, see TOYNBEE.

In the United States the titles university and college are used indifferently, the former occasionally even for a college where the course of study is not advanced, and either title for a university in the European sense, with several faculties. A considerable proportion, therefore, of the 415 'colleges' of the republic are universities, whilst a still larger number are simply high-schools. In the best universities, it should be noted, the course of study will bear comparison with any British university at least; elective and post-graduate courses have been introduced in many of the larger colleges. A state university is part of the educational system of most states, and is generally, like most of the newer colleges, open to both sexes. Most of the American colleges, the state universities excepted, were founded as religious institutions, their chief purpose being to train men for the ministry; this applies not only to Harvard, William and Mary, Yale, Princeton, and others founded before the 19th century, but also to many of the later western colleges.

Canada possesses sixteen degree-granting colleges and universities, one at least in every province of the Dominion except British Columbia. The chief are the university of Toronto; M'Gill College, Montreal; Dalhousie University, Halifax; and Laval University (Roman Catholic), at Quebec. There are universities in Sydney, Melbourne, and Adelaide; the university of New Zealand has branches in various towns; since 1873 there is a university of the Cape of Good Hope. India has three principal and two lesser universities.

The more important universities have separate articles (OXFORD, CAMBRIDGE, HARVARD, DUBLIN, EDINBURGH, &c.), or sections in the articles on the towns where they are found; and the articles on the several countries deal with the university system of each.

See Denifle, *Die Entstehung der Universitäten des Mittelalters bis 1400* (vol. i. 1885); for the university of Paris specially, the works of Du Boulay, Crevier, Thurot, and Jourdain; J. Conrad, *German Universities for the last Fifty Years* (Eng. trans. 1885); Georg Kaufmann, *Die Geschichte der Deutschen Universitaten* (vol. i. 1888); S. S. Laurie, *Lectures on the Rise and Early Constitution of Universities;* for Oxford, Anthony Wood, Parker, Maxwell Lyte; for Cambridge, Dyer and Bass Mullinger; Grant, *The Story of the University of Edinburgh; Monumenta Almæ Universitatis Glasguensis;* Spalding, *Fasti Aberdonenses;* Lyon, *History of St Andrews;* Hastings Rashdall, *The Universities of the Middle Ages* (1892); Thwing, *American Colleges* (New York, 1878). Information regarding the teachers and faculties of all the universities in the world is given in the *Minerva* (Strasbourg, annual). Interesting general studies of the functions of universities will be found in Sir William Hamilton's *Discussions*, Mark Pattison's *Suggestions on Academical Organisation*, Matthew Arnold's *Schools and Universities on the Continent*, and Döllinger's *Akademische Vorträge*, vol. ii.

Unleavened Bread. See PASSOVER, HOST.

Unna, a town of Prussia, once a Hanse town, in Westphalia, 15 miles E. of Dortmund. Near by are the famous salt-works of Königsborn, yielding 120,000 cwt. of salt annually. Pop. 8904.

Unreason, ABBOT OF. See FOOLS (FEAST OF).

Unsoundness. See WARRANTY.

Unst. See SHETLAND.

Unterwalden, one of the four 'Forest Cantons' of Switzerland (q.v.), forms part of the hill country which surrounds the Lake of Lucerne; area, 295 sq. m.; pop. (1888) 27,586. Unterwalden is divided into two parts, Upper and Lower; the capital of the Nidwald is Stanz, and of the Obwald Sarnen. See Sowerby's *Forest Cantons* (1892).

Unyanyembe, a district of German East Africa, between Lake Tanganyika and the coast.

Unyoro, district of Central Africa between Uganda and the Albert Nyanza, with a population of about 1,500,000. It now forms part of the British Protectorate of Uganda.

Upanishad. See VEDA.

Upas (Malay, 'poison') is the name given to various vegetable poisons in the Indian Archipelago, including some kinds of Strychnos. But that best known under this name is the arrow-poison prepared from the gum that exudes from

incisions in the stem of the Antjar or Anchar tree (*Antiaris toxicaria*), a large tree belonging to the Artocarpaceæ. The portentous tales current in Europe, especially towards the end of the 16th century, and set forth in Erasmus Darwin's *Loves of the Plants*, are mostly baseless inventions—as for example that the atmosphere for miles round a upas tree was deadly to all animal life, and that no other vegetation could flourish near one. It is true that when a tree is felled or its bark much bruised an effluvium issues acrid enough to cause cutaneous eruptions. And it has been suggested as an explanation of the fantastic stories that upas trees grow in a Javanese valley where carbonic acid, in quantities dangerous to animal life, issues from the volcanic soil, as in the Grotto del Cane. But the tree has no such powers.

Upernivik. See GREENLAND.

Upheaval and Subsidence are terms applied to movements of the earth's crust that result in more or less permanent changes of level. Such movements are believed to be due to the sinking in of the crust upon the cooling and contracting nucleus. The crust under such conditions is necessarily subjected to great crush and strain, from which it gets relief, it is thought, by wrinkling—the wrinkles running in linear directions—or by bulging up over much broader areas. Hence two kinds of movement are recognised—(*a*) *linear* or *axial*, to which mountains of elevation owe their origin (see MOUNTAINS), and (*b*) *regional*, affecting broad areas, over which the crust seems to rise or, as the case may be, to sink without much disturbance or tilting of strata, although these may often be more or less fractured and dislocated. Such earth-movements are believed to take place very slowly and gradually as a rule. These are the generally received views; but of late years doubt has been expressed as to whether regional elevation of the crust is possible. The only movements of elevation of which we have obvious evidence are those that give rise to mountain-chains. These movements are *tangential*—the crust is squeezed and puckered up in rapid folds—but a *vertical* uprise of a continental area seems to Professor Suess and others impossible. Probably many of the supposed evidences of regional elevation really point to sinking of the crust under the great oceanic basins. These basins, there is reason to think, are pre-eminently subsiding areas, and if this be so the mere withdrawal of the sea from the continental areas must produce an apparent elevation of the land. Some now begin to suspect, however, that changes of sea-level may also be due to other causes. Thus, Professor Suess—believing that in equatorial regions the sea is upon the whole gaining on the land, while in other latitudes the reverse appears to be the case—points out that this is in harmony with his view of a periodical flux and reflux of the ocean between the equator and the poles. Dr Schmick also thinks that the apparent elevations and depressions of continental areas are the result of secular movements of the hydrosphere, but the sea according to him attains a high level in each hemisphere alternately—the waters being at present heaped up in the southern hemisphere. Others again, as Dr Hilber, have suggested that sinking of the sea-level may be due in part at least to absorption. This recalls the view of Celsius (q.v.), who attributed the retreat of the sea from the coasts of Sweden to gradual desiccation. At present none of the hypotheses that would attribute change of sea-level to secular movements of the hydrosphere has found favour with British geologists, who continue to maintain that all such changes are the result of upheaval and depression of the lithosphere caused by subterranean action. It seems probable that this view will eventually be modified.

Upolu. See SAMOA.

Uppingham, a town of Rutland, 2½ miles WNW. of Seaton by rail (1894), 12 SW. of Stamford, and 83 NNW. of London. The parish church, of which Jeremy Taylor was rector, was restored and in great part rebuilt in 1861; but the feature of Uppingham is its public school, founded in 1584 by Robert Johnson (1540–1625), from 1591 Archdeacon of Leicester. With an endowment of only £1000 a-year, it owes its development from a mere grammar-school to Edward Thring (q.v.), its headmaster from 1853 to 1887. He found it with only twenty-five boarders, and left it with 330; and to him was due the building in 1863, from designs by Street, of the great schoolroom and the decorated chapel, as also of the gymnasium, swimming-bath, &c. Pop. 2500. See the *Century Magazine* for September 1888.

Upsala, the historic centre of ancient Sweden, the principal and last stronghold of heathenism in that country, and still one of the most important towns in Sweden, stands on a little stream that runs down to Lake Mälar, 41 miles by rail N. by W. of Stockholm. Its existing importance is due to its being the seat of the primate, the only archbishop of the Swedish church, and of the principal university. The cathedral, built of brick in the Gothic style, was founded in 1289, completed in 1435, partly burned down in 1702, and only partly restored since that disaster. It contains the tomb of Linnæus, and those of Gustavus Vasa and some other Swedish kings. The university, founded in 1477, though new buildings were erected in 1877, is attended by 1900 students, and possesses a library (1620) of 250,000 volumes and 10,000 MSS., an observatory, botanical garden, and various scientific collections. In the older town, around which on the east and north new suburbs have been built, there stands the castle of Gustavus Vasa (1548). Pop. (1890) 21,511. About 3 miles to the NE. lies OLD UPSALA, where are three vast tumuli of the ancient legendary kings; and about 4 miles to the SE. are the Mora stones, on which the old kings used to take the oaths of good governance.

Ur. See ABRAHAM.

Uræmia. When excretion of waste products from the body by the kidneys is defective, particularly therefore in cases of Bright's disease (see under KIDNEYS), peculiar symptoms, mostly cerebral, are met with, which are commonly called *uræmic*. Among the most characteristic are fits like epileptic seizures, delirium, tremors or spasms of muscles, transient attacks of blindness, dyspnœa, itching, vomiting. It is as yet uncertain whether it is to the urea (as implied by the name) or to others of the retained effete materials that these symptoms are due, which, though not infrequently recovered from, are always cause for grave anxiety.

Ural, a river of Russia, rises on the east side of the Urals in the government of Orenburg, and runs mainly southwards for 1400 miles into the Caspian Sea, being practically the boundary between Europe and Asia. It gives name to a province, URALSK, which lies mainly east of the river and north of the Caspian, belonging to the Steppe-region (see RUSSIA, Vol. IX. p. 35) and to the 'Kirghiz provinces' included in Asiatic Russia.

Ural-Altaic, a term given to a racial and linguistic group of peoples of the Mongolic stock, classified at ASIA, Vol. I. p. 493.

Ural Mountains, separating European Russia (physically though not politically) from Siberia, have been described at RUSSIA, Vol. IX. p. 33. The main axis of the series of ridges and plateaus

consists of granite, diorite, syenite, porphyry, and schistose rocks. The mineral wealth is great, comprising gold, platinum, silver, copper, and iron, besides precious stones, malachite, &c. All the platinum of Russia is found here, and some two-thirds of its pig-iron.

Uralsk, a Russian town, in Uralsk government, on the right bank of the Ural, 280 miles N. of its mouth in the Caspian Sea. It has for centuries been an important seat of the Cossacks, and carries on a busy trade with them and with the western Kirghiz steppes, besides horse-rearing, fisheries, and the preparation of caviare. Pop. 26,054.

Urania. See MUSES.

Uranium (sym. U, equiv. 240) is a very hard but moderately malleable metal, sp. gr. 18·33, resembling nickel or iron in its lustre and colour; but in a finely comminuted state occurring as a black powder. It is not oxidised by exposure to air or water at ordinary temperatures; but if heated in the air it burns brilliantly, and is converted into oxide. It is a comparatively rare metal, which never occurs native; its chief source being *Pitch-blende*, which contains from 40 to 90 per cent. of black oxide. Uranium forms at least four oxides—viz. two principal ones—a *dioxide*, UO_2, and a *uranic oxide*, UO_3; and two intermediate oxides—the *black oxide*, $UO_2 + UO_3$, and the *green oxide*, $UO_2 + 2UO_3$. The black oxide is of much value as a pigment for colouring porcelain; and compounds of uranic oxide with the earths are employed to communicate a peculiar yellow tint to glass. The salts of the dioxide have a green, and those of the trioxide a yellow colour. Uranium with platinum and copper forms two beautiful alloys resembling gold in appearance. The metal is extracted from pitch-blende; and its isolation in a pure form is due to Peligot in 1842. The metal was not obtained in the compact form till 1856; it is found in Saxony, Bohemia, and Cornwall, usually in patches; in 1889 a lode was found in Cornwall. The price reaches £2400 a ton. For uranium in the electric furnace, see *Nature*, vol. liv.

Uranus. See TITANS, PLANETS.

Urari. See CURARI.

Urban, the name of eight popes.—URBAN I. (222–230), an alleged martyr under Alexander Severus.—URBAN II. (1088–99), born near Châtillon-sur-Marne, was originally a monk of Clugny. He was made by Gregory VII. cardinal-bishop of Ostia, and was elected pope in a council held at Terracina in 1088, during the schismatical pontificate of the antipope Guibert, styled Clement III. He laid Henry IV. of Germany under the ban and finally drove him out of Italy, triumphed also by the same means over Philip I. of France, and aroused the crusading spirit by the fire of his eloquence at Piacenza and the Council of Clermont (1095).—URBAN III. (1185–87), Uberto Crivelli, was a Milanese by birth, and consumed his brief reign in a struggle with the Emperor Frederick I.—URBAN IV. (1261–64), Jacques Pantaléon, was a Troyes cobbler's son, the steps of whose elevation were the see of Verdun and the patriarchate of Jerusalem.—URBAN V. (1362–70), William de Grimoard, was a native of Grisac in Languedoc, and had been Abbot of St Victor at Marseilles. On the death of Innocent VI. in 1362 he was elected at Avignon, but set out for Rome in 1367, only to return a few months before his death.—URBAN VI. (1378–89), Bartolommeo Prignani, was born in Naples in 1318, and at the time of his election he was Archbishop of Bari. The French cardinals set up against him the Bishop of Cambray as Clement VII., who took up his residence at Avignon. See ANTIPOPE, and POPE.—URBAN VII., John Baptist Castagna, died twelve days after his election (15th September 1590).—URBAN VIII. (1623–44), Maffeo Barberini, was born at Florence in 1568, and was elected pope in September 1623. He supported Richelieu's policy against Austria and Spain, was a patron of Galileo, canonised Loyola and Philip Neri, and wrote sacred poetry.

Urbana, capital of Champaign county, Ohio, 95 miles by rail NNE. of Cincinnati. It manufactures woollens, carriages, glue, &c. Pop. 6510.

Urbanists. See CLARE (ST).

Urbi et Orbi (Lat., 'to the city and the world'), a form used in the publication of papal bulls, for the purpose of signifying their formal promulgation to the entire Catholic world, as well as to the city of Rome. See also BENEDICTION.

Urbino, an ancient town of Central Italy, in the province of Pesaro and Urbino, nestling among wooded hills, between the rivers Foglia and Metauro, remote from the highways of commerce. The nearest station, Faro (97 miles by rail SE. of Bologna), is 29 miles away. It is a town of narrow, tortuous streets, with an archbishop's cathedral and other churches; a magnificent ducal palace (1447; restored, and now housing the fine art institution); a free university, dating from 1564, but now attracting only eighty students; and the house in which Raphael was born, now the town museum. Cheese, silk, pins, and some majolica ware are manufactured, but not the majolica for which the place was famous for a century and a half after 1475 (see MAJOLICA). Urbino, anciently the Urbinum Hortense of Umbria, was a *municipium* under the Romans and was the seat of a line of independent dukes from 1474 to 1631. On the death then of the last duke, Urban VIII. took possession of the duchy as a vacant fief; and it belonged to the Papal States till 1860, when it became part of the kingdom of Italy. Pop. 5087.

Urchin. See HEDGEHOG, SEA-URCHINS.

Urdú. See INDIA, Vol. VI. p. 102.

Ure, ANDREW, M.D., chemist, was born at Glasgow in 1778, and educated at the university there. In 1802 he became professor of Chemistry and Natural Philosophy in the Andersonian Institution in Glasgow, and a few years later became first astronomer in the city observatory. In 1813 he published a *Table of the Materia Medica*, but achieved a more lasting reputation by researches on Caloric (in *Phil. Trans.*, 1818). Later works were his *Dictionary of Chemistry* (1821); a translation of Berthollet on *Dyeing* (1824); and a *System of Geology* (1829), in which the hypothesis of a general Flood was maintained. In 1830 Ure removed to London, and in 1834 was appointed analytical chemist to the Board of Customs. He was already F.R.S. in 1822, and he died in London, January 2, 1857. His latest books were the *Philosophy of Manufactures* (1835), *The Cotton Manufacture of Great Britain* (1836), and *Dictionary of Arts, Manufactures, and Mines* (1839; 7th ed. 4 vols. 1875–78).

Uredineæ. See FUNGI, PLANTS, p. 223.

Urethra is the term given in Anatomy to the canal by which the urine is discharged from the bladder. Its most common affections are the special inflammatory condition of its mucous lining known as gonorrhœa, and Stricture (q.v.).—For the Ureter, see KIDNEYS.

Urfa, a modern name for Edessa (q.v.).

Urfé. See D'URFEY.

Urga, a town of Mongolia, on the river Tola, stands in a valley in the great Asiatic plateau, 180 miles SE. of Kiachta, on the trade route to Peking. It is the religious centre for northern Mongolia,

has considerable trade, and a population (partly living in tents outside the city proper) of about 30,000, of whom 6000 are Chinese. In and about the town, which is the seat of the Bogdan or chief Lama of the Mongols (see LAMAISM), there were in 1895 about 14,000 Mongolian Lamas.

Urgel (or Seo de Urgel), a small mountain town of 2892 inhabitants, in the Catalonian province of Lerida, at the foot of the Pyrenees. Its bishops have extensive powers in the adjoining republic of Andorra (q.v.).

Urgenj. See KHIVA.

Uri, one of the 'Forest Cantons' of Switzerland, forms part of the hill country which surrounds the Lake of Lucerne; area, 416 sq. m.; pop. (1888) 17,284. It consists of one valley, that of the Reuss, through which runs the great road, and also the railway, into Italy by the St Gothard Pass. Uri is almost entirely pastoral; and the constitution is a pure democracy (see SWITZERLAND, p. 22). Altorf, with traditions of Tell (q.v.), is the capital. See Sowerby, *The Forest Cantons of Switzerland* (1892).

Uriconium. See WROXETER.

Urie. See INVERURIE.

Uriel, or ORGIAL. See LOUTH.

Urim and Thummim (Heb.), first mentioned in Exod. xxviii. 30 in connection with the High-priest's breast-plate, apparently a pair of objects used at critical junctures as a kind of traditional oracle, but which could not always be counted on for an answer (1 Sam. xxviii. 6). They were wanting to the High-priest after the Captivity (Ezra, ii. 63). The LXX. translation of these words is δήλωσις καὶ ἀλήθεια; the Vulgate, *Doctrina et Veritas.*

Urine is the fluid which is secreted or separated by the kidneys from the blood, and it is the principal means of removing the worn-out tissues, especially the nitrogenous and saline matters, from the system. It is a very complex fluid, and its composition varies considerably in different classes of animals—among the mammalia mainly in accordance with the nature of the food. The study of its modifications in disease forms a most important branch of medical work.

Healthy human urine, when freshly discharged, is a clear fluid of a bright amber colour, a bitter, saltish taste, and a peculiar aromatic odour. Its normal reaction is acid, and its specific gravity ranges from 1·015 to 1·025. A healthy adult man passes on an average about 50 fluid ounces (2½ pints) of urine in twenty-four hours; but the amount is subject to very great variation, being diminished during sweating or thirst, and increased under the influence of cold, by copious draughts of fluid, and by large quantities of salt or sugar, as well as many drugs. The solid constituents of the daily urine weigh a little more than two ounces, of which about half is urea. The other substances present are, in the order of quantity, common salt (sodic chloride), phosphates, sulphates, uric and hippuric acids, with others of less importance (mucus, colouring matters, &c.). The amount of solids, and the amount of urea excreted per day, are less subject to variation in health than the whole amount of urine; careful observations of the daily excretion of urea are of special importance in the investigation of disease.

Urea (chemical formula, CON_2H_4) is the form in which the great bulk of the nitrogenous waste of the human body is removed. It is formed in the tissues during the disintegration of proteid material, and carried by the blood to the kidneys, which separate it and pass it off in the urine. It is very readily soluble in water; it gives rise to carbonic acid and ammonia during ordinary decomposition. It is of great interest chemically, being the first animal product which has been produced by synthesis from inorganic bodies without the intervention of animals.

Uric acid, $C_5H_4N_4O_3$, is present in small amount in the blood and in normal urine, chiefly in combination with alkaline bases. It is very much less soluble in water than urea; its presence in excess in the blood is the chief feature of the gouty state. In birds and reptiles, however, the nitrogenous waste is excreted chiefly in this form.

Hippuric acid, $C_9H_9NO_3$, is usually present in still smaller quantity in human urine; but in considerable amount in the urine of herbivora.

Of *abnormal constituents dissolved* in urine the most frequent is *albumen* (see KIDNEYS, DISEASES OF). It causes no change in the appearance of the urine; but is visible as a white precipitate, insoluble in dilute acids, on boiling, or on the addition to the urine of certain reagents (e.g. strong nitric acid, solution of picric acid). *Sugar* is excreted in considerable quantity in Diabetes (q.v.) Mellitus. *Bile* is present in cases of jaundice, giving the urine a deep yellow, brown, or almost black colour. *Blood-pigment* may be present without blood-corpuscles, but more commonly as a result of the escape of blood from the vessels in some part of the urinary tract. It may give the urine either a bright red or a 'smoky' tint.

Urinary Deposits.—When normal urine is allowed to stand in a clear glass vessel for some hours, a faint cloudy deposit appears at the lower part, consisting chiefly of mucus from the bladder. When the urine is much concentrated, as it often is in hot weather, a dense yellow or reddish deposit frequently appears as it cools, readily soluble on heating. This consists of urates, and is generally of no particular importance; but it may be an indication of digestive disturbance. When from administration of alkalies or otherwise the urine is alkaline, a white deposit of phosphates may be seen, readily dissolved by acids. If habitually present, it may arise from an unhealthy condition of the bladder. Small red 'cayenne-pepper' grains consist of uric acid, and indicate its presence in excess. Larger particles (gravel) are sometimes passed; if retained in the bladder they lead to the formation of a Calculus (q.v.). Casts of the kidney tubules in Bright's disease, pus from the kidney or bladder, and blood are distinct indications of disease in the urinary tract. They are best recognised under the microscope. Numerous other deposits are occasionally met with, but they are not of any general interest.

Incontinence of Urine, or *Encuresis,* is a troublesome affection, far more common in childhood than in more advanced life, and in boys than in girls. The child may have no bad symptom of any kind that can be detected, but it is in the constant habit of discharging its urine in bed during sleep. The act may take place once or several times during the night, and sometimes there is an interval of a night, but seldom more. The child may often be broken off this unpleasant habit by proper domestic management, as withholding any excess of fluids before going to bed, and waking it, and making it discharge the contents of the bladder at the time when the elder members of the family retire to bed. Some hard substance—e.g. a cotton-reel in a towel—fixed over the spine, so as to prevent the little patient from lying on its back, sometimes has a good effect. When such means as these fail, recourse must be had to medical advice. Some slight abnormality in the urinary organs is frequently present, the correcting of which cures the complaint. Cold douches to the spine, combined with

the internal use of chalybeates, are frequently serviceable. The most certain remedy, however, is extract of belladonna, given at first, according to the age of the patient, in doses varying from $\frac{1}{16}$th to $\frac{1}{8}$th of a grain, twice daily, and increased, if required, till it gives rise to marked constitutional disturbance. The various forms of mechanical pressure that have been suggested, with the view of preventing the passage of the urine, cannot be too strongly reprobated. The same remark applies to the too common practice of punishing the unfortunate child for a condition which is utterly beyond its control, and deserves pity rather than chastisement.

Retention of Urine is the term employed in medicine to signify a want of power to discharge the urine from the bladder, and it must be carefully distinguished from a far more serious affection known as *suppression of urine*, in which also no urine is passed, because in this case there is none in the bladder. Retention may arise from Stricture (q.v.) in any of its forms; from some mechanical obstacle in the urethra, a tumour, calculus, clot of blood, &c.; from enlargement of the prostate gland; from want of power in the bladder; or by reflex nervous influence, either owing to some painful condition in the urinary or adjacent organs, or owing to a hysterical condition in the patient. The patient finds himself unable to pass his water, although he has a great desire and makes strong efforts to do so. The bladder soon becomes so distended that it can be felt as a tense round tumour above the pubes. If relief be not speedily afforded, the bladder may burst, and discharge its contents into the peritoneal cavity, in which case death rapidly ensues; or if the urethra be obstructed, it may give way behind the stricture, when the urine is extravasated into the cellular tissue of the adjacent parts—a condition which, if not promptly relieved by surgical interference, is likely to be followed by gangrene, typhoid symptoms, and death.

If the symptoms are not very severe, and there is no evidence of impassable obstruction, a hot bath, combined with the administration of steel-drops, in doses of ten minims, taken every ten minutes in thin gruel or in barley-water, will often give relief. Sometimes a full opiate administered by the mouth, or preferably as an enema, or the inhalation of a few whiffs of chloroform, will, by allaying spasm, give immediate relief. If these means fail, surgical assistance must be at once procured, and the bladder evacuated by a catheter—an operation often requiring very delicate manipulation. If this cannot be done, which rarely happens, except when the spasm is associated with old-standing disease of the urethra, the surgeon must either puncture the bladder through the rectum, or above the pubes, or make an incision into the urethra either at or behind the seat of the stricture. In cases of enlarged prostate permanent relief can sometimes be afforded by operation; but in most cases the patient is taught to use a catheter for himself, and thereby prevented from the danger of a recurrence of the retention.

Paralysis of the muscular coat of the bladder may arise from the debility of old age, from the depressed state of the nervous system in severe fevers, from injury or disease of the head or spine, and from various other causes. In a temporary form it is often a result of over-distention of the bladder from stricture or prostatic disease, and it sometimes occurs in the case of nervous sedentary persons, if they have allowed rather more than the usual time to elapse without evacuating the bladder. It should be generally known that retention of urine from paralysis, or even from incomplete obstruction, is sometimes accompanied by dribbling away of the water, so that the retention might at first sight be mistaken for *incontinence* of urine. On examination, however, it will be found that the bladder is abnormally distended, and cannot be evacuated by the act and will of the patient. In these cases the urine must for a time be regularly drawn away by the catheter. General tonics, such as the cold bath (or sometimes preferably the sitz-bath) and chalybeates, must be given to improve the general health; while medicines which are supposed to act locally on the muscular coat of the bladder or on the spinal cord must be simultaneously administered. A peculiar form of retention sometimes occurs in women of hysterical temperament, in which the will rather than the power is at fault.

Frequent and Painful Micturition may be a symptom of disease of the kidneys, the bladder, or some neighbouring organ, but is very often merely an indication of an abnormally concentrated, acid, and irritating condition of the urine, which causes excessive stimulation of the bladder and urethra. Persons suffering from this affection usually refrain from drinking fluid under the mistaken idea that a diminution in the quantity of urine to be passed will diminish their discomfort. The right course is exactly the opposite; for the more the urine is increased in quantity in such a case, the more its irritating constituents are diluted, and the less pain and annoyance it causes. Free drinking of diluents is often sufficient of itself to remedy the condition.

Strangury (Gr. *strangx*, 'that which oozes out,' *ourcō*, 'I micturate') is a symptom of many diseases of the urinary organs (calculus, inflammation of the bladder, gonorrhœa, stricture, &c.). It shows itself in a frequent and irresistible desire to pass water, which is discharged in very small quantity, but causes scalding and cutting pains along the course of the urethra. The pain often extends to the bladder and even to the kidneys, and is sometimes so severe as to implicate the lower bowel (the rectum), and to produce the straining condition known as *Tenesmus*. It may also be caused by irritating substances in the urine, especially by *cantharides* or Spanish flies (whose irritant principle is liable to find its way into the renal secretion, whether the above-named drug is taken internally or merely applied to the skin as a blistering agent), and by oil of turpentine, when administered internally. Treatment must of course be directed if possible to the cause of the condition. But among measures generally beneficial may be mentioned a drachm of laudanum in a wineglassful of starch mucilage thrown into the lower bowel, copious mild mucilaginous draughts (of barley-water, for example), the warm bath, and, if that cannot readily be obtained, hot local fomentations.

Urmia. See URUMIAH.

Urn, any vase; but specially a cinerary urn, the vase, of clay, glass, or sculptured marble, in which peoples who practised cremation preserved the ashes of their dead. The forms and patterns in use amongst the prehistoric northern nations differed widely from those found in Roman tombs; nor did any one type prevail even in Rome. See BURIAL, CREMATION.

Uromastix. See AGAMIDÆ.

Urquhart, SIR THOMAS, of Cromarty (1611–60), miscellaneous writer, eldest son of Sir Thomas Urquhart, head of an old family possessed of extensive estates in that county, was born about 1611. He was educated at King's College, Aberdeen, travelled in France, Spain, and Italy, and there (according to his own account) acquired a perfect knowledge of foreign languages and

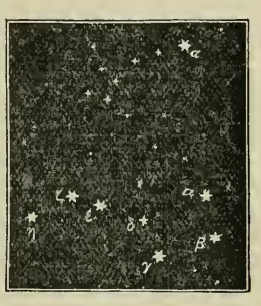
great skill in fencing. On his return he bitterly opposed the covenanting party, took up arms against them in the north, but was worsted and forced to pass to England by sea. Becoming attached to the court, he was knighted at Whitehall, 7th April 1641. The same year he published his *Epigrams Divine and Moral*, dedicated to the Marquis of Hamilton. This contains only three of the ten books he wrote. He brags of having 'contryved, blocked, and digested those eleven hundreth epigrams in a thirteen weeks tyme.' Its speed proves, he thinks, his 'great maturetie and promptness of wit.' But the pieces written in Latin and English, though quaint, have no real merit. On his father's death in 1642 Urquhart found the estate he inherited much encumbered, whereupon, 'I, as I had done many times before, betook myself to my hazards abroad.' Returning after some years, he fixed his residence at Cromarty. Here, though much troubled by his creditors, he produced his *Trissotetras; or a most exquisite Table for resolving all manner of Triangles*, &c. (1645), a curious but useless mathematical treatise.

In 1649 his library, 'compiled (like a compleat nosegay) of flowers, which on my travels I had gathered out of the gardens of above sixteen several kingdoms,' was seized and sold. He took up arms in the royal cause, was declared a rebel by parliament, was present at the battle of Worcester, where he lost most of his MSS., 'seven large portmantles full of precious commodity.' One treatise hastily seized 'by a file of musquettiers to afford smoak to their pipes of tobacco,' was rescued by a friendly officer. Urquhart was removed to London, where through Cromwell's influence he was allowed considerable liberty. There in 1652 he published *The Pedigree* and *The Jewel* (the full titles are too long to quote). The first was an exact account of the Urquhart family, in which they are traced back to Adam. Among his ancestors were 'the sister of Spartus that built Lacedemon, Pharaoh's daughter, and Panthea, daughter of Deucalion and Pirra.' The second is chiefly a panegyric on the Scots nation. Its account of the soldiers and scholars of the period is still of value. In 1653 he issued his *Introduction to the Universal Language*, which 'for variety of diction in each part of speech surmounteth all the languages of the world.' The 'longings of the generous reader' were to be satisfied by fuller treatises which never appeared. The same year we have his version of the first two books of *Rabelais*. The translation of the third was not issued till after his death. This is said to have occurred in 1660 abroad (whither he had escaped), in a fit of laughter on hearing of the restoration of Charles II.

Urquhart's works are a strange mixture. The learning is enormous, yet the scholarship is inaccurate. He is very industrious, yet very slovenly. Crazy with conceit, he yet evinces a true appreciation of all that is noble. Though a clumsy writer, he has many phrases of quaint felicity, many passages of great power. His rendering of *Rabelais* is an English classic. The extravagance, the grotesqueness, the wild humour, the wisdom of the great Frenchman had a peculiar attraction for the Scottish cavalier. It must be added that he amplifies and lingers over the grosser passages with a gusto there is no mistaking. His extraordinary acquaintance with strange English words is not less remarkable than his command over his author's language.

See his *Works* in Maitland Club Publications (1834). Editions of his *Rabelais* are numerous; that edited by Whibley for the 'Tudor Translations' is in 3 vols. (1900). There is a Life of Urquhart by the Rev. J. Willcock (1899).

Ursa Major, 'the Greater Bear,' and **Ursa Minor,** 'the Lesser Bear,' are two celebrated constellations in the northern hemisphere of the heavens. *Ursa Major* was distinguished as early as the time of Homer by the names *Arktos*, 'the Bear,' and *Hamaxa*, 'the Wagon,' the vivid imagination of the Greeks discovering a fanciful resemblance between these objects and the group of brilliant stars in this constellation. The Roman name Ursa was a translation of the Greek *Arktos;* the Romans also called its seven bright stars the *Septentriones*, 'the seven ploughing oxen,' whence the adjective *septentrionalis* came to signify north. The common names throughout Europe for these seven stars are 'the Plough,' 'Charles's (Charlemagne's) Wain,' 'the Wagon'—evidently derived from the classical epithets above mentioned; the common American name is 'the Dipper.' The remarkable group of stars in the hinder part of the Great Bear, being within 40° of the north pole, never sinks below the horizon of any place in a higher north latitude than 40°, a peculiarity alluded to by Ovid in his *Metamorphoses*. It contains a considerable number of stars, seventeen of which are easily visible to the naked eye; but of these only one (α) is of the first magnitude, two (β and γ) of the second, and eight (among whom are δ, ϵ, ζ, and η) of the third. The accompanying figure shows the arrangement of the seven stars constituting 'the Plough.' α and β are known as 'the Pointers' from their use in detecting the *Pole-star* (q.v.). A line drawn from the Pole-star through η of the Great Bear, and produced its own length, passes close to the star Arcturus of the first magnitude.—*Ursa Minor* is less prominent in the heavens. It was also *Arktos* and *Hamaxa* among the Greeks, but was besides distinctively denominated *Cynosura*, 'the Dog's Tail,' from the circular sweep formed by three of the stars in it. The star α in the extremity of the tail of the Little Bear, at present the Pole-star (q.v.), is the brightest in the constellation, though only of the third magnitude.



Ursa Major.

According to a Greek legend Ursa Major was the metamorphosis of Callisto, one of Diana's nymphs, who having violated her vow, and being transformed by her indignant mistress into a bear, was slain by her son Arcas, and afterwards transferred to the heavens as a constellation by Zeus; Arcas being at the same time metamorphosed into Boötes, the Arktophylax, 'Bear-warden,' of the Greeks. See STARS.

Urson (*Erethizon dorsatus*), a rodent nearly allied to the Porcupine, and often called the Canada Porcupine. About the size of a small hare, it differs from the porcupine in the flatter head, the shorter and not convex snout, the longer tail, and in having the short spines almost hidden by the long hair. It is found in the forests of Canada and the United States. Its quills are dyed by the Indian women, and used for ornamental purposes.

Ursula, ST, a celebrated saint and martyr of the Roman calendar (October 21), especially honoured at Cologne, the reputed place of her martyrdom. The legend in its present form is found as far back as the 12th-century *Chronicle* of Sigebert of Gembloux, and fills 230 folio pages in the Bollandist *Acta Sanctorum*. Here Ursula is the daughter of a British king, and is sought in

marriage by the son of a heathen prince. She made it a condition that her suitor should become a Christian, and that she should be allowed a space of three years to make a voyage of pious pilgrimage with her maidens, 11,000 in number. She sailed up the Rhine to Cologne, thence to Basel, travelling thence to Rome. Returning to Cologne, the pious virgins fell into the hands of a horde of Huns, who put them all to the sword save Ursula herself, reserved as a prize for the chief. But she demanded to join her companions in martyrdom, and thus the full tale of victims was made up. The centuriators of Magdeburg exposed this ridiculous story; the Jesuit Crombach devoted an entire folio volume to its defence (1647). One explanation offered is that this belief arose from the name of a virgin who was really the companion of Ursula's martyrdom—*Undecimilla*. The record of the martyrdom in the calendar thus being 'Ursula et *Undecimilla VV.*,' 'Ursula and Undecimilla Virgins,' was easily mistaken for 'Ursula et *undecim millia VV.*,' 'Ursula and *eleven thousand virgins*.' Or again the entry might have been 'Ursula et XI.M.V.,' where M. being misread for *millia* not *martyres* gave 'Ursula and 11,000 virgins,' instead of 'Ursula and 11 martyr virgins.' Early in the 12th century the citizens of Cologne in digging foundations for their new walls across the cemetery of the old Roman settlement of *Colonia Agrippina* naturally enough found a large number of bones. These were declared by an ecstatic nun of Schönau, Elizabeth by name, to be the relics of the virgins. Unhappily many of these were soon discovered to be the bones of males, but the nun redeemed the reputation of the virgins by discovering in a series of fresh visions that a pope of the name of Cyriacus, an archbishop, several cardinals, bishops, and priests had been so charmed by the holiness of the lovely virgins as to follow them to Cologne, only to gain for themselves also the martyr's crown. But still worse, a number of young children's bones were found, and unhappily the ecstatic nun was now dead. This compromising fact, however, was explained by a vision vouchsafed to a patriotic English monk of Arnsberg to the effect that many of their married relations had accompanied the virgins on the voyage from England. But, as Schade first pointed out (*Die Sage von der heiligen Ursula*, Han. 1854), Ursula is none other than a Christianised survival of old German paganism still remembered under the names of Berchta, Hulda; in Swabia, Ursel or Hörsel; and in Sweden, 'Old Urschel.'

See, besides the work by Schade mentioned above, Kessel, *St Ursula und ihre Gesellschaft* (Col. 1863); Stein, *Die heilige Ursula* (ib. 1879); and S. Baring-Gould's *Popular Myths of the Middle Ages*.

Ursulines, a female teaching order in the Roman Catholic Church, founded by St Angela Merici of Brescia in 1537, who was born at Desenzano in 1470, died in 1540, and was formally canonised in 1807. She formed at Brescia an association of young women for the tending of the sick and poor, and the instruction of children, and papal confirmation of the order was obtained from Paul III. in 1544. In 1565 a house was opened at Cremona, and St Charles Borromeo brought the order to Milan. In France one of its most distinguished members was the celebrated Madeleine de Ste Beuve, who endowed an Ursuline house at Paris in 1610. Here they first adopted the common life instead of dispersion in various homes. They were introduced into Savoy by St Francis de Sales in 1635. They spread also over Germany, Austria, and in the fullness of time Canada and the United States. An establishment was founded at Edinburgh in 1836, being the first Catholic convent in Scotland since the Reformation. See French works on the foundress and the order by Sainte-Foi (1858), Postel (1879 *et seq.*), and At (1885).

Urticaceæ, a natural order of trees, shrubs, and herbs, natives of almost all parts of the world. The order embraces about 110 genera, divided into 8 tribes or sub-orders, and about 1500 species. The tribes are Artocarpeæ, which includes the Bread-fruit Tree (*Artocarpus incisa*); Cannabineæ, which is represented by Hemp (q.v.); Celtideæ, the principal representative of which is the Nettle-tree (*Celtis australis*); Conocephaleæ, to which no interest attaches; Moreæ, to which belongs the Mulberry (q.v.); Thelygoneæ, including nothing of interest; Ulmeæ, represented by the Elm (q.v.); and Urticeæ, which comprises the Stinging Nettle, the Fig (q.v.), &c.

Uruguay (officially, *República Oriental del Uruguay;* formerly known as the *Banda Oriental* or 'Eastern Bank'—i.e. of the Uruguay) is the smallest of the South American republics, although its area—72,110 sq. m.—is three-fifths that of the United Kingdom and exceeds that of the New England states and Maryland together. Its general outline is that of a pear, the sides marked by the Uruguay River and the rivers and chain of hills which, with the Lagoa Mirim, form the boundary line with Brazil. The Atlantic washes its shores for 120 miles, the Plate and Uruguay for nearly 600 miles. The most important of the numerous rivers of the interior is the Rio Negro, which flows across the central portion. The country is not mountainous, but full of low hills, often forming long ranges, the highest reaching only 1650 feet. Gneiss and granite predominate in the north, and elsewhere porphyry and sandstone. Gold and copper mines are being worked, and other minerals more or less abundant are silver, iron, tin, mercury, mica, beautiful marbles, slate, gypsum, cobalt, and columbite; diamonds also have been found in Minas. But little has been done so far to exploit the mineral wealth of the country. Uruguay enjoys on the whole a delightful climate; the temperature normally does not fall below 35° nor rise much above 90° F. The flora includes many useful trees, amongst them the palm, brilliant flowers, and a host of medicinal plants. Of the fauna may be mentioned the jaguar and puma, the wild cat, tapir, deer, rhea, parakeets, humming-birds, plentiful waterfowl in the lagoons, and snakes (rattle-snake, a cross-marked viper, &c.), lizards, and venomous spiders.

The population, estimated at 684,000 in 1889, and again at 830,000 in 1898, is made up mainly of half-breeds, from whom the Gauchos (q.v.) are drawn; but the foreign element, in which Basques and Italians are most prominent, is rapidly increasing. In 1891 more than two-thirds of all the children born had foreign blood on the side of one at least of their parents. The leading industry is still the raising of cattle and sheep, the latter mainly in the south and west. Six-sevenths of all the exports are embraced under the head of pastoral and saladero produce. Liebig's factory is at Fray Bentos (q.v.). Uruguay possesses some 16,000,000 head of sheep and 6,000,000 of cattle, valued at over $76,000,000. Agriculture takes up only 1,500,000 acres, mostly under wheat and maize, though tobacco, grapes, and olives also are grown. There are several agricultural colonies, chiefly Swiss, Spanish, and Italian. The manufactories are limited to those of Montevideo and a few breweries, flour-mills, &c. throughout the country. The foreign trade on the whole has largely increased within late years; but it fluctuates with the sense of public security, and unfortunately financial as well as political scares have helped to unsettle this. In 1890 the imports

reached $32,364.627, and the exports $29,085,519; compare with these the figures for 1896—imports $25,500,000, and exports $30,400,000—the fall being due to a financial crisis involving the readjustment of the public debt. Yet even the latter year shows an average of £12, 12s. per head of population, as against £9 for the Argentine Republic. Even without taking into account its mineral wealth, which at present is estimated according to the individual imagination, the country is very rich in natural products, and has nothing against it except its government.

This may be summed up as a sham constitutionalism, in spite of the honest efforts of many of the senators and representatives. Uruguay is divided into nineteen departments, for each of which a senator is returned by an electoral college chosen by the people. Senators are elected for six years, members of the lower house (in the proportion of one for every 3000 male adults who can read and write) for three years. The president is elected for four years, and with a strong military force he is practically master of the country: arbitrary arrests and imprisonment without trial are endured; and even the scandal connected with the sacking of the National Bank failed to unseat President Herrera in 1892. The army, whose influence with the executive is very great, numbers 3500 men, well armed; and there is an armed police force of 4000, besides a citizen force. The navy has only 185 men and officers, manning three gunboats, seven steamers, &c. The revenue in the years 1885–95 crept up from $13,719,693 to $15,350,000, while the expenditure remained between $13,000,000 and $16,000,000. But financial incapacity raised the public debt within even fewer years from $81,000,000 to $120,000,000 in 1899; the debt was partly converted in 1892, but a new loan was raised in 1897. Primary education is compulsory: there are about 15,000 children inscribed in the public schools (7·1, with 300 teachers); and there are besides numerous private schools, religious seminaries, a military college, a normal school, school of arts and trades, and a university in Montevideo. The state religion is Roman Catholic, but all are tolerated; Catholics outnumber Protestants as eighty to one. Over 1000 miles of railway were open in 1900, and 90 of tramways; and there were 4400 miles of telegraph lines. The chief towns, Montevideo, Paysandú, Colonia, Minas, &c., have separate articles.

The history of all the Plate states is woven of the same materials, mostly in the same colours and patterns, and largely in one piece. Uruguay is mainly distinguished as in its earliest years a bone of contention between the Portuguese and Spaniards, and afterwards between Brazil and Argentina. The Portuguese founded the town of Colonia, opposite Buenos Ayres, at the beginning of the 17th century, when the king of Spain, to protect the trade of Peru, had limited the Buenos Ayres exports to 16,000 bushels of wheat and 25 tons each of salted beef and of tallow; and by this means much contraband trade was drawn off to Brazil, until in 1724 the governor of Buenos Ayres founded Montevideo to checkmate the Portuguese colonists. This city was carried by assault by General Whitelocke in 1807, but evacuated after his defeat at Buenos Ayres; and, during the years of revolt from the mother-country, the royal forces held it until 1814, in which year Uruguay was recognised by the congress of Tucuman as independent. Brazil, however, had at once after the Spanish evacuation seized on Montevideo, and occupied the country as the Cisplatine Province until 1825. Then Argentina, resenting this occupation, laid claim to the territory, and in the war which followed, aided by the Uruguayans (see TREINTA Y TRES), defeated both the Brazilian army and navy, till in 1828 the two powers agreed to guarantee the independence of the little republic. But its proximity to Buenos Ayres made it too easy and popular a refuge from the tyranny of the dictator Rosas, and drew down upon it his vengeance (see ROSAS). In the long wars which followed 1839 the chief event is the more than eight years' siege desperately but successfully endured by Montevideo, to whose aid came Garibaldi (q.v.). Rosas fled in 1852, and in the next eight years Uruguay enjoyed eight changes of governors. Then Brazil intervened and placed General Flores at the head of affairs; and from 1864 to 1870 the republic joined with Brazil and Argentina in the disastrous war against Paraguay, Flores being assassinated in 1868. For nearly twenty years after the republic was misgoverned by a succession of political gangs who shamelessly plundered it during their more or less brief periods of power: how far matters have improved since it might be rash to say. There was a rebellion in 1897; yet with the help of immigration and private enterprise, something has been done, in spite of misrule, to develop the country.

See Mulhall's *Handbook of the River Plate*, and Levey's *Handy Guide to the River Plate* (2d ed. 1890); Diaz, *Notice Historique* (Paris, 1878); Van Bruyssel, *La République Orientale de l'Uruguay* (Brussels, 1889); also histories by F. Banza (Spanish period; Montevideo, 1880) and De Maria (ib. 1864). *The Purple Land that England Lost*, by W. H. Hudson (1885), is readable, and gives a picture of the country in the period after Rosas.

Uruguay River rises in the Sierra do Mar in the Brazilian state of Santa Catharina, and flows in a swift course west and south to form with the Paraná the Plate estuary (see LA PLATA). It separates Brazil and Uruguay from the Argentine provinces, and has a course of nearly 1000 miles. It is encumbered by numerous rapids, but it is navigable for vessels to Salto (200 miles), and above this point steamers run as far as Paso San Isidro.

Urumiah, or URMIA, a town of the Persian province of Azerbijan, 10 miles W. of the lake of Urmia, in a wide and fertile plain; pop. 32,000. Urumiah, the seat of a Nestorian bishop, and of American and Anglican missions, was said to be the birthplace of Zoroaster (q.v.). The Lake of Urmia (4500 feet above the sea), lying in a depression between the Kurdish mountains and the hills that bound the south end of the Caspian Sea, is about 90 miles by 25, and contains numerous islands. It has no outlet, but has many feeders, some 80 to 150 miles long; the water is intensely salt, on an average only 12 or 15 feet deep, the greatest depth sounded as yet being 40 feet; fish are not found, but plenty of small crustaceans, on which various kinds of water-birds feed.

Urumtsi, the most important city in the Chinese territory of Zungaria, at the northern base of the Tian-Shan Mountains. It is in a fertile district, commands the principal route from Mongolia into Eastern Turkestan, and has a large trade with all the adjoining lands. Pop. 20,000–30,000.

Urus (*Bos taurus*), the Latin name for the wild ox, which in the time of Julius Cæsar (see *Bell. Gall.* vi. 28) was abundant in European forests. The same animal seems to have been called Aurochs by the Germans, and was the ancestor of the European domesticated cattle, and probably also of the wild cattle preserved at Chillingham and some other British parks. See Storer, *Wild Cattle of Great Britain* (1879).

Usagara, a territory in German East Africa, between Lake Tanganyika and the coast.

Usbegs. See UZBEGS.

Usedom, an island of Prussia, lies at the mouth of the Oder, and together with the island of Wollin shuts off the Stettiner Haff from the Baltic. Area, 157 sq. m.; pop. 33,000. On its east side is the port of Swinemünde (q.v.), on the south-west side the town of Usedom (pop. 1786).

Uses, a form of equitable ownership peculiar to English law. Under the old law, if A and B were enfeoffed in land, to hold it to the use of C, A and B were legal owners, but C could bring them into a court of equity, and compel them to perform the trust. Uses were employed in various ways to evade the policy of the feudal law; parliament attacked the system more than once, and at last in 1536 the Statute of Uses provided that, where one held to the use of another, the person having the benefit of the use should also have the legal estate. The effect of this enactment was just the reverse of what parliament intended; uses were freely created, in order that the statute might operate upon them, and turn them into legal estates; equitable interests were created by the simple expedient of limiting a 'use upon a use.' Trusts (q.v.) of land and modern forms of conveyancing cannot be explained without reference to the old doctrine of uses.

See the works of Williams and Challis on *Real Property*. A clear account of the system is given in Bacon's famous *Reading on the Statute of Uses*.

Ushak. See CARPETS.

Ushant (Fr. *Ouessant*), an island off the west coast of France, included in the dept. of Finisterre, with an area of 20 sq. m. and a pop. (1891) of 2490. The coasts are escarped and difficult of access; the soil is fertile. The island has two lighthouses and a telegraph station. Off Ushant an indecisive sea-fight took place on 27th July 1778 (see KEPPEL); and here too on 'the glorious first of June' 1794 Howe (q.v.) gained a great victory, capturing seven vessels, one of which, the *Vengeur*, almost immediately went down with more than half her crew—in no glorious 'suicidal sinking,' in spite of Barère (q.v.).

Ushas, Hindu goddess of the Dawn. See VEDA.

Ushaw, 4 miles WNW. of Durham, the seat of St Cuthbert's Roman Catholic College, transferred hither in 1808 from Crook Hall. See DOUAY.

Usher (or USSHER), JAMES, in Dr Johnson's phrase 'the great luminary of the Irish church,' was born in Dublin, January 4, 1581. His father, Arland Usher, one of the clerks in Chancery, was a gentleman of good estate and family; his uncle, Henry Usher (*c.* 1550-1631), was his predecessor as Archbishop of Armagh. A brother of his mother's was that Richard Stanihurst who with his sister and father turned Roman Catholic, translated the first four books of the *Æneid* into English hexameters, and wrote the Description of Ireland for Holinshed's *Chronicles*. At thirteen Usher entered the newly-founded Trinity College, Dublin, being its second scholar and eighth fellow elected by merit. His father had intended him to study law, but his death in 1598 left the young scholar free to follow his natural bent. He first made over all the family property to his brother and sisters, only keeping enough for his support during his studies. The learned Catholic Thomas Stapelton's *Fortress of Faith* led him at twenty to the study of the Fathers, and their writings he read systematically every day for eighteen years. At nineteen he argued publicly with success against the Jesuit Henry Fitzsymons; in 1600 he took his Master's degree, and was chosen Catechist reader in his college; in 1601 he received both orders on the same day, and shortly after was appointed to preach at Christ Church on Sunday afternoons before the Lord Deputy. About 1603 he became Chancellor of St Patrick's, and in 1607 he was chosen professor of Divinity in Dublin, which office he held for thirteen years. He often visited England, and became an intimate friend of Camden, Selden, Bodley, Cotton, and Evelyn. In 1620 he was made Bishop of Meath, Privy-councillor for Ireland in 1623, and Archbishop of Armagh in 1625. He took part in 1634 in the convocation which drew up the canons of the Irish Church. He had Quarles as his secretary down to the outbreak of the Rebellion. Usher left Ireland for England in 1640, and it was on this journey that Wodrow tells us in his *Analecta* he paid a visit at Anwoth to Samuel Rutherford. During the Irish rebellion in that year all his property save his books was plundered. He continued to live in England, declined to sit in the Assembly of Divines at Westminster, and for about eight years was preacher at Lincoln's Inn. He was constant in his loyalty to the throne, yet was treated with more than indulgence by Cromwell. In his last years he lived with his son-in-law, Sir Timothy Tyrrell, at Cardiff, under the roof of the dowager Lady Stradling at St Donate, Glamorganshire, and of the dowager Countess of Peterborough, in whose house at Reigate in Surrey he died, 21st March 1656. Cromwell gave him a splendid burial in the Erasmus Chapel of Westminster Abbey, allowing the Church of England burial service to be used on that occasion alone.

Usher stands distinguished amongst the theologians of any age, not more by his vast learning and sagacity than by his charity, his sweetness of temper, and his humility. We are told that at the close of his long conferences with the learned Puritan Dr John Preston the good archbishop would say: 'Come, doctor, let us say something about Christ before we part'—a thoroughly characteristic story. He was Calvinistic in theology, and moderate and tolerant in his ideas of church government. As an *circnicon* he proposed a modification of episcopacy which failed to commend itself to the zealots of either side—this was published by Dr Bernard in 1658 as *The Reduction of Episcopacy to the Form of the Synodical government in the Antient Church*. Of his numerous writings the greatest is the *Annales Veteris et Novi Testamenti* (2 vols. folio, 1650-54), which gave us the long accepted chronology of Scripture, the Creation being fixed at 4004 B.C., &c. As early as 1647 we find from the Stationers' Hall Registers that Fuller was labouring at an English translation of this work, which appeared in 1658 under Usher's own name only. Fuller acknowledges in his *Church History* that his 'wares' were from the 'storehouse of that reverend prelate—the Cape merchant of all learning.' He says further: 'Clean through this work, in point of chronology, I have with implicit faith followed his computation, setting my *watch* by his *dial*, knowing his dial to be set by the *sun*.'

Usher's *Discourse of the Religion anciently professed by the Irish and British* (1632) and *Britannicarum Ecclesiarum Antiquitates et Primordia* (1639) opened up new ground, giving in Gibbon's phrase 'all that learning can extract from the rubbish of the dark ages;' in his *SS. Polycarpi et Ignatii Epistolæ* (1644; cum appendice Ignatiana, 1647) he supported the authenticity of the Middle Form of the much contested letters of Ignatius (q.v.); the Calvinistic *Body of Divinity* (1645) was published without his consent, and part of it was denied to be his; his *De Græca Septuaginta Interpretum Versione Syntagma* (1655) was the first attempt at a real examination of the Septuagint. There is a complete edition of his writings by Professor Elrington and Dr J. H. Todd (17 vols. 1841-48-62-64); Lives by Nicholas Bernard (1656), Richard Parr (1686), Elrington, and Carr (1895). See also W. Ball Wright, *The Ussher Memoirs* (Dublin, 1889).

Usk, a river of Brecknock and Monmouth, winds 57 miles south-east to the Bristol Channel at Newport. The town of Usk, 12 miles SW. of Monmouth, with Monmouth and Newport returns a member to parliament; pop. 1417.

Uskub, or SKOPLIE, a town of Turkey, on the Vardar, 130 miles NW. of Salonica by rail, was once the residence of the Servian kings; pop. 30,000.

Ussuri. See AMUR.

Ust-Urt. See CASPIAN SEA.

Usury now means iniquitous or illegal interest, but formerly meant interest of any kind on money lent. The Mosaic law forbade a Jew to take usury from a fellow-countryman. Greek and Roman moralists mainly disapproved of any usury; the church fathers, the popes, the canon law, absolutely forbade it; hence the Jews had a kind of monopoly of usury at the Reformation. Luther condemned interest, while Calvin allowed it. The moral question is still debated, and moralists such as Ruskin have waxed fierce against the taking of interest. A long series of laws were passed on the understanding that usury was wrong, but admitting many exceptions; the usury laws, thus doing much harm and multiplying legal fictions, were finally repealed in 1839. From that time till 1900 there was practically no law on the subject, and any amount of interest could be enforced on agreement or contract. In consequence, however, of numerous cases of oppression by professional money-lenders trading under various names, and the enormous rates of interest and other charges exacted, a commission was appointed by the House of Commons in 1897–98 to inquire into the subject. The result was the passing of the Money Lenders' Act, 1900, by which all money-lenders are compelled to register their business names and addresses, and must not trade in any other under heavy penalties. When proceedings are taken by a money-lender to recover money lent, the court may take into consideration whether the interest and other charges are excessive or oppressive, and if so, may set aside any contract and give an equitable decision, and may even order the repayment of any oppressive charges already paid. See INTEREST, PAWNBROKING.

Utah, since 1894 a state of the American Union, in the Rocky Mountain region, is nearly rectangular in shape, extending from north to south 350 miles, and from east to west 280 miles, with an area of 84,970 sq. m. It lies in a great plateau region, having an average elevation of 5000 feet above the level of the sea. The Wahsatch Mountains, running north and south, and their eastern spur the Uintah Mountains, divide the territory into two widely differing portions. The division lying to the north and west of these ranges belongs to the great interior basin of the continent, from which no water escapes except by evaporation. The eastern and southern sections form a part of the basin of the Colorado River, and are noted for their lofty and broken plateaus and deep cañons. The greatest elevation is attained in the Uintah range—nearly 14,000 feet. Mounts Nebo and Baldy, the highest points of the Wahsatch range, are about 12,000 feet high. In the basin region there are some lower and parallel ranges having a general north and south trend. The prevailing westerly winds are robbed of their moisture by the lofty peaks of the Wahsatch range, and the streams which flow from the mountains find their way toward the west, ultimately discharging their waters into Great Salt Lake, or into some of the smaller saline lakes or sinks of the desert. In the valleys lying among the lateral spurs along the western side of the Wahsatch range irrigation is not difficult. On the east, however, the towering plateaus which overhang stupendous cañons have but a slight and irregular rainfall, and except in a few favoured valleys agriculture is almost an impossibility. Portions of the Colorado basin are nevertheless, especially in the rainy season, well adapted for grazing. Even in the valleys along the western base of the mountains the success of irrigation varies in different years. The streams during the spring and summer are fed by the melting of the snow on the mountain summits. If the snow chances to fall early in the winter it becomes compact, and the melting is retarded. A fall of snow late in the season lies loosely on the mountain sides, and the water reaches the valleys before the crops are ready to receive its full benefit. Much of the soil in the west is extremely fertile, but, as it lacks the necessary element of moisture on account of the insufficient altitude of the surrounding mountains, large areas of land seem destined to remain unproductive desert wastes. Great Salt Lake (q.v.), with its extraordinary percentage of saline matter in solution, is but the remnant of a vast body of fresh water which once covered western Utah.

Utah, which formed a part of the territory acquired by the United States from Mexico in 1848, had been colonised by the Mormons in 1847 under Brigham Young (q.v.), to whose administrative ability the early development of this region is in a great measure due (see MORMONS). In 1850 a territorial government was organised, and in 1868 the boundaries of the territory were definitely defined as embracing the present area of the state. Meanwhile a rapid increase in population was constantly going on—owing largely to the efforts of Mormon missionaries in foreign countries—and the question of Utah's admission to the Union as a state was earnestly agitated. Finally, at the session of the United States Congress for 1893–94, an Enabling Act was passed, under which a constitution was adopted in convention at Salt Lake City (March–May 1895) and ratified by the voters; and by proclamation of President Cleveland, January 4, 1896, Utah was admitted as a state.

The annual product of copper, lead, silver, and gold is valued at more than $11,000,000. There is also a considerable output of coal. Some $5,000,000 are invested in manufacturing and industrial establishments. Besides Salt Lake City, the important towns are Ogden, Provo, and Logan. Pop. (1870) 86,786; (1880) 143,963; (1890) 207,905.

See H. H. Bancroft's *History of Utah* (1888), and A. Lambourne's *Scenic Utah* (folio, New York, 1891).

Utakamand. See OOTACAMUND.

Uterus. See WOMB.

Utica, an ancient city of North Africa, 20 miles NW. of Carthage, originally founded as a Phœnician colony in 1101 B.C. Its ruins include an amphitheatre, an aqueduct, and the remains of quays; for a bay then carried the sea (now nearly 10 miles distant) to the site. During the third Punic war Utica submitted to Rome, and became the capital of the province of Africa. Afterwards it was the see of a bishop, till its destruction by the Arabs. Here the younger Cato (q.v.) killed himself.

Utica, a city of New York, 232 miles by rail NNW. of New York City. Regularly and substantially built, it rises in a gentle slope from the south bank of the Mohawk River, and is traversed by the Erie Canal. It contains a fine United States building, a city hall, state lunatic asylum, several hospitals, and a large and handsome Masonic Home and School (begun in 1891), is a noted market for cheese, and manufactures boots and shoes, cottons and woollens, organs and pianos, machinery, starch, &c. Pop. (1880) 33,914; (1890) 44,007.

Utilitarianism, the ethical theory which finds the basis of moral distinctions in the utility of

actions—i.e. their fitness to produce happiness. This hedonistic theory, its genesis, and its various types are dealt with at ETHICS, Vol. IV. p. 435. The words utility and utilitarian in this sense were first used by Bentham about 1802; Mill, however, believed that he first employed in philosophy the term utilitarian (which he found in Galt's *Annals of the Parish*) in 1823. Utilitarian and utilitarianism are also used loosely in a much wider sense of the view of life which would regulate all effort and action with total disregard to what is merely noble or beautiful, to culture, grace, and artistic perfection, and would look for the universal test of aims and conduct in practical usefulness alone. 'Will it pay?' becomes then the first and the final problem for this degrading and impossible Philistinism, which is the negation of all poetry and art, of ideal morals or true religion. This is of course not necessarily involved in the acceptance of a hedonistic system of ethics. The utilitarian conception of education is a preliminary apprenticeship to the future trade or occupation in life; science or some branch of science may constitute an essential part of serious education, but literature should be but pastime for leisure hours. The contrasted ideals are well shown in Herbert Spencer's *Education* and Fouillée's *Education from a National Standpoint* (trans. 1892). See also BENTHAM, MILL, &c.; and Leslie Stephen, *The English Utilitarians* (1900).

Utopia (Gr. *ou*, 'not,' and *topos*, 'a place,' equivalent to 'Nowhere'), the name given by Sir Thomas More (q.v.) to the imaginary island which he makes the scene of his famous political romance, *De Optimo Reipublicæ Statu, deque Nova Insula Utopia*, originally published in Latin at Louvain in 1516, and translated into English by Raphe Robynson (1551; 2d ed. 1556, reprinted by Professor Lumby 1880), as well as by Bishop Burnet in 1683. More represents this island as having been discovered by Raphael Hythloday, a companion of Amerigo Vespucci, but it of course is England, its capital Amaurote, London. Its laws and institutions are represented as described in one afternoon's talk at Antwerp, occupying the whole of the second book, to which, indeed, the first serves but as a framework. More's romance, or rather satire, obtained a wide popularity, and supplied (though incorrectly enough) the epithet *Utopian* to all impracticable schemes for the improvement of society.

Utraquists. See HUSS.

Utrecht (*Oude trecht*, 'old ford;' Lat. *Trajectum ad Rhenum*), the capital of a province of the Netherlands, on the 'Old' Rhine (q.v.), 23 miles SSE. of Amsterdam and 38 ENE. of Rotterdam. The walls were levelled in 1830, and formed into shady promenades, the present fortifications consisting of strong forts. St Martin's Cathedral, founded by St Willibrord about 720, and rebuilt in 1251–67, had its nave destroyed by a hurricane in 1674, so that the choir and the tower (321 feet high) now stand separate. The famous university, founded in 1634, numbers nearly 700 students, and has a library of 160,000 volumes. Other edifices are the 14th-century Roman Catholic cathedral, the town-hall (1830), the 'Pope's house' (built by Adrian VI., who was born here in 1459), the palace (in 1807) of Louis Bonaparte, &c. Utrecht since 1723 has been the headquarters of the Jansenists (see Vol. VI. p. 280). The manufactures include tobacco and cigars, woollen fabrics and carpets, salt, furniture, chemicals, machinery, &c. Pop. of the town (1869) 59,299; (1890) 86,116; and of the province (1890) 224,001, its area being 530 sq. m. Utrecht is one of the oldest cities of the Netherlands, and probably was founded by the Romans. Here the famed union of the northern provinces for the defence of political and religious freedom was formed, January 23, 1579 (see Vol. V. p. 742); and Utrecht is famous for the nine distinct treaties there concluded on April 11, 1713, which brought to a close the war of the Spanish succession (see Vol. IX. p. 779). By the treaty between France and Britain, the former ceded St Kitts, Hudson Bay, Nova Scotia, and Newfoundland (the liberty of fishing for cod being reserved), recognised formally the Hanoverian succession, engaged that the crowns of France and Spain should never be united, and that no part of the Spanish Netherlands should ever be ceded or transferred to France; whilst Spain renounced her Italian possessions in favour of Austria, and gave up Gibraltar and Minorca to Britain.

Utrecht, capital of the southernmost province of the Transvaal or South African Republic, 30 miles NE. of Newcastle in Natal. Pop. 4000.

Utrera, an old town of Spain, 19 miles by rail SE. of Seville. Pop. (1887) 15,010.

Utricularia. See INSECTIVOROUS PLANTS.

Uttoxeter (A.S. *Uttoccester*), a market-town of Staffordshire, on an eminence above the Dove, 14 miles ENE. of Stafford. It has a modern church with an ancient tower and lofty spire, a town-hall (1855), a mechanics' institute, a free grammar-school (rebuilt 1859), and manufactures of iron, nails, ropes, beer, &c. Pop. 5000.

Uvula. See PALATE, DIGESTION.

Uxbridge, a market-town of Middlesex, on the Colne, 16 miles W. of London. It has one church, St Margaret's, restored 1872; another, St Andrew's (1865), with a spire of 170 feet; a town-hall (1836); and a spacious corn exchange (1861). Pop. (1851) 3236; (1891) 8206. Commissioners met here in January 1645 to discuss terms of peace between Charles I. and the parliament, but separated the month after without coming to any agreement. See Redford's *History of Uxbridge* (1818).

Uxmal, a ruined city in the north-west of Yucatan, 40 miles SW. of Merida, with vast remains of ancient grandeur, temple-terraces (see TEOCALLI) like those at Palenque (q.v.), &c.

Uzbegs, an important branch of the Turkish family of Tartars, who constitute the chief element in the native population in Khiva, Bokhara, Khokand, and some other parts of Turkestan. In some places their blood is mixed with a Tajik (or Aryan) strain; elsewhere, with Kiptchak, Kalmuck, and Kirghiz elements. Some are still nomads, but the most are settled in towns.

V

the twenty-second letter of our alphabet, is a differentiated form of U. The two signs were at first merely the capital and the uncial forms of the same letter, which had two values, a vocalic and a consonantal. The uncial form, U, or u, has now been conveniently appropriated to denote the vowel, the capital form V being reserved for the consonantal sound. How this came about has already been explained in the article U, where the history of the symbol has been traced through the Greek *upsilon* and the Phœnician *vau* to the Egyptian hieroglyphic picture of an asp, which denoted *f*. The English sounds of *f* and *v* are closely related; they are both labio-dentals, formed by bringing the lower lip into contact with the upper teeth, *v* being the soft or voiced sound, and *f* the hard or unvoiced sound. This close relation of the sounds explains the derivation of one form from the other, and accounts for the fact that in the Anglo-Saxon alphabet there was no separate sign for *v*, the symbol *f* representing both sounds, as is indicated by the fact that in A.S. the Latin words *Virgilius* and *levisticum* were transliterated *Firgilius* and *lufestice*. It is believed that a medial *f* was pronounced as *v*, and an initial *f* as *f*. Thus in A.S. the words 'over,' 'heaven,' and 'five' are written *ofer*, *heofon*, and *fif*. The use of the symbol *v* to denote the voiced labio-dental is believed to be due to French influence, as it came in soon after the Norman conquest. Thus in the Peterborough MS. of the Saxon Chronicle, which was written before 1131, we find 'silver' and 'luve' (love) replacing the *seofor* and *lufe* of the earlier copies. In Latin the consonantal sound of *v* was that of our *w*, as is shown among other proofs by the name of the letter, which is *ve*. If the sound had been that of our *v*, which is a continuant, the name would have been *ev*, following the analogy of *ef*, *es*, and the other continuants. But the name *ve*, originally pronounced *we*, follows the analogy of *be*, *pe*, and the other explosives, and hence the sound must have been that of *w*, an explosive. The change from the explosive to the continuant sound must have taken place in France before the Frankish conquest, and from France it came to us. In Germany the symbol *v* normally retains the old value of *f*, our *v* sound being represented by *w*.

Vaal, a river of South Africa, rises in the Drakenberg, and flows W. and SW. generally along the northern border of the Orange River Colony to its junction, after a course of some five hundred miles, with the Nu Gariep or Orange River. For the Vaal River Colony, see TRANSVAAL.

Vaccination (inoculation with *vaccine*, the virus of cowpox; Lat. *vaccinus*, 'of a cow') is the pure cultivation of artificial cowpox (*vaccinia*) in the human system with the object of protecting from smallpox (*variola*). The practice was introduced by Jenner (q.v.) in 1796–98, and gradually made way in spite of the fierce opposition both of the medical profession and of the public. *Natural* cowpox is a vesicular disease of the teats and udders of milch-cows, and the vesicles contain lymph which has, when inoculated, the property of transmitting the same disease. Jenner thought that cowpox was derived from the ailment in horses' heels called Grease (see WEED), and Loy actually succeeded in producing vaccinia from this source. Ceely and Badcock produced vesicles by variolating cows (i.e. infecting them with smallpox), and Voigt, Simpson, Hime, and King claim to have succeeded, though Chauveau and Klein failed. There is no doubt protective vaccine material can be obtained from either natural cowpox, horsepox, or smallpox passed through the cow. Sir John Simon believes that cowpox is the smallpox of the cow, and this opinion appears to be justified by positive results. *Artificial* cowpox has been chiefly maintained since the time of Jenner by means of *humanised* lymph. The use of arm-to-arm instead of preserved lymph is essential to the success and efficacy of vaccination with humanised lymph. Ordinarily lymph can be taken from a vaccinated arm at the end of a week, and it should be carefully selected from the best formed vesicles upon the healthiest children. The Vaccination Acts of 1867, 1871, and 1874 made vaccination effectively compulsory in England, so that it is estimated about 95 per cent. are vaccinated. The registrar of the district must within a week of the registration of a birth deliver to the parent a 'notice of requirement' of vaccination of the child within three months of its birth in England and Ireland, and within six months in Scotland. In America vaccination is not compulsory, except indirectly, in most of the states of the Union, nor in Canada. It is in Victoria, Western Australia, and Tasmania, but not in New South Wales.

Calf-lymph.—Since 1880 the use of animal lymph has increased to an enormous extent; the use of this lymph is now obligatory in Berlin and in Saxony in public vaccination stations, and an establishment for the preparation of it exists in Berlin. Consequently there is now no active agitation against vaccination in Germany. Bovine lymph from spontaneous cowpox at Beaugency in France was introduced into the United States in 1870, and has almost entirely superseded humanised lymph. In Britain also animal vaccine has recently been found to be as manageable as humanised lymph, the station being at Lamb's Conduit Street in London. The lymph used was sent over to England in 1882 from Laforêt, near Bordeaux, from a calf vaccinated with material taken from a case of spontaneous or natural cowpox. Five calves are vaccinated every week in fifty or sixty places on the abdomen. The ordinary course run by the disease is that between three and four days after insertion of the lymph a line of inflammation appears, which on the fifth day is distinctly vesicular, and yields lymph. On the sixth day the vesicle is broader, and on the fourteenth or fifteenth day the crust is fully formed, and generally falls off about the end of the third week. The course of the vesicle is more rapid in the calf than in children, and the lymph is best on the fifth day. Part of the lymph is collected on points and sent up

Copyright 1892 in U.S. by J. B. Lippincott Company.

to the National Vaccine Establishment. A calf yields sufficient lymph for vaccinating 400 or 500 children, and more than 30,000 children have been vaccinated by Dr Cory from calf to arm since the station was started. The effects of lymph from the calf and of lymph from the infant are identical; he failed in twenty-two cases out of 5005 at the first trial, but succeeded the second time. Five vesicles are produced on each child, and the insertion success with calf-to-arm lymph is the same as that with human arm-to-arm vaccination, 96·7 per cent. Only about 1 per cent. of the cases were brought back for 'sore arms,' and these were mainly due to improper applications, plasters, &c. Out of 32,000 cases there were also thirty-eight cases of eczema and lichen, and sixteen of erysipelas.

Re-vaccination.—The claim first made on behalf of vaccination was that of equal immunity from smallpox as compared with the immunity resulting from 'inoculation,' without the danger of spreading infection. The protection was originally expected to last a lifetime, but now re-vaccination is thought advisable as early as ten years if in presence of smallpox. Re-vaccination, as a rule, gives protection for the remainder of life. Assuming that the State intends to compel complete insusceptibility, compulsory re-vaccination would be necessary. The impermanence of infantile vaccination has been ascribed to deterioration of the lymph in successive generations; but mere number of generations does not make it less effective any more than passing the contagion of smallpox through a great many generations diminishes its virulence. In 1887 in the smallpox hospitals of the Metropolitan Asylums Board out of 53,000 cases of smallpox treated 41,061 had been vaccinated. No case of smallpox has occurred during fifty years among nurses and attendants at smallpox hospitals who have been re-vaccinated before going on duty.

Protective Power of Vaccination.—The report (1884) of Sir George Buchanan shows the vast superiority as a protective against smallpox of public vaccination as compared with private vaccination, which is not supervised. Before vaccination was made compulsory, the smallpox mortality in England was double that of any other European state where it was compulsory, and 70 to 80 per cent. of the smallpox mortality in Great Britain and Ireland occurred under five years of age. Since the Vaccination Act of 1871 was passed, the smallpox mortality in the whole country has been greatly reduced, especially in the case of young children. The decennial reports for 1851–60 and 1861–70 show that the actual rates of smallpox mortality, at ages five and upwards, remained at a stand-still, and that the rates under five years had enormously decreased. Study of the London epidemics of 1876–78 and 1881–82 showed that the marked increase of smallpox at ages over five had really been the expression of an alteration in the behaviour of smallpox in this country. Statistics show that the fatality of smallpox varies (1) with the amount of vaccination possessed by the individual; (2) according to the age of those attacked; (3) according to the quality of the vaccination scars in those attacked. In addition to Mr Marson's well-known tables, Dr Gayton's report to the Metropolitan Asylums Board of 10,403 cases of smallpox shows the fatality per cent. of the attacks. He divides the scars according as they are 'good' or 'imperfect.' 'With four "good" scars there is an absolute immunity from death up to the age of fifteen, and with "good" scars, whether one, two, or three, there is an absolute immunity of death from smallpox up to the age of five.' When all the 'good' and 'imperfect' vaccinations are grouped together, it shows that from ten to fifteen and from fifteen to twenty years of age the 'good' vaccination afforded just three times the amount of protection against smallpox death that the 'imperfect' vaccination afforded. The protection against attack is of chief avail in the first few years after vaccination, and infantile vaccination cannot be relied on as lasting through adult life. According to Dr Gayton, whereas there was no death amongst those under five years who had 'good' vaccination, the percentage was 56·5 amongst the unvaccinated; from five to ten the corresponding figures were ·9 and 35·2, from thirty to forty 9·5 and 40·7 per cent., and over forty 12·5 and 43. From Dr Barry's report on the Sheffield epidemic, it appears that the rate of attack among the vaccinated and unvaccinated of the population generally is one attack among the vaccinated under ten years of age for every twenty attacks among the unvaccinated; and over ten years one attack among the vaccinated for every five unvaccinated attacks. *In invaded houses*, irrespective of quality of vaccination, there were under ten years one vaccinated to eleven unvaccinated attacks; and over ten years one vaccinated to 2·4 unvaccinated attacks. In the children under ten years of age, where there was no visible mark, or one cicatrix only, 75·7 per cent. had discrete or mild attacks, and 24·3 confluent or severe attacks; where there were two cicatrices, the corresponding figures were 88 and 12; where three cicatrices, 95 and 5; where four or more cicatrices, 97·5 and 2·5. The fatality per cent. was shown to vary according to the amount of vaccination as shown by the cicatrices without reference to their quality. With increased number and better quality of the scars produced the severity and fatality of smallpox has decreased. Diminution in the amount of fatality and mortality corresponds with the nearness of the time to the vaccination at which the patient was attacked by smallpox. The greatest protection against attack is found near to the operation of primary vaccination or re-vaccination. The greater the remoteness from the date of vaccination, the greater has been the incidence of smallpox and the fatality upon those attacked. The safeguarding is essentially in the years immediately subsequent to vaccination, and the gain especially as regards infant life. Were this decline due to improved sanitation, we should naturally expect the fall to be shared by persons of all ages. During 1872–87 the fall in the general death-rate has been 9 per cent., and in other zymotic diseases 9 per cent. for measles and 1 per cent. for hooping-cough, as compared with 72 per cent. for smallpox. The fall in 'fever' mortality has been nearly as much, but it has been at all ages.

Objections to vaccination are made on the ground of alleged injurious effects resulting from the practice. Complaints of public vaccination in England and Wales in 1888 were only ten in number out of 689,323 children vaccinated. Inquiry by medical inspectors showed two of these cases to be measles and hooping-cough concurrent with vaccination, two to be skin eruptions following on vaccination, and the remainder to be cases of erysipelas or other similar disease. The Registrar-general reports that in from forty to fifty cases annually vaccination is mentioned among the causes of death, and from 1888 onwards all such cases were to be made the subject of careful investigation. Most of the accounts of 'vaccinal accidents' come from abroad. In 1883 certain cases of *erysipelas* followed the vaccination of soldiers at Dortrecht, Holland, with humanised lymph received from a vaccination office. Seven men were attacked three days after the operation, and three died; but no official report of the cases has been published, and it is uncertain whether other cases of erysipelas were prevailing at the time. The risk of erysipelas

is greatest during the second week. On the 30th December 1880 it is alleged that *syphilis* was communicated by vaccination to fifty-eight Zouaves in Algiers. The statement that two healthy children served as vaccinifers for 280 men, and that those fifty-eight men were operated on by lymph taken from one single child, is opposed to all experience in vaccination. Mr Ernest Hart says, 'during the twenty years in which there has been systematic inspection of public vaccination in England, some millions of vaccinations have been performed, but in no single instance have the government inspectors of vaccination been able, after the most rigid inquiry, to find one single case of syphilis after vaccination.' *Impetigo contagiosa*, which is caused by pediculi, has been attributed to vaccination at Elberfeld in 1887, and in the island of Rügen in 1885. Acute *septicæmia* followed a series of vaccinations in March 1885 at Asprières, Aveyron, France, and six children died. The lymph was taken from a vesicle which had been opened twenty-four hours previously, and had been contaminated. The preponderance of evidence goes to show that *leprosy* is not inoculable, but when it occurs is due to food, such as decayed fish; leprosy has declined in Norway and Sweden since vaccination was introduced.

Opponents of the practice have attempted to show not only that smallpox has not been reduced by vaccination, but that it has actually been increased; alleging that in France the greatest smallpox mortality occurred in the best vaccinated departments, and *vice versâ*. The returns were, however, shown to be very incomplete and unreliable Körösi showed that Keller's statistics on the dangers of vaccination were falsified.

Substitutes for Vaccination.—Improved *sanitation* has been credited with the decline in the prevalence and mortality from smallpox. Dr Creighton, however, thinks that sewerage, water-supply, and nuisance removal have little influence upon smallpox. New South Wales has a system of compulsory notification with heavy fine for neglect, and power of isolating persons and things infected, or exposed to infection, for three weeks.

The Royal Commission of 1889 reported in 1897, 11 out of 13 signing the report that vaccination has a protective effect, greatest for nine or ten years, and then rapidly diminishing, but never vanishing entirely; revaccination restores the protective power. The diseases alleged to arise through vaccination are real, but are inconsiderable in comparison with the amount of vaccination performed, and are diminishing from the precautions used. Calf lymph is to be preferred; isolation, though valuable, is not a satisfactory substitute for vaccination. Two commissioners disapproved of compulsory vaccination.

The Vaccination Act of 1898 made many changes in the law. Hereafter the public vaccinator must go, if asked, to the home of the child, glycerinated calf lymph is to be used if required, and parents not vaccinating their children are exempted from penalty if they satisfy the magistrates that they conscientiously believe vaccination would be prejudicial to the health of the child.

See Cokeman, *Vaccination, its History and Pathology* (1899); Reports of Commissions (1871, 1889); Seaton, *Vaccination* (1868); Ballard, *Vaccination* (1868); Warlomont, *Manual of Animal Vaccination* (Eng. trans. 1885); *Vaccinia and Variola*, with bibliography, by the present writer (1887); and handbooks of the law by D. P. Fry (1875) and by a 'barrister-at-law' (1888); and the *Index Medicus*. *Vaccination and Smallpox*, by E. J. Edwardes (1892), is a plea for compulsory re-vaccination. Expressly in defence of vaccination are Ernest Hart, *The Truth about Vaccination* (1880), J. C. M'Vail, *Vaccination Vindicated* (1888), and Körösi (as above). Directly hostile are A. R. Wallace, *Vaccination Proved Useless and Dangerous* (1889); C. Creighton, *Jenner and Vaccination* (1888) and *The Natural History of Cow-pox and Syphilis* (1888); E. M. Crookshank, *History and Pathology of Vaccination* (1890); and the publications of the London Society for the Abolition of Compulsory Vaccination (founded 1887). The town of Leicester has taken a very prominent part in the anti-vaccination agitation. See also Germ, Inoculation, Jenner, Smallpox; and for the analogous application of inoculation, Hydrophobia.

Vacciniaceæ, an order of plants closely akin to Ericaceæ, and including the cranberry and whortleberry.

Vacuum literally means space empty of matter—i.e. empty of those ordinarily recognised realities whose properties are the objects of our perception. To empty a region once filled with matter is a practical impossibility. The Air-pump (q.v.) enables us to remove from the interior of a vessel a large fraction of the air originally contained therein. By other devices we may to a still greater degree reduce the quantity of gaseous matter filling the region; but even with the most efficient means we find it impossible to get rid of a last residuum. Thus the ideal vacuum is unattainable. The word, however, is used as applicable to the approximate realisation of this absolute emptiness, and the smaller the residuum left the higher is the vacuum said to be. Across such vacua light passes, and magnetic and electrostatic inductions take place with even greater ease than if the region were filled with air at ordinary pressure. Hence we conclude that a vacuum is after all a plenum, not of matter, in the ordinary acceptance of the term, but of some substance capable of transmitting energy. This substance we call the Ether (q.v.).

Besides the ordinary air-pump, there are several forms of apparatus useful for producing vacua. The most efficient of these are the various modifications of the Sprengel pump. In its simplest form the Sprengel pump consists of a long vertical glass tube of narrow bore, down which mercury is allowed to flow. The region to be exhausted is connected by an oblique tube with the vertical tube, at a point some 30 inches (the barometric height) above the lower end of the latter. As the mercury streams down the vertical tube the pressure at the place where the oblique tube enters tends to be less than the atmospheric pressure by an amount equal to the pressure of the mercury column from this place downwards. The air is therefore pressed out of the side tube and connected vessel into the vertical tube, and passes down with the mercury stream and escapes at the lower end. This process goes on until nearly all the air in the connected vessel has been carried away. It is convenient to measure the pressure of high vacua in millionths of atmospheres. With the most improved form of air-pump with valves and cylinders the highest vacuum attainable is 150 times the millionth of an atmosphere, whereas with an improved Sprengel pump it is possible to get a vacuum whose pressure is only 0·005 of the millionth of an atmosphere.

Vacuum-tubes, glass tubes in which a 'Vacuum' (q.v.) has been made and which have then been hermetically sealed, and into the opposite extremities of which platinum wires have been soldered, with an arrangement at the free ends of these whereby they may be connected with the secondary wires of an induction coil, or may, generally, be put into the circuit of an electric current (see Electricity). The object of this arrangement ('Geissler's tubes') is to pass a high-pressure current of electricity through the so-called vacuum, which is in reality a highly rarefied quantity of the particular gas (air, oxygen, nitrogen, &c.) with which the tube had been filled prior to exhanstion. When such a current passes, the residual gas glows with a bright light the colour of which varies with the nature of the gas in the tube, the glow being

brighter round the negative electrode, but being separated from it by a thin dark layer. The discharge is repelled, attracted, or made to turn round a magnet brought near it in the same way as a perfectly flexible current-bearing conductor would be. If any fluorescent substances, such as a solution of sulphate of quinine, or uranium glass, be placed round the rarefied gas, these will glow brightly with their own fluorescence-colours, under the influence of the ultra-violet rays, in which the light of the discharge is rich. If a part of the tube be narrow the glow is broken up into discs or striæ, the cause of which is not clear. These striæ can in some cases be rendered less numerous and at a greater distance from one another by slowing the frequency of oscillatory discharge of each make-and-break of the induction coil. This can be done by interposing in the circuit a coil of numerous convolutions. The striæ are, however, observed when the current is apparently continuous, as when the source of electricity is a battery of 500 or more Daniell's cells. Gassiott inferred that the discharge of the battery itself through a rarefied gas is not continuous but intermittent. The number and position of the striæ is altered by altering the resistance in the circuit. If the discharge is rapidly and regularly intermittent the glow is sensitive to the approach of a conductor connected with the earth or a large condenser, and is repelled or attracted thereby according to the arrangement of the apparatus. It is not necessary that the platinum terminals should be in contact with the wires of an electric circuit; it is sufficient to put them to widely different potentials, as by lowering the tube into the electric field between the knobs of a Holtz machine: the residual gas then glows without contact. The same thing occurs when the field is one of high potential and rapid alternation. If the vacuum be reduced to $\frac{1}{1000000}$th of an atmosphere the current will not pass and there is no glow. At about one-millionth of an atmosphere the molecules become so few that there are very few collisions between them. There is no light produced in the body of the gas unless these collisions occur. If the tube be less in its dimensions than the *mean free path* (see GAS) of the molecules the first collision of any given molecule leaving the negative electrode will probably be against the glass of the tube itself. The glass accordingly begins to glow with a bright phosphorescent light, but only at such points as can be reached by molecules leaving the negative electrode at right angles and travelling in straight lines. If the negative electrode be so formed as to concentrate the molecular impact upon a diamond it will shine with a green light equal to that of a candle; a ruby or aluminum oxide, bright red; glass, green. The position of the positive electrode appears to have no bearing on the phenomenon. Since the molecules travel in straight lines, any solid obstacle will cast a shadow, and the molecules exert mechanical force when they strike (see RADIOMETER); and they also produce heat which can, when they are concentrated upon a point, melt glass or even a piece of metallic iridio-platinum. These are phenomena of *Radiant Matter* or the ultra-gaseous state (Crookes) in which the ordinary properties of gases (see GAS) are profoundly modified by the absence of collisions between the molecules. Lenard, following up Crookes and Herz, discovered that the dark or invisible rays emitted from the vacuum-tubes through an aluminium 'window' would, in a dark box, take photographs; and in 1895 Röntgen (q.v.) of Würzburg found that these dark rays, the so-called Röntgen rays, when passed through the hand or other part of the body would imprint a shadow-picture of the bones on a sensitive photographic plate—a discovery speedily applied in various ways, and utilised in surgery.

Vagrants, a very numerous class of homeless persons roaming about the country, and from town to town, subsisting chiefly upon what they can beg or steal. In Great Britain it is reckoned that there are at least 60,000 vagrants. The nomadic life led by these waifs seems to possess a charm for them which proves irresistible, and they very rarely settle down to a regular occupation after they have been any length of time wandering. Vagrants have been known as a class for many centuries; and in almost every part of the world evidence has been obtained of the existence from remote times of wandering beggars whose mode of life bears striking resemblance to that of the vagrant of the present day. The Gypsies (q.v.), while having many of the same characteristics, do not usually associate with the ordinary vagrants, but belong to a class quite distinct and exclusive.

One of the most interesting and instructive records to be found concerning vagrancy is the *Liber Vagatorum, The Book of Vagabonds and Beggars*, edited by Martin Luther, and published in 1529 (Eng. trans. 1860). In it he gives a minute description of the various kinds of vagrants who were then known in the north of Europe, which may be condensed as follows:

(1) Beggars, or those who plainly and simply went about asking alms. (2) Bread-gatherers, who went about with their wives and children with them, dressed in ragged garments, collecting food, &c. These carried cooking utensils, &c. as a part of their equipment, and neither they nor their children ever left off begging from their infancy to the day of their death. (3) Liberated prisoners, who excused themselves for begging by saying they had been unjustly deprived of their liberty and character, and thus prevented from earning a different livelihood. (4) Cripples, many of whom shammed lameness or deformity. (5) Church mendicants, producing false credentials to show that they were collecting alms for religious purposes. (6) Learned beggars, young scholars or students, who said they had naught on earth but the alms wherewith people helped them, and which they would use in furthering their studies for the church or some of the professions. (7) Pretended murderers, who asserted that they had taken a man's life away, and had afterwards been seized by remorse, though it was in self-defence, and that this had driven them to a wandering life. (8) Wives of the above. (9) Lepers, or those suffering from loathsome diseases. (10) Spurious beggars, who pretended that like the Capuchin friars they were voluntarily poor. (11) Pretended noblemen and knights, who travelled about well dressed, saying that they had suffered by war, fire, or captivity, or had been driven away and lost all they had. (12) Pretended merchants, who produced documents to show that they had been possessed of merchandise which they had lost. (13) Baptised Jewesses who had turned Christians. (14) Pretended pilgrims. (15) Beggars suffering with sores. (16) Strollers professing to country-people that they were possessed of magic power, and could prevent murrain, &c. (17) Knaves with falling sickness, who took fits and assumed sudden illness. (18) Invalids alleging that they had suffered for years with incurable ailments, or whose wives or families were alleged to be so afflicted. (19) False begging priests. (20) Blind beggars. (21) Naked beggars, whose apparel was so very scanty as to arouse universal pity. (22) Silly or half-witted beggars, who, while apparently bereft of some of their mental faculties, were generally 'more knave than fool.' (23) Hangmen, who had given over their hateful avocation. (24) Women so clothed as to lead to the

belief that they were pregnant. (25) Mendicants who besmeared themselves with a yellow fluid to simulate jaundice. (26) Vagrants professing to be doing penance. (27) Blind harpers. (28) Goose-shearers, or those who put on good clothes and begged, saying that they had lain ill a long time, and were mechanics who had expended all their goods, and were ashamed to beg, but asked that they might be helped to proceed on their journey.

If one makes allowance for the changes which have taken place in the manners and customs of the people and in their modes of living, the similarity which exists between the modern vagrant and many of those described by Luther is apparent. Perhaps the most crafty of the vagrant class of the present time are to be found among the begging-letter impostors whose carefully worded epistles so often succeed in extracting contributions from the charitable. The cause assigned for these appeals is generally the death of a wife, husband, or child, or the distress which has been caused by accident or illness. The begging-letter writer generally carries on the business in such a manner as to make sure that, by the time the local police have been communicated with, the gains have been secured, and a new field of operations has been found in a distant part of the country. A considerable number of 'Indian natives' are to be found in Great Britain and over the continent of Europe who may be classed as vagrants. They go from place to place, dressed in their native costume, and subsist on the profits of small articles which they sell at street corners, and by exhibiting a printed card hung round the neck. The dress they wear, their dusky skins, and their want of knowledge of the language of the country in which they are found, form sufficient capital to enable them to live in comparative comfort, and in numerous cases even to set aside enough for their wants in old age. Representatives of this class are constantly to be found in all the large cities in the United Kingdom. Many other kinds of vagrants might be described, the most numerous amongst those not included in Luther's list being the 'Patterers' or street singers, or speech-makers, to be found in almost every country. Luther's list, however, embraces most of the vagrants of the present day. There are still the same freemasonry, slang, nicknames, and practices which formed so striking characteristics of the vagrants in the olden time. The introduction of mechanical labour, the facilities of communication between places at a distance, and the operations of the poor-laws have, however, brought about great changes among the wanderers, and the ranks of the vagrants have been swelled, especially during the last half-century, by a vast number of unsteady and unskilful workmen and labourers who are continually travelling from town to town 'in search of work.' Many of these degenerate from the 'tramp' into the habitual vagrant, whose habits they become daily familiar with. The habitual vagrant is known to the tramp as a 'moucher,' while the tramp is known as a 'traveller.' The 'common lodging-houses' to be found in all large cities are the meeting places where the 'traveller' and the 'moucher' foregather, and there is too much reason for believing that the constant recital of experiences in begging, &c. to irresolute and unsteady tradesmen is gradually increasing the enormous army of vagrants by which the country is overrun. These 'common lodging-houses' are known to their frequenters as 'doss-kens,' and those of them resorted to by juveniles as 'padding-kens.' In them the plans of operation and different routes to be followed by the begging and thieving fraternity are generally arranged, and the chances of different neighbourhoods discussed. In many of them will be found rough maps or charts showing the various roads, the houses on the way, and the chances of success which each provides. If no map or chart is to be found, there is generally no lack

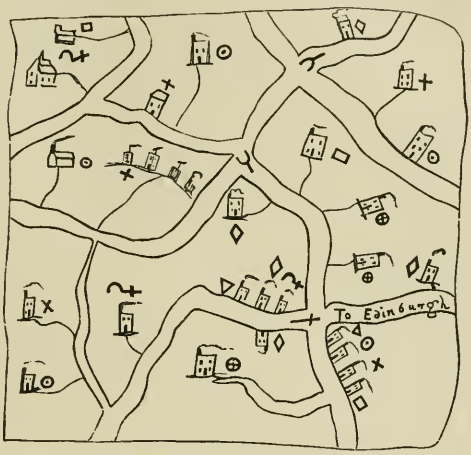


Fig. 1.—Specimen of a Moucher's Map:

- Go in this direction; the other road not good.
- Spoiled; too many vagrants call.
- Dangerous; likely to be given in charge.
- Too poor; give nothing.
- Good; safe for something if you don't talk much.
- Religious but kind.
- Stop. If you are selling what they happen to want, they'll buy; they are cute.
- Mind the dog; may give you in charge.
- Cross sticks put by Gypsies and tramps at the junction of roads to show in which direction their friends have gone before them; the long limb pointing the way.

of means of information in the persons of old members of the fraternity, who in accordance with their traditions are bound to furnish their brethren with all the assistance they can in the pursuit of their calling.

Great improvements have been made of recent years in the construction of these lodging-houses, especially regarding the sleeping accommodation, and many of the most objectionable features of the old 'doss-ken' or 'padding-ken' have been removed. More regard is paid to decency, and in

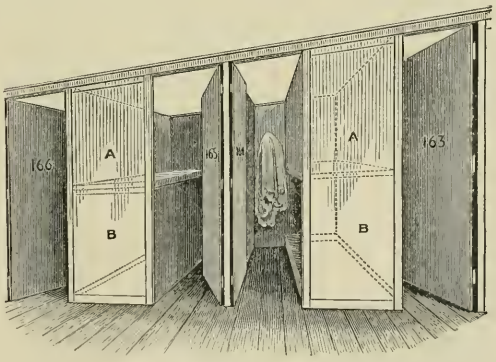

Fig. 2.—Four Sleeping Bunks in 'Castle' Common Lodging-house, Grassmarket, Edinburgh.

many of those of the best class each of the inmates is by an ingenious economising of space provided with a private apartment for sleeping. The bunks are arranged in rows in large apartments; fig. 2

shows part of one of the rows. The beds AA, BB, shown by the dotted lines, are one above the other, and have access from separate doors. In the figure Nos. 163 and 165 have the upper beds AA, and 164, 166 the lower, BB. The top of the structure being several feet from the ceiling ensures ventilation. The beds are 6 feet by 28 inches. Although separate sleeping quarters are now provided, the kitchen is still, however, an apartment in all common lodging-houses where the inmates meet together. In it the vagrants discuss their plans of operation each night, and arrange their 'work' for the following day, so as to interfere as little as possible with each other's 'business,' and their respective 'walks' are assigned with as much deliberation and care as if they were conducting legitimate trade.

Statutes for the suppression of vagrancy have been in force for many years, the principal measures in existence in England being 5 Geo. III. chap. 83, 1 and 2 Vict. chap. 38, and the Vagrant Act Amendment Act of 1873. These acts cannot be said to have materially affected the growth in numbers of the vagrant class, while it is to be feared that in many places the existing arrangements under the poor-laws have given direct and material support to vagrancy. The 'casual wards' which have been provided have been largely used by the 'mouchers,' who have thus been relieved of any anxiety they formerly had as to being able to secure sleeping quarters and a morning's meal. The shelter and society which the casual ward provided were found to act so powerfully in attracting the vagrant class that various methods had to be adopted for counteracting these influences. Tasks of work were exacted, and relief was refused to all able-bodied young men unless they produced certificates of character from some person in a public position, or unless the workhouse officials were satisfied they were actually destitute. These rules, however, are now only partially enforced, although in some places the task of work is still carried out, and in others admission is only given to the casual ward on the production of a pass from the police. Great difficulty is experienced in discriminating between genuine workmen travelling in search of work and idle, habitual tramps. Where the police have been employed as relieving officers this difficulty has been best overcome, and it is generally believed that if this course were universally followed a great improvement would be effected, and many of the inducements held out to vagrants by the present system would be removed. Experience in some parts of the United States, where the slang and the hieroglyphics of the tramps are practically identical with those of the English fraternity, proves that, while proper regard has been had to the difficulties of the genuine working-man on tramp, a firm administration of the law by the infliction of exemplary sentences upon habitual vagrants has had quite a phenomenal effect in reducing the number of that class.

See John Awdelay, *The Fraternitye of Vacabondes* (1565; ed. by Furnivall, 1869 and 1880); Thomas Harman, *Caucat for Vagabones* (1568); H. Mayhew, *London Labour and the London Poor* (4 vols. 1851-61); Avé-Lallemant, *Das Deutsche Gaunertum* (4 vols. Leip. 1858-62); C. J. Ribton Turner, *History of Vagrants and Vagraney* (1887); Paulian, *The Beggars of Paris* (trans. 1897); and the articles CHARITIES, MENDICANCY, SLANG, SHELTA, POOR-LAWS, and HAWKERS.

Vaigatch. See NOVA ZEMBLA.

Vaishnavas, the sects worshipping Vishnu (q.v.). See also INDIA, p. 106; SANSKRIT, p. 153.

Valais (Ger. *Wallis*), a frontier canton of Switzerland (q.v.), bounded on the N. by the cantons of Vaud and Bern, and on the S. by Italy. Area, 2036 sq. m.; pop. (1888) 101,837. It forms one long and deep valley, included between two of the loftiest mountain-chains of Europe—the Pennine and the Bernese Alps—and is drained by the Upper Rhone, which, rising at its north-eastern extremity, falls at the western boundary of the canton into the Lake of Geneva. The greater part of the surface consists of barren mountain-slopes—in their higher elevations covered with the greatest of the Swiss glaciers. The forests and pasture-lands supply the inhabitants with their chief occupations. The heat at the bottom of the valley, where there is a strip of corn-land, is intense in summer, and Indian corn and the vine are grown with great success. The Grimsel and Gemmi passes connect the eastern part of the valley with German Switzerland; and the Great St Bernard and Simplon (q.v.) passes connect it with Italy. Sion (q.v.) and Martigny (q.v.) are the chief towns.

Valckenaer, LODEWYK KASPAR, an eminent Dutch philologist, born at Leeuwarden, June 7, 1715, studied at Franeker and Leyden, and in 1741 became professor of Greek at Franeker, in 1766 successor to Hemsterhuis at Leyden, where he died, March 14, 1785. His works included editions of the Greek grammarian Ammonius (1739), the *Phœnissæ* (1755) and *Hippolytus* of Euripides (1768), the so-called *Epistles of Phalaris* (1777), Theocritus, Bion, and Moschus (1779-81), and posthumously the *Fragmenta* of Callimachus (1799).

Valdenses. See WALDENSES.

Valdepeñas, a town of Spain, in the province of Ciudad Real, 140 miles by rail S. by E. of Madrid. The district is celebrated for its red wine. Pop. (1887) 15,404.

Val de Travers, a valley in the Swiss canton of Neuchâtel. Near the villages of Travers and Couvet, both on the line of rail from Neuchâtel to Pontarlier, are great asphalt-mines (see ASPHALT), the stratum being over 18 feet thick.

Valdez, or VALDES, JUAN DE, Spanish reformer (1500-44), became an object of suspicion to the Inquisition by a politico-religious tractate or 'Dialogue between Mercury and Charon,' and settled in Italy, living the rest of his life at Naples. He was the centre of an influential circle of religious thinkers, including Ochino; though regarded as a heretic, he sought the regeneration of the Catholic Church from within, and never inclined to Lutheranism.

Among his works are *Spiritual Milk*, *The Christian Alphabet*, *CX. Considerations and Commentaries on Matthew*, *Romans*, *and 1st Corinthians*, some extant in the original Spanish, some only in Italian translations. The four last-mentioned works have been translated into English (1865-83). See monographs by Stern (Strasb. 1869) and Carrasco (Geneva, 1880), M'Crie's *Reformation in Italy*, and Wiffen's life prefixed to his translation of the *Considerations* (1865).

Valdivia, capital of one of the southern provinces (area, 8315 sq. m.; pop. 70,000) of Chili, on the navigable Callecalle, 15 miles above its mouth in Valdivia Bay. It has a considerable import trade. Pop. 6000.

Valence, capital of the French dept. of Drôme, is on the left bank of the Rhone (crossed by an iron bridge), below the mouth of the Isère, and 66 miles by rail S. of Lyons. It contains several interesting Renaissance buildings, an 11th-century cathedral (with a monument of Pius VI., who died here in 1799), an 18th-century Protestant temple, normal schools, a communal college, &c. Dyeing and the manufacture of silk, glass, and iron are carried on, besides a busy trade in the produce of the Isère valley. Pop. (1891) 22,947.

Valencia, (1) a seaport of Spain, formerly capital of the kingdom, and now of the province of the same name, stands on the shores of the Mediterranean, 3 miles from the mouth of the Guadalaviar and 200 miles SW. of Barcelona by rail. In the *Huerta* ('garden') surrounding the city the carob, citron, orange, palm, and mulberry grow in wild luxuriance. The old picturesque battlemented walls, erected by Pedro IV. in 1356, were removed in 1871; and while, in the old quarters, the houses are closely packed and gloomy-looking, well suited to keep out the heat, those recently erected are gaily-coloured and furnished with courts freshened with flowers and cooled by fountains. Valencia is the see of an archbishop, and its cathedral, which was commenced in 1262, classical in the interior, and Gothic on the exterior, is 350 feet long. The church of the Colegio de Corpus is quite a museum of pictures by Ribalta. The picture-gallery contains chiefly the productions of the Valencian school (Juanes, the Ribaltas, Ribera, &c.). The university has a library of 42,000 vols. The custom-house, dating from 1758, is now a cigar-factory. Silk-spinning and weaving are extensively carried on; there are also manufactures of cloths, hats, glass, linen, leather, cigars, and Valencia tiles for flooring. The exports are mainly grain, silk, rice, and fruits. Pop. (1887) 170,763; (1897) 204,768.—Valencia, or *Valentia del Cid*, dating from the second century B.C., was destroyed by Pompey, taken by the Goths in 413 A.D., by the Moors in 715, and by the Cid in 1094. The union of Ferdinand and Isabella brought it under the Castilian crown. Suchet captured the city in 1812.—The old kingdom of Valencia, now subdivided into the three modern provinces of Valencia, Alicante, and Castellon de la Plana, comprises a tract of country in the east of Spain, washed by the Mediterranean, and extending from Catalonia to Murcia. It has a hot but fine climate, a fertile soil, mineral wealth, and many industries; see SPAIN.—(2) *Valencia de Alcántara*, a town and fortress of Cáceres province, is the frontier station on the line from Madrid (250 miles ENE.) to Lisbon (159 miles WSW.). Pop. 8230.

Valencia, a city of Venezuela, capital of Carabobo state, lies close to the beautiful banks of the Lake of Tacarigua, 34 miles by rail S. of Puerto Cabello. It has a college, a normal and a technical school, several parks, and manufactories of woollens, machinery, and agricultural implements; and there is a railway from the coast. Pop. 38,654.

Valenciennes, a dark, ill-built manufacturing town and first-class fortress of France, in the dept. of Nord, stands at the entrance of the Rhonelle into the Scheldt (which flows through the town in several arms), by rail 155 miles NNE. of Paris and 58 SW. of Brussels. It possesses a citadel constructed by Vauban, an hotel-de-ville with decorated façade, and a modern Gothic church of Notre Dame with tower 272 feet high. The famous Lace (q.v.) is no longer made here, but a coarse sort is manufactured. Other manufactures are a fine cambric, cotton yarn, hosiery, linseed-oil, beet-root sugar; and the town contains extensive ironworks. The country round about is a great coal-basin, with numerous pits. Valenciennes (the *Valentinianæ* or *Valentiana* of the Romans) was ceded to France in 1678, and was taken by the Allies in 1793, after a siege of 84 days, but restored again next year. It is the birthplace of Watteau and Froissart (statue, 1856). Pop. (1872) 22,118; (1891) 24,520.

Valency. See ATOMIC THEORY.

Valens, emperor of the East from 364 to 378, and brother of Valentinian I., was born near Cibalis in Pannonia about 328, and at thirty-six was chosen by his brother as his associate in the empire. He first crushed the formidable revolt of Procopius, next reduced all taxes by one-fourth. Incapable in all things of independent judgment, Valens adopted the views of his Arian councillors, and persecuted the orthodox. After some fighting with the Goths, he concluded a six years' truce with them, the Danube being agreed upon as the frontier. The years 371–377 he spent in Asia Minor, chiefly at Antioch, and conducted with as little vigour as success an indecisive war with Sapor (Shappur II.), king of Persia, closed by a discreditable truce in 376. The prophecy of some fortune-tellers that his successor should be one whose name began with *Theod* led to the death of their young dupe Theodorus as well as many innocent men who bore names with the unlucky prefix, and to a severe persecution of those who practised magic and necromancy. About 376 the Huns began to press upon the Goths, who craved permission to cross the Danube. Valens allowed them to cross, but the terms of treaty were not kept, and the Goths, under their chief Frithigern, were quickly changed to enemies by the imperial mismanagement and faithlessness. They burned and ravaged the country, and, though driven back for a time, returned reinforced by Huns and Alans, and met the emperor in battle near Adrianople, August 9, 378. The imperial army was totally routed, and two-thirds of it, including Valens himself, left dead on the field. His successor was Theodosius.

See Gibbon's *Decline and Fall*, and Hodgkin's *Italy and her Invaders*.

Valentia, or VALENCIA, a small island off County Kerry, 5 miles long by 2 broad. In some parts fairly good in soil, it has much rocky moorland, and cliffs nearly 900 feet high at the north end. The islet is chiefly notable as the European terminus of more than one Atlantic Telegraph (q.v.). The name, long held to prove that a colony from Valencia in Spain had settled here, is most likely corrupted from the Irish *Val-inch* or *Fail-inis*.

Valentine, BASIL, a pseudonym framed to imply occult mastery over the metals (*Basilius*, 'royal;' *Valentinus*, from *valeo*), was the name given to the author of a series of alchemistic works, assumed to have flourished in Germany at the end of the 15th century. Kopp (in his *Alchemie*) and Schorlemmer have proved that the actual author was Johann Thölde, who in 1612 published the *Halographia* under his own name, and in 1644 under that of Basil Valentine. A translation of *The Triumphal Chariot of Antimony* was published in 1661. See ALCHEMY.

Valentine's Day, the 14th of February, on which, in England and Scotland in former times, each young bachelor and maid received by lot one of the opposite sex as 'valentine' for the year. It was a kind of mock betrothal, and was marked by the giving of presents. From Pepys's *Diary* we see that married as well as single people could be chosen. The usage no doubt grew out of the old notion, alluded to by Chaucer and Shakespeare, that on this day birds first choose their mates. The observance of St Valentine's day degenerated into the usage of youths and maidens sending each other by post prints of a sentimental kind, such as Cupids, transfixed hearts, and the like. Another and less pardonable form is the sending of ludicrous caricatures, often vulgar enough; but such boorish witticisms are fast dying out. Several saints of this name (one of them a martyr at Rome under Claudius) were venerated on February 14; but the observances seem to be connected rather with the spring-time than with the career or character of the saints whose name is thus taken in vain.

Valentinian, Roman emperor (364–375), was born of humble family at Cibalis in Pannonia, 321 A.D. By his capacity and courage he rose rapidly in rank under Constantius and Julian, and on the death of Jovian was chosen as his successor (February 26, 364). He resigned the East to his brother Valens, and himself governed the West with watchful care down to his sudden death at Bregetio, November 17, 375, brought on by a fit of passion. By his first wife he had one son, Gratianus (q.v.), and by the second, Justina, another son, Valentinian II., and three daughters, one of whom, Galla, became the wife of the Emperor Theodosius I.—VALENTINIAN II. was born in 372 A.D., and received from his elder brother, Gratianus, the provinces of Italy, Illyricum, and Africa, as his share of the western empire. During his long minority the empress Justina administered the government; and about three years after her death Valentinian was murdered by Arbogastes, the commander-in-chief of his army (392).—VALENTINIAN III., the grandnephew of the preceding, being the son of Constantius III. by Placidia, the daughter of Theodosius the Great and Galla, was born about 419 A.D., and was seated on the throne of the West by Theodosius II., emperor of the East, in 425. Valentinian was a weak and contemptible prince, and never really ruled during the thirty years that he sat disesteemed and unhonoured on the imperial throne; his mother, Placidia, governed till her death in 450, and was succeeded by the eunuch, Heraclius, one of those malignant fribbles who swarmed around the throne of the falling empire. His treatment of Bonifacius made the latter throw himself into the arms of Genseric (q.v.), chief of the Vandals, and thus lost Africa to the empire. Aëtius, the buttress of his empire, he stabbed to death in a fit of envious jealousy (454), but next year was himself slain by Maximus, whose wife he had ravished.

Valentinians, a Gnostic sect founded by Valentinus, who went from Alexandria to Rome about 140 A.D., and died there, or in Cyprus, about 160. The distinguishing feature of his system lies, in the first place, in his recognising heathenism as a preparatory stage of Christianity; and then in his dividing the higher spiritual world into fifteen pairs of æons, each consisting of a male and a female. The first pair, or syzygy, is made up of the unfathomable profundity Bythos, or God in Himself, and Ennoia, or God as existing in His own thoughts; from these emanated next Nous ('mind') and Aletheia ('truth'), Logos ('word') and Zoe ('life'), Anthropos ('man') and Ecclesia ('church'). As the last æon, Sophia ('wisdom'), transgressed the bounds that had been laid down by the æon Heros, and a part of her being became lost in Chaos, there was formed a crude being, called Achamoth (Heb. *chochmah*, 'wisdom'), which, through the Demiurgos that emanated from it, created the corporeal world. Heros now imparted to the souls of men a *pneumatic* or spiritual element, but this only attained to full activity when Christ, a collective emanation from all the æons, appeared as Saviour, and united Himself with the man Jesus. In the end all that is pneumatic, and even the originally psychic or soul element in as far as it has assimilated itself to the psychic, will return into the Pleroma. The chief Valentinians were Heracleon of Alexandria, Ptolemy, and Marcus of Palestine. See GNOSTICISM, and Lipsius, *Valentinus und seine Schule*, in the *Jahrbücher für Prot. Theologie* (1887).

Valenza (*Valentia*, or *Forum Fulvii*), a town of Northern Italy, on the Po, 9 miles by rail N. of Alessandria. Pop. 6466.

Valera. DON JUAN VALERA Y ALCALÁ-GALIANO, Spanish writer and politician, was born of good family at Cabra (Cordova), 18th October 1824, and in the diplomatic service lived successively at Naples, Lisbon, Rio, Dresden, and St Petersburg. He next plunged into politics, contributing actively to Albarada's opposition journal, *El Contemporaneo*, and thereafter rose and fell with the fortunes of his party, as deputy, minister of commerce, plenipotentiary to Frankfort, minister of public instruction, ambassador at Lisbon, Washington, Brussels, councillor of state, senator, and member of the Spanish Academy in Madrid. His *Estudios críticos sobre literatura* (1864) and *Disertaciones y juicios literarios* (1882) brought him reputation; but his fame depends on his romances, *Pepita Jiménez* (1874; Eng. trans. 1891), *Las ilusiones del Doctor Faustino* (1876), *El Comendador Mendoza* (1877), and *Doña Luz* (1878). Besides these he has published poems (1858), Dramatic Experiments (1878), short stories (1882), and *Cartas Americanas* (1889).

Valerian (*Valeriana*), a genus of plants of the natural order Valerianaceæ, an order of exogenous plants, containing nine genera and about 300 known species, natives of temperate climates, chiefly of Europe, the mountainous parts of India, and South America; annual or perennial herbs, sub-shrubs or rarely shrubs, with opposite leaves, destitute of stipules, and small flowers in cymes. They are nearly allied to Dipsacaceæ (see TEASEL) and Compositæ, but differ in the mode of inflorescence, and in the seeds being destitute of albumen and other intrinsic features. The genus Valeriana is distinguished by a pappus-like calyx, a spurless corolla, and three stamens. The species are pretty numerous. The common Valerian (*V. officinalis*) is abundant in ditches, moist woods, &c. in Britain, throughout Europe, and in northern Asia, and is cultivated in the United States. It has a fleshy root, pinnatifid leaves, a stem 2 to 4 feet high, and pale flesh-coloured flowers. The root is a well-known medicine, which possesses powerful antispasmodic and stimulant properties, and a very considerable influence over the nervous system (being used in hysteria, chorea, &c.). Cats are very fond of it, and it exercises a remarkable stimulating and intoxicating power over them. Although the plant grows chiefly in damp soils, the root is most powerfully medicinal in dry hilly ground. The chief ingredients of valerian are woody fibre, resinous and gum-like matters, and a little more than 1 per cent. of a volatile oil, in which *valerianic* or *valeric* acid (also obtained from several other sources) is developed on exposure to the air. Some of the salts of valerianic acid act with more certainty than the tincture and other officinal preparations.

Valeriana officinalis.

The Small Marsh Valerian (*V. dioica*) is much less powerful than the common species. The Greater Valerian (*V. Phu*) grows in alpine districts of the continent of Europe, and is perhaps the *V. dioscoridis* of the Greeks. *V. celtica* and *V. salinuca*, gathered on the mountains of Styria and

Carinthia, are used in India to aromatise baths, and as a substitute for Spikenard (q.v.). *V. sitchensis*, a native of the north-west of America, possesses the medicinal properties of the genus. The root of *V. edulis*, a species found in the north-west of America, was an article of food with the Digger Indians. Corn Salad (q.v.) or Lamb's Lettuce belongs to the order Valerianaceæ; and Red Valerian is *Centranthus ruber*.

Valerianus, P. Licinius, Roman emperor (253–260), was proclaimed emperor by the legions in Rhætia after the murder of Gallus. He was then about sixty, and he assumed as colleague his eldest son Gallienus (q.v.). Throughout his reign trouble hovered on every frontier of the empire, but as the East appeared most threatening Valerian set out at the head of an army, and was suddenly attacked and completely defeated at Edessa (260). He languished till death in hopeless captivity, subjected to all the cruelties an oriental imagination could suggest. It is said that he was tortured into betraying to Sapor the city of Antioch and the passes of the Taurus, and that after his death his skin was stuffed, painted purple, and preserved as a trophy of victory.

Valerius Flaccus. See Flaccus.

Valerius Maximus, a Roman author, who, about 29–32 A.D., wrote in a bombastic style a somewhat miscellaneous collection of historical anecdotes. There are recent editions of the *Factorum et Dictorum Memorabilium Libri IX.* by Halm (1865) and Kempf (2d ed. 1888).

Valetta (*La Valetta*), a fortress and beautiful city, capital of Malta, on the north-east side of the island. It occupies a rocky tongue of land over 3000 yards long, on either side of which are two noble harbours which are well worthy of the city's importance as chief naval station of Britain in the Mediterranean. The town and harbours are defended by a series of fortifications of great strength, many of them hewn out of the solid rock, and, mounted with the most powerful artillery, considered impregnable. The city proper on the rocky ridge has several suburbs on the other side of the harbours or on minor spits running into them. Besides the enormous forts, balconies, and battlements which are the principal architectural characteristics of the city, Valetta contains many noble edifices. The governor's palace—formerly that of the Grand-masters of the order of St John—is plain without, but magnificent within, and possesses an interesting armoury; the cathedral of St John is a superb structure; and the church of San Pubblio, with its famed *sotteraneo* ('vault') of embalmed monks and skeletons, the public library of 60,000 vols., the university, and the aqueduct, which brings water to the city from the far side of the island, a distance of 8¾ miles, are worthy of notice, as well as many of the palazzi of the Maltese nobles. There is a railway to Rabat in the interior. The city was named after the Grand-master La Valette, though there were fortifications and dwellings here long before that date. Valetta is the centre of the commerce of the island (see Malta, and map given there). Pop. of Valetta (1891) with its suburbs of Floriana and Sliema, 37,350; of the other 'three cities' or suburbs of Senglea, Cospicua, and Vittoriosa, 24,802; collectively 62,152.

Valette, Jean Parisot de La (1494–1568), born of a noble family of Toulouse, entered the order of the Knights of St John, of which order he was elected Grand-master in 1557. His life thenceforward is a series of exploits in warfare with the Turks, culminating in his famous defence of Malta, lasting from 18th May 1565 till 8th September. The Turks had 159 war-ships and 30,000 men; the defenders were 8500 men, with 700 knights, and unsupported held the fortifications heroically in spite of awful loss and privations, till the approach of a Neapolitan fleet caused the Turks to raise the siege. The veteran commander died 28th August 1568. See Malta, Hospitallers.

Valguarnera, a town of Sicily, 16 miles E. by N. of Caltanisetta. Pop. 11,341.

Valhalla, Valkyrjur. See Scandinavian Mythology.

Valla, Laurentius, a great humanist of the Renaissance, born in 1405 at Rome, where, and afterwards at Florence, he studied the classics, which he taught chiefly at Pavia. Having incurred many enmities, he shifted his quarters from one university town to another, much to their advantage and his own, till he found a protector at Naples in King Alfonso V., whose military fortunes he shared by sea and land. Rehabilitating Epicurus against scholastic depreciation, he was expelled from Rome, whose claims to temporal power he attacked. Continuing to lead an actively controversial and scholarly life, he was prosecuted by the Inquisition in the diocese of Naples, but underwent neither condemnation nor punishment. In 1448 we find him again in Rome as apostolic secretary to Nicholas V., whom he eulogised as 'the common father of the learned.' He died 'worn out by continual alternations of humiliation and redress,' in the flower of his age, in 1457. His vagrant, agitated life considered, he wrought marvels for scholarship and literature. Latin style (as commemorated by George Buchanan in two famous epigrams) owes him the deepest debt, while his versions of Xenophon, Herodotus, and Thucydides, made from texts which he had himself to purify, if not actually construct, extort even still the admiration of philologists. His scientific insight into language and idiom was only less than his gift of eloquence and invective. New Testament criticism he signally advanced by his comparison of the Greek original with the Vulgate. His *Elegantiæ* of Latin speech was long a class-book in the schools; while his *De Donatione Constantini Magni* remains a weapon valued by assailants of the temporal power.

See Mancini's brilliant and exhaustive monograph (Florence, 1891) for the investigation and settlement of disputed points in Valla's life, and Symonds, *The Renaissance in Italy* (1877).

Valladolid, a famous city of Spain, sometime capital of the whole country, and still capital of a province of Old Castile (q.v., and see Spain), stands on a plain on the left bank of the Pisuerga, 150 miles NW. of Madrid by rail. It is 2200 feet above sea-level, and has a healthy climate, the air being pure and the sky generally cloudless. The Museo contains such of the statues, carvings, and sculptures as could be collected at the suppression of convents in the province. The Classical cathedral (1585) was never finished; there are some fifteen other churches. Of the once numerous monasteries the Dominican house, of which Torquemada was prior, is now a house of correction, and that of the Benedictines is a barrack. The university dates from 1346. The Scots College here was long the only seminary for the education of Scots Catholics; see Scotland (Ecclesiastical History). Some of the squares are very large. The city, which contains a royal palace and many other public buildings, is fortified. Manufactures are springing up; silk, cotton, and woollen stuffs, jewellery, hats, paper, perfumery, chemicals, gloves, &c. are manufactured; there are iron-foundries; and though the place has a dull appearance, trade and industry have lately grown. The province is a great corn-field. Pop. (1887) 62,018; (1897) 68,746. Valladolid, the *Pincia* of Ptolemy, is first men-

tioned as *Vallisoletum* in 1072. Charles V. erected many splendid edifices here. About this time Valladolid was the most prosperous city in Spain, containing 100,000 inhabitants. Formerly capital of Castile and Leon, it was still the usual residence of the kings. In 1560, under Philip II. (who was born here), Madrid was declared the only court; and from this time the prosperity of Valladolid declined. In 1808 it was sacked by the French, and much damage done to buildings and pictures.

Valladolid, a town of Yucatan, founded in 1543, 90 miles ESE. of Merida. Pop. 3500.—See also MORELIA.

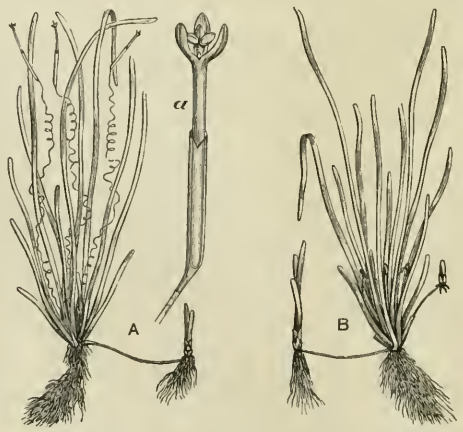
Vallauri, TOMMASO, Latinist, was born in 1805 at Chiusa di Cuneo, and in 1843 became professor at Turin. He has published editions of numerous Latin classics, including Plautus, Horace, Cicero, Sallust, Curtius, in whole or in part, besides dictionaries, epitomes, books on the literature of Piedmont, and an autobiography (1879).

Vallejo, a port of California, on San Pablo Bay, 31 miles by rail NE. of San Francisco. It has a good harbour, ships large quantities of grain, and contains shipyards and several factories. Here, on Mare Island, is a navy-yard. Pop. (1890) 6343.

Valleyfield, a town of Quebec, on the St Lawrence, 54 miles by rail SW. of Montreal. A fall of 15 feet supplies water-power, and the place contains a cotton-mill employing 1000 hands, woollen, flour, and saw mills, canning and door and sash factories, &c. Pop. 6500.

Valleys, low-lying or hollow tracts on the earth's surface between mountains or elevated ground. They are generally parallel to the direction of the ridges; but some are transverse, cutting through mountain-chains. As a rule they have a watercourse at or near their lowest level. The origin of valleys and their growth are dealt with in numerous articles in this work: see EARTH (Vol. IV. p. 164), DENUDATION, GEOLOGY (Vol. V. p. 149), MOUNTAINS, LAKE, and especially RIVER; besides those on notable valleys, as that of the Colorado, Yosemite, &c., and the mountain-systems which enclose such—Alps, Appalachians, &c.

Vallisneria, a genus of the natural order of plants Hydrocharideæ. Its one species, *V. spiralis*,



Vallisneria spiralis:
A, female plant; *a*, female flower; B, male plant.

is an aquatic found in fresh-water lakes and streams in the tropical and warm regions of the earth. They generally grow in running waters. *V. spiralis* is particularly celebrated on account of its peculiar process of fecundation. At the time when this is to take place the flowers of the female plants rise to the surface of the water by means of their long spirally-twisted stalks. The flowers of the male plants, in order to follow them thither, become detached, having previously grown on short stalks at the bottom of the water, and expand, liberating their pollen, which, floating about upon the surface, comes in contact with the female flowers which are stationary. After fecundation the female flowers return under the water by the spiral contraction of their stalks, and the fruit is ripened under water. This plant is found in ditches and bogs in Italy and the south of France, and is frequently grown in aquaria in Britain and other countries. Considerable depth of water should be provided for it, as the leaves are long, and should always be submerged.

Vallombrosa ('Shady Valley'), a celebrated abbey among the Apennines, 15 miles E. of Florence, in a valley surrounded with forests of fir, beech, and chestnut trees. Here an order of Benedictine monks was founded about 1038. They became very wealthy through donations, and the present magnificent buildings were erected in 1673. In 1869 the monastery was suppressed; but the place is still much visited by artists and tourists. Vallombrosa was visited by Dante, celebrated by Ariosto in the *Orlando Furioso*, and is mentioned by Milton in the *Paradise Lost*.

Valls, a manufacturing town of Spain, 12 miles N. of Tarragona. The French defeated the Spaniards here in 1809. Pop. 13,500.

Valmy, a French village in the department of Marne, 20 miles NE. of Châlons. Here on 20th September 1792 took place the famous 'cannonade of Valmy,' in which the Prussians under the Duke of Brunswick maintained for some hours a heavy fire on the army of the republic, and then retreated (see DUMOURIEZ). The loss was trifling on either side; but Valmy has not unjustly been treated by Creasy as one of the great battles of history, inasmuch as it was the first triumph of the republican arms—a triumph by which, with characteristic impulsiveness, the French were transferred from the depths of despair to the very pinnacle of self-confidence. When Napoleon was creating his 'noblesse' this great service rendered to France by Kellermann was fitly remembered by his title of *Duc de Valmy*.

Valois, HOUSE OF. See FRANCE, Vol. IV. p. 778. The ancient Valois, first a county, then a duchy, now forms part of the depts. of Oise and Aisne.

Valonia, a vegetable product very extensively used by tanners, in consequence of its being rich in tannic acid. It is the acorn-cup of a species of oak (*Quercus ægilops*) indigenous to the Levant. It is largely exported from Asiatic Turkey and to a less extent from Greece.

Valparaiso ('Vale of Paradise'), the second city of Chili, and next to San Francisco the principal American port on the Pacific, is situated on the bay of the same name, 115 miles by rail WNW. of Santiago, and 881 W. of Buenos Ayres by the Trans-Andine Railway. The bay is horseshoe shaped, open towards the north, and in winter a dangerous anchorage. The city is built chiefly upon a gently sloping plain at the head of the bay, which is, however, cut up by many ridges of hills that terminate in bluffs near the water's edge, and that are often so steep as to require staircases to pass from one part to another. Its long streets of busy shops and handsome private buildings, with several imposing churches, trams, gas, and here and there the electric light, suggest much more a European than a South American city. The old town, El Puerto, contains the vast customs warehouses, huge elevators, the mole and harbour,

wharves, the exchange, post-office, and municipal palace, with a bronze statue of Lord Cochrane in the plaza in front; above it rises the Cerro Alegre, with a Protestant church and the pretty houses of some of the foreign merchants. In the eastern portion of the city, where the houses are mostly of one story, are the theatre and railway station. Batteries crown the heights and also guard the harbour. Valparaiso's imports exceed £5,000,000 and its exports £2,000,000. It suffered from earthquakes in 1822 and 1851; was bombarded by a Spanish fleet on 31st March 1866, when much property was destroyed; and after a great three days' battle near by, August 21–23, during the civil war of 1891, fell to the insurgents on August 27, when looting and incendiarism cost the city nearly $2,000,000. Pop. (1900) 143,050.

Valpy, Richard, D.D., was born in Jersey, 7th December 1754, and had his education at Valognes in Normandy, Southampton grammar-school, and Pembroke College, Oxford. He took orders in 1777, was the successful head-master of Reading grammar-school (1781–1830), as well as rector of Stradishall in Suffolk from 1787, and died at Kensington, 28th March 1836. His Greek and Latin grammars carried his name far beyond the bounds even of the large influence of a head-master of fifty years.—His brother, Edward Valpy (1764–1832), was head-master of Norwich School from 1810, and left *Elegantiæ Latinæ* (1803), and an edition of the Greek Testament (3 vols. 1810).

Valtelline (*Val Tellina*, Ger. *Veltlin*), the rich and fertile valley of the upper Adda down to its influx into the Lake of Como. In a wider sense the term covers the whole of that part of Lombardy which includes this valley, as well as Chiavenna and Bormio, corresponding to the modern province of Sondrio. The 120,000 inhabitants speak a dialect of Italian akin to the Romansch (q.v.). In the 16th century the district became subject to the Swiss canton of Grisons (q.v.); the latter, however, steadily resisted the efforts of the Valtellines to secure citizenship, which resulted in the bloody Valtelline war (1620). The Grisons was victorious, and governed the Valtelline more oppressively than ever, till at the petition of the inhabitants Napoleon incorporated the country with the Cisalpine republic, and the Valtelline has since shared the fortunes of Lombardy and Italy.

Valuation is the process of fixing the price or rent to be paid for a piece of property. Surveyors and valuers are often called upon to advise persons who propose to become purchasers, lessees, or mortgagees of real estate; trustees are, generally speaking, bound to take a professional opinion before advancing trust moneys on the security of land, &c. When property is required as a qualification for a franchise or office the law prescribes the rules for ascertaining the value. Again, property must be valued in order to determine the taxation to which it is subject; thus the whole property of a deceased person is valued for probate and succession duty. Domesday Book (q.v.) contains a valuation for feudal purposes of the lands of England, except the four northern counties. When revenue was raised by means of subsidies the burden was distributed 'according to the faculties of men'—i.e. according to ability to pay: land, offices, and personal property were all valued for taxation. In 1692 a new valuation was made for land-tax, and lands continued to be assessed as in that year until the Act of 1798 by which the old land-tax was rendered permanent, and means were provided for its gradual redemption. The true land-tax of our own day is the landlord's property-tax collected under schedule A of the Income-tax Act. See Griffith's *Valuation*.

Valuation of Lands in Scotland seems first to have been made in the 13th century. Next century a new valuation was made by authority of parliament; and as prosperity increased this *new extent*, as it was called, came to be much above *old extent*, and the new was often fixed by adding a certain proportion to the old extent. Under Cromwell and after the Restoration the total sum to be raised by taxation was first fixed, and then distributed amongst the counties, commissioners having the power to alter the old valuation. The *valued rent* thus arrived at was the basis of the land-tax till 1854, when the commissioners of supply in counties and the magistrates in burghs were directed to make a valuation roll annually showing the value of all lands and heritages within the county or burgh, according to which roll all local assessments were to be made, and assessors were to be appointed to carry out the act. By the Local Government Act, Scotland, 1889, the powers of the commissioners of supply were transferred to the county councils.

Value, one of the fundamental conceptions of political economy, has been the subject of many controversies, and has been variously defined. Usefulness does not determine value in the economic sense. Air is eminently useful, but it is not valuable in that sense: hence 'value in use' is distinguished from 'value in exchange,' and the latter is treated as the only meaning relevant to economic science. Thus value depends on usefulness and difficulty of attainment. There can be no absolute standard of value; but to avoid too rapid and violent fluctuation values are usually measured by the precious metals (see Money). A *general* rise of values is impossible; if there is a general rise in prices this means that the value of money has fallen. Mill established three laws of value, varying as the objects dealt with were (1) absolutely limited in quantity, like pictures by a dead artist; (2) capable of being increased by proportionally greater labour, like agricultural produce from a limited area; (3) capable of being increased indefinitely without increased cost of production. Ricardo's too abstract doctrine that value depends simply on the quantity of labour expended implies disregard of interest, profits, risk, different rates of wages, and other elements of the question.

For Marx's doctrine of surplus value, see Marx, Socialism. On the wide subject of value generally, see the works of Ricardo, Mill, Fawcett, Jevons, and other works cited at Political Economy.

Vambéry, Arminius, traveller and philologist, was born at Szerdahely in Hungary, 19th March 1832. At twelve he was apprenticed to a ladies' dressmaker, but afterwards took to teaching. Next he entered a school at St George, Presburg, helped by various friends; he was soon able to speak Latin with fluency. In 1846 he entered a school at Coronation, where he struggled to support himself, undaunted by want and privation. His holidays were spent in tramping through the country; at sixteen he was conversant with several languages. A strong desire for eastern travel led him to Constantinople, where he applied himself to the study of Oriental languages. In 1858 he issued a German-Turkish dictionary. He was made corresponding member of the Hungarian Academy, and in 1861 he received a travelling stipend of a thousand florins. In 1862–64 he travelled in the disguise of a dervish, by routes unknown to Europeans, through the deserts of the Oxus to Khiva, and thence by Bokhara to Samarcand. His position precluded him from making instrumental observations for the purposes of geography, but was eminently favourable to an insight into the customs and language of the peoples visited.

His valuable *Travels and Adventures in Central Asia* (Lond. 1864) was written out in three months from meagre pencil notes on scraps of paper. As a result of his experience he has spoken and written in favour of British influence in the East as against the rule of Russia. In his periodical and other writings Vambéry supports the idea that the rule of England in the East is most beneficent, that of Russia the least so. He has repeatedly visited England and lectured on this subject.

His other publications are partly philological and ethnographical, partly also historical and political. To the former belong his works relating to the Eastern Turkish and Tartar languages, such as the ethnography of the Turks, the origin of the Magyars, &c., whilst the latter comprise his *Wanderings and Adventures in Persia* (1867); *Sketches of Central Asia* (1868); *History of Bokhara* (1873); *Central Asia* (1874); *The Origin of the Magyars* (1882); *Arminius Vambéry, his Life and Adventures* (1883); *The Coming Struggle for India* (1885); and, with Heilprin, *Hungary* (1887), besides several contributions to the present work.

Vampire. One of the most gruesome superstitions in the world is that of the Vampire, of the dead leaving their graves to destroy and prey upon the living. It is characteristically Slavonic, though by no means exclusively so, and it is strongest of all in White Russia and the Ukraine. It still dominates the popular imagination in Russia, Poland, Servia, among the Czechs of Bohemia, and the Slovaks of Hungary, and also in a less degree in Albania and Greece. The modern Greek term for a vampire is βουρκόλακας, which Bernhard Schmidt identifies with the Slavonic name of the werewolf (Bohemian, *vlkodlak;* in Bulgarian and Slovak, *vrkolak*), the regular name for a vampire in Servia being *vukodlak*. The Russian *vampir* (South Russian, *upuir*, anciently *upir;* Polish, *upior*) in his earthly life was a wizard, a witch, a werewolf, a suicide, or one cursed by his parents or the church. But even an innocent man may involuntarily become a vampire by himself falling a victim to one, or merely by a cat or a bird accidentally crossing his corpse before its burial. And we find a survival of this notion in Henderson's account of how the Northumbrians at once put such a cat to death. Such bodies do not decay in the kindly earth, for when a vampire's grave is opened no trace of death is seen on the corpse; he lies turned in his grave, with fresh cheeks, open staring eyes, the skin, hair, and nails still growing. During the night he rises from his grave and sucks the blood of sleepers, who pine and die while he draws his nourishment from their life. He can only be laid to rest by a stake (in Russia of aspen) being driven through his body at a blow—a custom only abolished in the case of suicides in England by 4 Geo. IV. chap. 52. Sometimes when he first awakes in the grave to his unhallowed shadowy life he begins to gnaw his own hands and feet, or to chew his shroud, causing his kindred to pine away and die. In many cases such witches only devour the hearts of their victims, or steal them out of their bodies, substituting for them the heart of a cock or a hare, and so destroying the nature. The stolen heart they expose over a magic fire in order to create hopeless love-longings in the breast from which it was taken—an idea which Jakob Grimm says lies at the foundation of our metaphorical phrases within the vocabulary of love of 'giving' or 'stealing one's heart.'

Such a notion of a nocturnal demon eating out the souls or hearts and sucking the blood of men gives to the primitive mind a natural and rational explanation of such phenomena as a patient seen becoming from day to day, without apparent cause, thin, weak, and bloodless. We find it widely prevalent in popular folklore, and imbedded in the doctrine of folk-medicine, sorcery, and witchcraft everywhere, and Dr Tylor refers it directly to the principles of savage animism. We need not linger over Afanasief's mythological interpretation of how the sucking of the sleeper's blood symbolises the drawing of rain from the clouds by the thunder-god and the spirits of the storm at the close of the death-like sleep of winter. The likeness to the corpse-eating *ghouls* of Oriental folklore and the *'alûkah* of Proverbs xxx. 15 is apparent, and scarcely less the points of contact with the still more widely-spread superstition of the Werewolf (q.v.). Teutonic mythology has parallels enough of animated corpses returning to satisfy a thirst for blood or their carnal appetites, and it is a commonplace of popular folklore that it is fatal to meet a *revenant* of any nature. Hertz notes that little is known of regular 'corpse-spectres' among races which burn their dead, and Hanusch maintained that therefore the ancient Slavonians who burned the dead must have borrowed the vampire superstition from some other race. But, as Ralston points out, it is not certain that burial by cremation was universally practised by the heathen Slavonians, Kotlyarevsky's conclusion being that there never was any general rule, some burying without burning, others burning first and then burying the ashes.

See W. R. S. Ralston's *Songs of the Russian People* (1872) and *Russian Folk-tales* (1873); W. Mannhardt, 'Ueber Vampyrismus' in vol. iv. (Gott. 1859) of the *Zeitschrift für Deutsche Mythologie;* W. Hertz, *Der Werwolf* (Stuttg. 1862); and Richard Andree, *Ethnographische Parallelen und Vergleiche* (Stuttg. 1878).

Vampire-bat, a name given to various kinds of bats, as being supposed to suck blood like the vampire, though few of those so called really indulge this propensity. Thus some of the frugivorous bats called 'flying foxes' (see BAT) of Asia, Africa, and the Malay Archipelago are so termed; so are some of the South American insectivorous Chiroptera; so are several genera of the Phyllostomatidæ (see figure at BAT), especially the perfectly harmless *Phyllostoma spectrum*, two feet in expanse of wing, with a well-developed nose-leaf. The real blood-suckers belong to the genera Desmodus and Diphylla, forming the family Desmodidæ, found in Central and South America. These have a bifid foliaceous appendage, two large projecting incisor teeth, and two lancet-shaped superior canines, and they attack cattle and horses and sometimes human beings when asleep.

Van, a walled town of Turkey in Asia, capital of a vilayet, stands near the south-eastern shore of Lake Van, 145 miles SE. of Erzerum. Once the capital of an Armenian kingdom, it is situated in a very fertile plain on the borders of Armenia and Kurdistan, contains mostly mud-houses of two stories, and narrow, dirty streets, and has some manufactures. Pop. 35,000, mainly Turks, with some Armenians and Kurds. It claims to have been the 'city of Semiramis.'—The LAKE OF VAN is a considerable inland sea, 80 miles long and about 30 in breadth; area, 1200 sq. m. It has no visible outlet. In its brackish waters a kind of bleak is caught, salted, and exported.

Vanadium (sym. V, equiv. 51·2), a rare metal of little practical importance. The name was first given to a substance then believed to be an elementary metal, but which has since proved to be a compound. The discovery of this substance, the vanadiate of lead, was made by Del Rio in 1801, but it was not till 1867 that the metal itself was first prepared by Roscoe. Vanadium possesses a silvery lustre, and has a specific gravity of 5·5. It burns readily in a flame or when heated in oxygen. It is used for making aniline black, for colouring porcelain, and in metallurgy.

Vanbrugh, Sir John, dramatist and architect, was the grandson of a Protestant refugee of Ghent, and the son of a Cheshire sugar-baker, and was christened in London, 24th January 1664. He was educated in France, and hardly had he returned than his wit, his handsome figure, and his geniality won for him a footing in society. In 1695 he was made one of the commissioners for finishing the palace at Greenwich for the purposes of a hospital. His first plays were the *Relapse, or Virtue in Danger*, brought out at Drury Lane with great success in 1697, and the *Provoked Wife*, produced at the theatre in Lincoln's Inn Fields. He then in partnership with Congreve started an unsuccessful theatre in the Haymarket, and there brought out the *Confederacy*. In 1702 he built Castle Howard in Yorkshire for the Earl of Carlisle, and such was now his reputation that he was commissioned to erect Blenheim House. The queen supplied from her private purse the money required, and Marlborough left a fund to meet the architect's claims, but the imperious duchess not only refused to pay Vanbrugh his salary, but dismissed him from his office. Finally he got nearly all the money that was due to him, but naturally ever after was the sworn foe of the Duchess of Marlborough. In 1714 he was made comptroller of royal works, was knighted at the accession of George I., acted as Clarencieux king-at-arms from 1705 to 1725, and died at Whitehall, March 20, 1726, leaving his *Provoked Husband* unfinished. Vanbrugh's plays lack the polish and refinement of Congreve's, but are free from his artificiality and laboured brilliancy. The interest is well sustained throughout; the characters are real, natural, and racy, the situations striking, and the dialogue bright and vigorous. But he is grossly indecent beyond all the allowable bounds of humour, and his grossness seems in grain. He failed pitifully in his attempt to repel the onslaught of Jeremy Collier. His architectural works are massive and pictorial; and if they gave rise to the witticisms of Swift and Pope, they gained the praises of Sir J. Reynolds. See the edition by W. C. Ward (1893), and select plays by Swaen (1896).

Van Buren, Martin, eighth president of the United States, was born 5th December 1782, the son of a small farmer, at Kinderhook, New York. He became office-boy to the village lawyer, studied hard, and was called to the bar in 1803. Long before this, however, he had developed a precocious interest in politics, and at the age of eighteen we find him already member of a nominating convention. In 1812 and 1816 he was elected to the state senate, and in 1815–19 he was state attorney-general. In 1821 he entered the United States senate, of which he was a member until his election in 1828 to the governorship of New York. In the same year he zealously supported Jackson for the presidency, and in 1829 he was rewarded with the portfolio of secretary of state. This he resigned in 1831. Two years later he was elected vice-president, and in 1835 president, but by a popular majority of less than 25,000, and that largely owing to his declared opposition to the 'slightest interference' with slavery. Van Buren's four years of office were darkened by the gloom of financial panic; but what one man could he did to lighten it, by wringing from congress its assent to a measure for a treasury independent of private banks. This and his firm adherence to obligations of neutrality during the Canadian rebellion of 1837 are his most statesmanlike acts, but both cost him popularity and votes: in 1840 he and his party were overwhelmingly defeated by the Whigs. He lost the nomination in 1844, because he opposed the annexation of Texas; and his nomination by the Free Soil party in 1848 only secured the return of the Whig candidate and the rejection of both Democrats. This was his last important appearance, and he died at Kinderhook, 24th July 1862. Van Buren was a master of the politician's arts, but he used his great skill for what he counted the highest ends. He loved not to follow, but rather to make public opinion and a party for himself; for he had on the whole a statesman's soul and not a place-hunter's. So we see him often doggedly ranging himself on the unpopular side—favouring negro suffrage, and opposing an elective judiciary. He was intensely partisan, trained a Jefferson Democrat, and loyal to his early teaching; yet his political antipathies did not destroy his warm private friendship for great opponents such as Henry Clay.

See Lives by W. L. Mackenzie (Boston, 1846) and E. M. Shepard ('American Statesmen' series, 1888), and George Bancroft's eulogistic *Martin Van Buren to the End of his Public Career* (New York, 1889).

Vancouver, a town of British Columbia, the terminus of the Canadian Pacific Railway (1887), stands on Burrard Inlet (at its head is Port Moody, formerly the terminus; pop. 3000), 2906 miles by rail W. by N. of Montreal. Its site a dense forest till 1885, it now possesses miles of well-made streets, lit by gas and electricity, electric trams, a handsome opera-house, a hospital, three parks, many good buildings of brick and granite, extensive wharves and warehouses, smelting-works, &c., and has a regular steamship service to China, Japan, San Francisco, and Alaska. Pop. (1890) 14,000.

Vancouver Island, belonging to British Columbia, lies in 48° 19′—50° 53′ N. lat. and 123° 17′—128° 28′ W. long., and is separated from the mainland by Queen Charlotte Sound, Johnstone

Strait, and Strait of Georgia, which taken together form an open sea-way. The island is 278 miles in length, and from 50 to 65 miles in breadth; area, 15,937 sq. m.; pop. 30,000. Its outline is boldly picturesque. The shores are marked by abrupt rocky cliffs and promontories, by pebbly beaches and sheltered coves, with fine harbours. The western shores are gloomy and frowning in aspect, deeply indented by fiord-like arms of the sea, the banks of which are formed by steep rocks rising like walls. The whole country is more or less densely wooded, except where the mountain-summits afford no foot-hold for plants, or where open grass-lands occur. There are no navigable rivers, and the streams, which are torrents in winter, and are nearly dry in summer, are short, and are valuable

only as supplying power for mills. The climate resembles that of southern Britain; the warm Pacific Gulf Stream striking the coast preserves a mild and agreeable temperature; and in the south-east, where there is much less rain than in the north or on the mainland, snow seldom falls. Only a small proportion of the surface is suited for agriculture—perhaps a million acres. Fruit-culture is profitably carried on. The island is very rich in minerals. Besides gold, silver, copper, iron, &c., it possesses great fields of excellent coal, at Nanaimo in particular: the annual output much exceeds 1,000,000 tons. Good fishing banks lie off the coast, and fish and fish products to the value of $1,200,000 annually are exported from Victoria (q.v.), the capital. Esquimalt (q.v.), a naval station, has an admirable harbour, with docks and fortifications.

The island was discovered in 1592 by Juan de Fuca, and visited in 1792 by Captain George Vancouver (1758–98), an officer in the British navy; but the first permanent settlement was not made till 1843, when the Hudson Bay Company built a fort and trading post where Victoria now stands. Its later history, along with other information, will be found at COLUMBIA (BRITISH).

Vandals, a Teutonic race, settled at their first appearance in history in the north-east of Germany in the region between the Vistula and the Oder. Thence they moved southward, suffered severe defeats from Aurelian, and later from the Goths under Geberich, and were permitted by Constantine to settle in Pannonia, where they became Christians of the Arian pattern. But at the beginning of the 5th century, urged, said his enemies, by Stilicho, they entered Gaul, and crossed the Pyrenees into Spain in 409. The Asdingian section settled in Galicia, and were almost entirely destroyed in the struggle with the Goths and Suevi; the Silingian Vandals, together with the allied Alans, settled in a part of Bætica, which received from them the name of *Vandalitia* (Andalusia). In 429, on the call of the rebel to the empire, Bonifacius, governor of Africa, they crossed the Strait of Gibraltar, under their dreaded leader, Genseric (q.v.), carrying such devastation and ruin from the shores of the Atlantic to the frontiers of Cyrene that their name has lived on the lips of man for fourteen centuries. After the death of Genseric (477) his son, Hunnerie, cruelly persecuted the Catholics, and kept the Mediterranean in terror by his piracies. His successors, Guntamund (d. 496) and Thrasamund (d. 523), were comparatively mild and tolerant rulers, but luxury had already begun to weaken the fibre of the ancient Vandals. Hilderic showed such strong leanings towards Catholic orthodoxy that his subjects grew discontented, and he was overthrown by his uncle, Gelimer, in 530. The Emperor Justinian sent Belisarius against the latter in 533, and the year after he surrendered, and was carried to Constantinople in triumph. Most of the Vandals were drafted into the imperial army, and sent to perish in the endless wars with Persia.

See the various histories of the Roman Empire, but especially Papencordt, *Geschichte der vandalischen Herrschaft in Africa* (Berl. 1837); also Felix Dahn's *Könige der Germanen* (part i) and Hodgkin's *Italy and her Invaders* (vols. ii. and iii.). See also Wrede, *Ueber die Sprache der Wandalen* (Strasb. 1886).

Vandamme, DOMINIQUE JOSEPH, general, was born 5th November 1771 at Cassel, in the dept. of Nord, and during the revolutionary war was distinguished as commander of the Chasseurs de Mont-Cassel. In 1799 he was a general of division, fought at Austerlitz, reduced Silesia in 1806 and 1807, and repeatedly commanded an army corps, but was defeated and taken prisoner at Kulm in 1813. He held a command during the Hundred Days, and after the second restoration was exiled, but returned from America in 1824 to die at Cassel, 15th May 1830. See the Life by Du Casse (1870).

Vanderbilt, CORNELIUS, was born on Staten Island, New York, in 1794, and at the age of sixteen bought a boat and ferried passengers and goods across to the city. Gradually extending his enterprise, by the age of forty he had become the owner of beautiful sound and river steamers running to Boston and up the Hudson; in 1849 he founded a line, *viâ* Lake Nicaragua, to California, and during the Crimean war he established a line of ocean steamships to Havre. A little later he transferred his capital from steamships, and at the age of seventy entered on a great career of railroad financing, gradually obtaining a controlling interest in a large number of roads, until he extended his system to Chicago. The Grand Central depôt in New York City was erected by him. At his death in 1877 he left a fortune of some $100,000,000, nearly all to his eldest son; shortly before he had given $1,000,000 to found Vanderbilt University at Nashville.—His son, WILLIAM HENRY (b. 1821), had been business manager of his father's railroads, and afterwards greatly extended the Vanderbilt system. He died in 1885, and was succeeded by his two eldest sons, Cornelius (1843–99) and William Kissam, his principal heirs. See Croffut, *The Vanderbilts and the Story of their Fortune* (1886).

Vanderdecken. See FLYING DUTCHMAN.

Van der Goes, HUGO, a Flemish painter of the school of Van Eyck, was born in Ghent, and was dean of the painters' guild there in 1473–75. Soon after he withdrew to a monastery at Soignies, where he died bereft of reason in 1482. Only one of the works attributed to him—a triptych in the hospital of Santa Maria Nuova at Florence, consisting of an adoration of the infant Christ by the Virgin, with portraits—is indisputably genuine. The famous Stewart triptych at Holyrood is believed by good judges to be his; and there are works attributed to him in the National Gallery and many continental collections.

Vandevelde, WILLIAM, the Elder, was born at Leyden about 1611. Till 1657 he practised his calling as a marine painter at Amsterdam, then settled in England, and became painter of sea-fights to Charles II. and James II. He died in London in 1693.—WILLIAM VANDEVELDE, the Younger, was born at Leyden or at Amsterdam in 1633, and in due time followed his father to England, where Charles II. employed him and gave him a pension of £100 a year. He died at Greenwich, 6th April 1707, leaving behind ample justification for his fame as one of the greatest of marine painters. Smith catalogues 330 of his paintings.—ADRIAN VANDEVELDE, his brother, born at Amsterdam in 1639, gained high estimation as an animal and landscape painter, and died 21st January 1672. See E. Michel, *Les Van de Velde* (1892).

Van Diemen's Land. See TASMANIA.

Van Dyck, SIR ANTHONY, portrait and history painter, was born at Antwerp, 22d March 1599, the seventh child of Frans Van Dyck, a silk and woollen manufacturer of the city, and his second wife, Maria Cuypers, a lady celebrated for her skill in embroidery. In 1609 he entered the studio of Hendrik Van Balen, a capable painter of the place; in his fifteenth year he began to study under Rubens, and in 1618 he was admitted a master of the Antwerp Guild of St Luke. He soon came to be recognised as the most promising of the pupils of Rubens. In the contract, dated 1620, for the decoration of the Jesuit Church of Antwerp it was stipulated that he was to assist his master in

the production of thirty-nine pictures; and the 'Christ Bearing the Cross,' in the church of the Dominicans, may be referred to as a work of this period. In 1620 the Earl of Arundel was advised that 'his works are beginning to be scarcely less esteemed than those of his master;' and in the end of that year Van Dyck made a brief visit to England, when he appears to have executed the full-length of James I. at Windsor. In 1623, by the advice of Rubens, he started to study in Italy; and, on his way, he is said to have fallen in love with a beautiful country girl of the little village of Saventhem, near Brussels, and to have delayed there, painting his famous 'St Martin dividing his Cloak,' still in the parish church, and a 'Holy Family,' since lost. The investigations of M. A. Wauters and other critics, however, have thrown doubt upon the details of this traditionary episode in the painter's life.

Arrived in Venice, he devoted himself to an enthusiastic study of the masterpieces of Titian, Giorgione, and Veronese; and, passing to Genoa, he executed there a series of noble portraits, strongly impressed with the influence of Italian art, many of which are still preserved in the palaces of the families for whom they were painted. In Rome he resided for nearly two years, producing a 'Crucifixion' for Cardinal Bentivoglio, and for the pope an 'Ascension' and an 'Adoration of the Magi.' After visiting Turin and Sicily, he again worked in Genoa, and by 1628 he had returned to his native city, where he painted his great 'Ecstasy of St Augustine' for the chapel of the Augustine monastery, a work spoiled by the changes insisted on by the monks, various subjects for the Célibataires, and the splendid 'Christ crucified between two Thieves' for the church of the Récollets at Mechlin, now in the cathedral there. It was about this period that he executed the fine series of *grisaille* portraits of eminent contemporaries which were published as engravings by Martin Vanden Enden, and with additions in 1641 by Giles Hendrix of Antwerp. In some twenty of these plates the painter himself etched the heads, and in their early states, before the line-work of the engravers has been added, these prints are greatly valued. The astonishing spirit, vigour, and expressiveness of the lines by means of which the features are rendered entitle Van Dyck to rank as one of the master etchers of the world.

In 1629 the painter again visited England, but he received little encouragement, and soon returned. We next find him at the Hague, painting the Prince of Orange and his family, Christian, Duke of Brunswick, and Count Ernest of Mansfeld; and in the spring of 1632 he again came to London, under the patronage of the Earl of Arundel, and was warmly received by Charles I., who had been impressed by his portrait of Lanière the musician, and had purchased his 'Armida and Rinaldo.' He was knighted by the king, appointed his principal painter in ordinary, installed at Blackfriars, and assigned a country residence in Eltham Palace; and in 1633 a pension of £200 was bestowed upon him, which, however, was very irregularly paid. One of his earliest works during this residence in England was the group of the king, queen, and two of their children, at Windsor; and during the next eight years he painted nearly every distinguished person connected with the court. About 1639 he married, through the influence of the king, Maria Ruthven, granddaughter of the first Earl of Gowrie. Leading a careless life and lavish in his pleasures, Van Dyck suffered from pecuniary straits; and frequently he found difficulty in obtaining payment for the royal commissions. He proposed to decorate the walls of the banqueting-room at Whitehall—the ceiling of which had been painted by Rubens—with a history of the order of the Garter, and prepared sketches of the subjects, but the work was never carried out. The greater part of 1634 and 1635 was spent in the Netherlands, when he painted Ferdinand of Austria, brother of Philip IV., now at Madrid, and many other portraits, and such religious subjects as 'The Adoration of the Shepherds,' in the church at Termonde, and 'The Deposition,' now in the Antwerp Museum; and at this time he was elected honorary president of the Antwerp Guild of St Luke. In 1640 he visited his native city for the last time, and then passed to Paris, hoping to be employed by Louis XIII. on the decoration of the Louvre; but here again he was unsuccessful, though he received other commissions. On his return to England he found that political troubles were distracting the country. His own health was now permanently broken, and he died in his house at Blackfriars, 9th December 1641, and was buried in Old St Paul's.

By universal consent Van Dyck is one of the most refined and graceful of painters. His portraits are full of expression, easy and natural in their attitudes, and the hands, in particular, are most elegant in form and pose. His religious subjects are distinguished by correctness of design, delicate blending of tones, and truth and purity of colouring. Most of the great English galleries contain examples of Van Dyck's art. Rich collections of his portraits were included in the Manchester Art Treasures Exhibition of 1857, and the National Portrait Exhibition of 1866; and in 1887 a special exhibition of 166 of his works was brought together in the Grosvenor Gallery. Seven of his works are in the National Gallery. These include his portrait of Cornelius Vander Geest, and the noble equestrian portrait of Charles I., purchased for £17,500 from the Blenheim Palace collection in 1885.

Vane, Sir Henry, was born at Hadlow, Kent, 26th May 1613. His father, 'old Sir Henry' (1589–1655), was a bustling and time-serving statesman, who rose to be principal secretary of state, but who, having, with his son, been a chief agent in Strafford's destruction, was six months later deprived of his offices, and sided thereafter with the triumphant party. 'Young Sir Henry' in his 'fourteenth or fifteenth year was awakened from good-fellowship,' and at Magdalen Hall, Oxford, whither he passed from Westminster in 1628, appears to have embraced those republican principles for which he afterwards became so famous. His travels to Vienna and Geneva (1631) confirmed him in his aversion to the government and discipline of the Church of England; and in 1635 he sailed for New England—the refuge of disaffected spirits in those days. He was chosen governor of Massachusetts; but his advocacy of toleration, and bias to the Antinomian views of Anne Hutchinson (q.v.), soon robbed him of his popularity, and in 1637 he returned to England. He married in 1640 a daughter of Sir Christopher Wray of Ashby, Lincolnshire; in the same year entered

parliament for Hull; and through his father's influence was made joint treasurer of the navy and knighted. Already, however, he had formed a close friendship with Pym and Hampden; and when the Civil War broke out no man was more conspicuous in the military and theological politics of the time than Vane. He relinquished the profits of his office (equivalent now to £30,000 per annum); he carried to the Upper House the articles of impeachment against Archbishop Laud; he was a 'great contriver and promoter of the Solemn League and Covenant' (though in his heart he abhorred both it and presbytery, and used them solely to attain his ends); with Cromwell he engineered the Self-denying Ordinance and the New Model (1644–45); and through the ten years 1643–53 'he was unmistakably the civil leader—that in the state, said his enemy Baxter, which Cromwell was in the field.' So, too, the sonnet by Milton. But he had no share in the execution of the king, and he did not view with satisfaction the growing power of Cromwell and the army. On the establishment of the Commonwealth he was appointed one of the Council of State; but it was largely Cromwell's dislike to his redistribution bill (1653) that prompted the dissolution of the Rump, when Vane's protest, 'This is not honest,' was met by Cromwell crying out with a loud voice, 'O Sir Henry Vane, Sir Henry Vane! the Lord deliver me from Sir Henry Vane.' Retiring to his Durham seat, Raby Castle, he there wrote his *Healing Question* (1656), whose hostility to the protectorate brought him four months' imprisonment in Carisbrooke Castle. On Cromwell's death he returned for a while to public life, but in the July following the Restoration was arrested and sent to the Tower. Thence he was shifted to the Scilly Islands, and thence brought back two years later to be tried for high-treason. Charles II. wrote to Clarendon, 'He is certainly too dangerous a man to let live, if we can honestly put him out of the way;' and on 14th June 1662 Vane was beheaded upon Tower Hill. Christopher, the youngest of his seven sons, was raised to the peerage by William III., and from him the Duke of Cleveland is descended. Vane's is a puzzling character, for he was a singular compound of a sane and far-seeing statesman, pure and high-minded withal, and of a fanatical and impracticable Fifth Monarchist. Rightly to comprehend him one should study his incomprehensible writings.

See the Lives by George Sikes (1662), Charles W. Upham (Sparks's 'American Biography,' Boston, 1835), John Forster ('Statesmen of the Commonwealth,' 1840), and James K. Hosmer (Boston, 1888).

Van Eyck. See EYCK.

Vanilla, a genus of epiphytal Orchideæ, natives of tropical America and Asia. They are distinguished from most other orchids by their climbing habit; they cling with their aerial roots to the stems of trees or to rocks, attain the height of 20 or 30 feet, and obtain their chief sustenance from the atmosphere. There are about twenty species comprised in the genus. The flowers are thick, fleshy, and fragrant, but dull in colour. Vanilla is remarkable among orchids as possessing the only species of the order that has any economical value. From the fruit of several species the vanilla of commerce is obtained, the best being produced by the West Indian species, *V. planifolia*, which is now cultivated in many tropical countries. The fruit is cylindrical, about a span long, and less than half an inch thick. It is gathered before it is fully ripe, dried in the shade, and steeped in a fixed oil, generally that of the cashew nut. It contains within its tough pericarp a soft black pulp, in which many minute black seeds are imbedded. It has a strong, peculiar, agreeable odour, and a warm, sweetish taste. Benzoic acid is sometimes so abundant in it as to effloresce in fine needles. Vanilla is much used by perfumers, and also for flavouring chocolate, pastry, sweetmeats, ices, and liqueurs. Balsam of Peru is sometimes used as a substitute for it. When the fruit of vanilla is fully ripe a liquid (*Baume de Vanille*)

Vanilla planifolia, portion of stem with spike of flowers: *a*, a seed pod.

exudes from it. Vanilla has ripened its fruit in British hothouses, but the flowers are apt to fall off without fruit being produced, unless care is taken to secure it by artificial impregnation. This is, in some measure, the case even in India and in some parts of America itself.

Vanini, LUCILIO, freethinker, was born at Taurisano in the Neapolitan territory in 1585, and at Naples and Padua studied the new learning of the Renaissance and the newer learning of physical science, qualified as *doctor utriusque juris*, and took orders as priest. But his 'naturalist'—anti-Christian and anti-religious—views soon brought him into collision with the church. Having taught in various parts of France, Switzerland, and the Low Countries, he had to flee from Lyons to England, where also he was imprisoned. At Genoa, Paris, and Toulouse he was constantly in trouble for his heresies, and at Toulouse he was arrested and condemned to first have his tongue cut out, then to be strangled, and finally to be burned to ashes (19th February 1619). From his *Amphitheatrum Æternæ Providentiæ* (1615) and his *De Admirandis Naturæ Arcanis* (1616) it is plain that, if he was not an atheist, he taught pantheism of an extreme type; and he was more notable for vanity and audacity than for learning or speculative originality. But as an innovator he has many points in common with Bruno (q.v.). There are monographs by Fuhrmann (1800), Vaisse (1871), and Palumbo (1878). See John Owen's *Skeptics of the Italian Renaissance* (1893).

Vanloo, JEAN BAPTISTE, a member of a family originally Flemish, in which a love of art seemed indigenous, was born at Aix in Provence in 1684. He painted successively at Nice, Toulon, and Aix, visited Genoa and Turin, and was sent by the Prince of Carignano, son-in-law of the Duke of Savoy, to study at Rome under Benedetto Luti. After a further residence at Turin, he proceeded in 1719 to Paris, and speedily acquired a great reputation as a portrait-painter. He was made a member of the Academy in 1731, and professor of

Painting in 1735; visited London, where he painted Colley Cibber and Sir Robert Walpole; and died at Aix, 19th December 1745.—Charles André Vanloo, his younger brother, was born at Nice, 15th February 1705. He also studied at Rome under Benedetto Luti, and then settled in Paris, but later returned to Rome. At Turin he painted for the king of Sardinia a series of subjects illustrative of Tasso, after which he returned to Paris, and was appointed in 1735 a member of the Academy, and later a knight of the order of St Michael, and chief painter to the king. He died at Paris, 15th July 1765.

Vannes, a seaport town of France, capital of the dept. of Morbihan in Brittany, stands at the month of a tributary of the Gulf of Morbihan, 10 miles from the sea. The cathedral (13th to 15th centuries) is the most important edifice; but the town possesses also an old Maison du Parlement and many carved houses, and a rich museum of Celtic antiquities. Manufactures of woollens and ropes and some shipbuilding are carried on; and the small port has some trade. Pop. (1881) 16,667; (1891) 19,625.

Vannucci. See Perugino.

Van Rensselaer, Stephen, eighth 'patroon' of the vast estate near Albany, now forming three entire counties, which was first acquired by Killian Van Rensselaer (1595–1644), was born in New York, 1st November 1765, educated at Harvard, and in 1783 married a daughter of General Philip Schuyler. He was a leader of the Federalists in his state, and served in the state senate and assembly, and in congress from 1823 to 1829. For a while during the war of 1812 he held command on the northern frontier, and captured Queenston Heights; but the refusal of his cowardly militia to cross the Niagara River enabled the British to recover the place, and the general resigned in disgust. He was a moving spirit in the construction of the Erie and Champlain canals, and president of their boards from 1811 till their completion in 1825; and in 1824 he founded at Troy the Polytechnic Institute which bears his name. He died 26th January 1839.

Vansittart, Nicholas, afterwards Lord Bexley, was the son of a governor of Bengal, and descendant of a family originally from Sittart in Jülich. Born in 1766, and called to the bar in 1791, he entered parliament as a Tory in 1796, and after a mission to Denmark held a series of posts in successive ministries till in 1812 he succeeded Mr Perceval as Chancellor of the Exchequer, and in 1823 was raised to the peerage and made Chancellor of the Duchy of Lancaster. In 1810 he proposed (against Horner) the motion against resuming cash payments to the Bank of England; at the exchequer he left a large surplus. He was president of the Bible Society, and zealous in religious and philanthropic work. He died 8th February 1851.

Van Veen, an occasional name for the meritorious Haarlem painter, Martin Jacobsz Heemskerk (1498–1574).—Otto Van Veen was a native of Leyden, born *c.* 1556. He studied art at Liége and Rome, settled first at Brussels, next at Antwerp, where the great Rubens was his pupil. Van Veen stood high in the favour both of Parma and the next governor, the Archduke Albert of Austria. He died in Brussels about 1634.

Vapour. See Matter, Fluid, Gas, Steam.

Var, a dept. in the extreme south-east of France; area, 2349 sq. m.; pop. (1872) 293,757; (1891) 288,336. The dept. receives its name from the river Var, which formerly served as its boundary on the east, but which, since the arrondissement of Grasse was taken from Var and added to the Alpes Maritimes, now belongs entirely to the latter. Var is well watered by a great number of streams, of which the chief are the Gapau, Argens, and Bianson. In the north and north-east it is mountainous, being traversed by a branch of the Alpes de Provence, called the Monts de l'Esterel. Between the mountains and the watercourses are many very fertile valleys. The climate, tempered by the altitude of the surface, is pleasant. Fruits of all kinds are here cultivated with remarkable success; tobacco is grown, and much wine is produced. The dept. abounds in minerals, and carries on an active commerce. It is divided into the three arrondissements of Draguignan, Brignoles, and Toulon. Capital, Draguignan.

Varallo, an Italian town in a beautiful valley amidst the foothills of the Pennine Alps, 35 miles NW. of Novara by rail; pop. 2500. On the Sacro Monte there is a famous Calvary.

Varangians. See Northmen, Russia, p. 40.

Varanidæ. See Monitor.

Varasdin. See Warasdin.

Vardö, a small town on the narrow Norwegian island of Vardö, at the eastern extremity of Finmark (pop. 1322). Here over 5000 fishermen come in the spring to fish; whaling with harpoon-guns is busily carried on, and the carcasses are towed to Vardö to be boiled.

Varennes, a town of 1900 inhabitants in the French dept. of Meuse, 18 miles NW. of Verdun, where Louis XVI. and his family were captured in the attempt to escape across the frontier, 22d June 1791. See book by O. Browning (1892).

Varese, a town of Northern Italy, at the end of Lake Varese (7 sq. m.), 18 miles by rail W. of Como, with delightful climate and surroundings. An old Roman and Lombard city, it has an old ducal palace, a church with a fine tower (246 feet), and manufactures of silk, &c. Pop. 5872.

Variation, in Music, a transformation of a melody by melodic, harmonic, contrapuntal, and rhythmic changes. The subject chosen is called the theme; it is first simply harmonised with or without an introduction, and then repeated in a variety of different transformations, and the variations collectively with the theme constitute the piece. Occasionally the different variations are combined by an intermediate passage; but generally each has its separate close, and the whole terminates with an extended and richly-developed variation, or a coda.

Variation is the departure in any direction from the mean character of the species. When the variation in a large number of individuals, generally more or less isolated in space, is of a marked and constant type, the group of individuals which exhibit such variation is termed a variety. On the Darwinian Theory (q.v.) the existence of variation in the individuals of a species under nature is essential to natural selection, which proceeds by the elimination of those individuals varying in such manner as to render them unsuited to the conditions of their existence; just as the similar variation of domesticated animals and plants is the basis of artificial selection, which proceeds by the intentional choosing out of those individuals varying in any desired or desirable direction.

A question which is to-day much discussed among biologists is whether variation is determinate or indeterminate in direction; that is to say, whether organic forms have or have not any tendency to vary in particular ways. According to the extreme advocates of the Darwinian Theory there is primitively no tendency to any special mode of variation, any existing tendency being the result of the selection of those individuals

which chanced to vary along these particular lines. According to other biological observers and thinkers there is, apart from the guidance of natural selection, an inherent bias, differing in different groups of organisms towards variation in determinate lines. This may be due to the inheritance of characters individually acquired under the stress of surrounding conditions (direct environmental determinism); or to constitutional tendencies inherent in the individuals of each species, and analogous to the inherent tendencies of inorganic substances, such as *calcite* or *aragonite*, *hornblende* or *augite*, to assume definite crystalline forms (innate specific determinism); or to the deep-seated antithesis of nutrition and reproduction as conditioned by the organic nature of the species (protoplasmic or physiological determinism).

It has been claimed by certain American biologists that palæontological evidence establishes the existence of determinate variation. The teeth and the limb-bones of more than one series of fossil ungulates are found to exhibit variation along definite and determinate lines. The facts may be admitted; but the reasoning based thereon is inconclusive. The variation adduced is confessedly along lines that are advantageous to the individuals in which it occurs. It would, therefore, on the Darwinian Theory, escape that elimination which would be the fate of non-advantageous and neutral variations. This may be made clearer by an illustration. Suppose a pendulum free to swing in any direction. Let a number of slight impulses indeterminate in direction be applied to it, but let all those which are in any but one particular direction be damped down and thus eliminated. Let this occur many times in succession, and the result will be that the pendulum will swing with considerable amplitude in the determinate direction through the checking of the oscillations in all other directions. So, too, if the teeth of mammals varied indeterminately, and if all variations save those along one line (or several correlated lines) were neutral or non-adaptive, these latter would be eliminated through inter-crossing, while the adaptive variation would become evident. In the fossil forms the variations along non-adaptive lines would be so slight as to escape detection, while those in a plus or minus direction along adaptive lines would be assigned to different stages in the evolution of the variation in question.

We seem forced, therefore, to the observation of existing forms if we would settle the question of the determinate or indeterminate nature of variation. Even here the difficulties are great if not insuperable. For if we take the individuals descended from a particular pair of parental organisms, it is scarcely possible to prove that determinate variation, should it be found to occur, is not the result of hereditary idiosyncrasy peculiar to those parents. And if we take the adult individuals of the species indiscriminately, it is scarcely possible to prove that determinate variation, should it be found to occur, is not the result of the elimination, at an early stage of life, of those individuals which were found wanting in this adaptive variation.

A. R. Wallace and others have tabulated some results of the observation of variation in the state of nature; and Wallace has shown that variations in size or length of particular parts are considerable, 'usually reaching 10 or 20, and sometimes even 25 per cent. of the varying part,' and occurring in 5 to 10 per cent. of the specimens examined. These results incidentally show that in the species under examination there was no very rigid elimination, and that inter-crossing did not suppress variations from the mean to such an extent as is sometimes supposed.

As a concrete example of variation we may take that which is found to occur in the 'wing'-bones of bats as observed and tabulated by the present writer. The wing of the bat was selected (1) because the bones are readily measured even in dried specimens; (2) because they form mutually related parts of a single organ; and (3) because they offer facilities for the comparison of variations, not only among the individuals of a single species, but also among several distinct species. The bones chiefly concerned are those of the arm and forearm, the metacarpals, and the phalanges of the digits. A glance at the tables dealing with the noctule (*Vesperugo noctula*), the long-eared bat (*Plecotus auritus*), the pipistrelle (*Vesperugo pipistrellus*), and the whiskered bat (*Vespertilio mystacinus*), together with the measurements of the greater and lesser horseshoe bats (*Rhinolophus ferri-equinum* and *R. hipposideros*), show (1) that variations of not inconsiderable amount (10 to 12 per cent., or even in some cases twice this amount) occur among the related bones of the bat's wing, and (2) that these variations are to a considerable extent independent of each other. Comparing now not individuals of the same species, but the mean results for different British bats, it is shown that the different types of wing may have resulted from emphasising certain variations and suppressing others. For example, the long and narrow wing of the noctule would result from the accentuated development of the metacarpals of the second and third digits and the correspondingly reduced development of the metacarpals and phalanges of the fifth digit. On the other hand, the broad and ample wing of the horseshoe bats would result from the reduction in length of the second and third metacarpals, and the relative increase in the length of the phalanges of the fourth and fifth digits and of the tibia of the hind-limb to which the hinder edge of the wing-membrane is attached.

On the hypothesis of indeterminate variation it must be confessed that we are to-day not much in advance of Charles Darwin, who said: 'Our ignorance of the laws of variation is profound. Not in one case out of a hundred can we pretend to assign any reason why this or that part has varied.' It may fairly be surmised that the variation in size of parts may result from variation in the vascular and nervous supply of such parts. But how these variations in vascular and nervous supply are occasioned we do not know. When we say that they are the result of chance and are indeterminate, we merely mean that their causes are unknown, and that the mode of their determination is at present undiscovered.

Weismann has endeavoured to elucidate the problem of the origin of variations by the study of the germinal cells from which the individual is developed. A portion of the nuclear substance of the ovum or egg is lost before or slightly after the act of fertilisation by the extrusion of the polar cells. It may be that by this process, and possibly analogous processes in connection with the sperm, material is got rid of, the loss of which by disturbing the hereditary equilibrium gives rise to variation. Weismann maintains that amphimixis, or the mingling of the peculiarities of two individuals in fertilisation, 'has arisen from the necessity of providing the process of natural selection with a continually changing material, by the combinations of individual characters.' The suggestion has hardly yet, however, got beyond the speculative stage.

Much careful work is being done by Poulton and others on the influence of the environment on the individual with the production of acquired variations not necessarily inherited. Caterpillars of the pepper-moth (*Amphidasis betularia*) reared from eggs produced by the same mother and fed on the

same food-stuff were found to vary from nearly black through brown and gray to green (due to the colour of the blood showing through the transparent skin) according as the twigs or other objects upon which they habitually rested were dark or light. The nature and proximate causes of individual variation, and the experimental inquiry whether such variations are in any cases inherited, offer a wide field for future research.

Varicose Veins. When a vein becomes dilated at a certain part of its course, for no apparent physiological object, such as relieving the venous circulation elsewhere (as, for example, in the case of the superficial abdominal veins enlarging in order to relieve a compressed vena cava), it is said to be varicose, the actual dilatation being called a *varix* (a word used in this sense by Cicero and Celsus). Some veins seem to be unaffected by varices, which, however, are of common occurrence in the sub-mucous veins of the rectum (constituting hæmorrhoids or Piles, q.v.), in the spermatic veins, giving rise to Varicocele, and in the veins of the lower extremities. They are occasionally (but very rarely) found in other veins. Certain conditions of the system favour the formation of varices, amongst which may be noticed an indolent temperament, and a debilitated condition of the general system, accompanied by a relaxed state of the walls of the veins; and possibly also a congenital predisposition or hereditary tendency. Persons with such a predisposition are more likely to suffer from this affection if their occupation is one which involves much standing or walking; and cooks, washerwomen, and foot-soldiers have been selected as specially prone to varicose veins. Varices may occur at almost any period of life, but are chiefly developed during middle age. Their formation is aided by any condition of the system which impedes the circulation, as certain diseases of the heart, lungs, and liver, and by continued *high living*, which is especially liable to induce hæmorrhoids. Direct pressure on the veins, e.g. by the use of garters, or by habitual constipation, is often an important factor in their production. From the researches of Andral, it appears that in varicose veins the coats of the dilated vessels may become thickened or may become thin; that they may be lengthened so that the veins become tortuous; and that the dilatation may be unequal, giving rise to the formation of pouches; and that, in consequence of the enlarged calibre of the vessels, the valves only act imperfectly, and gradually undergo degeneration.

Varicocele occurs as a tumour in the scrotum, most often on the left side, generally and aptly described as feeling under the fingers 'like a bag of worms.' It is rarely serious or painful, but often causes much anxiety and mental distress. The use of a well-fitting suspensory bandage and free bathing with cold water are generally efficient in keeping it in check; but it is often removed by operation, particularly when it prevents the patient's entrance into one of the public services.

Varices occurring in the leg, to which our remaining observations apply, commonly give rise to deep-seated aching pain in the limb, with a sense of weight, fullness, and numbness, before there is any external appearance of the affection. In a more advanced stage the ankles swell in the evening, and the feet are always cold. After a time a small tumour of a bluish tint appears, which disappears on pressure, but returns on the removal of the pressure, and is caused by a dilating vein. This dilatation extends, and forms knotty, irregular tumours, soft to the touch, diminishing on pressure or on the patient's assuming a horizontal posture, and giving a bluish tint to the adjacent skin. These tumours commonly occur in the middle of the leg, along the track of the saphena veins, but they often extend along the whole of the leg and thigh. Amongst the troublesome consequences of varicose veins are the obstinate ulcers, known as varicose ulcers, to which they give rise; and it must be borne in mind that occasionally, when the skin gets thinned by prolonged pressure, the varices burst through it, and give rise to hæmorrhage, which, if not promptly stopped, may cause fainting, and even death. When such an accident occurs the patient should at once be placed in a horizontal position, and the leg raised, in which case the bleeding will probably cease. If it continue, a pad of lint must be pressed upon the mouth of the bleeding vessel by means of a few turns of a bandage round the limb.

Treatment must in the main be palliative; pressure on the veins by garters, constipation, &c. must be removed; the general health must be attended to, liberal diet with tonics, or restricted diet with mild purgatives, being enjoined according to the patient's requirements. The weakened veins must be supported when the patient is going about by suitably regulated pressure; the application of a domett or india-rubber bandage every morning before rising is the most satisfactory method; but an elastic stocking is less trouble, and is more commonly used. The obliteration of one set of varices by operation is generally followed by the dilatation of adjacent veins. If, however, the varicose veins give rise to much discomfort, or prevent the healing of an ulcer, operation is often justifiable, and is followed by great relief. The operations employed may consist in the use of caustics, subcutaneous division of the veins, compression by ligatures or metal pins, or excision.

Variegation, in plants, is a condition in which other colours are exhibited in parts where the normal colour should be green. Thus white, yellow, or other tints take the place of green in the leaves and other herbaceous parts. Yet variegation is regarded in botany as a disease, the causes of which are unknown. All that is yet determined respecting it is that it is invariably accompanied by a more or less complete suppression of the chlorophyll, the green granular matter which underlies the cuticle of the green parts of plants. Although often presenting similar peculiarities to chlorosis, another plant-disease, the cause of which is equally obscure, variegation is distinguished from it by the presence of chlorophyll in larger or smaller patches in the leaves, branches, or stems of the affected subjects. Variegation is usually a permanent characteristic, or may be made so by careful methods of propagation, and is compatible with vigorous health. These considerations give an importance to variegated plants in ornamental gardening which they would not otherwise possess. Variegated pelargoniums and many other bedding plants, perennial herbs and annuals, and some shrubs and trees derive their popularity as ornaments of the flower-garden from their variegation, which in many cases is so brilliant that it is substituted for flowers in the production of colour effects. Variegation is rarely perpetuated by seed; when it appears in a plant it can only be increased by

means of cuttings, layers, division, or budding and grafting. In rare instances some tendency is shown in variegated plants to revert to the normal state; this is especially so in those that are grafted or budded. Inversely also the scion is found to exert influence upon the stock occasionally. Reversion to the original state is usually prevented by pruning away the first indications of it.

Varinas (*Barinas*), a town of Venezuela, 100 miles SE. of Lake Maracaybo. Once famous for its tobacco, it has sunk to 7000 inhabitants.

Vari'ola. See SMALLPOX.

Varley, JOHN (1778–1842), painter, born at Hackney, was one of the founders of the Society of Painters in Water-colours. He believed in astrology, and wrote on perspective and design.—His brother CORNELIUS (1781–1873) was also a water-colourist, and invented the graphic telescope.—CROMWELL FLEETWOOD (died 1883), the son of Cornelius, was an F.R.S., and advanced telegraphy. See Story, *James Holmes and John Varley* (1895).

Varna, a seaport of Bulgaria, on the northern side of a semicircular bay, an inlet of the Black Sea, 115 miles SE. of Rustchuk by rail. Varna yielded to the Russians in 1828. The allied French and British troops were here encamped for some time in 1854, and occupied the town. Though the harbour is exposed, a considerable trade is carried on, the value of the year's imports averaging £600,000, and of the exports (mainly grain) £350,000. The Congress of Berlin in 1878 decided that the strong fortifications by which the port was formerly defended should be destroyed, and the Bulgarians resolved to supply the loss by earthworks. The town is the seat of Greek and Bulgarian metropolitans, and of a dozen consuls. Pop. (1898) 28,256, of whom 5000 are Greeks, 6000 Turks.

Varnhagen von Ense, KARL AUGUST, German biographer, was born at Düsseldorf, 21st February 1785. He studied, first medicine, then philosophy, at Berlin and Halle, aided Chamisso in his *Musenalmanach*, joined the Austrian army and was severely wounded at Wagram, served as adjutant to Prince Bentheim, and in 1813 entered the Russian service, and became adjutant to Tettenborn, accompanying him to Paris. Here he was called to the Prussian diplomatic service, and accompanied Hardenberg to the Congress of Vienna (1814) and to Paris, becoming next resident minister at Carlsruhe. Recalled hence in 1819, he lived chiefly at Berlin thereafter, till his death, 10th October 1858. He had married in 1814 the charming Jewess, Rahel (q.v.). His chief works are critical biographies, written in graceful and polished style.

Of his many books may be named *Goethe in den Zeugnissen der Mitlebenden* (1823); *Biographische Denkmäler* (5 vols. 1824–30); *Denkwürdigkeiten und vermischte Schriften* (7 vols. 1843–46; vols. 8 and 9 ed. by his niece, Ludmilla Assing, 1859). His *Tagebücher* fill 14 vols. (1861–70); an edition of his *Ausgewählte Schriften* alone, 19 vols. (1871–77). His correspondence also has been published, with A. and W. von Humboldt, &c.

Varnish. The greater number of varnishes consist of some resinous material (see LAC, and RESINS) dissolved in linseed-oil, alcohol, or some liquid hydrocarbon such as turpentine and benzole. Those made by dissolving a resin in a non-volatile drying oil, like that from linseed, are called oil-varnishes; and those prepared by using volatile solvents (alcohol, benzole, &c.) for the resins are called spirit varnishes. In the case of the latter the solvent becomes dissipated as the varnish dries, so that when any surface is coated with a varnish of this kind only a film or coating of resin remains, which is apt to crack and peel off; but means are taken either in the preparation of the varnish or in the laying of it on to counteract this tendency. With an oil-varnish, on the contrary, the oil remains as part of the coating, giving it toughness, while the resin gives it hardness.

For shell-lac varnish, the spirit-varnish most largely made, see FRENCH POLISHING; and for the varnish called Lacquer, used for coating brass, see that head. Bookbinders use a spirit-varnish, composed of elemi, mastic, and sandarac resins, together 14 parts, Venice turpentine 3 parts, and alcohol 30 parts. They also use among other lacquers one consisting of shell-lac 10, turpentine 1, and alcohol 30 parts. A good spirit-varnish for woodwork is sandarac resin 40, Venice turpentine 4, and alcohol (methylated spirit) 120 parts.

The best oil or fat varnishes are prepared from hard resins, along with linseed-oil and turpentine. Copal and amber, the two hardest resins, require a preliminary heating or fusing before mixing them with the solvents. The proportions given for a good copal varnish are 30 parts of melted copal resin, 100 parts of linseed-oil, and 70 parts of oil of turpentine, part of the oil in a hot state being first mixed with the melted resin. Three parts of litharge, or ¼ of a part of borate of manganese is added to act as a 'dryer.' Throughout the process of preparing the varnish a carefully regulated heat is used, and the temperature of the mixture is allowed to fall to 140° F. before the turpentine is added. A copal varnish is also made on a more limited scale by a newer process, which consists in first treating the resin with a powerful solvent (afterwards drawn off by distillation), such as acetone or ether, and afterwards adding 'manganese' oil (linseed-oil and borate of manganese) and turpentine. There are several kinds of copal resins (see COPAL); but the best kind is obtained from Zanzibar, and is now known to be produced by *Trachylobium verrucosum*. Inferior 'copal' varnishes are made from kauri and other cheap resins. The use of oil-varnishes which are sold at a low price (some of them at one-half that of good copal) should be avoided, as many of these never dry properly. An elastic varnish, useful for rendering textile fabrics waterproof, can be made with the aid of heat, by mixing together common resin 2 lb., caoutchouc 16½ oz., linseed-oil 2 lb. It may be stated here that, from the inflammable nature of the materials used, the making of most varnishes is attended with much risk of fire.

Oil-varnish is extensively used for coating the internal woodwork of houses, either after it has been previously painted, or simply to cover the bare wood without hiding its grain. Good copal varnish is the best kind that can be used for this purpose. If properly put on it forms a fine glossy, enamel-like surface, which is very durable, and stands washing with soap and water repeatedly without injury. To produce such a surface at least five coats of the varnish are required, and each in turn is rubbed smooth with pumice except the last. It is only in the best class of work, however, that more than two or three coats are given. A coating of varnish does not increase the durability of oil-paint on external woodwork.

A pure transparent mastic varnish is used for oil-pictures, but, as it has the defect common to spirit-varnishes of being easily abraded, copal oil-varnish is often preferred for this purpose. A less pure mastic varnish is used for maps. As spirit-varnishes dry very quickly, it is often convenient to use suitable kinds of them for coating metal, wood, &c., in cases where it is inconvenient to give proper time for oil-paint or oil-varnish to dry. Japan varnish is noticed under JAPANNING.

See Brannt's translation of Andres on *Volatile and Fat Varnishes* (1882), and Church's *Chemistry of Paints and Painting* (1890).

Varnish Tree, a name given to trees belonging to several distinct natural orders, the resinous juice of which is used for varnishing or for lacquering. The Black Varnish Tree, *Melanorrhœa usitatissima* (Anacardiaceæ); the Japan Varnish Tree, *Rhus vernicifera* (Anacardiaceæ); the New Granada Varnish Tree, *Elæagia utilis* (Cinchonaceæ); and the Sylhet Varnish Tree, *Semecarpus anacardium* (Anacardiaceæ).

Varro, Marcus Terentius, the most learned of the Romans, was born probably of equestrian rank in the Sabine town of Reate, 116 B.C. He studied under L. Ælius Stilo, and at Athens under Antiochus of Ascalon, whose philosophy Cicero makes him expound as an interlocutor in the *Posterior Academics*. He saw some service under Pompey, and in the civil war was legate in Spain with Petreius and Afranius. He awaited the result of Pharsalia with Cicero and Cato at Dyrrachium, and was kindly treated by the conqueror, who appointed him to be librarian for his intended collection. The second triumvirate plunged him into danger, and Antony plundered his splendid Casine villa, burned his beloved books, and placed his name in the list of the proscribed. But he was soon exempted, and Augustus even restored his property, so that he was able to spend his latest years in peace. He survived till 27 B.C. Varro was a man of upright and honourable character, a monument of the old-fashioned Roman virtues, even to their hard and unsympathetic side. His diction shows qualities of the same kind—it is pithy and vigorous, but harsh, abrupt, without flexibility or charm. The total number of his works amounted to about 620 books, belonging to seventy-four different works. Of the poetical works (*saturæ*, *pscudo-tragœdiæ*, and *poemata*) we know nothing but the names. But of the 150 books of the *Saturæ Menippeæ*, a medley of prose and verse, imitated from the Cynic satirist Menippos (q.v.), enough fragments (ed. Riese, 1865; Bücheler, 1882) remain to prove the greatness of the loss. Here we find in singular medley grotesque personifications of ideas, ridicule of the philosophers, mythology, erudition, proverbs, bitter satire at the social corruptions of the day, and praise of the homely virtues of the good old times, the whole spirited and rich in humour, if seldom artistic in form. Varro's prose writings embraced oratory, history both general and literary, jurisprudence, grammar, philosophy, geography, and husbandry. The most important of these were his *Antiquitates Rerum Humanarum et Divinarum*, a work of vast learning in forty-one books, a mine in which burrowed Pliny, Plutarch, Gellius, Festus, Macrobius, as well as the Christian fathers, especially St Augustine; *De Lingua Latina*, in twenty-five books, of which only v.–x. are extant (ed. C. O. Müller, 1833; L. Spengel, re-edited by his son, 1885), on the formation and inflection of words, and on syntax, marred by arbitrary arrangement, and etymologies due to mere empirical word-play; *Rerum Rusticarum Libri III.*, almost entire (ed. Keil, Leip. 1884), in dialogue form, on agriculture, cattle, bird- and fish-breeding. His *Disciplinarum Libri IX.* deserved to live, being an attempt at an encyclopædia of the liberal arts; his *Imaginum Libri XV.*, or *Hebdomades*, was a series of 700 illustrated biographies of Greek and Roman celebrities with a metrical eulogium on each. See Ritschl's *Opuscula* (vol. iii.).—Publius Terentius Varro, distinguished from the foregoing as Atacinus from his birth at Atax in Narbonensian Gaul about 82 B.C., wrote an epic on Cæsar's wars in Gaul (*Bellum Sequanicum*), and satires at which Horace scoffs, while Quintilian characterises him as 'interpres operis alieni.' His *Argonautica*, a free adaptation of Apollonius Rhodius, delighted Ovid and Statius; his erotic elegies pleased Propertius. He died 37 B.C.

Varuna (akin to Gr. *Ouranos*), an ancient Indian Vedic god of heaven and day; latterly, rather the deity that rules over the waters. See Veda.

Varus, Publius Quintilius, was consul in 13 B.C., next governor of Syria, and about 7 A.D. was sent by Augustus to command the armies of Germany, and form that country into a Roman province. For the story of his disaster, see Arminius. Varus killed himself in despair.

Varzin, a Pomeranian village of 1200 inhabitants, 25 miles SE. of Köslin, and notable as having near it the castle and park of Prince Bismarck.

Vasa, a county or *län* of Finland, on the Gulf of Bothnia. The noble Swedish family of Vasa (see Gustavus Vasa) is named from its armorial bearings, a bundle of yarn (*vasa*).

Vasarhely. See Maros-Vasarhely.—Hódmezö Vasarhely, a Hungarian town 20 miles NE. of Szegedin by rail, had in 1890 a population of 55,483, great cattle-markets, and varied industry.

Vasari, Giorgio, an Italian architect and painter, famous as a biographer and critic of artists, was born at Arezzo, 30th July 1511. He was a pupil of Michelangelo, and obtained the patronage of many distinguished persons, as Cardinal Ippolito de' Medici, Clement VII., and the Dukes Alessandro and Cosmo de' Medici; but his pictures (many of which still exist, as in the Palazzo Vecchio, Florence) possess no distinctive merit. His reputation rests exclusively on his *Vite de' più excellenti Pittori, Scultori, e Architetti* (1550; 2d ed. 1568; standard modern edition by Milanesi, 9 vols. 1878–85; Eng. trans. by Mrs Foster, 1850). This work is written, on the whole, in a simple and honest style; at times it is even marked by a noble eloquence. The criticism is often admirable; and in spite of frequent inaccuracies in the early biographies, it remains a model of art criticism and biography. Vasari died at Florence, 27th June 1574.

Vasco da Gama. See Gama.

Vascular Tissue. See Tissues.

Vase (Fr. *vase;* Lat. *vas*, 'a vessel'), a hollow vessel, usually decorated and decorative; modern vases being solely ornamental. Ancient vases were made of metal, stone, glass, or earthenware. Historically interest attaches chiefly to vases of glass and earthenware; and such vases—Egyptian, Phœnician, Greek, Etruscan, Roman, Chinese, Japanese, and modern European—are discussed, with illustrations, at Glass and Pottery. See also Portland Vase.

Vaseline is a substance obtained from petroleum or paraffin, which is now of commercial importance. Yellowish, translucent, and crystalline in appearance, it is nearly of the consistency of soft soap, and is almost perfectly tasteless and inodorous. It is soluble in ether, and resists the action of most chemicals. Largely used as a salve or liniment, it is also made the base of various ointments and pomades; and it may be employed inwardly as a remedy in colds, coughs, and hoarseness. It is an excellent lubricant; is serviceable for protecting polished steel or iron from rust; and has the advantage over animal and vegetable fats that it does not become rancid. The name vaseline is copyright and refers only to one make of this article, but it is known in commerce under a host of fancy names, while it appears in the pharmacopœia as *Paraffinum molle*.

Vasishtha. See Veda.

Vassal. See Feudalism.

Vassar College, opened in 1865 for the higher education of women, lies to the east of Poughkeepsie, New York, in grounds extending to 210 acres—the gift, along with $800,000, of the founder, Matthew Vassar (1792–1868), who came a child from Norfolk, and died a wealthy brewer at Poughkeepsie. The main building provides accommodation for 300 students, and there are also a museum, an observatory, a laboratory, and a library of 16,000 volumes. Schools of painting and music were established in 1878. In the regular studies for the degree of A.B. elective courses are followed in the third and fourth years; and the degree of A.M. or Ph.D. is given for post-graduate work. In 1887 the first honorary degree, LL.D., was granted. See works by Lossing (1867) and Raymond (1873).

Vassilkov, a town of Little Russia, 18 miles SW. of Kieff. Pop. 18,000.

Vasto, a town of Southern Italy, on the Adriatic, 70 miles NW. of Foggia, with a small harbour, fisheries, olive-gardens, &c. Pop. 9761.

Vatican, see ROME, Vol. VIII. p. 785. The Vatican Council, which proclaimed the Infallibility (q.v.) of the Pope, met under the auspices of Pius IX. (q.v.) on the 8th December 1869, and was adjourned (but not dissolved, so that it might still reassemble) 18th July 1870. It is variously reckoned the 19th, 20th, or 21st of the Œcumenical Councils (see COUNCIL), and was attended by the largest number of ecclesiastics ever assembled at a council—by 764 out of 1037 entitled to attend. Of those present 276 were Italians. After the outbreak of the Franco-German war the attendance sunk to about 200. In the end Ultramontanism triumphed over the opposition of liberal bishops like Hefele and Strossmayer. The œcumenicity of the Council was denied by the Old Catholics (q.v.).

See the history by Cecconi (1873); Gladstone's *Vatican Decrees* (1874) and *Vaticanism* (1875), Manning's *True Story of the Vatican Council* (1877), and other controversial pamphlets; German works by Fessler (Catholic), Friederich and 'Janus'(Old Catholic), and Friedberg (Protestant); and the *Acta et Decreta* (new ed. 1892). For the Vatican MS. of the New Testament, see CODEX.

Vatke, WILHELM, theologian, born at Behndorf near Magdeburg, 14th March 1806, habilitated at Berlin as *privat-docent* in theology in 1830, was appointed professor extra-ordinary in 1837, and died 18th April 1882. His works were *Die Religion des Alten Testaments* (1835), *Die menschliche Freiheit* (1841), *Historischkritische Einleitung in das Alte Testament* (1886) and *Religionsphilosophie* (1888). He grasped the idea of the post-Exilic origin of the Priestly Code in the Pentateuch (q.v.) as early as Graf, but the names of both have paled before those of Kuenen and Wellhausen.

Vatnajokull. See ICELAND.

Vattel, EMÉRIC DE, writer on the law of nations, was born at Couret, in Neufchâtel (then Prussian), 25th August 1714. Trained for the church, he entered the diplomatic service of Saxony, and from 1746 till 1764 was Saxon representative at Bern. Here he published several works, but became known for his *Droit des Gens* (1758), which contained little that was new, but abridged and systematised the doctrines of Grotius, Pufendorf, and Wolf. It was often edited and translated, and had a greater vogue than it deserved. Vattel died 28th December 1767.

Vauban, SÉBASTIEN LE PRESTRE DE, military engineer and marshal of France, was born at Saint Léger du Fougeret, near Avallon in Burgundy, 15th May 1633. Left a destitute orphan at ten, he was brought up by the village *curé*, and at seventeen enlisted in the regiment of Condé, then in league with Spain against the king. Taken prisoner in 1653, he was persuaded by Mazarin to take service under the king, and in 1655 he received his commission as one of the royal engineers. Already in 1658 he had the chief direction of the attacks made by Turenne's army, and the eight years of peace that followed this campaign he devoted to works at Dunkirk and elsewhere. In 1667 he helped to reduce Lille, and next was appointed governor of its new citadel. During the campaigns in Holland (1672–78) he took part in seventeen sieges and one defence, rising to be brigadier and major-general, and at the close commissary-general of fortifications. He first introduced the method of approach by parallels at the siege of Maestricht (1673), and with such effect that that strong fortress capitulated in thirteen days. The rest of his more famous exploits in these campaigns were the triumphant defence of Ondenarde and the sieges of Valenciennes and Cambrai. During the ten years of peace which followed 1678 Vauban rendered to France perhaps the greatest of his services, in surrounding the kingdom with a complete cordon of fortresses (for his system, see FORTIFICATION); and he planned and partly executed the magnificent aqueduct of Maintenon, by which the waters of the Eure are conveyed to Versailles. In 1703 he rose to be marshal of France.

War breaking out again in 1688, Vauban conducted with his usual success the sieges of Philipsburg—introducing here his invention of ricochet-batteries—Mannheim, Mons (1691), and Namur (1692). The sieges of Charleroi (1693), Ath (1697), Breisach (1704), and the construction of the entrenched camp near Dunkirk (1706) are the only professional works of importance during the last fourteen years of his life. After the peace of Ryswick in 1697 he had applied his active mind to the consideration of various faults in the internal government of France, and he had observed the fatal consequences of the Revocation of 1685. His ideas he submitted in a memoir to Louvois and Madame de Maintenon in 1686. But another work, the *Dime Royale* (1707), in which he discussed the question of taxation, and anticipated in the most striking manner the doctrines which eighty years later overthrew the French monarchy, brought down a heavier storm upon his head. Saint-Simon tells us the book was clear, simple, and exact, but the truths it told were unpalatably plain. In 1699 and again in 1704 he had sent it to the king, but no notice was taken till in 1706 he began privately to print 300 copies, whereupon the book was at once condemned. Vauban did not long survive his disgrace, dying at Paris, March 30, 1707. 'I have lost a man very devoted to my person and to the state,' said his self-complacent master. His body was buried at Bazoches; in 1806 Napoleon deposited his heart in the Invalides.

Saint-Simon describes Vauban as 'perhaps the most honest and most virtuous man of his age . . . never was man more gentle, more kindly, or more obliging.' Of middle height, hardy frame, blunt manners, sound judgment, and indomitable courage, he never experienced a reverse, yet all his success never turned his head nor impaired his modesty. He conducted fifty successful sieges, and designed or improved the works of more than 160 fortresses, among them Dunkirk, Landau, Lille, and Strasburg. He it was, and not Mackay, who in 1687 invented the socket instead of the plug bayonet.

In 1669 he wrote in six weeks for Louvois his *Mémoire pour servir d'Instruction dans la Conduite des Siéges*, published at Leyden in 1740. A selection of his MSS. formed the *Oisivetés de M. de Vauban* (4 vols. 1843–46). See Chambray, *Notice historique sur Vauban* (1840); Michel, *Histoire de Vauban* (1879); Ambert, *Le Maréchal de Vauban* (1882); also Major E. M. Lloyd's *Vauban, Montalembert, Carnot: Engineer Studies* (1887).

Vaucluse, a department in the SE. of France, bounded on the west by the Rhone, and on the south separated by the Durance from Bouches du Rhone. Area, 1370 sq. m.; pop. (1872) 263,451; (1891) 235,411. The east is intersected by spurs of the Alps; in the west are plains. Agriculture is the chief occupation; of late oaks have been largely planted for the culture of truffles; and there are manufactures of silk, wool, pottery, chemicals, &c. Originally composed of the county of Venaissin, the principality of Orange, and part of Provence, the department is divided into the four departments of Apt, Avignon, Carpentras, and Orange, Avignon being the capital.—The village of Vaucluse (*Vallis clausa*) stands in a romantic ravine 19 miles E. of Avignon, and is noted as having been for sixteen years the residence of Petrarch, and for its famous fountain. Here, too, lived John Stuart Mill.

Vaud (Ger. *Waadt*), a canton which forms the western corner of Switzerland, between the Jura and the Bernese Alps. Area, 1244 sq. m.; pop. (1888) 247,655. It is a comparatively level district, traversed, however, by an elevated tract known as Mount Jorat, from which plains slope on either side to the Lake of Geneva on the south and the Lake of Neufchâtel on the north. On both sides, near the mountains, there are extensive pasture-lands, but the greater part of the country is highly cultivated. The vineyards yield white wines of excellent quality. Vaud forms part of French Switzerland; the religion is Protestant. After the fall of the Roman empire it belonged to the Burgundian kingdom, but in the 13th century it became a dependency of Savoy, and in 1536 the Bernese took possession of it. The French invasion put an end to the rule of Bern, and Vaud became a separate canton. The existing democratic-representative constitution dates from 1845 (see SWITZERLAND). Lausanne is the capital. See WALDENSES.

Vaudeville, originally a popular song with words relating to some story of the day; whence it has come to signify a play in which dialogue is interspersed with dances and songs of this description, incidentally introduced, but forming an important part of the drama. It is usually comic. The name Vaudeville is a corruption of Val de Vire, the name of a picturesque valley in the Bocage of Normandy. One Olivier Basselin, a fuller in Vire, composed about the middle of the 15th century a number of humorous and more or less satirical drinking-songs, which were very popular, and spread over France, bearing the name of their native place (Vaux de Vire).

Vaudois. See WALDENSES.

Vaudoux. See NEGROES.

Vaughan, CHARLES JOHN, was born at St Martin's vicarage, Leicester, in 1816, and had his education under Arnold at Rugby, and at Trinity College, Cambridge, graduating senior classic (bracketed with Lord Lyttelton) and chancellor's medallist in 1838. Elected next year to a fellowship in his college, he was successively vicar of St Martin's, Leicester (1841–44), head-master of Harrow (1844–59), vicar of Doncaster (1860–69), Master of the Temple (1869–94), and Dean of Llandaff (1879). Already in 1860 he had declined the bishopric of Rochester; in 1882 he was made a Clerk of the Closet to the Queen. He died 15th October 1897. An eloquent preacher of the liberal evangelical school, he published *Harrow, Temple,* and *University Sermons;* Lectures on Acts, Revelation, Philippians; editions of Romans, Philippians, Hebrews; *Family Prayers, Discourses on Liturgy and Worship, Addresses to Young Clergymen, On Some Ministerial Duties, The School of Life,* &c.

Vaughan, HENRY, poet, styled 'the Silurist' from his having been born among the Silures of South Wales, was descended from an ancient family, and was born in 1622 at Newton, near Skethiog, in the parish of Llansaintfraed, Brecknockshire, twin-brother of the alchemist Thomas Vaughan (1622–65). He entered Jesus College, Oxford, in 1638, and shared the loyalty of his family, although apparently he did not actually bear arms in the cause. Early a devoted admirer of Ben Jonson, Randolph, and other poets of the day, in 1646 he published at London his first *Poems, with the tenth Satyre of Juvenal Englished.* He now studied medicine, became M.D., and retired to practise first at, and then near, Brecon. The collection of poems entitled *Olor Iscanus* ('Swan of the Usk') was sent to his brother at Oxford, and was published by him without authority in 1651. About this time a long and dangerous illness deepened his religious convictions, and henceforward the themes of all verse are the littleness of time and the greatness of eternity, the sinfulness of sin, the death and saving grace of Christ. In 1650 he printed at London his *Silex Scintillans* ('Sparks from the Flintstone'), a collection of pious meditations after the model of Herbert (second part printed with it in 1655), and followed it up in 1652 with *The Mount of Olives,* a little book of devotions in prose, and the *Flores Solitudinis,* also in prose. Not till the year 1678 was another collection of his verses published, and this time again by a zealous Oxford friend ('J. W.') without his concurrence. This was the *Thalia Rediviva; the pastimes and diversions of a Country Muse,* a collection of elegies, translations, &c. of all periods of his life, closing with a few religious pieces (*Pious Thoughts and Ejaculations*), and a pastoral elegy on the death of his brother Thomas. Of the rest of his life we know nothing save that it wore itself away in the labour of his profession and in a quiet walk with God in his beloved vale of Usk. He died April 23, 1695. Vaughan's poetry is very unequal—his vein seems to have been a *flinty* soil, from which the right Promethean fire could be struck but now and then. At his best he reaches an exquisiteness of phantasy and of expression beyond the reach of Herbert, but by far the larger part of his poetry, and indeed of almost every poem, sinks below that more popular poet's usual level. 'The Retreat,' 'Childhood,' and especially 'Departed Friends' are some of the rarest flowers in the whole garden of our sacred verse, and atone for much uncouthness, obscurity, and prose. The first of these has been claimed as the prototype of Wordsworth's greater *Ode,* and it certainly supplies a dim hint of its fundamental thought.

There is a complete edition by Grosart (4 vols. 1868–71), and of the poems by E. K. Chambers (1896). The *Silex Scintillans* and other sacred poems were published by Lyte in 1847 (repr. 1858). See Dr John Brown's *Horæ Subsecivæ* (series i.), Palgrave's paper in *Cymmrodorion* (1891), and Miss Guiney's *English Gallery* (1894).

Vaughan, HERBERT, Roman Catholic archbishop of Westminster, was born at Gloucester on 15th April 1832, the eldest son of Lieut.-colonel Vaughan, of Courtfield, near Ross. Educated at Stonyhurst and on the Continent, he entered the priesthood, and in 1872 was consecrated Bishop of Salford, in 1892 succeeded Cardinal Manning as Archbishop of Westminster, himself shortly after being raised to the cardinalate. He is an eloquent preacher, the founder of St Joseph's College for foreign missions at Mill Hill, Hendon, and proprietor of the *Tablet* and the *Dublin Review.*

Vaughan, ROBERT, was born in 1795, in 1819 entered the ministry, and was in turn Independent minister at Worcester, Kensington, professor of

History in the university of London, and president of the Lancashire Independent College, Manchester (1843-57). After his retirement he preached at Uxbridge, St John's Wood, and Torquay, where he died, June 15, 1868. He founded the *British Quarterly Review* in 1845, and edited it for twenty years, and was chairman of the Congregational Union in 1846.

Among his many books may here be named *Life of Wycliffe* (1828), *Causes of the Corruption of Christianity*, *History of England under the House of Stuart* (1840), and *Revolutions in History* (3 vols. 1859-63).

Vault, an arched roof, usually constructed of stone or brickwork. See GOTHIC ARCHITECTURE, Vol. V. p. 315.

Vauvenargues, LUC DE CLAPIERS, MARQUIS DE, a French writer of *Pensées*, born at Aix, near Marseilles, 6th August 1715, of ancient but impoverished provincial nobility, entered the army as lieutenant in the Regiment du Roi, 1733, and became known for his simple life and studious habits. In 1737 he wrote a treatise on *Free-will*, and began a correspondence with his cousin, the Marquis de Mirabeau—otherwise known as 'the Friend of Man.' Vauvenargues' health suffered from the hardships of campaigning, and in 1743 he left the service after bearing part in the defeat of Dettingen. With health and means hopelessly impaired, he retired to his native place, having vainly sought for diplomatic employment. In 1744 his health was further shaken by an attack of smallpox; on recovering he resolved to settle in Paris, where he became intimate with Marmontel and his set. The conditions of such a life, always embarrassed by bad health, did not allow of a high level of literary attainment. He obtained, however, the good opinion of still more important literary men, especially by a comparison between Corneille and Racine which he sent to Voltaire. In 1746 he published his *Introduction à la Connaissance de l'Esprit Humain*, with *Réflexions et Maximes* appended. The work was anonymous, but obtained commendation from Voltaire, who said that 'he knew of no book better suited to form a well-born, well-trained spirit.' Next year the author died. Vauvenargues never mastered the languages of Greece and Rome; never even formed a mature taste in the literature of his own country. Yet his 'Greek style' and 'neat justice' have been praised by Sainte-Beuve; and the 'Advice to a Young Man' which closes the *Réflexions* is a fine piece, full of noble character and subtle thought. Vauvenargues was pious, though liberal; and Voltaire continued to praise him after death had prematurely arrested his career. Less pungent than his prototype La Rochefoucauld, Vauvenargues seems to have gained upon him in the favour of posterity: he is an instance of the power of sympathy: and his goodness is a source of strength and even of a certain sort of greatness. Often trivial and bald, sometimes reaching only a truism or a shallow paradox, he yet arrests the attention of his reader, and endears himself to his heart. Close observation, suggestive, if hardly profound thought, insight into the fundamental conditions of morality have proved less effectual to this end than his inherent goodness of heart. His literary fortune is illustrated by his own saying: 'Les maximes des hommes décelent leurs cœurs.'

The chief editions are by Gilbert (2 vols. 1857) and Plon (3 vols. 1874). See Sainte-Beuve, *Causeries du Lundi*, vols. iii. and xiv.; also the monograph in 'Les Grands Écrivains Français,' by Maurice Paléologue (1890).

Vauxhall, a public garden in London, opened immediately after the Restoration (May 1660), and closed on 25th July 1859, the site being sold for building purposes. It was situated in Lambeth, opposite Millbank, and near the manor called Fulke's Hall (the residence of Falkes de Breauté, a follower of King John), from which is derived its name. Pepys, writing May 28, 1667, describes the garden and its entertainments as 'mighty devertising.' But the eating, drinking, dancing, and flirtation that continually went on there led also to much quarrelling and dissipation. The loose character of the amusements it afforded is freely sketched by the dramatists and novelists of the 18th century, and is again revived in Thackeray's *Vanity Fair*. In 1823 the total number of visitors was 133,279, and on the one night of 2d August 1833, 20,137 (both maximum figures).

Vavasour, or VALVASSOR, a term of feudal times, more in use in the continent of Europe than in England, employed somewhat loosely, and defined by Camden as the rank next below a baron. Its usual meaning was one who held his lands, not directly of the crown, but of one of the higher nobility. See FEUDALISM.

Vecellio. See TITIAN.

Vector, in Mathematics, is any directed straight line of definite length. It is conceived of most simply as a carrying or transference or step from any chosen point to that other point lying in the proper direction and at the proper distance. Take any three points ABC. Then it is evident that the operation of passing from A to C is equivalent to the successive operations of passing from A to B, and then from B to C. In other words, the *vector* AC is equal to the sum of the *vectors* AB and BC. Of course if we limit our consideration to lengths only this theorem does not hold. It is easy to see that two vectors cannot be equal unless they have the same length and the same direction. The opposite sides of a parallelogram are equal vectors. On the other hand, the radii of a sphere, although they are all of the same length, are different vectors. The fundamental law of vector addition, which has been given above, is illustrated by the law of combination of a great many important physical quantities, such as velocity, force, rotation, couple, and so on. These can all be represented by directed straight lines, and are called vector quantities (see COMPOSITION). Laws for the multiplication and division of vectors have been given by Hamilton (see QUATERNIONS) and partly by Grassmann.

For a discussion of the chief properties of vectors, see Maxwell's *Matter and Motion*, Clifford's *Kinematic*, Kelland and Tait's *Quaternions*.

Veda—from *vid*, 'to know,' hence 'knowledge, (sacred) science'—is the name of a body of religious writings which the Hindus believe to be divinely inspired. This body primarily consists of four collections (*saṃhitâ*) of hymns, detached verses, and sacrificial formulas—viz. the *Ṛigveda*, or Veda of praises or hymns; the *Sâmaveda*, or Veda of chants or tunes; the *Yajurveda*, or Veda of prayers; and the *Atharvaveda*, or Veda of the Atharvans—to each of which are attached certain theological prose-works, called *Brâhmaṇa*, and intended chiefly to elucidate the meaning and application of the sacred texts, especially from a sacrificial point of view. The first three Vedas are often referred to as the 'trayî vidyâ,' or threefold science; and they alone must originally have formed the sacred canon, whilst the fourth Veda, which is less archaic in language, was not recognised till a later period. The Saṃhitâs of the Sâmaveda and Yajurveda are of a purely sacrificial and professional character, being intended to serve as text-books for two of the four chief classes of priests—viz. the chanters (Udgâtar) and the offering priests (Adhvaryu) respectively; and the verses contained in them are to a large extent taken from the Ṛiksaṃhitâ, though not unfrequently with considerable textual variations. The Ṛiksaṃhitâ, on the other hand,

though likewise assigned to a special class of priests—viz. the invokers (or sacrificers, Hotar), is not a sacrificial text-book in the same narrow sense of the word; but it has rather to be looked upon as a collection of all the sacred poetry which was within reach of the collectors, and seemed to them worthy of being preserved for devotional purposes. The hymns recited by the Hotar at the sacrifices were, however, drawn almost exclusively from this collection, the study of which was therefore especially incumbent on him. The fourth class of priests, the Brahmans, whose function it was to superintend the entire sacrificial performance, had not, and could not from the very nature of their office have, any special text-book assigned to them; and it was doubtless from mere theoretic considerations that the Atharvaveda came ultimately to be regarded as specially connected with the Brahman priest.

More or less closely connected with the Brâhmanas are two classes of works—viz. the *Âraṇyakas*, or forest treatises, so called from the recondite nature of their subjects, which it required an anchorite's seclusion to study adequately; and the *Upanishads*, or secret doctrine, treating of the nature of the Brahman, or supreme spirit. The gradual elaboration of the sacrificial system also at length gave rise to ceremonial manuals, composed in the form of strings of concise rules (sûtra). These *Kalpasûtras* usually consist of two parts—viz. *S'rautasûtras* and *Grihyasûtras*, dealing with the great Vedic sacrifices and the ordinary domestic offerings and ceremonies respectively. In course of time the oral transmission of the canonical scriptures led to more or less serious discrepancies, as regards both the order of arrangement and textual readings, which gave rise to different schools recognising different recensions (*s'âkhâ*, lit. 'branch') of the sacred texts. The number of such different versions was at one time very considerable, especially in the Sâmaveda and Yajurveda; but only a few of them have been preserved.

The *Ṛigveda-saṃhitâ* has come down to us in a single recension, that of the S'âkala school. It consists of 1028 hymns, composed in various metres, and arranged in ten books, or maṇḍalas. Book i. is mainly made up of sixteen collections of hymns ascribed to as many poets belonging to different families. Books ii.–vii., on the other hand, are attributed each to a special family of Rishis or seers—viz. the Gritsamadas, Kus'ikas (or Vis'vâmitras), Vâmadevyas, Atris, Bharadvâjas, and Vasishṭhas respectively—whence they are usually called the family books. In the several collections of these seven books the hymns are arranged according to the deities to whom they are addressed—viz. Agni (god of fire), Indra (god of the sky), followed by minor deities. Book viii. consists mainly of hymns adapted for chanting, and for the most part belonging to the Kâṇva family of seers. Book ix. is made up exclusively of hymns addressed to Soma, the deified power of the intoxicating juice of the soma-plant, and used for recitation at the Soma-sacrifice (see SOMA). Book x., consisting like the first of 191 hymns, has the appearance of an appendage, containing for the most part hymns of later origin, though also doubtless including not a few genuine old hymns which had probably escaped the attention of the original collectors. The date at which the hymns were collected may be approximately fixed at 1000 B.C., while the composition of the earlier hymns would probably go back several centuries before that period. The Vedic Aryans, as pictured in the hymns of the Ṛik, were scattered in numerous clans over the Punjab and adjoining districts west of the Indus. Their religion was mainly a worship of the powers and phenomena of nature; the favourite deities being Indra, for ever battling with the demons of darkness and drought; Agni (ignis), the genial inmate of the human dwelling in the shape of the household fire; Ushas (aurora), the fair awakener of the daily life; Soma; and Varuṇa (*οὐρανος*), the stern and ever-wakeful guardian of the sacred ordinances.

There is an English translation of the Ṛiksaṃhitâ, based on the native traditional interpretation, by H. H. Wilson, completed by E. B. Cowell; another, in metre, by Ralph Griffith; the hymns to the Maruts, or storm-gods, by F. Max-Müller.

The *Brâhmaṇa* of this Veda has been handed down in two distinct versions differing considerably, especially in their arrangement of the common matter—viz. the *Aitareya-brâhmaṇa* (trans. by M. Haug) of the school of the Aitareyins; and the *Kaushîtaki* (or *S'ânkhâyana*)-*brâhmaṇa* of the Kaushîtakins. The work deals exclusively with the various forms of Soma-sacrifice, and the consecration of the king. Each of the two schools has also its own Âraṇyaka—the *Aitareyâraṇyaka* and *Kaushîtaki-âraṇyaka*—certain portions of which are styled Upanishads. Similarly there are two complete sets of ceremonial rules, or Kalpasûtras, ascribed to Âs'valâyana (? 4th or 5th century B.C.) and S'ânkhâyana respectively.

The *Sâmaveda-saṃhitâ* consists of two parts (or ârchika), the first of which contains the (585) verses to which the several sâman-tunes are usually sung, whilst the second gives the text of the made-up chants in the order in which they are required in the sacrificial ritual. The tunes themselves, on the other hand, are given in four special tune-books, called *Gâna*, attached to the Saṃhitâ. The latter, consisting as it does mainly of detached verses taken from the Ṛiksaṃhitâ, has only a technical interest. The mode of chanting somewhat resembled the Gregorian or Plain chant. The *Brâhmaṇas* of this Veda have a special character of their own, inasmuch as they are not different versions, or editions, of the same traditional exegetic and legendary matter, but altogether distinct treatises, dealing chiefly with chants. Nine such works are hitherto known, the most important of which are the *Tâṇḍya-brâhmaṇa*, also called *Panchaviṃs'a*, consisting as it does 'of twenty-five chapters;' the *Shaḍviṃs'a-br.*, or 'twenty-sixth;' the *Chhândogya-br.*, including the Chhândogyopanishad (trans. Röer, F. Max-Müller); and the *Jaiminîya-* or *Talavakâra-br.*, of which the interesting Kena-upanishad (trans. Röer; F. Max Müller), on the nature of the Brahman, forms part. There are also several ceremonial Sûtra-works connected with this Veda, among which may be mentioned the S'rautasûtra of Lâtyâyaṇa and the Grihya-sûtra of Gobhila.

The *Yajurveda* offers the spectacle of a complete schism, its teachers and followers dividing themselves into an older and a younger branch, or the Black and the White Yajurveda, so called from the form in which their canonical books were handed down. For whilst the scriptures of the older branch presented a somewhat confused appearance, caused by the constant intermingling of the sacrificial formulas (*yajus*) and the exegetic portions (*brâhmaṇa*), the younger school adopted the practice of the followers of the Ṛik by dividing their scriptures into a regular Saṃhitâ, or collection of sacrificial formulas, and a Brâhmaṇa. The older branch became again split up into numerous schools; four different recensions of their texts being so far known to us, the most important of which is the *Taittirîya-saṃhitâ*, with an appendix called *Taittirîya-brâhmaṇa*, though characterised by the same motley intermixture of textual and exegetic matter. There is further a *Taittirîyâraṇyaka*, part of which constitutes the *Taittirîyopanishad* (trans. Röer; F. Max-Müller). Of the

Sûtra-works of the older schools several have come down to us, at least in part, the most complete being the *Âpastamba-Kalpasûtra*. Of the texts of the White Yajus—viz. the *Vâjasaneyi-saṃhitâ*, and the *S'atapatha-brâhmaṇa*, or Brâhmaṇa of a hundred paths (books i.–vii. trans. by J. Eggeling), which includes the *Bṛihadâraṇyaka*, the recensions of two different schools are so far known to us—viz. the Mâdhyandinas and Kâṇvas, both of which recognised a common set of ceremonial rules, the *S'rautasûtra* of *Kâtyâyana* and the *Kâtiya-Gṛihya-sûtra* of *Pâraskara*.

The *Atharvaveda-saṃhitâ* is a collection of hymns and spells which, in importance and interest, ranks next to the Riksaṃhitâ. The two collections present two different aspects of the religious belief of the ancient Hindus. Whilst the Rik reflects a simple belief in divine powers who are, on the whole, well disposed toward the Aryan man, and whose favour the worshipper is confident of gaining by his song, the Atharvan, on the other hand, reveals a superstitious dread of a host of malevolent powers, the effects of whose ill-will man seeks to avert by means of incantations and magic practices. As the language of the Atharvan presents a more modern appearance than the main body of the Rik, the marked change in the religious spirit of the people may perhaps be due to contact and intermixture with non-Aryan tribes. It is not impossible, however, that superstitious rites of the kind favoured in the Atharvan had long been practised by the Aryan people, though they found no expression in the devotional lyrics approved by the priests. The Saṃhitâ, which is traditionally connected with the priestly families of the Atharvans and Angiras, is divided into twenty books, the last two of which are, however, later additions. The ordinary text of Northern India is usually ascribed to the S'aunaka school. A new recension lately discovered in Kashmir not only differs from it considerably in its arrangement, but also contains some new matter, amounting to about one-sixth of the whole. The Brâhmaṇa of this Veda, the *Gopatha* (or cow-path)-*brâhmaṇa*, containing cosmogonic speculations and explanations of certain sacrificial rites, is probably a comparatively modern work; whilst of the two ceremonial sûtras, the *Vaitâna* (or s'rauta)-*sûtra* and the *Kaus'ika-sûtra*, a manual of domestic rites, the latter is by far the more interesting. The Atharvaveda has also usually assigned to it a large number of *Upanishads*, amounting to considerably over a hundred. They are evidently of various ages, many of them coming down to very recent times.

See the article SANSKRIT; Max-Müller, *History of Ancient Sanskrit Literature;* J. Muir, *Original Sanskrit Texts;* W. D. Whitney, essay on Veda, in *Oriental and Linguistic Studies.*

Vedanta. See SANSKRIT, Vol. IX. p. 153.

Vedder, ELIHU, an American painter, was born at New York in 1836, and studied at Paris and in Italy, where he ultimately made his residence. His subjects are mostly ideal—'The Lair of the Sea-serpent,' 'Fisherman and Djin,' 'Death of Abel,' 'Greek Actor's Daughter,' 'Cumean Sibyl,' 'Nausicaa and her Companions.' He has also illustrated Edward FitzGerald's *'Omar Khayyám* (Boston, 1884).

Vedettes are mounted Sentinels (q.v.) in advance of the outposts of an army.

Veen. See VAN VEEN.

Vega. See GARCILASO DE LA VEGA.

Vega Carpio, LOPE FELIX DE, was born in 1562 at Madrid, but of a family that had its seat on the Vega of Carriedo, south of Santander. The story of Lope's life, as commonly told, is full of confusion. That he lost his parents early; was a student and graduate of Alcalá; a soldier in the Portuguese campaign of 1580, and in the Armada, 1588; secretary to the Duke of Alva, Marquis of Malpica, and Marquis of Sarria; had many amours, was twice married, and father of at least six children, three of them illegitimate; was banished from Madrid because of a quarrel, and lived two years at Valencia; took orders, became an officer of the Inquisition, and died at seventy-three a victim to hypochondria—all this is indisputable, but the order and relation of the facts are by no means clear. Too much reliance has been placed upon his friend and biographer, Perez de Montalvan, who suppresses everything touching his reputation, and, knowing him only in his ascetic days, and being forty years his junior, was not likely to hear much from him about his love-affairs and early adventures. Lope himself, too, increases the confusion by his obscurity and invariable practice of making himself out younger than he was in his reminiscences. Thus he has puzzled Schack and Ticknor by giving his age as fifteen when he fought against the Portuguese at Terceira, a thing he had no opportunity of doing until he was twenty. On Montalvan's authority it is said that on leaving Alcalá he attached himself to the Duke of Alva (i.e. the third duke, the Alva of history), at whose instance he wrote the pastoral romance of the *Arcadia*, that soon afterwards he married and was banished, and that grief on the death of his wife drove him to join the Armada. But his own words in the *Eclogue to Claudio* and in the *Dorotea* (Act V. sc. viii.) show that it was not the loss of a wife, but trouble with a mistress, Filis, *alias* Dorotea, that sent him to sea; and that his marriage came later; and abundant evidence, internal and external, proves that the *Arcadia* was written after the Armada, and not for Duke Ferdinand, but for his grandson Antonio, the fifth Duke of Alva. It is, in fact, the story, in a pompous, pastoral setting, of the young duke's matrimonial vacillations in 1589–90, the sober prose version of which may be found in Cabrera's *Felipe Segundo* (part ii.). It must have been soon after this that he married his first wife, Isabel de Urbina, and got into the scrape that drove him to Valencia, for both events are referred to in the *Romancero General*, in ballads written at the latest in 1593. He hints at a woman's revenge as the cause of the latter; but in a petition to the king in 1598 he specifies 'certain satires against a manager,' for which he was sentenced to ten years' banishment and suffered two, the remainder being remitted. The only issue of his marriage that we hear of was a daughter, Theodora, whom he calls 'the consolation of his exile.' The year of his wife's death is uncertain, but about 1600, apparently, he married Doña Juana de Guardio. Soon after marriage he had a *liaison* with one Doña Maria de Luxan, the fruit of which was two children born in 1605 and 1606, Marcela, who took the veil in 1621, and Lope, who was drowned at sea the same year. By his wife he had also a son and a daughter, Carlos, who died in childhood, and Feliciana, who survived him. In giving birth to the latter (1612) the mother died, and Lope, already a Familiar of the Inquisition, took orders, resolved, Montalvan says, to devote himself to the welfare of his soul; but three years later a woman, beautiful, brilliant, and 'mated with a clown,' crossed his path, and after a struggle he yielded to his destiny. Tenderness for his name has withheld the mass of his letters to his friend and patron the Duke of Sessa, but a few bearing on this episode were printed in 1876, and it was as well they were, for they dispose of some of the worst imputations against him—e.g. that of having been pander in the duke's amours, which is only

true in so far that he drafted his love-letters. But they are evidence of deplorable moral laxity. He was no hypocrite: he had a conscience, and it troubled him sorely; but the opiates of the church enabled him to lay it to sleep, and as soon as it was silent he fell to sinning again. Out of his own mouth he is proved to have been a miserably weak man with passions too strong for him. A daughter born to him in 1617, to whom he was tenderly attached, as indeed he was to all his miscellaneous offspring, deserted him, it seems, in his old age, and his last years were darkened by sorrow as well as remorse. He took to practices of the severest asceticism, and, sinking at last into what Montalvan describes as a 'continued melancholy which of late has been called hypochondria,' he died, August 27, 1635. His funeral was more like a prince's than a poet's, and the largest and most illustrious concourse ever seen in Madrid followed his remains along the same street where Cervantes had been carried to his obscure grave on the shoulders of four friars; a contrast, yet not greater than that between the cheerful serenity of the one deathbed and the gloom that lay heavy upon the other. He died poor, but not because of his Castilian love of pomp and display, as Sismondi assumes. His large income from his dramas and other sources was all but wholly devoted to charity and church purposes. His tastes, wants, and habits were of the simplest; a little flower-garden a few yards square was his one luxury, and a few books and pictures all his worldly goods.

The mere list of Lope's works presents a picture of unparalleled mental activity from boyhood to old age. He wrote plays, he says, in his twelfth year, and certainly wrote some not much later, but his first work of any length was a characteristic attempt in twenty cantos to prove that his was the *miglior plettro* to which Ariosto left the completion of Angelica's story. It was written at sea in 1588, but not printed till 1602. The *Arcadia* was written, as book v. shows, before the Duke of Alva's marriage, July 1590, but he, no doubt, was not eager to see in print pre-nuptial vagaries, which had already, as Cabrera says, 'made a noise,' and it was kept back till 1598. The *Dragontea*, a shout of exultation in ten cantos over the death of the Dragon, Drake, the destroyer of Spanish naval supremacy, appeared at Valencia the same year, but a few months earlier, and was Lope's first publication with his name. But it was as a ballad-writer that he first made his mark. The 'Flores de Romances,' the little 'garlands' out of which the *Romancero General* was formed, had begun to come out at Valencia when he was there in 1590–92, and of the contributors of the Moorish and pastoral ballads in vogue 'Belardo' (his name in the *Arcadia*) was, we learn, the most esteemed. Of his miscellaneous works some, like those on St Isidro and his canonisation, and on the marriage of Philip III., are merely occasional, and others owe their escape from utter oblivion solely to his name. The more notable are the *Rimas* (1602), comprising the *Angelica*, 200 sonnets, and a reprint of the *Dragontea;* the *Peregrino en su Patria* (Seville, 1604), a romance on the model of *Theagenes and Chariclea*, with a preface giving his views on the drama, and a list of the 219 plays he had already produced; the *Jerusalen Conquistada* (1609), an epic in twenty books in competition with Tasso; the *Pastores de Belen* (1612), a religious pastoral; *Filomena* and *Circe* (1621–24), miscellanies in which he tried to rival the *Novelas* of Cervantes; the *Corona Tragica* (1627), an epic with Mary Stuart for heroine; the *Laurel de Apolo* (1630), a poem on the pattern of Cervantes' *Viage del Parnaso;* the *Rimas de Tome de Burguillos* (1634), a collection of his lighter verse, with the *Gatomaquia*, a mock-heroic. The most noteworthy of all is the *Dorotea* (1632), in form a prose drama, but obviously the story of his own early love-adventures from 1583 up to a little before the sailing of the Armada, with a prediction from an astrologer of his marriage, imprisonment, and banishment.

Originality, it will be seen, was not Lope's forte. He was fonder of following in the wake of others than of striking out a line of his own. He was always measuring himself against any one who had achieved success, and always unsuccessfully. All these works show the hand, not of a great artist, but of a consummate artificer. The merits of Lope's verse are undeniable. He was a master of easy, flowing, musical, graceful verse; but he rarely passes the frontier line between mere excellent verse and poetry, and never tarries long when he does. Once only he seems to write from his heart and not from his head, in the ballad on his first wife's grave, visited on a bright spring day when the trees were coming into leaf, the birds singing gaily, the lambs frisking round him, and all nature as usual unsympathetic with sorrow. These *obras sueltas*—detached works—of Lope's shine in fact in the reflected light of his dramatic renown. It is clear that though he had written plays he did not become a writer for the stage until after 1588. From his quarrel with a manager, it seems he had tried his hand at Madrid; but no doubt it was at Valencia, where it was more forward, that he served his apprenticeship to the drama. Not the least of his many gifts was his intuitive perception of the Spanish playgoer's tastes. He saw what his predecessors, Cueva, Virues, Argensola, Cervantes, all failed to see, that the public did not care for tragic emotion or development of character or passion; that what it wanted was excitement pure and simple, and that a drama that ignored a craving which had been utilised by the Inquisition, been the mainstay of chivalry romance, and had made the bull-fight a sacred institution, could never become a popular national drama. In the *New Art of Comedy-writing* and in the *Peregrino* he puts the case with a candour almost cynical. It is true, he says, that plays written in defiance of the rules of art are barbarous, but the public does not trouble itself about the unities, or the twenty-four hours rule, or inconsistencies, or improbabilities, and he who would be listened to must put away all restrictions that hamper him, and make it his business to give the public what it asks for, even if that be nonsense: he who pays the piper calls the tune. The great point was not to allow the excitement to flag for an instant, and to drop no hint of how the play was going to end; the *enredo*—not 'plot' but 'entanglement'—was all in all. Lope's qualifications for this were extraordinary. His invention was boundless. He could string striking situations and ingenious complications one after another without stop or stay, and keep the audience breathless and the stage in a bustle for three long acts, all without a sign of effort. Not less astonishing was his mastery of easy musical verse that charmed the ear and gave additional brilliancy to the dialogue. And then, long before one play had ceased to excite he was always ready with another as good or better. It is no wonder that Cervantes called him a prodigy of nature, or that he was idolised by the nation which for forty years he kept supplied with the stimulant it craved. Imagination or creative power need not be looked for in Lope's drama; they were not among his gifts, and would have been useless if they had been. His dramatis personæ, for the most part, have no more individuality or character than a batch of puppets. Don Luis of one play is only Don Lope of another in a different wig and doublet, declaiming rage, jealousy, or despair with precisely the same unchanging wooden

countenance. In principle Cervantes was right in his strictures on Lope's drama, but on the practical question he was wrong, as is amply proved by the reception given to the plays of Alarcon, a dramatist in a sense in which neither Lope nor Calderon could claim the title. As regards his relations with Cervantes, Lope has not been fairly treated. The charge of malignity rests upon his disparagement of *Don Quixote* and its author in a private letter, and his silence in public as to the merits of the book. He would have been a marvel of magnanimity if he had liked either. Impartiality must allow that Cervantes was the aggressor. His attack was in the language of a courteous gentleman and an honest critic, but it was an attack all the same; and the sly hits at little vanities that accompanied it could not but be galling to a vain and sensitive man. As for the charge brought by Don Ramon Leon Mainez, that Lope was 'Avellaneda,' that rests on nothing at all, and evidence must be forthcoming before any one who knows human nature will believe that a gallant soldier who had fought in the Armada sneered at another for having been wounded at Lepanto.

Lope's plays have been elaborately classified by Schack, Hennig, and others, but for convenience they may be roughly divided into the historical or quasi-historical (including legendary and sacred dramas) and those that deal with every-day life. Of the latter the most characteristic in every way are the 'Comedias de capa y espada'—cloak and sword plays—a picturesque title that puts the principal figures before the eye. They are as a rule dramas of upper-class society, in which love, gallantry, jealousy, and above all the hyper-sensitive Spanish honour supply the necessary complications. The *Noche de San Juan*, one of Lope's very last plays, the *Maestro de Danzár*, one of his first, and the *Azero de Madrid*, the source clearly of Molière's *Médecin Malgré Lui*, are excellent specimens. It is not easy to make a selection of typical characteristic examples out of a repertory so vast and varied as Lope's, but his peculiarities and excellences as a dramatist may be studied with advantage in such plays as the *Perro del hortelano*, the *Desprecio agradecido*, the *Estrella de Scvilla*, the *Esclava de su Galan*, the *Premio del bien hablar;* and no student of Calderon should overlook the *Alcalde de Zalaméa*, which, if not better than Calderon's famous play, as Chorley thought it, is unquestionably the bold vigorous outline that left little more than filling in to be done by Calderon's hand, and is one more proof that later dramatists found Lope, as Fuseli said the painters found Blake, 'good to steal from.'

The number of Lope's plays is given by Montalvan as 1800, exclusive of 400 *autos;* but this is obviously excessive, as he wrote but few during the last two or three years of his life, and in 1632 the number is put at 1500 both by himself in the *Eclogue to Claudio* and by Montalvan in *Para Todos*. This is probably near the truth, as it agrees with the rate of production indicated by other statements. In 1603 he had written 230; in 1609, 483; in 1620, 900; and in 1624, 1070. Of these the very names of all but 608 according to Barrera, 680 according to Chorley, have been lost, in a great many cases nothing but the name has survived, and frequently one play is represented by two names. All necessary deductions made, we have about 440 plays and 40 *autos* in print or MS. Some have been printed singly or in general collections, but the greater number are to be found in the *Comedias de Lope de Vega*, a series of 25 volumes of which 9–21 were authorised by himself. A selection comprising about a fourth of the extant plays, edited by Hartzenbusch, fills 4 volumes of the *Biblioteca de Autores Españoles*. The non-dramatic works were collected and published at Madrid in 1776–79 in 21 handsome volumes; and a selection fills vol. xxxviii. of the *Bib. Aut. Esp.*

See also Ticknor's *Spanish Literature*, Schack's *Geschichte der dramatischen Literatur in Spanien*, Hennig's *Studien zu Lope de Vega*, Chorley's *Catalogo de Comedias y Autos de Lope de Vega*, Barrera's *Catalogo del Teatro Español*, Lord Holland's *Life of Lope de Vega*, and G. H. Lewes' *Spanish Drama*, an unpretending little book full of sound criticism. A complete edition of Lope's works is being issued by the Spanish Academy.

Vegetable. See PLANTS, BOTANY, BIOLOGY, GEOGRAPHICAL DISTRIBUTION, &c. For Vegetable Chemistry, see VEGETABLE PHYSIOLOGY; for Vegetable Histology, see TISSUES, BARK, BAST, LEAF, WOOD, &c.; for Vegetable Marrow, see GOURD; and see also IVORY (VEGETABLE) and PARCHMENT. The general history of classifications of the 'Vegetable Kingdom' is given in the articles BOTANY and BIOLOGY, and the details of the great divisions will be found under ALGÆ, FUNGI, MOSSES, FERNS, GYMNOSPERMS, MONOCOTYLEDONS, DICOTYLEDONS. The student will find an excellent account of the older classifications of Linnæus, De Jussieu, De Candolle, Endlicher, and Eichler in Leunis' *Synopsis der Pflanzenkunde* (1883). Recent progress has in part been due to the influence of replacing long verbal descriptions by diagrams, introduced by De Candolle and greatly developed by Eichler in his *Blüthendiagramme*, which led to better classifications from a purely morphological standpoint. The effect of evolutionary ideas may be traced in Warming's *Haandbog i den systematiske Botanik* (German trans. Berlin, 1890). No quite satisfactory classification of plants has yet been constructed, nor indeed can one well be until a thoroughly evolutionary point of view is adopted.

The student may consult text-books such as Bentley's *Manual of Botany;* Henfrey's *Botany;* Asa Gray's *Botany;* Goebel's *Outlines of Classification and Special Morphology* (Oxford, 1887); Hooker's translation of Lemaout and Decaisne's *Botany;* Van Tieghem's *Traité de Botanique* (Paris, 1891); Kerner's *Pflanzenleben;* and for fuller information the great works—Bentham and Hooker's *Genera Plantarum*, Baillon's *Histoire des Plantes*, and Engler and Prantl's *Pflanzenfamilien*. For local plants he should consult the various floras, of which we may cite as typical Rabenhorst's *Deutsche Kryptogamen-Flora*. Of elaborate monographs, Saccardo's *Sylloge Fungorum* may be mentioned as typical and very complete.

Vegetable Physiology. The seasonal sequence of leaf, flower, fruit, and seed ever reminds us that plants live and change; and the cycle of farm or garden operations is correlated with this. The relation of these processes to plant development must be closely and carefully examined, and the manifestations of life seen as the resultant of many hidden internal actions. It is useful to begin by sowing some seeds and studying the conditions under which they grow best, and what changes constitute this growth, and on these germination experiences base a fuller investigation of the life-processes of the adult plant.

Germination (see SEED, SPORE, &c.).—The seed sown must be alive. The common test—that a living thing breathes—may be adopted. In many cases this Respiration (q.v., and see also below) can be shown by drawing the air surrounding the seeds through a tube containing lime-water, when the insoluble white carbonate of lime is formed by the union of carbon dioxide, CO_2, with lime. In some cases transpiration (see below) can be detected. Most seeds in temperate regions live a year at least, sometimes two or more. Where there is no winter, some seeds (as those of the coffee) must be planted almost at once. On the other hand, melon seeds have germinated when over forty years old. The young plant must be nourished by food stored around or within it, until such time as it can make its own food. These reserves (see ALBUMEN, SEED) are not directly assimilable by the embryo, but must first be digested by 'ferments' (see FERMENTATION, and below), which

exist in necessary quantity only at a certain period of the seed's life. The reserves are often very dry, and must have a supply of moisture before digestion and assimilation are possible.

No motion of particles bringing this about can take place if the seed be frozen; so a minimum of heat—from 4° to 13° C.—is necessary, and germination is impossible at temperatures higher than 36° to 46° C., and is most active at 26° to 35°, varying according to the nature of the seed. Other external influences are of comparatively little importance. The visible results of germination are the appearance of root, seed-leaves, and shoot. The life-processes of the seed have all been intensified—breathing is more rapid, transpiration is marked, and sometimes enough heat is given out to let us feel and measure it—e.g. in malting. The seedling is very sensitive to all outside influences: it quickly droops in drought, shrivels up should the sun's heat be too great, and blackens if the nights be frosty. As the plant develops it becomes less influenced by environment, and soon begins to make its own food; but before discussing this special function of plants it is well to look at the life-processes common to all organisms.

Respiration (q.v.) is manifested by the intaking of oxygen, O, and the final liberation of carbon dioxide, CO_2, gas. Attempts to grow most plants without free O are failures; and the CO_2 can be precipitated as calcium or barium carbonate when drawn through lime or baryta water. The activity of respiration is best measured by the number of volumes of gas per unit mass taken in and given out in unit time under constant conditions. Thus comparative accounts of the rate of breathing of different plants and of different parts of plants may be obtained, as well as the relative intensity of respiration at different ages of organism and of organ. Succulent plants and very dry ones do not respire so energetically as rapidly growing grasses and annuals; and the young plant breathes very actively, whereas the hibernating bulb or seed respires most sluggishly. External influences have no great effect on respiration, which, however, is somewhat quickened by a rise of temperature up to that which kills the plant. For most plants in normal conditions the volume of oxygen taken in is approximately the same as that of CO_2 given out.

Most cells are not immediately asphyxiated if deprived of free oxygen, but take it from some of the simpler organic compounds they contain or that surround them—a leading product in many cases being Alcohol (q.v.; and see FERMENTATION). The yeast plant has been domesticated for this purpose, and other moulds and also many bacteria are able to prolong the process and convert large quantities of sugar into alcohol, or split up other substances into different constituents. Here the volume of CO_2 exhaled is greatly in excess of the O inhaled. The volume of O consumed is much greater than that of CO_2 liberated in other cases, such as that of the acetons ferment.

Transpiration.—The heat given off in respiration is partly used in evaporating water, ever present in organic substances. This vaporising of water is usually termed transpiration. It may be shown by placing a plant in a pot on one of the scales of a balance, and noticing that the weight lessens, although, as we shall see, a green plant in the light must be adding to its substance all this time. Accurate estimations of the volume of transpired water can be made by sealing the moist soil and the root of a plant in a glazed pot covered with a waterproof lid, placing this under a bell-jar, supplying the plant with water-free air, and measuring the change of weight of the drying tubes through which this air is sucked after passing through the bell-jar.

The amount of water vaporised is by no means constant. It varies with nature and age of plant, and part of plant, and with external conditions. Some seeds, especially oily ones, cannot be found to transpire, others can; young plants readily do so, and leaves more vigorously than roots or stems. Transpiration seems very analogous to evaporation, and is less marked in moist conditions, but it never ceases in saturated air as the latter does. It is said to be less than evaporation, because a plant killed and uninjured (by anæsthetics for instance) gives off more water vapour after death than before it; but the experiments are inconclusive. In fungi and other greenless plants the influence of light is noticeable to a slight extent, increasing transpiration. But if a green plant be kept in the light there is a much stronger marked maximum when the sun is brightest. When this plant is kept under a sealed bell-glass for some time no CO_2 but an excess of O is found. If this last change be prevented by ether, respiration being unaffected, then the amount of water vaporised is increased. All these phenomena are closely related, and will be discussed below. The leaf is the green organ *par excellence*, and by its construction, its distribution on the plant, and its position with the surface normal to the sun's rays (except when these are excessive) it can arrest the greatest possible number of radiations (see LEAF).

The maturing leaf has two transpiration maxima. The first and greatest is when the leaf is very young and every surface-cell can transpire freely. Gradually a cuticle develops which may be coated with wax in addition, and then the transpired water passes by the stomata. The crescentic bounding cells of these openings are specialised, and contain Chlorophyll (q.v.), which, absorbing radiations, sets up activities synchronously with those of other green tissue of the leaf, and modifies the contents of these guard cells, so that they swell and open the stomata to their widest when the other green cells are most active. The second transpiration maximum occurs when most stomata are developed.

'Assimilation' and 'Chlorovaporisation.'—When a plant grown in the dark is brought into the light it first turns green, and then begins its new functions. The yellow etiolin stops certain ether waves which transform it into green Chlorophyll (q.v.). The spectrum of chlorophyll shows absorption bands in the red and violet, with less marked ones in the yellow. These waves move the molecules of plastic matter (protoplasm, solids, and solutions) associated with this chlorophyll, so that CO_2 is taken up and O is ultimately set free. This 'assimilation' is the reverse of respiration, a deoxidising process, an unburning where the sun's rays supply the needed energy. It often masks the breathing, and early physiologists were led to conclude that green plants respire in the reverse sense to animals. The volume of O given off is approximately the same as that of CO_2 taken in. Naturally optimum conditions of light promote optimum 'assimilation,' and the minimum occurs at night; but too bright light is injurious. Heat, up to 30° C. at least, increases it, and any optimum must be above this. A young leaf 'assimilates' more vigorously than an old one. The increase of transpiration when a green plant is in the light is probably due to all the energy arrested by the chlorophyll not being spent in 'assimilation,' but in part vaporising water; and this seems probable not only because more water is transpired when assimilation is inhibited by anæsthetics, while respiration is unaffected, but it is found that the blue and violet rays absorbed are more efficient in transpiration, while the red ones are most active in assimilation. M. van Tieghem has termed the transpiration, which is a function

of chlorophyllic activity, *chlorovaporisation*, and others *transpiration chlorophyllienc*. Chlorovaporisation is a useful term when it is necessary to distinguish between it and the transpiration due to protoplasmic activity.

Absorption.—Plants living in water have all their epidermal cells absorptive, and need no elaborate water conducting system. Land-plants must either extract the water from the air, or from the soil, or from both. Experiment shows that the Roots (q.v.) are the active absorbers, and the fine root-hairs near the tip of the roots the special organs concerned in this. These absorbing hairs, as they are best termed, are drawn-out epidermal cells with walls of Cellulose (q.v.), differing from that of most cells in being more readily permeated by water, inside which is a lining layer of Protoplasm (q.v.). This double layered cylindrical bag is filled with cell-sap.

The contact between these hairs and the grains of soil is very close, and a film of water coating their outside is continuous with that adhering to the particles of soil. The sap is more viscid than this mineral water outside, and so we have a living cell acting as a complex dialyser (see Osmose)—colloid cell-sap, crystalloid soil water, with protoplasm membrane supported by permeable cellulose skeleton work between. We have thus the conditions necessary for a flow of mineral water into the plant (any outflow being very small, although when acid aiding in the decomposition of the soil), which is continuous as long as these conditions remain constant. The cell-sap made less colloid by this influx of water is crystalloid compared to that of the inner cell, and the current accordingly flows inwards. Yet this is but the crudest approximation to a full explanation, for not only are the variations of the cell-sap's quality due to this dilution to be considered, but also those due to protoplasmic activity, and in addition the fact that the osmotic properties of the protoplasmic membrane itself are ever being modified by its continual oxidation and deoxidation.

Movements of Water.—In water-plants and those living in damp conditions, as well as in low-growing plants, osmose is the main agent. We need not imagine a long series of cells, each with its sap more colloidal than that of the next in order; for even in the laboratory the reversing of a membrane sometimes alters the direction of the current, and the plant membrane is very complex in structure, as well as constantly changing. It is difficult to set a limit to the influence of osmotic action.

Experiments making plants absorb tinted water show that it passes up the wood (xylem) part of bundles (see Stem), as may also be proved by noticing that only when the young wood has been incised all round do the leaves wither, and even hollowing out old wood does not induce drooping. Conifers have true vessels only in first-formed wood; hence any satisfactory explanation must not lay too much stress on capillarity, which would account for a rise of a few feet at most. Much stress has been laid on the porosity of the cell-walls and their permeability by water, and Sachs in his 'imbibition theory' has emphasised the mobility of this water, and believes he can explain the phenomena by its aid. The transpiration of water helps to raise water owing to pressure differences resulting from it, and these may be increased by the bubbles of air in the vessels or fibres losing their oxygen to respiring cells, the CO_2 given off being dissolved in the water. But pressure differences can account for no more than a few yards of rise.

The pressure from below at some periods of the year is very considerable, as Stephen Hales showed in his classical experiments on 'root-pressure,' when the watery sap was forced up a tube tightly fastened to the end of a cut stem. This is most noticeable in spring, and in part at least is a function of temperature, for a slight heating of the soil will sometimes make an experiment work more rapidly. This 'root-pressure' gives rise to 'bleeding' when the sap is forced out at buds in spring, and to 'dew' when exuded along the edge of a Lady's Mantle or other leaf. This exudation occurs from stomata in grasses, &c., and from special organs in saxifrages, balsams, &c. (called water-pores or stomata). Should the water have passed through a sugar-laden tissue it becomes nectar, and the organ a nectary. Some plants show an excessive development of water-pores and nectaries, and may be specially modified so that the exuded sap may be retained—e.g. the pitcher-plant (see Insectivorous Plants).

Metabolism (q.v., and see Protoplasm).—We have seen how green leaves are supplied with gases, water, and dissolved salts, and how they can trap special ether waves. The active energy of these waves is used to transmute the simple inorganic compounds into complex organic ones, which in the process of respiration are reduced to simpler substances again, and the potential energy transformed into kinetic. These metabolic changes take place in living cells full of intense activities. Currents course through the protoplasm and cell-sap in every direction and between the cells, which are also united by strands of protoplasm. The gases used and given off in respiration and 'assimilation' are floated in and out, and each protoplasm particle burned or unburned is the centre of an area of disturbance. Pure protoplasm is influenced equally by all rays: that associated with chlorophyll is affected by certain red and violet rays in particular. These, especially the red ones, bring about the dissociation of the elements of the CO_2, the assimilation of the C, and the excretion of the O. But carbon is not found isolated in the plant. The simplest carbon compound found in a green leaf after a few minutes' exposure to light is starch. Remembering that the same volumes of CO_2 are absorbed as of O excreted, we may write a chemical equation expressing results though not processes: $6CO_2 + 5H_2O = C_6H_{10}O_5 + 6O_2$. But we suspect that starch has had a more complex life-history, and that the first-formed organic compound is probably simpler, though very difficult to detect. Probably formic aldehyde is the product, and again the first and last chemical conditions may be written $CO_2 + H_2O = CH_2O + O_2$. From this higher compounds of C, H, and O may be formed.

Since the synthetic process is hidden from us, it will be best to give an idea of the gradual increase of complexity of the compounds found in plants. With nitrogen added to carbohydrates, Amides (q.v.) are formed, and when S and P are combined with these, the Proteids (q.v.). Protoplasm may be either a peculiar unstable arrangement of proteid molecules or a collection of many compounds in a similar unstable condition, so that the wandering oxygen molecules coming in contact with them explosively seize hold on some of the C, and completely unite with it in the most stable way. The protoplasm is constantly oxidising to be deoxidised again, burning to unburn. Irritable and unstable, it is formed to be destroyed, and recomposes only to be once more decomposed.

The result of this burning of protoplasm is either to form proteids, which may become protoplasm again or decompose into simpler compounds; or else to form a combination of compounds—proteids, carbohydrates, &c., which wholly or in part may form new protoplasm, be reduced, or remain in their new form. This may be conveniently summarised in fig. 1, A. The contrast between protoplasmic and

chlorophyllic processes is shown in fig. 1, B. It is very difficult to discover whether a compound is a synthetic or a decomposition product; and it is just as hard to obtain some substances at all, since they are transferred to another cell, or transformed to another shape almost as soon as they are formed.

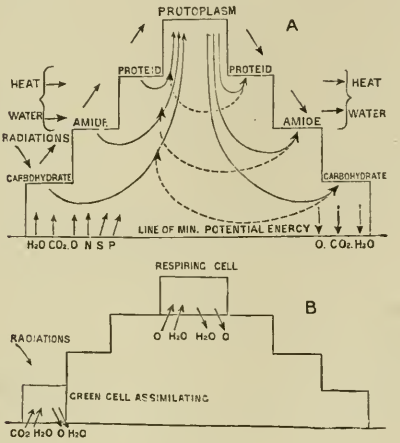

Fig. 1.

Other substances, however, may be stable for a long time. Any matter used to form protoplasm is called a food or reserve, and what is not utilised in this way is a waste. Both may be temporary or last for a considerable time. The same substance may be both a temporary and a seasonal reserve; for instance, starch found in green leaves during the day disappears at night; and starch is the main reserve in many seeds, tubers, &c.

The matter elaborated in the leaves is conveyed to growing and storing organs. Many constituents of elaborated matter cannot be transferred as they are, but must be changed to soluble substances, capable of passing through the cell membranes. This is effected by digestives, often called 'soluble ferments' (see FERMENTATION), which are found in all living cells. Insoluble starch is acted on by diastase, and changed to a cane sugar, which in turn is 'inverted' to soluble glucose; insoluble proteids are changed to soluble peptones by pepsine, &c. This soluble matter is transported by bast cells (see STEM), as is shown by peeling the bark off a tree, when growth takes place above the ringed part alone. A chain of living cells may osmotically conduct this elaborated sap, while the sieve vessels of the bast are active according to some, or according to others may be storehouses supplying food to the actively growing and dividing embryonic tissues (cambium) rather than conductors. Some wastes are at once excreted—e.g. O, CO_2, H_2O; some are secreted, and others are deposited in aggregates or crystals. Some so-called wastes are used again, and really are seasonal reserves. Many wastes are of great use in industry and medicine (see PHARMACY, NARCOTICS, GUM, RESINS, &c.). The odours and colours of plants are probably wastes (chlorophyll itself is sometimes thus classified).

Composition of Plants.—The plant uses O in respiring and CO_2 in assimilating, both of which come from the air. Water and the salts dissolved in it supply the other elements which are absorbed by the roots. All substances washed out of the soil are not used by the plant, but cease to enter when its lower cells become saturated; whereas the constant assimilation of any useful salt makes it be constantly absorbed. Some plants use more of one substance than of another, and a soil soon becomes poor if the same crops be constantly grown on it. Thus we need to have Rotation of Crops (q.v.) and also fertilisers (see MANURE). Plants may be grown in clean sand, and watered with nourishing solutions. But soil is not essential (witness hyacinth culture in our rooms), provided the roots are properly protected, supported, and supplied with water and the necessary minerals. An excellent solution for watering or growing plants is the following 'normal culture solution:' Dissolve 1 gramme nitrate of potash, ½ gramme sulphate of magnesia, ½ gramme sulphate of lime, and ½ gramme common salt in 1 litre of distilled water, and add a trace of phosphate of lime and of any ferrous salt.

The results of growing a plant in this normal culture solution are very satisfactory if external conditions are kept favourable; and when these latter are the same for all plants an excellent comparison of the effects of the lack of each of the compounds may be obtained, as is shown in fig. 2. The plant's needs regarding matter may be accurately determined by analysing all the gases given

Fig. 2.—Maize Plants grown under similar conditions, except that the roots were in different nutritive solutions, and that one plant was kept in darkness:

1, maize plant grown in 'normal culture solution' (see above); 2 had no sulphate of magnesia; 3 had no common salt; 4 had no sulphate of lime; 5 had no phosphate of lime; 6 had no nitrate of potash; 7 had no iron, and has become chlorotic; 8 was grown in distilled water; 9 was grown in normal solution, but in the dark.

off during life, and on combustion at death, and all the ashes that are left. The most important elements are C, O, H, N, S, P, and other essential ones are Ca, K, Na, Mg, Cl, and Fe.

Growth.—After germination the root of the young seedling spirally winds its way down among the particles of the soil, turning away from them with its sensitive tip, seeking out the moister parts. Behind the tip it clasps anything it touches and thus anchors itself. As it grows older it contracts, making this anchorage securer. The shoot, often with arched head, shoulders its way upwards towards the light, twisting round more or less as it rises. Root and shoot grow in thickness as well as in length (see ROOT, STEM). The curves and movements of growing parts are discussed under PLANTS (MOVEMENTS OF). The rate of growth varies very greatly. Bamboos are said to lengthen 10 inches in twenty-four hours. Our cereal crops (36-60 inches high) ripen about twenty weeks after the sowing of the seed, and some trees are hundreds of years old. Growth is most active in spring, and elongation is greater at night than by day, and indeed varies from hour to hour—the

Victoria regia leaf, according to Drude's experiments, lengthening 99·4 mm. between 11 P.M. and midnight, and 127·9 mm. between 12 and 1 A.M. The greatest elongation takes place near the tip both of root and of shoot, within the last few millimetres in the former, on the last few centimetres in the latter. Fig. 3 represents the lengthening of equal divisions of a bean root after twenty-four hours' growth.

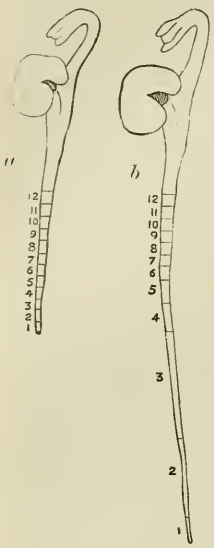

Fig. 3.
a, bean root divided into equal divisions; *b*, same root 24 hours later.

In rapid-growing parts respiration is naturally very active and transpiration stimulated; but it must be noted that the maxima of elongation and of transpiration do not coincide. Growth may occur below freezing-point, but in some plants none takes place below 10° C. or 15° C.; the best temperature varies from 20° to 36° C., and the maximum from 36° to about 50°, but plants are found growing in warm springs hotter than this. Light retards growth. A certain amount of water is essential to its occurrence. The matter used for the permanent changes we call growth comes from the excess of it elaborated over that used to repair waste, and the energy from the heat given off in respiration. It is necessary to examine what changes constitute this growth more closely; but, unfortunately, a satisfactory mechanical explanation seems scarcely possible.

It is necessary to imagine all the stir and change going on in the Cell (q.v.). The protoplasm grows by new organic matter formed by the chlorophyll grains being digested and assimilated. At the limit of growth cell-division occurs (see CELL, REPRODUCTION). After a cell has ceased dividing, the mass of its protoplasm is probably not greatly increased, but vacuoles appear in it, and as the cell grows older and elongates the protoplasm finally forms a membrane bounding one large sap vacuole and lining the cell-wall. The protoplasm has been rapidly adding to the cell-wall, and at last the wall assumes its final shape and markings. The elongation is due to the distension (*turgor*) of the cell by accumulated water. When a plant is rapidly transpiring (for instance a green plant in sunlight) the cells are not so likely to become turgescent. This is one cause at least of the lengthening being greatest by night, and it is well to emphasise that it is elongation that is then a maximum, and not necessarily the substantial increase which makes it permanent. When the wall is stretched in this way new cellulose can most readily be added. The cellulose may be deposited as such, or precipitated from some compound the rest of whose constituents are soluble. The unit may be the cellulose molecule, or a more complex one formed of an intimate union of several molecules (micellæ of Nägeli).

There are several theories as to the way in which the cellulose in any of the conditions just mentioned may be deposited. It may be plastered on inside of the wall (apposition theory), or the protoplasm may penetrate the cellulose wall and there lay down new matter, or the cellulose may be floated into position between old particles (intussusception). The transformation of cellulose into wood (lignin), or cork (suber), or gum (mucilage) may be explained most readily by one of the two latter hypotheses. The constant passage of cell-sap, and the permeability of the cell-wall (unless corky or gummy) must never be forgotten.

Movement in Plants.—The constant currents in cell-sap and protoplasm may be co-ordinated so that the whole contents are caused to glide round and round the cell (Elodea), or stream from side to centre, and from the nucleus back to the wall again (stamen hairs, Tradescantia). Sometimes this affects the whole organism, which may creep along like an amœba (Myxomycetes) or slowly swing to and fro (oscillatoria); or may be concentrated in one special part of the organism (cilium) whose rapid movements transport the plant from place to place (Volvox, zoospores). The sleep of plants may be explained as a partial periodic movement of plants, and classed among these natural movements. A number of motions are to be seen when a plant is specially stimulated, and these movements of irritability are discussed under PLANTS (MOVEMENTS OF).

Habits of Plants.—The simplest plants live in water, but other forms exist underground (Truffles, q.v.), while some can live in sugar (Yeast, q.v.) or in oil. The majority, however, are fixed to the soil and spread their expansions in the air. Some simply scramble along the ground (Brambles, q.v.), some keep erect, and others twine and climb up their stronger neighbours or other support to reach the light. Plants may live on decaying matter (Saprophytes, q.v.), or on other living plants (Parasites, q.v.): many associate with other plants or animals, each mutually helping the other (Symbiosis, q.v., or Consortism).

Reproduction.—At the limit of growth cell-division occurs; and sometimes special cells are cut off which either separately or after union with another cell are capable of reproducing the plant (see REPRODUCTION, FERTILISATION, &c.).

LITERATURE.—The works of Stephen Hales, Ingen Housz, Sénébier, De Saussure, De Candolle, Hofmeister, Boussingault may be consulted. The best books in English are Vines's *Physiology of Plants* (Cambridge, 1886), Sachs's *Lectures on the Physiology of Plants*, translated by Marshall Ward (Oxford), Goodale's *Physiological Botany* (Macmillan, 1890), and an excellent introductory book is Master's *Plant Life* ('Life on Farm' series). For experimental work Detmer's *Pflanzen-physiologische-practicum* (1888) is very useful. The physiological chapters in Van Tieghem's *Traité de Botanique* (Paris, 1891) may be consulted, as should be Pfeffer's *Pflanzenphysiologie*, and Frank's *Lehrbuch der Botanik*, Band i. (Leip. 1892).

Vegetarianism is popularly defined as the practice of eating foods obtained from the vegetable kingdom exclusively, and abstaining from all foods obtained from the animal kingdom. This is an approximately correct definition of what was meant by the word when the Vegetarian Society was founded in 1847. It was not long, however, before it was discovered that there was as great a need of discrimination in the use of the various products of the vegetable kingdom as there was cause to abjure the use of flesh. Vegetables are not all equally wholesome, some are absolutely poisonous. There is a great difference between the stalks and leaves and the seeds of plants. Cooked and uncooked foods differ greatly. The study of food leads to the study of equally important laws. Eggs, milk, cheese, butter (animal *products*) differ from the carcasses of slaughtered animals. Many of the arguments against the use of flesh do not apply to the use of fish. These and similar questions arose, and so sects sprang up. Some ate fish; some were called Vems (eating Vegetables, Eggs, and Milk); some were *strict* vegetarians or Vegs (excluding all

animal products); some took up the Edenic diet (excluding all cooked food); some, though using cooked food, excluded cereals; some adopted a theory of a specific vitality in uncooked fruits, grains, nuts, and pulses, specifically adapted to the development of man on his four planes of body, mind, soul, and spirit. Out of this clash of conflicting ideas there gradually grew up in the London Society a symmetrical theory which has widened the basis of vegetarianism (Neo-vegetarianism). It holds that nature is governed by universal law; that health, happiness, and life are normal, and disease, misery death abnormal; that man has power to regain the normal by obedience to the laws of nature (the abnormal being the result of inherited or personal disobedience); and that vegetarianism is coincident with obedience to these laws.

In strictness, therefore, no one is yet entitled to the name of vegetarian, but since it is believed that the eating of flesh is antagonistic to progress on so many grounds, and that reform in food is the basis of all individual reform, the renunciation of flesh in whole or in part is made the test question of vegetarianism, leaving the positive question of what articles in the vegetable kingdom constitute man's proper food to be one of the branches of further study. In support of abstinence from flesh the following ten claims are made: I. Physiology proves man to be closely akin to the frugivorous ape and essentially different from the carnivora, herbivora, or omnivora. But it is objected that man has canine teeth, and his intestines of mid length between the herbivora and carnivora show that he should partake of the food of both. To this the reply is that canine teeth are found in apes also; and the mean length of his intestines proves rather that he is fit for *neither* than for *both* forms of food, for grasses need long intestines which he has not got, and flesh needs to be passed away very rapidly through intestines shorter than man's, to prevent putrefaction. Physiologically and anatomically man can scarcely be differentiated from the higher apes. II. Embryology shows that to be a permanent differentiation of type which comparative anatomy shows to be actually different: the typical herbivora being placentally non-deciduate, the carnivora zonary deciduate, and apes and men discoidally deciduate. III. Chemistry proves that all elements for perfect nutrition in assimilable forms are found in a proper vegetarian dietary. It is objected that (*a*) an enormous bulk must be consumed to get the requisite nutriment; (*b*) flesh is food ready prepared by another animal, and so requires less vital strain to assimilate it than vegetable food. It is replied that (*a*) increased bulk is not necessary—e.g. of flesh alone it would be necessary to eat 96 oz. per day to get sufficient carbon; of bread alone, 64 oz. to get enough proteids; of mixed flesh and bread, 42·3 oz. (34·5 oz. bread and 7·8 oz. beef) would suffice; similarly 34·6 oz. of a mixture of 9·5 oz. lentils and 25·1 oz. of bread, or 24·1 oz. of almonds and raisins, would give the same result; (*b*) animal cells are not absorbed as cells, but must be broken down and converted to chyle before absorption, so that assimilableness varies as much between different sorts of flesh as between flesh and non-flesh foods. Thus pork takes, raw, 3 hours; well roasted, 5¼ hours; beans, 3½ hours; beef, raw, 2 hours; well boiled, 2¾ to 3 hours; well roasted, 3¼ to 4 hours; rice, boiled, 1 hour; fresh-baked bread, 3½ hours to digest. IV. Flesh as sold is diseased to a very high percentage by diseases communicable to man, which the purchaser is quite unable to detect. V. Higher instincts revolt against taking life, and the repression of these higher instincts prevents evolution of the higher man; while the relegation of the function of slaughtering to others is the unjust perpetuation of a degraded class to be an ever-constant source of danger to the stability of the morality of the community for the sake of supplying the luxurious demands of an artificial appetite. The objection made is that butchers are often kind and gentle, and that other occupations produce types of men as low as slaughtermen. VI. Unnecessary destruction of life is immoral. Objections are made—(*a*) that it begs the question to say that flesh food is unnecessary; (*b*) the land would be overrun if the animals were allowed to breed unhindered; (*c*) is it not more merciful to breed, tend, feed, and painlessly kill, than allow the animals to battle for existence and then die of hunger or fall a prey to the carnivora? The reply to these difficulties is—(*a*) physiology and chemistry prove flesh to be unnecessary; (*b*) the balance of nature prevents overrunning—e.g. is any new land when discovered overrun with animals, although they have had countless ages in which to propagate unhindered by man's interference? (*c*) the problem presented is hypothetical, for in reality the cruelties inflicted by man on the animal world are appalling, and for these cruelties the habit of flesh-eating is to a great extent responsible. VII. It is economically superior—for 1·281 lb. of oatmeal at a cost of 3d. will supply power to raise 140 lb. to the height of 10,000 feet, while of beef fat it would take ·555 lb. at a cost of 4½d., or of beef lean 3·532 lb. at a cost of 3s. 6½d. On the other hand it is said that if *all* were to adopt it it would simply mean an all round depreciation of wages by a reduction of the subsistence minimum. VIII. Physical strength increases, as proved by the usually superior physique of peasants to that of middle classes; Arab porters, Indian runners, and Scotch and Irish peasants are especially pointed out as physically above the average, while the frugivorous gorilla is noted for enormous strength. But it is objected that (*a*) men who are so fed improve when flesh is added to their diet; (*b*) many Hindus are puny and staminally weak. It is replied that (*a*) they appear to improve because flesh is a stimulant, and so transforms latent energy into manifest force; (*b*) it is not claimed that a diet chiefly composed of rice is the best, while the fact that many fine races do live without flesh proves that under such conditions at any rate it is not a necessity; and immediately the non-necessity is admitted the whole weight of the moral argument enters the scale against the habit. IX. Whereas 12 acres of land, if used for the rearing of cattle for slaughter, will maintain one man feeding on the flesh produced, the same area under wheat will maintain twenty-three, and on a mixed crop of fruit, pulse, grain, and vegetables a still higher number. The objection here is that much land is suitable for nothing else but, e.g., sheep runs. By the vegetarian this may be granted, but the assertion does not apply to the thousands of acres of valuable horticultural land now under grass. X. It is claimed that horticulture, and especially *petite culture*, would employ an enormously greater amount of labour than does stock-raising, and so tend to afford a counter current to the present townward drift and to congested labour centres.

Vegetarianism has spread so extensively that in addition to its pledged adherents it has a still greater number who practise abstinence from flesh to a greater or lesser degree in obedience to medical advice, for the curing or relieving of disorders of digestion, gout, and rheumatism. The Catholic Church enjoins abstinence from flesh during Lent, and on some other days during the year. Many religious orders (e.g. the

Trappists) abstain wholly from flesh. Brahmins also abstain from flesh and eggs. The Vegetarian Federal Union was formed in 1889. Its offices are at the Memorial Hall, Farringdon Street, E.C. To it are affiliated the Vegetarian Society, the London Vegetarian Society, eighteen other English societies, and those of America, Germany, and Australia. An international congress was held at Cologne in 1889, in London in 1890. There are now vegetarian restaurants in many large towns.

The chief publications are *The Vegetarian* (weekly, Lond.); *The Vegetarian Messenger* (monthly, Manchester); *Food, Home, and Garden* (monthly, Phila.); *Der Vegetarier* (bi-monthly, Berl.); *Die Neue Heilkunst* (bi-monthly, Berl.). See John Smith, *Fruits and Farinacea;* Alcott, *Vegetable Diet;* Professor Francis W. Newman, *Essays on Diet;* Howard Williams, *Ethics of Diet*—all obtainable from the Veg. Federal Union; also Springer, *Wegweiser durch die Veg. Litteratur* (2d ed. 1880).

Vegetius (in full, Flavius Vegetius Renatus), a Roman author who about 375 A.D. wrote the famous *Epitome Institutionum Rei Militaris*, mainly extracted from other authors, which during the middle ages was a supreme authority on warfare.

Vehmgerichte (also spelt *Femgerichte*, or simply *Vehme*, *Fehme*), dread tribunals in Germany during the middle ages, empowered by the emperor to try cases in which the penalty was death, and to execute the punishment on the guilty. They were doubtless based on ancient Germanic methods of tribal justice, though the tradition refers their institution to Charlemagne. It was in Westphalia they were especially powerful, and this is explained by the fact that, whereas in other German lands the ruling princes assumed to themselves all capital jurisdiction, in Westphalia there were for long no territorial potentates strong enough to take over the authorities originally peculiar to the emperor alone and those specially commissioned by him. The anarchical condition of Germany favoured the extension of the Vehmgerichte; and in the 14th century the solemnly initiated members of this tribunal, called *Schöffen* or *Freischöffen*, were found scattered all over Germany. Wherever he lived, the Schöffe could be tried capitally only by the Westphalian court; princes found it convenient to be initiated themselves and choose *Schöffen* for their advisers, and free cities aimed to have their councillors associates of this august body. Any free German born in wedlock might be admitted with solemn formalities, after taking an awful oath to be faithful to the duties and privileges of the order, on pain of an ignominious and specially painful death. The chief of the society, the *Oberstuhlherr*, was the emperor's representative, namely the Archbishop of Cologne as Duke of Westphalia. The *Stuhlherr* was the chief at any given Stuhl or seat of justice, of which the most famous was in the market-place of Dortmund. Officers or *Freigrafen* were named by the Stuhlherren. Any free man might attend the meetings, always held by daylight in the open air, unless the court specially resolved itself into a secret tribunal for the time being; and even then the number of members in important cases took away any real 'secrecy' from the trials. Thus eighteen Freigrafen and 800 Freischöffen took part in the trial of Duke Henry of Bavaria in 1434. The places and times of meeting were perfectly known to all who cared to know. The summons was not delivered personally but usually fastened to the door of the accused. The mode of trial—by accusation and pleading in defence—was the same as in other German courts; and for centuries the power of the Vehme seems to have been used for the best ends, with a full feeling of responsibility and love of justice. Torture was never had recourse to: the convicted prisoner was usually executed at once, or whenever he was found, by being hanged on the nearest tree, a dagger with the device of the society, the mysterious letters S.S.G.G. (whose meaning is unknown), being fixed beside the corpse to show by whose decree the man died. Gradually abuses crept in: the dread powers were used in personal feuds; and the minor princes became more and more jealous. Maximilian subjected the Vehme to very stringent regulations; already in the 16th century they were strictly confined to Westphalia, and gradually subordinated even there to the ordinary courts. They continued to exist, maintaining the ancient formalities, though now bereft of power and little better than a laughing-stock, till they were finally dissolved in 1811 by Jerome Bonaparte. The last Schöffe died in 1835.

There is an extensive literature on the subject, a series of monographs having corrected many picturesque but erroneous conceptions of the once so formidable secret tribunal. Amongst them are those by Berek (1814), Usener (1832), Essellen (1877), Wächter (1882), Lindner (1887), and Thudichum (1889). There is a graphic account of the Vehme in Immermann's *Münchhausen;* see also Scott's *Anne of Geierstein* and the introduction to the same. The etymology of the name in its various forms has been much debated, but is quite obscure.

Veii, an ancient city of Etruria (q.v.), in early times the formidable rival of Rome, supposed to have been at *Isola Farnese*, 12 miles from Rome. It waged fourteen distinct wars with Rome—an almost incessant warfare down to its capture after a ten years' siege by Camillus (396 B.C.).

Veiled Prophet. See MOKANNA.

Veins, in Anatomy, if we except the pulmonary, the portal, and the umbilical veins, are the vessels which carry back venous blood from the capillaries, and, enlarging as they proceed, finally pour it through the ascending and descending *venæ cavæ* into the right auricle of the heart; see CIRCULATION. Their coats are similar to those of the arteries, but much thinner, and may be even transparent. They are, however, of considerable strength. The *internal coat* consists of an epithelial layer, supported on several laminæ of longitudinal elastic fibres. The *middle* or *contractile coat* consists of numerous alternating layers of muscular and elastic fibres, the muscular fibres being disposed circularly round the vessel. The muscular fibres are wanting in some parts of the venous system, and specially developed in others. In the *venæ cavæ* and pulmonary veins near the heart striped muscular fibres may be detected, continuous with those in the auricles. The *external coat* consists of connective or areolar tissue, and of longitudinal elastic fibres; within some of the larger veins, as the inferior *vena cava*, through its whole length, the external iliacs, the azygos, &c., there is also a longitudinal network of unstriped muscular fibres. The existence of valves in the veins is mentioned in the article CIRCULATION. These valves are most numerous in the veins of the extremities, especially the lower ones, these vessels having to act against the force of gravity more than most others. They are absent in the *venæ cavæ*, the hepatic, portal, renal, pulmonary, and some other large veins, and in very small veins generally. The veins are nourished by nutrient vessels, or *vasa vasorum*, like the arteries; but except in a few instances (including the inferior *vena cava*) nerves are not distributed to them. For the chief diseases of the venous system, see the articles PHLEBITIS, THROMBOSIS, and VARICOSE VEINS.

Veins, in Geology, are crevices or fissures—regular or irregular, and inclined at any angle to the horizon—caused by contraction during consolidation or by mechanical disturbance, and filled up with materials different from the adjacent rocks.

Veins occupied by ores and other minerals are termed lodes (see Ore, Mining, Gold, &c.). These very often occur on lines of fracture (see Dislocations). Some veins, again, consist of intrusions of Igneous Rock (q.v.). See Dykes, Geology.

Veit, Philipp, painter, was born at Berlin, February 13, 1793. His mother, a daughter of Moses Mendelssohn, had for her second husband Friedrich Schlegel, and Veit became devotedly attached to the religious and artistic ideas of his stepfather, like whom he embraced Catholicism. After finishing his studies at Dresden, he proceeded to Rome in 1815, and became a prominent member of that band of young German painters who sought to infuse into modern art the purity and earnestness of mediæval times. Of all the associates Veit ventured furthest into the obscure realms of symbolism and allegory. His first famous work was the 'Seven Years of Plenty,' executed as a companion-piece to Overbeck's 'Seven Years of Dearth,' and forming part of a series of frescoes illustrative of the history of Joseph, painted at the Villa Bartholdy in Rome. Other pictures of his Roman period are 'The Triumph of Religion' (Vatican), 'Scenes from Dante's *Paradiso*' (Massimi Villa), and an altarpiece, representing 'Mary Queen of Heaven,' in the Trinità de' Monti. These procured him so great a reputation that he was called in 1830 to the directorship of the Art Institute in Frankfort-on-the-Main. While holding this position he produced many grand pictures, of which the most celebrated is the large fresco (at the Institute) representing 'Christianity bringing the Fine Arts to Germany.' In 1843 he removed to Sachsenhausen in Hesse-Cassel, in 1853 to Mainz. He died December 18, 1877.

Veitch, John, LL.D., born at Peebles, October 24, 1829, studied at the university of Edinburgh, and from 1855 to 1860 was assistant to successively Sir William Hamilton and Professor Fraser. He himself became professor of Logic and Rhetoric at St Andrews in 1860, and at Glasgow in 1864. His works include a *Memoir of Sir W. Hamilton* (1869), *Tweed and other Poems* (1875), *History and Poetry of the Scottish Border* (1877; new ed. 1892), *Feeling for Nature in Scottish Poetry* (1887), *Knowing and Being* (1889), *Merlin and other Poems* (1889), *Dualism and Monism*, and *Border Essays* (1896). He died 2d September 1894. See Life by Miss Bryce (1896).

Veitch, William, born in Liddesdale in 1794, qualified at Edinburgh for the Church of Scotland; but finding his true walk in scholarship, he published a text of Cicero's *De Natura*, and *Greek Verbs Irregular and Defective* (1848; 4th ed. 1878), which led to his employment by Liddell and Scott in revising successive editions of their Lexicon. He rendered similar services to Smith's *Latin-English Dictionary*, and to a vast number of school-books and works of reference, classical and theological, generally at the solicitation of their editors, whom he had trenchantly reviewed. In 1866 his Alma Mater gave him her degree of LL.D. A humorist and entertaining *raconteur* to the last, he died in Edinburgh, July 8, 1885.

Velazquez, Diego de Silva, was born at Seville, 1599, the son of Juan Rodriguez de Silva and Geronima Velazquez. His father was a cadet of the noble Portuguese family of Silva, but, like Gongora and others, he gave the preference to his mother's name, an old and well-known Seville one. Properly speaking, Velazquez was a self-taught painter. He studied under Herrera 'el Viejo,' a man of marked originality, but of a temper and manners that drove away pupils as fast as his ability attracted them. What Herrera really taught Velazquez was how to teach himself. He used to set his pupils to make *bodegones*, 'cook-shop studies' of meat, fish, loaves, melons, pots and pans, and the like, and thus it was that Velazquez acquired the power that manifests itself in all he did, of seeing what he had to paint and painting what he saw with unerring firmness and truth. His second master was Pacheco, Herrera's opposite in many ways, a feeble, conventional painter, but a man of some culture and refinement, whose greatest merit, perhaps, is that from the first he recognised his pupil's genius, and worshipped it to the last. But Velazquez was only nominally his pupil; he followed his own course of instruction, passing from still-life to life models, the peasant lad whom he hired as a study, or the faces and figures he found in the streets and market-places of Seville. In 1622 he visited Madrid, and was kindly received by his fellow-townsman, Fonseca, by whose advice he returned the next year, bringing with him as a specimen of his work one of his Seville street studies, the famous 'Water-seller,' now in Apsley House, presented by Ferdinand VII. to the Duke of Wellington, who had intercepted it at Vittoria on its way to France in Joseph Bonaparte's carriage. By Fonseca he was introduced to Olivares, and by him presented to the king, who commissioned him to paint his portrait, the first of some forty in which he painted Philip IV. youthful, elderly, on foot, on horseback, hunting, praying, in armour, in velvet, head, bust, half-length, full-length, and made him, so far as paint and canvas could, the best-known monarch in history. The portrait was a complete success, and Velazquez was appointed *pintor de camara*, with a salary of 20 ducats a month over and above the price paid for his pictures. He was thus at the outset relieved from the necessity of seeking the patronage of the church, and painting altarpieces, martyrdoms, and miracles. Fortune for once sided with genius in his case. Even the course of true love ran smooth with him, for when, in obedience to what seems a law in the lives of painters, he fell in love with his master's daughter, Pacheco, who by all precedent was bound to send him packing, accepted him gladly for a son-in-law. In the same year (1623) Charles, Prince of Wales, during his hair-brained wooing at Madrid, sat to him for his portrait; and in 1627, by the king's order, he painted 'The Expulsion of the Moriscos' in competition with Caxes, Carducho, and Nardi, the prize being the office of usher of the chamber, which was unhesitatingly awarded to Velazquez by the judges, Mayno and Crescenzi. In 1629 he obtained leave of absence to enable him to improve his acquaintance with Italian art, and spent two years in Venice, Rome, and Naples. On his return fresh honours and emoluments were bestowed upon him, and a studio close to the royal apartments assigned to him, where the king used to spend some hours daily watching the progress of his works. He was in Italy again in 1648–50, this time with a commission from the king to purchase works of art. In 1652 he was appointed Aposentador Mayor, a high dignity, the bestowal of which posterity has had reason to lament, for the duties took him away from his painting-room, and undoubtedly shortened his life. It fell to him, *ex officio*, to direct the arrangements for the marriage of the Infanta with Louis XIV., but more particularly the erection and decoration of the pavilion on the Isle of Pheasants in the Bidasoa, where the ceremony was to take place; and a tertian fever contracted there carried him off, a week after his return to Madrid, 6th August 1660.

Velazquez may be said to have been all but a *pictor ignotus* until the beginning of the 19th century. While the works of other great painters,

who painted for churches, monasteries, and uncrowned heads, passed from time to time into the market and were scattered broadcast, his remained for the most part royal property, and only to be seen on palace walls, in the Alcazar of Madrid, the Buen Retiro, the Pardo, or the Escorial. To this in a measure they owed their preservation from the military art-collectors of 1808–10, who were bound to respect pictures that belonged to the heritage of Joseph Bonaparte; but doubtless insensibility to their merits was also a protection, for Velazquez offered little temptation to men whose taste had been formed by David. The transfer of the royal pictures to the Museo del Prado at Madrid was virtually a revelation of Velazquez, and it caused his outlying works to be eagerly sought after by collectors of all nationalities. Mr C. B. Curtis reckons up 274 attributed to him, of which no less than 121 are to be found in the United Kingdom, more than half of them being in London. France and Austria possess twelve each, Italy ten, and Russia and the United States seven each. In quality as well as quantity Velazquez is better represented in England than elsewhere, Madrid of course excepted. Good examples of his early work are to be found in the 'Water-seller' and in the 'Adoration of the Shepherds,' and 'Christ in the House of Martha' (National Gallery), painted under the influence of Ribera and Tristan, before he had settled down to a style of his own; and of his maturer powers in the 'Boar-hunt,' and the portraits of Philip IV. (National Gallery), Innocent X. and Quevedo in Apsley House, Philip IV. and Olivares in Mr Holford's gallery, and others in Lord Ellesmere's, Lord Lansdowne's, the Duke of Westminster's, and at Dulwich. The best of all, however, and, no doubt, the finest Velazquez outside the walls of the Madrid Museo, is the portrait of Admiral Pulido Pareja in the National Gallery, painted, like most of his greater works, with brushes of a length that enabled him to stand at the distance from which he meant it to be seen, and so to produce effects that Palomino justly calls 'miraculous.' To any one properly placed the story of the king's reprimand addressed to the portrait will not seem incredible. But it is only at Madrid that Velazquez can be seen in the full variety of his powers, a master in portrait, genre, landscape, animal, and, in fact, every branch of painting except the marine. Philip IV. was too true a lover of art to restrict him to the functions of a court-painter, and Velazquez apparently was allowed a free hand to paint such subjects as took his fancy. His court-pictures, the grand equestrian portraits of the king, Olivares, Prince Baltasar Carlos, and the like, are the more conspicuous, but the more characteristic and perhaps more interesting are the portraits of the *truhanes*, jesters, and odd characters that figure in catalogues and guidebooks under arbitrary titles, or else the nicknames of the originals, 'Menippus,' 'Esop,' 'Barbarossa,' &c. These, and his matchless series of dwarfs, were clearly subjects chosen for their own sakes, painted *con amore*, and treated in the spirit of a hidalgo Hogarth. But if he is to be compared to any man it is to his compatriot Cervantes, as an exponent of Spanish realism and Spanish character. It is sometimes said that sacred subjects and female beauty were beyond his reach, and that he could paint nothing that he had not before his eyes. And yet no painter ever painted a more profoundly pathetic Crucifixion than the one in the Prado, or two more charming figures than the 'Meninas' in the marvellous picture named after them, or a more thoroughly dramatic scene than the 'Surrender of Breda,' which might be a scene from a historical play by Shakespeare transferred to canvas.

See Pacheco, *Arte de la Pintura* (1649; reprinted 1866); Palomino, *Museo Pictorico* (1715–24); Ford, *Velazquez* (*Penny Cyclopædia*), *Handbook for Spain*; Head, *Handbook of the Spanish and French Schools of Painting* (1848); Stirling, *Annals of the Artists of Spain* (1848), *Velazquez and his Works* (1855); C. B. Curtis, *Velazquez and Murillo, a descriptive Catalogue* (1883); Justi, *Velazquez und sein Jahrhundert* (1888; Eng. trans. by A. H. Keane, 1889); R. A. M. Stevenson, *The Art of Velazquez* (1895).—In France and England the name is usually spelt *Velasquez*.

Velazquez, the Conquistador. See CORTES.

Veldes, a village in the Austrian province of Carniola, 30 miles NW. of Laibach. A summer-resort, situated on a beautiful lake, it is specially famous for its 'sun-baths,' the whole body (except the head, which is sheltered) being exposed to sunshine. Pop. 500.

Velcia, an ancient Ligurian city, whose ruins, 20 miles S. of Piacenza, were uncovered in 1760–65, and yielded many Roman antiquities, including tablets with inscriptions, coins, &c. The place seems to have been overwhelmed by a landslip about 280 A.D.

Vélez-Málaga, a Spanish town 16 miles E. of Malaga, near the mouth of the Velez, with a Moorish castle and sugar-refineries. Pop. 23,425.

Velleius Paterculus. See PATERCULUS.

Velletri, a city at the foot of the Alban hills, 25 miles SE. of Rome by rail, with a cathedral and many fine palaces. Pop. 13,532.

Vellore, a town of British India, 80 miles W. of Madras by rail, famous for its old fortress defended for two years by the English against Hyder Ali. Here Tippoo Saib's family lived till 1806, when, after a bloody mutiny of sepoys, they were transferred to Calcutta. Pop. 38,022.

Vellozia, a genus of plants of the natural order Hæmodoraceæ, natives of Brazil, Africa, Guiana, and Madagascar, and sometimes called *Tree Lilies*. They are perennials, with trunks closely covered by the withered remains of leaves, branching by forks, and bearing tufts of long, narrow, aloe-like leaves at the extremities of the branches. Some of them are from 2 to 10 feet high, and the trunk is sometimes as thick as a man's body. The structure of the trunk is very remarkable. It has a slender sub-cylindrical central column, of the ordinary monocotyledonous structure, outside of which are arranged great quantities of slender fibrous roots, which cohere firmly by their own cellular surface, and form a spurious kind of wood. The flowers of the larger species are about 6 inches long, pure white, yellow, blue, or purple.

Vellum. See PARCHMENT.

Velocipede. See CYCLING.

Velocity, in its full significance, involves the notion of direction of motion as well as that of speed or rate of motion. The notion of speed is a very familiar one. In measuring it we assume the possibility of measuring space and time; and the unit of speed is that speed which a moving point would need to have in order to pass over the chosen unit of space in a unit of time. Such phrases as four miles per hour, one mile per minute, eighteen miles per second are perfectly intelligible to all who know what a mile, hour, minute, and second are. It should be noted that when we speak of a man walking with a speed of four miles an hour we do not necessarily imply that he really completes four miles, or that he walks for one hour, but only that he would do so were he to keep up that speed for the time named. In fact, speed is an instantaneous property of the moving point. Again, since at every instant the moving point

must be moving in a definite direction, as well as with a definite speed, it follows that velocity also is an instantaneous property. If it does not change from instant to instant, the velocity is constant, and the point moves in a straight line with constant speed. If the point moves in any other than a straight line, the velocity will be variable even although the speed should remain constant; and the most general change of velocity involves both change of direction and change of speed. Velocity is in fact a vector quantity, and may be treated mathematically as a Vector (q.v.). The rate at which velocity changes is called acceleration. When the velocity changes in direction only, as when a point moves with constant speed in a circle, there is no acceleration in the direction of motion —i.e. parallel to the velocity. The acceleration must therefore be wholly normal to the velocity, and will be towards the centre of the circle in the simple case of uniform circular motion. If any change of speed occurs it is due to an acceleration acting parallel to the velocity, and therefore tangential to the path pursued by the moving point. When only a tangential acceleration exists, the point will move in a straight line with variable speed. A body falling vertically near the earth's surface gives a very good illustration of a pure tangential acceleration. See COMPOSITION, FORCE, HODOGRAPH, MOTION (LAWS OF).

Velvet is one of the most familiar of what are known as pile fabrics. It is produced by adding to the usual warp and weft threads of plain weaving an additional row of warp yarns which are woven into the ground of the cloth, and passed over wires on the surface. In the case of a loop pile (see CARPETS, fig. 3) the wires are simply drawn out, but for velvet or other cut pile a knife is first passed along a groove on the top of each wire to cut the pile before the wire is withdrawn. Real velvet is made entirely of silk, but a kind is made with a silk face on a cotton basis. For cotton fabrics made in the same way as velvet, including velveteen, see FUSTIAN; the name velveteen is however extended to fabrics in which silk and cotton are mixed throughout. Some of the richest and most artistic of the many splendid textiles woven on Italian looms in the 15th and 16th centuries were made, in part at least, of velvet. Similar stuffs were also made in Spain and Flanders. Many of these were for ecclesiastical vestments, altar cloths, and the like, as well as for hangings. Plain velvets were likewise woven. The effect of a raised pattern in velvet on a plain or figured silk ground is often very beautiful. Sometimes a diaper design was formed of a long upon a short pile, called velvet upon velvet, and this too has a fine effect. Choice examples of these old velvet fabrics are preserved in some industrial art collections. Velvet is believed to have been first made in China. Modern velvets are largely made at Lyons and Crefeld.

Venaissin, an ancient county of France, between the Rhone and the Durance (named from its capital the village of Venasque), now included in Vaucluse.

Vendace (*Coregonus vandesius*), a species or variety of the large genus Coregonus (q.v.), found in rivers and lakes of Sweden, and in the Castle Loch at Lochmaben in Scotland. It is popularly said to have been introduced at Lochmaben by Queen Mary; but the statement rests on no authority. Like most of its congeners, the vendace is a palatable fish. Its food consists chiefly of minute crustaceans. It generally swims in shoals, often with a remarkable separation of the sexes. It attains a length of 6–8 inches; the outline rises quickly from the snout to the dorsal fin, and the body tapers rather suddenly at the tail; the under jaw projects a little; the tail is deeply forked, and the dorsal and ventral fins are long. The back is brown, the sides tinged with yellow, the cheeks

Vendace (*Coregonus vandesius*).

partly white, and there is a red heart-shaped mark between the eyes. The vendace spawns in November and December, and multiplies rapidly; but it is now scarce at Lochmaben.

Vendée, LA, a maritime dept. of western France, bounded on the W. by the Bay of Biscay, on the N. by Loire-Inférieure, and on the S. by Charente-Inférieure. Area, 2588 sq. m.; pop. (1886) 434,808; (1891) 442,355. The dept., which owes its name to a small affluent of the Charente, is traversed from east to west by a range of hills, called in the east the Plateau de Gatin, and in the west the Collines Nantaises, and is watered in the north by the affluents of the Loire, and in the south by the Lay and the affluents of the Charente. Of its three divisions the western is the *Marais*, occupied by salt marshes and lakes; the northern, the *Bocage*, covered with plantations; in the south and middle is the *Plaine*, an open and fertile tract. The coast-line, 93 miles in length, presents few deep indentations, the chief being the safe Bay of Aiguillon. There are three arrondissements—La Roche-sur-Yon, Fontenay-le-Comte, and Sables-d'Olonne. The capital is La Roche-sur-Yon.—For the obstinate resistance of the Vendeans to the Revolution, and the bloody vengeance of the Republic (1793, 1794–95, 1799, and 1815), see CATHELINEAU, LAROCHEJACQUELEIN, HOCHE, and CHOUANS.

Vendémiaire (the 'vintage-month'), the first month in the French Revolution calendar, from September 22 to October 21. Memorable in the history of the Revolution is the 13th Vendémiaire of the year IV. (5th October 1795), when the Paris Sections, worked upon by royalist reactionaries, rose in insurrection against the National Convention, but were crushed by the historic whiff of grape-shot by Napoleon Bonaparte, then a young artillery officer.

Vendetta, the term used to denote the practice, as it existed till lately in Sicily, Corsica, Sardinia, of individuals taking private vengeance upon those who had shed the blood of their relatives. It is not yet entirely extinct in Calabria and Corsica, and even in remote districts of Kentucky and other parts of the United States, and indeed was an established institution in primitive society everywhere. Our criminal law is merely a development of a stage of culture when it was every man's right and duty to take the law into his own hands. Bloodshed had to be atoned for by death, and if the actual slayer had escaped his kinsfolk were held responsible for his deeds, and he was punished through vengeance taken upon them. This primitive law of vengeance of blood afforded an elementary means of protection for society, and the fact that the whole family are held responsible brings

to bear the full pressure of the family influence to make each of its members keep the peace. The Avenger of Blood is thus a useful functionary, but through ignorance and passion he is prone to err and confound the innocent with the guilty. In the usage of the Israelites we see the method of progress in civilisation—a distinction is made between the wilful and the innocent slayer, and the Cities of Refuge afford the latter a Sanctuary (q.v.). Again we see how the cry for vengeance sinks into a claim for compensation—the blood-money wipes out the blood. Our Anglo-Saxon forefathers had their *wér-gild* ('man-money'), a money value on each man's life which had to be paid to his kinsmen by the murderer—600 shillings for a thegn, 200 for a ceorl, and naturally less for a Welshman than an Englishman. The law of retaliation—the Roman *lex talionis*—held also for lesser injuries, and was sound morality enough till it was superseded by the higher law of the Gospel. Now the state undertakes the task of punishment, but, as Tylor says, we have still survivals of ancient modes of feeling in such phrases as 'the vengeance of the law,' or the legal form by which a private person is bound over to prosecute as though still suing for his own revenge or compensation. The right of private war between families and tribes long survived in the Borders and the Highlands; but Freeman notes that the battle (1470) between Lord Berkeley and Lord Lisle at Nibley Green in Gloucestershire, in which the latter was slain and Berkeley compounded by a money payment to the widow, was the latest English example either of private war or the payment of the *wér-gild*.

Of all civilised races the vendetta has survived longest among the Italians, and even so late as 1890 it showed itself in strange juxtaposition to the law in the murder at New Orleans of the chief of police who had been instrumental in bringing to light some of the organised murders of the Maffia (q.v.). In Corsica it was a sacred article of duty, so binding that it needed not the *rimbicco*, the wail of reproach against delay, to spur up the consciences of the next of kin. Here it often happened that its course was complicated by the *vendetta transversale*, when each of two sets of relatives had a murder to avenge on the other. Mérimée's *Colomba* is a striking picture of the intensity with which the imaginations of the Corsican women clung to the wild justice of this form of revenge. And something similar in spirit, as the vendetta of a class or community rather than a person or family, were the cruel murders and outrages committed by Irish peasants or their hirelings upon those who had occupied land from which other men had been evicted. In Corsica at least it needed the burning outrage of blood to rouse the spirit of the vendetta. See BLOOD (AVENGER OF).

Vendôme, a town of the dept. Loir-et-Cher, on the Loir, 42 miles NNE. of Tours and 111 SW. of Paris by rail. Above it rise the picturesque ruins of the castle of the Dukes of Vendôme, destroyed at the Revolution, and within the town is a fine 15th-century abbey church, with early Gothic tower and spire. Gloves and paper are made. Pop. (1891) 7864.

Vendôme, an ancient countship of France, erected into a duchy by Francis I., for behoof of Charles de Bourbon, through whom it fell to his grandson, Henry IV., who again conferred it upon César, the eldest of his sons by Gabrielle d'Estrées. César's eldest son, Louis, Duke of Vendôme, married Laura Mancini, one of Mazarin's nieces, and had by her three sons, the eldest of whom was the famous soldier, Louis-Joseph, Duke of Vendôme, called till his father's death the Duc de Penthièvre. He was born at Paris, July 1, 1654, and saw his first service in the Dutch campaign of 1672. He next served with distinction under Turenne in Germany and Alsace, again in the Low Countries under Luxembourg, in Italy under Catinat, and received in 1695 the command of the army in Catalonia. He shook off his indolence, and closed a series of brilliant successes by the capture of Barcelona (1697). After five years of sloth and sensuality he superseded Villeroi in Italy, much to the delight of the soldiers. He fought an undecided battle with Prince Eugene at Luzzara (15th August), then burst into the Tyrol, returning to Italy to check the united Savoyards and Austrians. On 16th August 1705 he fought a second indecisive battle with Prince Eugene at Cassano, and at Calcinato he crushed the Austrians (19th April 1706). That summer he was recalled to supersede Villeroi in the Low Countries, under nominal command of the Duke of Burgundy. The defeat at Oudenarde (11th July 1708) cost him his command, but in 1710 he was sent to Spain to aid Philip V. His appearance turned the tide of disaster; he brought the king back to Madrid, and defeated the English at Brihuega, and next day the Austrians at Villaviciosa. After a month of gluttony beyond even his wont, he died at Tinaroz in Valencia, June 11, 1712. Saint-Simon hated Vendôme, and has gibbeted to all eternity his sloth, his gluttony, and his shameless debauchery.

Veneer. Beautifully grained or figured woods are, owing to their cost, rarely used in the form of solid boards, but are cut into thin slices called veneers. These vary in thickness from that of ordinary writing-paper to $\frac{1}{16}$th of an inch and upwards for special purposes. For furniture $\frac{1}{10}$th is a good average thickness. There are 'saw cut' and 'knife cut' veneers, very thin kinds as well as those sliced off in circular fashion from round blocks being always knife cut. The process of veneering consists in simply glueing the veneer to thicker wood, and placing what is then virtually one solid board or panel with the veneer face downwards on a metal table heated with gas. By means of cross bars and screws, above and below the table top, the veneer is held tightly to its backing for two or three hours till the glue is dry and firm. It will be readily understood that veneering is best done on woods which hold glue well—plain mahogany, American yellow pine, &c.

Ven'ema. HERMANN (1697–1787), divine and professor of Theology at Franeker. Of his numerous works, the *Institutes of Theology* (trans. 1850) is the best known.

Venereal Diseases. See GONORRHEA, SYPHILIS.

Venesection. See BLEEDING.

Venetian Style, the type of the Renaissance (q.v.) developed in Venice (see ITALIAN ARCHITECTURE). 'Venetian-Gothic' is a type of Italian-Gothic.

Venezuela, UNITED STATES OF, a northern republic of South America, between the Caribbean Sea, Colombia, Brazil, and British Guiana. The total area is slightly over 417,000 sq. m. According to official returns it is 594,165 sq. m., but this result is obtained by disregarding recent boundary decisions. In 1891 the frontier dispute with Colombia was decided by the arbiter Spain in Colombia's favour, and the south-western boundary is now formed by the rivers Arauca, Orinoco, Atabopo, and Negro, while the whole peninsula of Goajira and the town and territory of San Faustino (on the Santander border) belong to Colombia; and in 1880–82 a Venezuelo-Brazilian commission marked

off a definite southern frontier. The boundary towards British Guiana has been the subject of long controversy, the Venezuelans maintaining their succession to Spanish rights, and Britain the claims taken over in 1814, when Guiana was ceded by Holland. A line surveyed by Sir R. Schomburgk (1839) was put forward in 1841 as a basis of agreement, but rejected by Venezuela; in 1881 Britain modified the line by including additional territory, and in 1890 asserted this as a minimum claim. British subjects having effectively occupied parts of the disputed (gold-bearing) territory, Venezuelan officials encroached on the districts thus occupied; and when President Cleveland's message at the end of 1895 intimated the intervention of the United States, there was the prospect of war between Britain and America. The award of the special arbitration court at Paris (1899) upheld in the main the British claim; the Schomburgk line was departed from only in two places, the lower Barima and the Cuyuni goldfields being assigned to Venezuela. Trinidad and Tobago islands are British, and Curaçao, Oruba, and Bonaire Dutch.

Venezuela is a land of mountains and valleys in the west and north, of lower mountains and wooded hills in the south, of llanos between the Orinoco and the northern ranges, and of lake and swamp and forest in the north-west. The Andes enter the country south of Lake Maracaybo, and push north-eastward as the Cordillera de Merida (15,500 feet) as far as Barquisimeto (190 miles). From this point along the north stretch two more or less parallel coast-ranges. A little farther north a range is distinguished, partly submarine, partly rising in the islands along the coast, partly in the often high and generally rock-bound coast itself. Turning now to the south we find all the country beyond the Orinoco filled with low mountains and, nearer the river, hills, thrown out by the great eastern mountain-system of the continent. Here, above a granitic foundation, rise great masses of red and white sandstones, the most notable Mount Roraima (q.v.), where the frontiers of Guiana, Brazil, and Venezuela meet. Innumerable streams find a way over waterfalls and rapids to the Orinoco, which itself rises amid these mountains, escapes to the west, and then flows north along their edge till they come to an end, when, turned by the volume of the Apure, it swings round to the east and rolls past their northern bounds.

The llanos occupy a fourth of the country, lying between the Orinoco and the northern chains, and are mostly undulating plains of long grass, broken by low plateaus or *mesas*, and by numerous clumps of trees and belts of forest, which are not confined to the banks of streams, but rise out of the savannah. It must be noted, however, that the llanos north of the lower Orinoco, towards Paria peninsula, are dreary and sand-swept, and treeless except along the shallow watercourses. Humboldt saw the llanos bare of aught save grass, and supporting countless herds of cattle; to-day most of the cattle have disappeared, killed off in great part to feed the insurgents in the various civil wars; and as a result the young trees have had a chance to grow. The remaining portion of the country, the north-western, around Lake Maracaybo, is rendered almost uninhabitable by its swamps, morasses, and pestiferous climate. Taken as a whole the climate of Venezuela cannot fairly be described as unhealthy. Of course, in a country enclosed between the parallels 2° and 12° N. lat., with the accompanying luxuriant vegetation, tropical fevers must be present; but South American fevers are not so fatal as those of Africa, and even the yellow fever, though it still is a scourge, is being coped with to some extent. The climate is moist: the llanos have the rainy season in the summer months, but in the mountains the fall is irregular and at all seasons, losing its tropical character. The temperature varies, of course, with the altitude, from freezing-point above the snow-line to great heat in the coast-towns, the valleys, and the llanos. In the *tierra caliente* (hot region, up to 1700 feet, the limit of the cocoa-nut and cocoa) the yearly mean is from 77° to 86° F., ranging often above 100°; in the *tierra templada* (temperate region, 1700 to 7200 feet, the limit of the banana and sugar-cane) it is from 50° to 77°; and the *tierra fria* (cold region) embraces everything below 50°. There are no active volcanoes in Venezuela, but earthquakes have done great damage at Carácas and elsewhere.

Almost everywhere the country is very abundantly watered, the drainage passing off by eight systems —the Orinoco, the Rio Negro, the Cuyuni, the lakes of Maracaybo and Valencia, the two gulfs on either side of the peninsula of Paria, and the short coast-streams. Vegetation in the tierra caliente is luxuriant often beyond description; the heavy forests are dense with noble trees, and yield gums, balsams, dye-woods, india-rubber, sarsaparilla, cinchona, vanilla, tonka-beans, &c.; tobacco, maize, and cocoa are cultivated. Where water fails in the low-lying valleys cactus forms prevail. In the temperate region coffee is the most valuable product; others are cinchona, sugar, maize, bananas, some cotton, and wheat and barley; these last are grown also in the higher regions, as are peas and beans and much potatoes. But for the most part primitive methods and implements of agriculture are obstinately adhered to. Agriculture suffers, too, in some parts severely, from periodic plagues of locusts.

The fauna is rich in animals and birds peculiar to the tropics, but is of great variety owing to the differences of altitude and temperature. The people are mostly half-breeds—mulattos or mestizoes (i.e. of crossed white and Indian blood). Pure negroes or whites are comparatively few; the latter form perhaps 1 per cent. of the population. The blacks are found mostly in the tierra caliente—chiefly on the coast; the survivors of the pure Indian stems are mainly confined to the highest regions, that of the lofty *páramos*, although they are found also in the Maracaybo forests and elsewhere, and in the llanos large villages of nearly pure Indians are met with. The Venezuelans are restless and passionate —least so in the cordillera region—honest and hospitable, universally polite, except among the llaneros, and as a nation sadly addicted to drink; rum in this land of sugar is manufactured everywhere, and its consumption in the ubiquitous *pulperias* occupies the general leisure, the lower classes adding gambling to the other vice; bull-fights and yet more cock-fights, and in the cooler regions horseracing, are the popular pastimes. The Roman Catholic is the state religion; others are tolerated. In 1870 primary education was made compulsory, but only 100,000 children take advantage of the 1600 public schools. There are two universities, at Carácas and Merida; the faculties of law and medicine are the most flourishing, for Venezuelans are fond of public life, and the overcrowded professions, in which all cannot find employment, contribute more than their quota to the ranks of the discontented and revolutionary.

Venezuela contains rich mineral deposits, as yet scarcely tapped, except for the Yuruari gold-mines, the Aroa copper-mine, various salt-mines worked by the government, and coal near Barcelona. In the neighbourhood of Lake Maracaybo there are rich springs of petroleum, and coal is abundant here, as well as in the peninsula of Paraguana; and a bituminous plain at the head of the Gulf of Paria

separates from the rest of the mainland the so-called 'island' of Brea. Valuable emeralds are found on the upper Orinoco. But the yearly value of minerals extracted is only £1,100,000 (£950,000 of this for gold). Manufactures are very backward; books (at Carácas), furniture, soap, tallow-candles, cheese almost exhaust the list; but sugar is refined in many parts, and rum and newspapers are produced everywhere. Official returns in 1888 claim 8,476,300 cattle, 5,727,500 goats and sheep, 1,929,700 swine, &c., as against 2,926,733 cattle, 3,490,563 goats and sheep, 976,500 swine, &c. in 1883. Trade has advanced within recent years, in spite of the absence or deplorable state of roads in the interior—though something has been done for this too. The first railway was made in 1877; in 1891 there were 282 miles in operation, besides 3528 miles of telegraph lines and several telephone systems. Most of the over-sea trade is in the hands of foreigners, German and other. By far the principal export from Venezuela (over two-thirds of the total exports) is coffee; next follow cocoa, gold, hides, cattle, sugar, cotton, copper, dye-woods, &c. The imports (over a fourth from Britain) are flour, cotton, linen, woollen, and jute goods, iron, machinery, glass and porcelain, paper, wine, beer, &c. In the years 1887–90 the imports advanced steadily from £3,158,000 to £3,344,500, and the exports from £3,376,500 to £4,036,700. Nearly six-sevenths of the total value of imports pays duty, and smuggling is actively carried on.

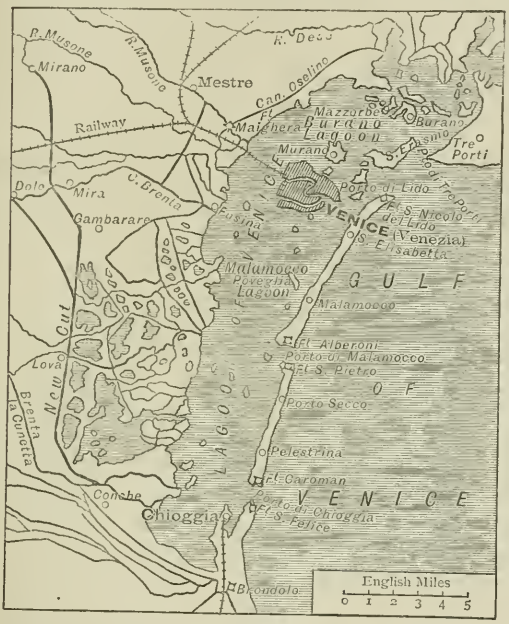
In 1881 Venezuela—till 1863 made up of provinces, and in 1864 constituted a federal republic, with twenty-one states and their territories—was redivided into eight large states, eight territories, two agricultural colonies, and the federal district of Carácas. The population in 1881 numbered 2,075,245, in 1891 2,323,527; of these 326,000 are Indians, and 35,000 foreigners. Each state and the federal district elect three senators, and every 35,000 of the population return one representative to congress. A federal council of nineteen members, appointed by congress every two years, chooses one of its own members for the presidency; and neither president nor councillors can be re-elected (see, however, below, under *History*). The president has no power of veto. Each state has its own executive, legislature, and justiciary. The revenue (mostly from customs duties) and the expenditure nearly balance each other at from £1,500,000 to £1,800,000. The government at the end of 1890 returned the national debt at £1,532,000, but the history of the foreign debt has been, as usual in South America, one very unsatisfactory for the bondholders. The army in 1891 numbered 5760 officers and men, including generals; and there is a militia which embraces all citizens from eighteen to forty-five, and which has supplied most of the forces for the civil wars. The principal cities are Carácas, Valencia, Maracaybo, Barquisimeto, Tocuyo, Maturin, and La Guayra. The chief ports are La Guayra, Puerto Cabello, Ciudad Bolívar (the port of entry for all southern Venezuela), Maracaybo, and Guanta (opened 1892; 12 miles by rail from Barcelona).

History.—Columbus on his third voyage discovered the Paria coast on 31st July 1498. The next year the whole Venezuelan coast was skirted by Ojeda and Amerigo Vespucci, and the name 'Little Venice' was given to an Indian village built on piles (as still is common) on the shores of Lake Maracaybo; this is the origin of 'Venezuela,' the name now of the whole country. In 1527 the territory of Coro was pledged by Charles V. to the Welsers of Angsburg, whose governors and adventurers (see HUTTEN, PHILIP VON) had eyes and thoughts only for gold and the fabled El Dorado. In 1538 the crown resumed possession; Carácas was founded in 1567, and in 1578 became the seat of government; the conquistadores penetrated inland in all directions, and settlements were made in many parts. During the 17th century the attentions of the crown were limited to extracting as much revenue from the colony as possible, while the people entered earnestly on agriculture and stock-raising, and the various religious orders arrived and partitioned out the territory among themselves. But the next century saw the beginning of troubles. The government insisted on all trade being carried on with Spain alone, and ultimately with only one city—first Seville, then, till 1778, Cadiz. Legitimate commerce dwindled away, and smuggling by the Dutch and English alone interfered to keep down the enormous prices of European goods. Only Spanish-born officials were appointed, and a hatred grew up between them and the creoles which bore fruit in open violence. The first revolt occurred in 1749; other outbreaks kept the land in a ferment, until in 1810 the revolution began which ended in the independence of the country, and the withdrawal of the royal forces in 1821 (see BOLÍVAR). Venezuela was united with Colombia (q.v.) and Ecuador; but these states soon fell away, and Venezuela was left to enjoy some years of comparative rest until 1847. Then followed twenty-three years of struggle between the 'Yellows' and 'Blues,' or Liberals and Conservatives, 1866–70 being terrible for the bloody *guerra de cinco años*, which left the llanos ruined for years and the country's credit destroyed. From 1870 to 1877 the 'Illustrious American,' General Guzman Blanco, was first dictator and then president, and did much to rescue the country from its embarrassments, resuming the service of the foreign debt, and patching up a quarrel with the Netherlands that had arisen over the old habit of smuggling. Again he held the reins of power in 1879–84 and in 1886–87; but actually he was dictator from 1870 to 1889, other presidents being merely figure-heads appointed by himself. In the latter year, however, the new president, Rojas Paul, broke with his patron, then residing in Paris as envoy and minister to all the European powers; and rumours of corrupt contracts and the bribed surrender of Venezuelan claims raised such indignation against Blanco as drove his friends from office and elected another hostile president, Dr Palacio, in the autumn. But love of office is perhaps more strongly developed in Venezuela than in any other land, and the dispossessed officials were eager for a return to power. Palacio, who entered on office a penniless lawyer, and proceeded industriously to enrich himself, played into their hands; public sentiment swung round to Blanco's party again; and in 1892, when Palacio, discounting the passing of a bill proposed by himself to extend the presidential term to four years, declined to resign, civil war broke out. The insurgents were victorious; but great part of the republic was meanwhile reduced to a state of anarchy. A revised constitution was adopted in 1893. The chief recent events have been connected with the disputed boundary with British Guiana.

See Curtis, *A Land where it is always Summer* (1896); Dr W. Sievers' *Venezuela* (Hamburg, 1888), and his admirable monograph *Die Cordillere von Merida* (Vienna, 1888), which describes also the northern ranges; also Codazzi, *Resumen de la Geografia de Venezuela* (Paris, 1841); Sachs, *Aus den Llanos* (Leip. 1878); Cazeneuve and Harani, *Les Etats-Unis de Venezuela* (Paris, 1888); Tejera's *Venezuela Pintoresca* (Madrid, 2 vols. 1877), his history (1875), and other histories by Baralt and Urbaneja (to 1831; Carácas, 1865) and Oviedo y Banor (the conquest and settlement; 2 vols. Madrid, 1885). Cf. also, for a special division, Von Langegg's *El Dorado* (Leip. 1888). There are no English works so valuable as some of the consular reports.

Venial Sin. See CONFESSION.

Venice (Ital. *Venezia*), the 'Pearl' or 'Queen' of the Adriatic. In the 5th century the Veneti, expelled by Lombards and Goths from Padua, Altinum, and Aquileia, found refuge in the islands of the lagoons, making Malamocco their chief port and their seat of government, afterwards (9th century) transferred to Rivo-Alto, the nucleus of Venice. Tradition places its first buildings on the site of the Basilica of S. Mark, and these now cover more than seventy-two islets, or rather mud-banks, their foundations being piles ('time-petrified') and stone. Through its two unequal portions winds for over 2 miles the Grand Canal (Canalazzo), spanned by the Rialto bridge (of stone) and two others (of iron), and from its outer rim flow into the Canalazzo 146 lesser canals, all bridged at frequent intervals.



This vast network of waterway is patrolled by countless gondolas ('the hansom-cab of the Adriatic'), while the pedestrian has his choice of innumerable lanes (calli), making every house accessible sooner or later on foot. A railway viaduct (1845) 2⅘ miles long connects Venice with the mainland, it being 165 miles E. of Milan, 71 ENE. of Mantua, and 181 NNE. of Florence. Its population, from well-nigh 200,000 in the 15th century, dwindled to 100,000 in the 18th, but has since increased to 158,019, speaking a dialect differing from the more masculine Tuscan in eliding the consonants and running the vowel-syllables into one, *figlio*, for example, becoming *fio*, and *casa*, *ca'*. Its industries are its famous glass manufacture, useful and ornamental; jewellery and embroidery in gold and silver; lace, velvets, and silks; candles of wax and spermaceti; soap, sugar, and confectionery. Printing, once its most honourable tradition, is now reviving; while the ship and boat building required for its fishing and pilot-service has, since its restoration to Italy, been supplemented by ironclads, of which several first-class specimens have left its arsenal. Besides an increasing coasting trade, employing over 30,000 tons of shipping, Venice imports from Great Britain coal, iron, and, in much less quantity, fish and manufactured goods; but in spite of engineering intervention it will never regain its historical distinction as a seaport. The alluvial discharge into its gulf has greatly and irregularly reduced its depth of water, its lagoon looking at low ebb (the tidal variation being between 2 and 3 feet) like so many acres of mud. The lagoon is connected with the sea by four entrances, of which the Lido and Malamocco are the most important. Measured even by Italian death-rates Venice is not healthy, but with the drinking-water now supplied from the mainland it is improving. Its prelate still bears the proud title of patriarch.

Detailed reference to all its attractions, architectural, artistic, and historical, belongs to the guide-book, but Venice possesses features distinctive enough for brief notice here. Such are its Piazza di S. Marco, the north side formed by the Procuratie Vecchie, surmounting an arcade of fifty arches, erected 1517, as the residence of the nine procurators of S. Mark, from whom the doge was usually elected. For the increasing number of these dignitaries were built the Procuratie Nuove, on the south side of the Piazza, now constituting a portion of the Palazzo Reale. Of this the library hall is a masterpiece of Sansovino, its ceiling decorated by the seven best Venetian artists of the time (1582), while Titian, Paul Veronese, Bassano, and Tintoretto contributed splendid work to other parts of the interior. The Campanile, begun 902, completed by the belfry 1510, commands from its altitude of 323 feet a glorious prospect. The clock-tower, on whose dial two bronze figures strike the hours upon a bell, gives entrance to the Merceria or main business quarter, threaded by streets converging towards the Rialto. In front of S. Mark's itself rise three red flagstaffs, surmounted by winged lions. From these once floated the silk and gold banners typifying Candia, Cyprus, and the Morea, the three possessions of the republic, now replaced on festas by the flag of Italy. Only less supreme in interest than the Basilica of S. Mark's is the Doge's Palace, which, dating from the 10th and 11th centuries, has been extended and modified, and even in 1892 was being restored. Successive conflagrations have destroyed the paintings by the Bellinis, Carpaccio, Pordenone, and Titian, which ennobled its vast chambers, but its outer shell, particularly the east aspect towards the Bridge of Sighs, commands universal admiration. Ruskin's *Stones of Venice* has familiarised the world with the beauty of its details, its columns with their capitals particularly; but from these and the Porta della Carta of the main entrance, the Scala dei Giganti, and the Scala d'Oro, we must hasten if only to give a glance at the Sala del Maggior Consiglio, and at what remains of the vivid and impressive touch of Titian, Bassano, Tintoretto, Paolo Veronese, and Palma Giovane, who lavished their genius on its walls. The celebrated Library or Biblioteca di San Marco, transferred (1817) from the above-described library hall of the Palazzo Reale, contains 120,000 volumes and 10,000 MSS.—the latter at one time including the codex of Homer, bequeathed by Petrarch, who had received it from Nicolaos Sigeros, ambassador from the Greek emperor, but since destroyed with all the others of Petrarch's bequest. The Museo Archeologico, also shorn of much treasure, among it the maps of those countries explored by Venetian travellers, and originally drawn by the great geographer Gian Battista Ramusio (1485–1557), still repays many a visit, if only for its Mappamondo in which the Camaldolese monk Mauro embodied a geographical encyclopædia of the information accessible up to 1457. Other rooms, the Sala della Bussola (antechamber to the Council of Ten), the Sala del Consiglio dei Dieci itself, the Sala del Senato, and the Sala del Collegio (to mention the more famous of them), have each their special associations and attractions historical or artistic, the interest deepening as we

mount to the Sotto Piombi ('under the leads') where Casanova and Silvio Pellico languished, or descend to the Pozzi ('wells') which shadow many a page of Venetian history, or emerge from the Doge's Palace to cross the Bridge of Sighs and enter the Carceri or public prisons, sombre as their destination and their records. The Zecca or Mint (now the Bourse) and the granite columns, one bearing the Lion of S. Mark, the other S. Theodore, have infinitely less to detain us than the Basilica di S. Marco itself, placed by Canova above the cathedrals of Pisa and Sienna as, on the whole, the first of the three finest churches in Italy. Signor Ongania's magnificent folio, *La Basilica di San Marco Esposta* (1883), does not suffice to exhaust the interest surrounding and pervading this wonderful edifice, of which the external mosaics, the bronze horses, the interior (also ennobled by its mosaics), the choir, the sacristy, the north transept, the baptistery, the treasury, and the pavement have each their special students and art-votaries, whose admiration a life-long succession of visits seems only to deepen and refine. Dwarfed by comparison, the remaining churches of Venice, formerly more numerous than the Roman ones in proportion to population, need now be noticed only in groups, of which there are four—the first, Gothic in style, exemplified in the plain, massive, and solemn church of the Frari; the second, the so-called Lombard (really a revival of the 15th-century Romanesque), of which the church of the Miracoli is the type; the third, the Italian, locally termed 'classical,' seen at its best in the Palladian Redentore; and the fourth, or modern Italian, ornate to excess, represented by the church of the Salute. Many of these are individually attractive, over and above their history or destination, by artistic *chefs d'œuvre;* that of the SS. Giovanni e Paolo was long famous for its masterpiece by Titian (the 'Death of Peter Martyr'), destroyed by fire in 1867, and replaced by an old copy; and still is for its neighbouring statue of Bartolommeo Colleoni, general of the republic (1475), which, designed by Verocchio and cast by Leopardi, is reckoned the finest art-product of its kind in the world. The church of San Rocco has also a reflected interest from its Scuola hard by, rich in magnificent Tintorettos.

To the museums and picture-galleries, which, as in times past, will always attract the student of painting, we can do even less justice than to the public buildings and churches—the interest of the former consisting in a wealth of *chefs d'œuvre*, around which a whole library of criticism and controversy has for more than a century accumulated. The Accademia delle Belle Arti is annually thronged for its Bellinis (Gentile and Giovanni), its Carpaccios, its Giorgiones, its Palmas (Vecchio and Giovane), its Paolo Veroneses, its Tintorettos, and its Titians; while the Museo Civico, infinitely less attractive in painting, never fails to reward the visits of the lover of majolicas, gems, carvings, autographs, miniatures, and other rarities bequeathed to the city in 1830 by Teodoro Correr. Interest of a sterner kind clings to the arsenal, founded in 1104, busy with 16,000 artisans in the 16th century to maintain the supremacy of the republic afloat, now employing 2000 workmen as the third dockyard for ships and ironclads in Italy. Its museum forms a running commentary on Venetian history, containing the model of the Bucentaur (q.v.) from which the doge every Ascension Day solemnly espoused the Adriatic. From the arsenal to the Grand Canal, with its rows of palaces on either side, we return to artistic Venice, the palaces themselves, notably the Palazzo Manzoni (15th century), the Palazzo Corner (16th century), the Palazzo Rezzonico, the Palazzo Foscari, the Palazzo Pisani a S. Polo, the Palazzo Contarini, followed by the three Mocenigo palaces (the centre one occupied by Lord Byron), the Palazzo Corner Spinelli, and the Palazzo Grimani, down to the Rialto Bridge (beyond which are the Palazzo Camerlenghi and the Palazzo Vendramin Calerghi), all recommended in divers ways for their architectural beauty, their interior arrangement and ornamentation, and their family associations closely linked with the fortunes of the republic. Other palaces of repute are the Palazzo Giovanelli, with its far-famed landscape, in which the nude figures are by Giorgione; the Palazzo Trevisan; and the Palazzo Moro, the traditionally-credited abode of Shakespeare's Othello. In theatres Venice is comparatively poor, La Fenice being the principal one; but in public gardens and islets adapted for holiday purposes it abounds. The Littorale di Malamocco, facing the city across the lagoon (the so-called 'Lido'), is an immensely popular resort, particularly during the bathing season, when it presents a very different aspect from the lonely, haunted-looking strand so dear to the misanthropic mood of Byron. This and the islets Murano (q.v., renowned for its glass), Torcello, and Burano (q.v., employing 300 girls in the celebrated lace-industry) are easily accessible by the steamers and steam-launches which—the latter especially—seem likely to replace the picturesque but much slower and more expensive gondola, not only in the Adriatic but within the city itself.

History.—Venice rises to historical importance 697 A.D. when its island-communities, governed for 240 years by annually elected tribunes, superseded these at the instance of Cristoforo, patriarch of Grado, by a Duke or Doge of absolute authority in church and state, during peace and war. Paolo Lucio Anafesto, first of the long line of Doges, ruled the republic with power and wisdom, suppressing faction, and acquiring from the Lombards a foothold on the mainland. Orso, the third Doge (720–37), gained further advantages over the Lombards, whom he compelled to reinstate the Exarch of Ravenna, for which service the Byzantine emperor honoured him with the title of Ipato (Hypatos) or imperial consul. Gravitating through political interest to Constantinople, Venice opposed the policy of France in the Adriatic and incurred the enmity of Pepin, whose fleet blockaded the Venetians in the central island (Rialto). But the ebbing tide left the invaders stranded off the islet of Albiola, where the light flotilla of Venice annihilated them. From the Rialto, now (810) the seat of government, the Doge Agnello Partecipazio ruled all the neighbouring islets, connecting them with bridges, and forming the modern Venice. Having acquired the relics of S. Mark (827), the Doge Giovanni I. Partecipazio made the evangelist the tutelary saint of Venice, and began (829) the building of his cathedral. A long interval of comparative peace favoured the maritime and mercantile expansion of the city. Istria and Dalmatia were conquered, while commercial relations were opened up with the west and still more with the east as far as the Crimea and Tartary, and made Venice a dominant power in the Levant and one of the leaders of the crusades. Ostensibly religious, but really commercial, this latter enterprise of the Venetians left them stronger in the Mediterranean than ever. Meanwhile the city itself, reduced to ashes by successive conflagrations, replaced its wooden by stone edifices, in which marble from Italian and Dalmatian quarries figured largely, and laid the foundation of those palaces since one of its characteristic features. Extended relations abroad provoked inevitable wars. The crusading expedition of the Doge Faliero, followed up by his successor Domenico Michele, riveted the power of

Venice in Syria by the reduction of Tyre, and eventually brought the republic into collision with the Byzantine emperor Joannes Comnenus, who decreed the suspension of all intercourse between the two powers. Resorting to swift reprisals, Venice next year (1123) punished the empire by the capture of Rhodes, besieged or sacked the Cyclades, Sporades, and Ionian islands with part of the Morea, and once more reduced Dalmatia, instigated by the Hungarian king to revolt. Siding first with the German emperor and then with the pope, the republic witnessed the meeting of the two (Frederic I. and Alexander III.) within its walls, and was confirmed by the latter in its eternal dominion of the sea. This triumphant policy, diplomatic and strategic, was the work of the Doge Ziani (1172–78), who also improved the city by laying out the Piazza di S. Marco. Enrico Dandolo (q.v.) reduced Trieste, reconquered Zara, and headed the fourth crusade, nominally for Palestine, really against Constantinople, which he stormed. He thus brought about the partition of the Greco-Latin empire, of which Venice received the lion's share—a large slice of Greece and its islands, with a foothold in the Balkan Peninsula, on the Hellespont, and in Constantinople itself, of which a fourth part was reserved for Venetian occupation, protected by Venetian laws and absolutely unrestricted as to trade. To this period belongs the embellishment of the city with the art-treasures of the east—its palaces receiving the care which a territorial aristocracy bestows on its lands, and employing a new and noble school of artists to celebrate the triumphs of the Doges.

Under the second Ziani (1205–29) arose the hostilities with Genoa, culminating in the ten years' naval war in which Dandolo succumbed to Doria, and Venice, shattered at sea, witnessed the re-occupation of Constantinople by Michael Palæologus, with whom the republic had to make truce. The abolition of the old laws regulating the election of the Doge caused the conversion of the republic into an aristocratic oligarchy (1297), whose malgovernment led to conspiracies, the most formidable being that of Quirini-Trepolo, which proved abortive, but gave direct occasion to reforms. Among these was the establishment of the Council of Ten (1310), declared a permanent body in 1335. The mercantile prosperity of this period was reflected in the ornamentation of the city, and an enlargement of the arsenal, whence Francesco Dandolo sailed against the Turks. Andrea Dandolo put down revolt in Candia and Zara, though this was supported by Hungary. The latter Doge's great capacity as a thinker and man of letters appears in his *Venetian Annals*—a model of mediæval history. In 1348 an earthquake upheaved the lagoon, and a seven month's pestilence ensued—the flood and the disease destroying two-fifths of the population and fifty patrician families. To the memorable conspiracy headed by the Doge Marino Faliero (q.v.) the 14th century owes much of its interest, enhanced by the commercial rivalry between Genoa and Venice which culminated in naval battles alternately in favour of either side, till Genoa followed up its latest advantage by seizing the island of Chioggia (1379). Venice in turn became the aggressor, starved the Genoese to the point of surrender, and accepted from them an unconditional capitulation (1380). Sixteen years thereafter Genoa became the dependant of France, and was no longer the effective rival of Venice, which in consequence reassumed its supremacy at sea in war and merchandise, trading with every European country, and with the east as far as India, importing from England the iron of Staffordshire, the tin of Cornwall and Devonshire, and the wool of Sussex. The close of the 14th and beginning of the 15th century saw the Venetian arms triumphant on the Italian mainland, till under the Doge Foscaro (1423–57) the long war with Milan was concluded by a peace, and a league of the Italian states was formed (1454) for the mutual safeguard of their possessions. The later half of the 15th century was chiefly occupied with hostilities against the aggressive Turks, with inter-Italian broils in which petty duke and sovereign pontiff figure, now as enemies, now as allies of Venice, and with a war with France closed by treaty (1499).

The 16th century opens with the oligarchy at the zenith of its power, but this was of short duration. The discovery of America and of a passage to the East Indies began to tell upon its trade, and the constant drain of wars, local and imperial, was not met by the diminished revenue from abroad. Incessant collisions on a great as on a small scale brought about by the League of Cambray impaired commerce and industry, necessitating an undecided policy between the great belligerents Charles V. and Francis I., and an unprofitable neutrality in the religious agitations of Europe. In the 17th century the pressure of Austria became such as to force the oligarchy to side with the enemies of that power—with Henry IV. of France, with Bethlem Gabor and Ragotski, with the Duke of Savoy against Spain, and with the Protestants against the Catholics of the Grisons. In 1644 began the twenty-five years' war in Candia, in which the Venetian admirals defeated the Turks in a succession of mighty engagements, resulting in future successes in Greece and Illyricum in which the highest name is that of the Doge Francesco Morosini, who, after heading his fleet triumphantly for the third time, died at Nauplia (1694). Neutral in the war of the Spanish succession, Venice became again embroiled with Turkey, and lost the Morea and its hold on Candia (1718). Gradual decay marks its subsequent history: its policy became feebler throughout the 18th century, its commerce had sunk irretrievably; so that in 1796 Napoleon found nothing but the shadow of its former self on his invasion of the city. By the shameful treaty of Campo Formio the Austrians became its masters (1798), and again by the Congress of Vienna re-occupied it in compensation for the Belgian provinces. Its revolt of 1848 and heroic defence by Daniel Manin led up to its final cession (1866) to Napoleon III., who handed it over to Victor Emmanuel—the last state but one to become absorbed in united Italy.

Brown's *Historical Sketch* (1893); and Alethea Wiel (1894). See also the articles Aldine Editions, Contarini, Cornaro, Dandolo, Faliero, Manin, Sarpi, and Painting, p. 699.

Veni Creator Spiritus, an ancient and celebrated hymn of the Roman Breviary, which occurs in the offices of the Feast of Pentecost for Vespers and Tierce, and in the Pontifical for the Ordination of Priests, Consecration of Bishops or of a Church, the 'Ordo ad Synodum,' and some other solemn services. Its author is not known with certainty. On the authority of Ekkehard's life (*c.* 1220) of Notker, it is ascribed to Charlemagne; and Daniel, in his *Thesaurus Hymnologicus*, adopts this opinion; but it seems to be certainly older than the age of Charlemagne; and its correct classical metre as

well as language bespeaks an earlier and purer age. Mone thinks it the composition of Gregory the Great; others, of St Ambrose or Rabanus Maurus. It was translated by Bishop Cosin, again by Dryden, whose version was adapted by John Wesley and Toplady. The labours of more than thirty later translators have not stripped this noble hymn of all its dignity. The Veni Creator Spiritus must not be confounded with another hymn to the Holy Ghost, Veni Sancte Spiritus, Et emitte coelitus, the 'Golden Sequence,' which ranks among the masterpieces of Latin sacred poetry. The latter belongs not to the Breviary, but to the Missal, in which it forms a Sequence in the Mass of Pentecost Sunday and Octave. It is in five stanzas, each consisting of six lines of seven-syllable trochaic verse. It is certainly not older than the beginning of the 13th century. It has been variously ascribed to King Robert II. of France, to Hermannus Contractus, to Stephen Langton, and, with perhaps most probability, to Pope Innocent III. The best translations are those by Caswall and by Neale.

Venlo, a Dutch town on the Meuse, close to the German frontier, and an important railway centre, 20 miles W. of Crefeld, with manufactures of needles, cigars, and gin. The fortifications that some ten times endured siege and capture were removed in 1868. Pop. (1888) 10,815.

Venn, Henry, an eminent English evangelical, was born of a clerical family at Barnes in Surrey, March 2, 1724. He studied at Jesus College, Cambridge, taking his degree in 1745, and became Fellow of Queen's College in 1749. After holding several curacies he was appointed to that of Clapham in 1754, but resigned in 1759 to become vicar of Huddersfield in Yorkshire, whence in 1771 he removed to the vicarage of Yelling in Huntingdonshire. He died in the house of his son, John Venn, rector of Clapham, June 24, 1797. The holiness of his life, his broad sympathies, and earnest zeal gave him wide influence even in that barren and unspiritual age. He was an indefatigable preacher, often delivering as many as ten sermons a week. His two books were *The Complete Duty of Man* (1763) and *Mistakes in Religion* (1774).

His Memoir by his son, together with his *Correspondence*, was edited by his grandson, the Rev. Henry Venn (1834). See Bishop Ryle's *Christian Leaders of the Last Century* (1869), and the study by W. Knight (1881).

Venomous Bites. The most important group, snake-bites, the poison contained and the antidote, have been already treated at Snakes. Others will be found dealt with under the heads of the creatures that inflict them—as at Scorpion, Bee, Ant, Hornet, Wasp, Tarantula, Tsetse, &c. The number of insects actually poisonous is few; in ants, bees, and wasps there is real venom (formic acid); but many injurious insects annoy otherwise than by injecting poison into the wound (see Bot). The pain of the mosquito bite is probably due to the sawing motion of his proboscis. But any biting insect, such as a gadfly, may, if it have formerly settled on a festering carcass, carry and inject into a delicate skin a deadly poison not its own; deaths have occurred from this cause in England. See Poison, Stinging-cells, Wound.

Venosa, a town of South Italy, 25 miles N. of Potenza, with a ruined castle, an old abbey, a venerable church, and catacombs. Pop. 8014. It was the ancient *Venusia*, Horace's birthplace.

Ventilation, artificial renewal of the air within a confined space, such as a mine or the interior of a building or vessel. This is required when the air is subject to contamination, as by products of respiration or by admixture with other gases. In a mine it is necessary to renew the air in order to carry off the products of respiration of men and horses, the products of combustion of lamps, and, in coal-mines, the inflammable gas which oozes from coal or rushes from 'blowers,' and causes risk of explosions. In general there are two leading methods of ventilation: (*a*) causing air to go out at the outlet, and allowing air to find its way in by any inlet (*vacuum method*); (*b*) forcing air in and allowing it to find its way out (*plenum method*). The advantage of the second method is that it is known whence the air comes which is forced in, and the access of air from other sources tends to be prevented by the excess of pressure within the confined space. In most cases, however, the vacuum method is much more easily applied.

In mines there are two main methods of applying the vacuum method: (*a*) by a furnace at the bottom of the upcast shaft; (*b*) by a vacuum fan at the top of that shaft. In both cases the actual quantity of air which is caused to travel up the upcast shaft must be sufficient to sweep away and sufficiently dilute all the mischievous admixtures in the workings; and the 'draught' must be sufficient to overcome the very considerable friction encountered by the air as it passes through the air-ways. This friction varies at each spot as the square of the velocity there; and therefore it is necessary to arrange the air-ways so as, with a given flow, to have the least velocity possible upon discharge into the outer air. When a furnace is used, air is heated by it and becomes light; it therefore tends to ascend in the shaft; other air takes its place from the workings; and a continuous current is thus set up, the fresh air entering by the downcast shaft. A furnace is, however, somewhat dangerous, for the air from the workings may, upon reaching it, be unsafely charged with gas and coal-dust; and during recent years powerful exhaust fans, like centrifugal pumps (see Pumps), have been largely employed. The velocity for a given flow is lowest when the air-ways are wide, and the velocity at any point of the workings is less the more numerous the air-ways. The flow through the workings is regulated by opening and closing air-doors or putting up barriers. If the flow through the workings is too much obstructed, the actual outflow of air being maintained by driving the engine hard, the pressure within the air-ways may be so far diminished that gas is exhausted from the coal-seam. In mines water-gauges are employed in order to test the local pressures in the workings; one limb of a U-tube containing a little water is connected with the 'dumb-drift,' and thereby with the upcast shaft; the other limb is open to the air-way; the movement of the water in the U-tube, taken along with the readings of the instruments in the upcast-shaft, indicates the suctional variations of pressure in the workings. The velocity is measured by anemometers, which are often made to signal their readings by electric transmission. Barometers and thermometers are also used in order to supply data for the requisite corrections and adjustment of quantity of air to be set in motion. Besides furnaces and fans, steam and air-blasts have been used in order to force air along; but these waste much power. In ore-mining the fresh and chilled air liberated from compressed-air motors at the working face is often very useful as a means of ventilation by the plenum method at the very point where air is most needed.

In regard to buildings and dwellings the greater care now taken in making doors and windows air-tight makes it more necessary than it formerly was to provide proper means of removing vitiated air and supplying fresh. In the old House of Commons Sir Christopher Wren made the chamber

communicate by means of tubes with an upper room into which the heated air went while the cold air from that room flowed down; this produced draughts. In 1723 Dr Desaguliers lit fires in the upper room; these fires heated the ventilating tubes from the chamber below, and caused air to ascend in them. He afterwards used a centrifugal blowing wheel, turned by a man, to effect the same purpose. Before 1744 Dr Stephen Hales proposed to use bellows for driving air into a room or a ship, or for expelling it; these being sometimes worked by a roof windmill. In 1749 Mr Samuel Sutton proposed the simple use of an open fire, the air-supply of which is wholly drawn from the interior of a building or the hold of a ship. Count Rumford proposed to take the air-supply of a building down from the roof by means of an air-shaft; a plan which implied that the fire must be kept burning, and extraneous air excluded. In 1811, at the House of Lords, Sir Humphry Davy admitted air, heated if necessary, by numerous apertures in the floor, and used Dr Desaguliers' mode of extraction, but his exit-pipes were too small, and the plan failed. About 1818 the Marquis de Chabannes wrote upon the ventilation of rooms. He proposed the admission of air by tubes heated by the fire, open to the outer air at one end and to the room at the other; and he proposed a chimney ventilator to remove the vitiated air, and also ventilating lamps and ventilating gas-fittings to carry off not only the products of their own combustion, but also an additional quantity of air, through special channels. In the House of Commons he applied steam-heat near the ceiling to warm the air and produce ascending currents. In 1834 Dr Reid of Edinburgh introduced, at the temporary House of Commons built after the fire, the principle of a much larger exit area than had previously been thought necessary. The vitiated air was drawn through a furnace and up a high chimney. There were very numerous apertures of admission for the air, which was filtered from dust, and warmed or cooled, dried or moistened, as might be required. The temperature was regulated by mixing highly heated air with an adjustable quantity of cold air in a mixing and equalising chamber before allowing the mixture to enter the House. Mr Gurney, in the new buildings, made the windows capable of being opened, introduced steam-heating, and took in the air at a low level instead of from the top of a tower as Dr Reid had done at first.

The products of combustion and respiration, comprising carbonic acid, water-vapour, and a small quantity of anthropotoxin (which is a virulent poison when concentrated), are rapidly diffused throughout the air of a room; and more air ought to enter a room, in order to dilute these, than is actually necessary in order to supply the requisite oxygen. The quantity of air required per head per minute has been very variously stated; the figure now usually stated is between 20 and 30 cubic feet per head per minute. The inflowing air should never be allowed to make sharp draughts across a room; for this reason it is frequently much safer to open a window widely than it is to open it a little; but the inflowing stream may be broken up so as to diminish its velocity as far as is consistent with adequate flow. For this purpose perforated zinc, perforated glass, wire gauze, sliding valves, air-bricks, and similar devices may be used; or the velocity may be practically diminished by directing the incoming stream of air towards the ceiling as by louvre ventilators in the window, or by Tobin's tubes. In these, when there is any withdrawal of air from the room, its place is taken by air directed in an upward stream through tubes whose upper end is open at a height of about 6 feet within the room, while the other end is open to the external air-supply at a lower level. In Sir Douglas Galton's grate there is an air-chamber behind the fire, which is continued into an air-flue above. The air-chamber is connected with the outer air; air is heated in the chamber and flue, and leaves the flue, passing into the room near the ceiling; fresh air enters the chamber from outside, and a continuous supply is thus kept up; warm air enters the room, and cold draughts are prevented. In Pierce's stove air from outside flows round the fire within an open stove; it enters the room through a perforated grating at the top, ascends to the ceiling and circulates there. There is still a good deal of divergence of opinion as to whether air should be admitted at the top or the bottom of an apartment. Neither method is entirely free from objection. Cold air admitted at a low level never allows the lower part of the room to become warm; this might, however, be an advantage in sultry weather. Cold air admitted at a high level brings the products of combustion down to be breathed over again. Mr Dye argues in favour of bringing in fresh air, if cold, at an intermediate height, just above people's heads.

For extraction of the vitiated air the open fireplace is to some extent effective even in summer time, for the chimney long remains slightly warm; but the current of vitiated air is better directed, not past the persons in the room, but towards the ceiling, and taken off by a grating opening into the chimney. When this is done down-draughts must be checked by a valve, the fireplace must not be too wide or open, and the chimney itself must not be too narrow. The fault of an open fireplace is in general that when the fire is lit it extracts more air than it is necessary to extract for ventilation purposes, and the air-supply must come in partly through the house or down some other chimney, or may fail to find its way in at all, in which case the chimney smokes. During recent years a great deal of attention has been paid to utilising the motive power of gas-flames as a means of ventilation. In the Paris Gas Company's cooking demonstration rooms in the Rue du Quatre-Septembre, 28, ventilation by this means is said to have been most successfully carried out. In every case a sufficiently large exit-channel ought to be provided, and this is a point apt to be overlooked.

The reader may consult Dr Reid's *Illustrations of the Theory and Practice of Ventilation* (Longman, 1844); Ritchie's *Treatise on Ventilation*; Tomlinson's *Rudimentary Treatise on Warming and Ventilation*; the chapter on Ventilation in Dye's *Hood on Warming Buildings* (Spon, 1891); Edwards on *Ventilation and Heat* (Longmans, 1881), a work to which we are largely indebted for our historical retrospect of the subject, and which contains numerous useful illustrations; and also Alan Bagot's *Colliery Ventilation* (Kegan Paul, 1882).

Ventimiglia, a small fortified town of the Italian Riviera, near the French frontier, and 3 miles E. of Mentone by rail. It has a cathedral and seminary, a small harbour, and a number of forts. Pop. 4195.

Ventnor, the principal town on the south shore of the Isle of Wight, 11 miles by rail S. by W. of Ryde. Situated amid the finest of the fine scenery of the Undercliff, it has a southern exposure, well sheltered from the north, and so possesses a mild climate, suitable for various classes of invalids. Hence from a small fishing-hamlet it has grown since 1830 to a favourite watering-place, with an esplanade (1848), numerous hotels and lodging-houses, and the National Consumption Hospital (1872). The beach is composed of beautiful yellow shingle; and fossils are found in great quantity in the vicinity. Pop. (1861) 3208; (1891) 5817. See works cited at WIGHT (ISLE OF).

Ventriculites, fossil sponges found in the Cretaceous System (q.v.), and often giving their shape to flint nodules.

Ventriloquism, the art of producing tones and words without any motion of the mouth, so that the hearer is induced to refer the sound to some other place. It does not depend on any peculiar structure of the organs of voice, but upon practice and dexterity. The name is founded upon the mistaken supposition that the voice proceeds from the belly. The art of the ventriloquist consists mainly in taking a deep inhalation of breath, and then allowing it to escape slowly; the sounds of the voice being modified and muffled by means of the muscles of the upper part of the throat and of the palate. The ventriloquist avails himself at the same time of means such as are employed by sleight-of-hand performers to mislead the attention. Ventriloquism is a very ancient art; the Greeks ascribed it to the operation of demons, and called ventriloquists *Engastrimanteis* ('belly-prophets').

Venue, the district from which a jury comes to try a question of fact; this, according to English law, should be the county where a crime is alleged to have been committed or a cause of action to have arisen, but modern rules permit civil cases to be set down wherever they may most conveniently be tried. In criminal cases, if a fair trial cannot be had in the county where the venue is laid, the High Court may change the place of trial. A similar power has often been conferred by statute on the Irish courts, when there has been reason to apprehend that a local jury would be liable to intimidation or undue influence.

Venus, originally a Roman goddess of spring, patron of flower-gardens, was subsequently identified with the Greek Aphrodite (q.v.), and so became also the Roman goddess of Love. In this capacity she is first heard of about 217 B.C. But over and above her cult as love-goddess she was worshipped by the Romans as *Dea Genetrix*, mother of the race, on account of her being the mother of Æneas (q.v.). She was also regarded as the tutelary goddess of the city of Rome, and as the ancestress of the Gens Julia. Hadrian built her a great temple in the Forum. Her sacred day was the 1st April. The ideal beauty of Venus was that created for the Greek Aphrodite; the famous statues of Venus are in fact Aphrodites. Most famous was that by Praxiteles at Cnidus, of which there are ancient copies at Munich and elsewhere. Of the great originals still extant by far the noblest is the Venus of Melos ('di Milone'), now in the Louvre, which was found on the island of Melos in 1820; the author and date are unknown. Next most famous are the Venus of Capua, at Naples; the Venus de Medici, now at Florence, but found at Rome near Tivoli in the 18th century, and long kept at the Villa Medici; and the crouching Venus of the Vatican. For the planet Venus, see PLANETS; and for the transits of Venus, see SUN. Venus' Flower-basket is one of the Sponges (q.v.); Venus' Fly-trap, one of the Insectivorous Plants (q.v., p. 164); and Venus' Girdle, one of the Ctenophora.

Venusberg. See TANNHÄUSER.

Venus' Looking-glass (*Specularia speculum*), a very pretty little annual, of the natural order Campanulaceæ, which has long been a favourite in flower-gardens, and is a native of cornfields in the south of Europe. It has brilliant blue, white, or violet-coloured flowers, which fold up in a pentagonal manner towards evening. There are seven or eight other species, one a native of Britain (*S. hybrida*), all being pretty, neat herbs.

Vera, AUGUSTO, philosopher, was born 4th May 1813 at Amelia in Umbria, studied at Rome and Paris, and, after teaching philosophy in France for thirteen years, lived in England from 1851 to 1860. From 1862 till his death (13th July 1885) he was professor at Naples University. He is known chiefly for his translations of Hegel's works into French, and for having introduced Hegel into Italy. But he wrote much on many subjects—on Plato's doctrine of immortality, on Strauss, on Cavour, on capital punishment, and, in English, an *Inquiry into Speculative and Experimental Science* (1856) and an *Introduction to Speculative Logic and Philosophy* (St Louis, 1875). See a monograph by Mariano (Naples, 1887).

Vera Cruz, the principal port of Mexico, lies on the east coast, in a low, unhealthy plain, backed by drifting sandhills, 263 miles by rail E. of the capital. There is no harbour, but only an open roadstead between the city and the island castle of San Juan de Ulua, which, with two shore batteries, defends the port. The streets are wide and straight, with numerous squares, and low, picturesque houses of various colours. The chief buildings are the cathedral, custom-house, and casino; a number of the churches have been perverted into tobacco-factories. The moist, hot climate of Vera Cruz is notoriously unhealthy, and the annual death-rate ranges from 1 in 11 to 1 in 20 of the population, mostly from lung diseases, and from yellow and other fevers. The fierce 'northers,' if they often drive vessels ashore from the exposed anchorage, at least are of use in sweeping away the fevers for a time. Most of the commerce is in the hands of foreigners; nearly 600 vessels enter and clear annually. Pop. 24,000.—The full title of the city is *Villa Nueva de la Vera Cruz*, or 'New City of the True Cross.' The old town was founded by Cortes in 1520 on the spot where he had landed the year before; the new one dates from 1580. The royal forces held out in the castle till November 1825. The castle capitulated to the French in 1838, and to General Scott in 1847; and during the French occupation the town was the base of supplies from 1862 to 1867.

Veratrine. See SABADILLA.

Veratrum. See HELLEBORE.

Verbena, a genus of plants of the natural order Verbenaceæ. The genus consists of numerous species of herbs or shrubs which inhabit the tropical and subtropical parts of the world; most numerous in America, more rare in Asia and Africa. One species, the Common Vervein or Vervain, is a native of the southern counties of England, and is occasionally met with in Ireland and in Scotland. They have opposite leaves, sessile bracteated flowers in simple or panicled spikes, terminal or axillary; a tubular five-toothed calyx, tubular corolla more or less curved with a spreading limb, generally unequally lobed; four stamens, included in the tube, the upper pair sometimes without anthers; a slender style with capitate stigmas. The ripe fruit splits into two or four nutlets, each containing one seed. The genus is more remarkable for the beauty of a number of the species, which under cultivation have given origin to numerous varieties greatly prized for their brilliant coloured flowers, than for other virtues, although formerly

Verbena officinalis.

the British species was credited with potent medicinal qualities, particularly in ailments of the bladder and in the cure of defective vision, which, however, appear to have been purely imaginary. It was also worn on the person as a protection against blasts and to promote general good-fortune, for which purpose it was gathered with special observances and ceremony. The Lemon-scented Verbena is *Aloysia citriodora*, which belongs to the same natural order; but the perfumers' Oil of Verbena is derived from the Lemon-grass (q.v.).

Verbenaceæ, a natural order of gamopetal plants, consisting chiefly of trees and shrubs, but partly also of herbaceous plants. The leaves are generally opposite and simple, and have no stipules; the flowers are generally in corymbs or spikes. The order contains fifty-nine genera and about 740 species, chiefly tropical, some of them natives of temperate countries. The Verbenaceæ are allied to Labiatæ both in botanical characters and in properties, but the leaves have no oil-glands. Some are beautiful ornaments of gardens and hot-houses; some are esteemed for their fragrance; some are used in medicine; the fruit of some species, as *Premna esculenta* and species of Lantana, is eaten; the leaves of *Stachytarpheta jamaicensis* are used as a substitute for tea; and the timber of a number of species (e.g. teak) is valuable.

Verboeckhoven, Eugen Joseph (1799–1881), a Flemish painter of animals, specially noted for landscapes with sheep.

Vercelli, an ancient but thriving town in North Italy, 40 miles SW. of Milan by rail, with several old churches, a modern cathedral, and manufactures of machinery, candles, matches, soap, and musical instruments. Pop. 20,165. Among the important MSS. in its libraries are an ancient Latin version of the four gospels, and the 'Vercelli Book,' a mutilated but invaluable collection of the remains of Anglo-Saxon literature, made probably about the time of Edward the Confessor, but discovered by Dr Blume at Vercelli in 1823. It contains six homilies and six poems; and a transcript was published for the Record Commission in 1836. The more important poems, *St Andrew* and *The Finding of the Cross*, have been separately edited.

Vercingetorix. See Alesia, and Cæsar.

Verd, Cape. See Cape Verd.

Verde-antique, a beautiful stone of a dark-green colour, with patches of white, and sometimes also black and red. It is a mixture of serpentine with limestone dolomite or magnesite, and was much prized by the ancient Romans, and is still in great favour in Italy. Oriental verde-antique is a green porphyry having much the same structure and texture as rosso antico (see Porphyry).

Verden, a town of 8600 inhabitants in the Prussian province of Hanover, on the Aller near its junction with the Weser, and 20 miles SE. of Bremen by rail. It has an old Gothic church of 1290–1490, and is noted as the place where in 782 Charlemagne massacred his Saxon captives.

Verdi, Giuseppe, the last and most widely successful of the school of Italian opera proper, was born at Roncole near Busseto, October 9, 1813. At ten years he was organist of the small church in his native village, the salary being raised after a year from £1, 8s. 10d. to £1, 12s. per annum. At the age of sixteen he was provided with funds to prosecute his studies at the conservatorium at Milan; but at the entrance examination he showed so little evidence of musical talent that the authorities declined to enrol him. Nothing daunted, he pursued his studies with ardour under Lavigna from 1831 to 1833, when, according to agreement, he returned to Busseto to take the place of his old teacher Provesi, now deceased. After five unhappy years in a town where he was little appreciated, Verdi returned to Milan. His first opera, *Oberto, Conte di S. Bonifacio*, is chiefly indebted to Bellini, and the next, *Un Giorno di Regno* (which fulfilled its own title, as it was only once performed), has been styled 'un Bazar de Reminiscences.' Poor Verdi had just lost his wife and two children within a few days of each other, so it is hardly to be wondered at that a comic opera was not a very congenial work, nor successfully accomplished. *Nabucodonosor* (1842) was his first hit, and in the next year *I Lombardi* was even more successful—partly owing to the revolutionary feeling which in no small degree was to help him to his future high position. Indeed his name was a useful acrostic to the revolutionary party, who shouted 'Viva Verdi,' when they meant 'Viva Vittorio Emanuele Re D'Italia.' *Ernani*, produced at Venice in 1844, also scored a success, owing to the republican sentiment in the libretto, which was adapted from Victor Hugo's *Hernani*. Many works followed in quick succession, each rousing the enthusiasm of the audiences chiefly when an opportunity was afforded them of expressing their feelings against the Austrian rule. Only with his sixteenth opera did Verdi win the supremacy when there were no longer any living competitors; and *Rigoletto* (1851), *Il Trovatore*, and *La Traviata* (1853) must be called the best as they are the last of the Italian Opera school. *I Vespri Siciliani* (1855) and *Simon Boccanegra* (1857) were not so successful as *Un Ballo in Maschera* (1859); and none of them any more than *La Forza del Destino* (1862) or *Don Carlos* (1867) added anything to the fame of the composer of *Il Trovatore*. Only now begins the interest which the student of musical history finds in Verdi's life. Hitherto he had proved a good man struggling with adversity and poverty, a successful composer ambitions to succeed to the vacant throne of Italian opera. But the keen insight into dramatic necessity which had gradually developed and had given such force to otherwise unimportant scenes in earlier operas also showed him the insufficiency of the means hitherto at the disposal of Italian composers, and from time to time he had tried to learn the lessons taught in the French Grand Opera school, but with poor success. Now a longer interval seemed to promise a more careful, a more ambitious work, and when *Aïda* was produced at Cairo (1871) it was at once acknowledged that a revolution had taken place in Verdi's mind and method, which might produce still greater results. The influence of Wagner and the music-drama is distinctly to be felt, and the advantage of more deliberate work. But Verdi was apparently not yet satisfied. For sixteen years the successful composer maintained absolute silence in opera, when whispers of a great music-drama roused the expectation of musical Europe to an extraordinary pitch; nor were the highest expectations disappointed when *Otello* was produced at Milan in 1887. The surrender of Italian opera was complete, and Verdi took his right place at the head of the vigorous new school which has arisen in Italy. A comic opera, *Falstaff*, was produced in 1893 by the composer, who was ennobled; a Requiem Mass (1874) was his only important non-operatic work. He died on the 26th of January 1901.

A sketch written by Caponi, and personal reminiscences by Giulio Ricordi, have furnished Signor Mazzucato with much that is interesting in a full, but over enthusiastic, article in Grove's *Dictionary*. Hanslick's brilliant, but unjustly severe, critique in his *Moderne Oper* (Berlin, 1885) more than restores the balance. See also Pougin's *Life of Verdi* (Lond. 1887).

Verdict. See Jury, Criminal Law.

Verdigris is a basic acetate of copper, or rather it is a mixture of three such acetates. This substance has long been largely made at Montpellier in France, by exposing thin sheets or strips of copper to the vapour of acetic acid arising from fermenting grape skins. Verdigris is used by itself as a green pigment, and also in the manufacture of several other green colours. It was in use as a paint by the ancient Romans, and it has continued to be employed as such to the present time. But as it suffers from exposure to impure air, and acts injuriously on some other pigments if mixed with them, it has fallen very much out of use for artistic work. Mixed with white-lead, it is largely used in Russia for painting iron roofs, the mixed paint changing by exposure from a bluish to a fine green colour. External wood-work is coated with it in Holland, partly, perhaps, because it is a good preservative of timber. It is mixed with some dark colours as a 'drier,' and is employed as an external application in surgery. Verdigris is very poisonous, and as it has a tendency to form on copper cooking-vessels they should always be kept perfectly clean.

Verditer. This pigment is a hydrated oxide of copper formed by adding lime to a solution of a salt of this metal, such as the nitrate, when a blue precipitate is thrown down. This blue verditer is scarcely injured by light, but it is blackened by impure air. It is used in common distemper painting and in paper-staining. Green verditer is the blue pigment changed to green by boiling, but it is a colouring substance of little value.

Verdun, a fortified French town in the department of Meuse, 35 miles W. of Metz by rail. It has eleven forts, a cathedral, and manufactures of iron, liqueurs, sweetmeats, leather, and beer. Pop. (1891) 18,195. In 843 a famous treaty was made here between the Emperor Lothaire and his brother Ludwig the German, by which the Frankish empire was divided in three (see France, p. 778). The fortress has been often besieged; as it was in 1870 by the Germans for six weeks, when it capitulated. It was the last place held by Germany, given up only in September 1873.

Vere. See Campvere.

Vere, Aubrey Thomas de, poet, was born 10th January 1814, the third son of Sir Aubrey de Vere of Currah Chase, County Limerick, who was himself a poet. He was educated at Trinity College, Dublin, and embraced the Roman Catholic faith about 1851. He has written a long series of poems, beginning with *The Waldenses* (1842), which show much grace and beauty, if little strength. Many of these are devoted to native Irish legends, especially those religious. His poetical works were collected in 3 vols. in 1884. Other works are on the picturesque aspects of Greece and Turkey, on the English government of Ireland, on church questions, and especially essays on Wordsworth, Landor, Shelley, Keats, &c. (2 vols. 1887), and *Recollections* (1897).

Vere, Sir Francis, soldier, was born probably in 1560 at Crepping or Crustwick, son of the fourth son of the 15th earl of Oxford. The family of Vere was one of the most ancient and famous in England; its head was hereditary Grand Chamberlain. The earldom of Oxford was created in 1137, and continued unbroken through twenty earls down to 1703. The home of the family was the valleys watered by the Colne and Stour—the borderland of Essex and Suffolk; the chief seat was Hedingham, the great keep of which is the finest relic of Norman civil architecture in England; their burial-place was the priory of Earl's Colne, 7 miles down the river.

Francis Vere obtained a company in the Bergen-op-Zoom garrison in the autumn of 1586, and won his first laurels in the memorable siege of Sluys, being knighted by Lord Willoughby at its close. Him he succeeded in August 1589 in the chief command in the Netherlands, with the rank of sergeant-major general. His spirit and courage even when desperately wounded made him a soldier's hero, while his skill and energy as a captain at Breda, Deventer, and a hundred fights carried his fame far beyond the Netherlands. He shared the glory of the Cadiz expedition (1596) as lieutenant-general and lord-marshal, and also next year the failure of the Island Voyage, the only laurels in which fell to his bitter rival Raleigh. Again in Holland, he governed Brill, and helped Maurice to victory at Turnhout (1597) and Nieuwpoort (1600), as well as in the heroic defence of Ostend. He died in London, 28th August 1609, and was buried in Westminster.

His brother, Horace, Lord Vere, was born in 1565, and at twenty went with Francis to the Netherlands, and took a hero's share in all his battles. Knighted for his courage at Cadiz, he succeeded his brother as governor of Brill, and at the beginning of the Thirty Years' War was sent by James I. to defend the Palatinate. But he was shut in at Mannheim and forced to surrender to Tilly (1623). He was created Baron Vere of Tilbury in 1625, and died suddenly at Whitehall, 2d May 1635. Fuller describes him as having 'more meekness and as much valour as his brother. . . . Sir Francis was more feared, Sir Horace more loved, by the soldiers.'—Another brother, Robert, died in the Netherlands on the battlefield, after but six years of service (1595). See Clements R. Markham, *The Fighting Veres* (1888).

Verestchagin, Vasili, painter, was born, 26th October 1842, at Tcherepovets in the government of Novgorod, and studied at the Naval School in St Petersburg, becoming an officer in 1859. He subsequently gave himself to art, and, after a sojourn in Tiflis, became a pupil of Gérôme at Paris. In 1867 he was with Kauffmann in the Turcoman campaigns, the fruits of which he put on canvas in Munich; and he reaped a richer artistic harvest from a visit to India in 1874. Still more famous were his painfully realistic pictures of the horrors of the fightings, plunderings, amputations, and battlefields cumbered with mutilated corpses of the Russo-Turkish war of 1877. In 1884 he made another journey to India, visiting by the way Syria and Palestine; and subsequently produced a series of striking but anticonventional pictures of the life of Christ and other sacred themes. He has painted also gigantic pictures of the execution of mutinous sepoys by English soldiers, and of Nihilists by the Russians. He has also given us autobiographical sketches of his travels (trans. 1887), and a book on *1812: Napoleon in Russia* (1899). *At Home and in War* (Eng. trans. New York, 1888) is by his brother Alexander Vasilievitch Verestchagin.

Verga, Giovanni, novelist, was born at Catania in Sicily in 1840. Of his numerous novels and tales, some of which illustrate the humours and passions of country life (as *La Vita dei Campi*, 1880, and *Novelle Rusticane*, 1883, from which comes the story of Mascagni's opera, *Cavalleria Rusticana*), the first to be translated was *The House by the Medlar Tree* (by Craig, preface by Howells, New York, 1890).

Vergennes, Charles Gravier (1717–87), French statesman, who, after a diplomatic career in Germany, Turkey, and Sweden, became Louis XVI.'s minister of foreign affairs, and, adopting the deliberate policy of humbling England by pro-

moting the independence of the United States, concluded the alliance of 1778. See his *Vie Publique et Privée* by Mayer (Paris, 1789), and Diniol, *La Participation de la France à l'Établissement des États Unis* (1889).

Vergil. See VIRGIL.

Vergil, POLYDORE, otherwise named De Castello, was a native of Urbino in Italy, born about 1470. He had his education at Bologna, and seems to have commenced life under the patronage of Guido Ubaldo, Duke of Urbino, to whom was dedicated his first work, *Proverbiorum Libellus* (Ven. 1498), an earlier book than the *Adagia* of his friend Erasmus. His second, *De Inventoribus Rerum* (Ven. 1499), was also the earliest book of its kind, became extremely popular, and was translated into English, Spanish, and Italian. Already chamberlain to Pope Alexander VI., Polydore Vergil was sent to England in 1501 as deputy-collector of the tribute called Peter's-pence, his superior in the office being his kinsman, Adrian de Castello, now Cardinal Sti. Chrysogoni, and soon after Bishop of Hereford. Polydore was presented to the living of Church Langton in Leicestershire in 1503, and next year was enthroned as the Bishop of Hereford's proxy on his translation to the see of Bath and Wells. In 1507 he was collated to the prebend of Scamblesby in Lincoln, in 1508 was nominated archdeacon of Wells, was naturalised in 1510, and collated to the prebend of Oxgate in St Paul's in 1513. Early in 1515 he was flung into prison for sending abroad slanderous letters about Wolsey, but apparently was soon released, whether from the entreaties of Leo X. and the Cardinal de Medicis or his own abject appeals to Wolsey. In 1525 he published the first genuine edition of Gildas, the year after the treatise *De Prodigiis*, dialogues in attack upon divination. His *Historiæ Anglicæ Libri XXVI.* appeared at Basel in 1534; the 27th book, bringing the story down to 1538, was added in the third edition (1555). About 1550 he obtained a license from Edward VI. to return to Italy for his health's sake, without losing his livings, and next he travelled to Urbino, where he lived in quiet till his death in 1555.

Polydore Vergil's History is a work of great research, vigorous and independent, written in clear and elegant Latin. It is the fullest original narrative for the reign of Henry VII., and here Hall has simply translated his Latin into English. As regards Wolsey, the value of his evidence is discounted by his strong prejudice. He spared no pains to ensure accuracy, and a strongly rational bias of mind hindered him from accepting the Scottish fables supplied him by Gavin Douglas, or the exploits of Brut and Arthur warranted by Geoffrey of Monmouth.

The work down to Richard III. was translated in the 16th century; and books xxiii.–xxv., relating to the reigns of Henry VI., Edward IV., and Richard III., were republished in 1844 by the Camden Society, with a preface by Sir H. Ellis. Another Camden Society issue, by the same editor, was the translation of the first eight books, coming down to the Norman Conquest (1846).

Vergniaud, PIERRE VICTURNIEN, one of the greatest orators of the French Revolution, was born at Limoges, 31st May 1753, the son of an unprosperous merchant there. Turgot, then intendant of the Limousin, divined his promise, and nominated him to a bursarship at the Collége du Plessis at Paris. He studied divinity aimlessly at the Sorbonne, but soon grew tired of it, next took a post in the civil service at Paris, but ere long threw it up and retired to his bankrupt father's house at Limoges. But a brother-in-law helped him to settle as an advocate at Bordeaux in 1781, and he quickly gained a great practice, and was elected a deputy to the National Assembly in 1791. His splendid eloquence, the charm of his personality, made him the leader of the Girondists, but he was too indolent and unambitious to care for political intrigue, and indeed he was far more of the orator than the statesman. Sent to the Convention by the department of the Gironde, he supported, in the question of the king's trial, the proposal of Salle to make an appeal to the people. When the decisive moment came he voted for death, and as president it was his duty to announce the result. In the struggle with the Mountain he made a splendid effort, but too late. He was guillotined 31st October 1793, the last of the twenty-one who died together.

See Vatel, *Vergniaud: Manuscrits, lettres et papiers* (2 vols. 1875); Aulard, *Les Orateurs de la Législative et de la Convention* (vol. i.); and the Lives by Touchard-Lafosse (1848) and Verdière (1866). See also vol. i. of H. Morse Stephens, *The Principal Speeches of the Statesmen and Orators of the French Revolution* (1892).

Verjuice (Old Fr. *verjus*, 'juice of green fruit'), a vinegar formerly much used, made from sour cider, or from the juice of the wild crab-apple. The expressed juice of unripe grapes is another kind of verjuice used in the vine districts. Both are occasionally employed in cooking.

Verkhoyansk, a small town (pop. 300) of Siberia, on the Yana River, 400 miles NE. of Yakutsk, one of the coldest places on the earth. See TEMPERATURE.

Verlaine, PAUL, French poet, was born at Metz, 30th March 1844, and chose French nationality in 1873. He began his course with *Poèmes saturniens* (1865), *Les Fêtes galantes* (1869), and *La bonne Chanson* (1870). Then followed a dozen years of silence, of Bohemianism, of the hospitals, and of Villon-like adventures, round which legends enough have already clustered. His next work, *Sagesse* (1881), breathed penitence and devotion in verse of singular sweetness, which Jules Lemaitre makes bold to compare with the *Imitation* itself. *Les Poètes Maudits* (1884), a volume of literary criticism, was followed by *Jadis et Naguère* (1885), *Romances sans Paroles* (1887), *Amour* (1888), *Bonheur* (1889), and *Parallèlement* (1890), the last a strange collection, the poet singing alternately perverse sin and religious repentance. As a perfect mirror of human impressions Verlaine's lyrics are unequalled in modern France, and many show a marvellous mastery over novel forms of rhythm. *Dedicaces* dates from 1894; and *Confessions: Notes Autobiographiques*, from 1895. Verlaine died 8th January 1896.

Vermejo, an affluent of the Paraguay (q.v.).

Vermes (Lat., 'worms'), the name given by Linnæus to the class (since much subdivided) in which he included all the invertebrate animals other than Insecta. See WORMS.

Vermicelli. See MACARONI.

Vermifuges, also called VERMICIDES, or ANTHELMINTICS, are remedies (see also at WORMS) for destroying intestinal worms, or for expelling them from the digestive canal. Those in most common use at the present day are, for Tape-worms, extract of male-fern root, in doses of half to one teaspoonful, and turpentine in doses of one to two tablespoonfuls; for Round-worms (*Ascaris lumbricoides*, q.v.), Santonin (q.v.); and for Thread-worms (q.v.), santonin and saline cathartics by the mouth, but particularly injections (see CLYSTER) by the rectum of common salt, strong green tea, infusion of quassia, or diluted steel drops.

Vermilion (sulphide of mercury, Hg, 87; S, 13) exists in the native state as Cinnabar (q.v.), from which this beautiful red pigment is obtained by selecting pure pieces and simply grinding them.

It is, however, generally made artificially. By one dry process the first step is to prepare an intimate mixture of 100 parts of mercury and 18 parts of sulphur, which are agitated together in revolving vessels until they have combined. The powder so obtained is afterwards sublimed in specially constructed retorts, and the purest portion condensed on the heads of the retorts is then treated with a little caustic potash, and washed with warm water. One of several wet processes in use for making vermilion consists in combining mercury and sulphur by grinding them together in the presence of water, caustic potash being afterwards added, and the mixture triturated for some hours at a temperature of 113° F. The product is afterwards thoroughly washed. The Chinese have long made beautiful vermilion. See PIGMENTS, and RED.

Vermin (Fr. *vermine*, through *vermineus* from Lat. *vermis*, 'a worm'), a worm or grub; more usually obnoxious insects, as bugs, fleas, and lice; troublesome animals, such as mice, rats; animals destructive to game, such as weasels, polecats, also hawks and owls. Badgers and otters come under this name; and the fox is called vermin, but without disrespect. See the articles on the various animals named; also INSECT-POWDER.

Vermont', the only entirely inland state of New England, received its name from its mountains (Verd Mont). It lies west of New Hampshire, with Canada on the north, Massachusetts on the south, and New York and Lake Champlain on the west. Its length from north to south is 140 miles, its width from 40 to 90 miles; area, 10,200 sq. m. The Green Mountains extend its entire length, being divided in the northern part, and forming a second range. Four peaks rise beyond 4000 feet above sea-level. The surface of the state is broken by many hills. The mountains are mostly clothed with trees to their summits. The hills furnish the best of pasturage, and, for the most part, can be cultivated to their tops. The air is pure and invigorating, and the scenery varied and beautiful. The average temperature is from 40° to 47° F., and the rainfall from 30 to 40 inches.

Copyright 1892 in U.S. by J. B. Lippincott Company.

Vermont is rich in quarries of granite, marble, and slate, which are extensively worked. Many of the rocks contain lime, and by disintegration make a strong soil. Steatite, verd-antique, sulphuret of iron, manganese, kaolin, and iron exist. Agriculture is the prevailing industry, and manufactures are comparatively few. A larger area is devoted to the raising of cereals—barley, buckwheat, Indian corn, oats, rye, and wheat—than in any other New England state. Its annual product of maple sugar exceeds that of any other state, and is nearly one-third of the total product of the country. By reason of the richness of the pasturage, the butter and cheese produced is of a superior quality.

The state is divided into fourteen counties, and returns two representatives to congress. Montpelier, centrally located, is the capital. The state prison is at Windsor; and there are insane asylums at Brattleboro and Waterbury, a reform school at Vergennes, and a house of correction at Rutland. Vermont possesses, besides its public schools and academies, three normal schools, the Vermont University and Agricultural College, Middlebury College, Norwich University, and the Methodist Conference Seminary and Female College.

History.—Samuel Champlain, in 1609, was the first white man who looked upon Vermont. The first permanent settlement was made at Bennington in 1761; a year later, one in Newbury. The whole territory now called Vermont was claimed by New Hampshire, and Governor Wentworth, of that state, between 1762 and 1768, conveyed to settlers 138 townships. These went by the name of 'New Hampshire Grants.' New York, however, asserted that the whole territory belonged to her, under a charter given by King Charles II. to the Duke of York; and in 1763 Governor Tryon ordered a sheriff to eject all settlers holding lands under titles from New Hampshire. But the settlers, under the lead of Ethan Allen, Seth Baker, and others, organised themselves into companies, and agreed to protect each other against all efforts to drive them from their lands. These were called 'Green Mountain Boys.' Their opposition to the New York officers was so determined and effective that the latter were compelled to return home without accomplishing their purpose. New York appealed to King George, and obtained a decision supporting its title. But as the settlers had paid for their lands, they refused to give them up on the king's decree. A bloody contest seemed inevitable, but the opening of the revolutionary war engrossed the attention of all parties. The settlers, however, intent on maintaining their rights, met in convention, adopted a constitution, proclaimed their independence, chose representatives to congress, and asked admission into the Confederacy. New York, by persistent opposition, succeeded for thirteen years in keeping them out. Finally, on payment of $30,000, it yielded, and Vermont was received into the Union, March 4, 1791, as the fourteenth state. Meanwhile the settlers rendered valiant service to the other states during the revolutionary war at Ticonderoga, Crown Point, and Bennington. At the same time, all the diplomacy of Ethan and Ira Allen was brought into requisition to prevent the 'Grants' from being overrun by British troops from Canada, who hoped to retain Vermont a British colony.

In the civil war the state furnished 35,242 soldiers, or one for every ten of its entire population, and one-half of all its able-bodied men. Pop. (1800) 154,465; (1840) 211,948; (1880) 332,286; (1900) 343,641. There is much emigration hence to other states.

Vermouth (a French spelling of Ger. *Wermuth*, wormwood) is a white wine, super-alcoholised and aromatised with wormwood, gentian, and other herbs. It is much used as a cordial or appetiser in Italy, diluted with aerated water and sharpened with quinine. It is in no way analogous to Absinthe (q.v.), also derived from wormwood.

Vernal Grass, SWEET (*Anthoxanthum odoratum*), common in Britain and throughout Europe and the northern parts of the world, is about a foot high, with spiked oblong panicle. It is relished by cattle, and is sown along with other grasses to form permanent pastures. The pleasant smell of newly-mown hay is often chiefly owing to this grass, which is fragrant when drying, and contains Coumarin (q.v.). It yields by distillation an essential oil of an agreeable odour. The straw is of use for the finest kinds of straw-plaiting.

Vernation, in Botany, a term employed to designate the manner in which the leaves are arranged in the leaf-bud. It corresponds with Æstivation (q.v.) in the flower-bud. There are great differences in the vernation of plants, which are characteristic not only of species but of genera, and even of natural orders; the vernation of the same species is always the same. In some plants the leaves are very simply placed together; in others they are most curiously folded, rolled, or plaited, and interlaced with each other, yet so as to separate most readily when the proper time for their expansion comes.

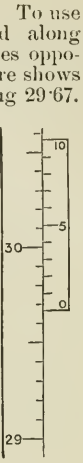
Verne, JULES, was born at Nantes on February 8, 1828. After writing various comedies and

operatic librettos, and turning out a great deal of hackwork, he struck a new vein in fiction whereby he earned a world-wide reputation. He cleverly exaggerated the possibilities of present-day science, and gave ingenious verisimilitude to narratives of wild adventure carried out by means of marvellous inventions. His stories, which have been translated into well-nigh every European tongue, include *Five Weeks in a Balloon*, *Twenty Thousand Leagues under the Sea*, *From the Earth to the Moon*, *Around the Moon*, *Meridiana*, *The Survivors of the Chancellor*, *Martin Paz*, *Michael Strogoff*, *Keraban the Inflexible*, *The Green Ray*, *The Fur Country*, *A Journey to the Centre of the Earth*, *Hector Servadac* (a wonderfully clever account of a voyage on a comet), *The Mysterious Island*, and *Around the World in Eighty Days*. The two last named are his best books—*Around the World* being a little masterpiece of construction and exciting narrative. The characters in these singular tales are the veriest automata. There is not a drop of human blood in all M. Verne's clockwork crowd of explorers, sailors, engineers, reporters, scientists, and puppets with labels innumerable. The reader's interest depends as solely on incident as it does in the *Arabian Nights*. And in M. Verne's earliest stories the interest is wonderfully well sustained. The amusement to be derived from his later books is hardly such as he aimed at creating—as in the case of his Glasgow worthies (in *The Green Ray*), who quaff tankards of 'foaming usquebaugh' and do other deeds equally characteristic of Scotsmen.

Verner's Law. See PHILOLOGY, p. 125.

Vernet, the name of three eminent French painters. CLAUDE JOSEPH VERNET was born at Avignon in 1714, travelled in Italy, and worked for twenty years in Rome, but returned to Paris in 1753 to paint for the king the sixteen chief seaports of France. He died 3d December 1789. See the study by Lagrange (Paris, 1863).—His son, ANTOINE CHARLES HORACE VERNET, popularly known as Carle Vernet, was born at Bordeaux in 1758. He received his education at the Academy of Paris, and, gaining the *grand prix* (1782), studied thereafter in Rome. He enjoyed a high reputation at Paris as a painter of horses, dogs, and large battle-pieces to the glorification of the great Emperor down to his death, 17th November 1836.—EMILE JEAN HORACE VERNET, his son, was born in Paris, June 30, 1789, and had but an irregular education amid the tumults of the Revolution. He soon made himself exceedingly popular by abundant work always brilliant and vigorous, but hardly ever anything more. His best work is marked by the characteristic faults of improvisation; his detail has ever much more of phantasy than nature. But his battle-pieces—Friedland, Wagram, Jena, Fontenoy, Isly—were delightful incense to that mean shadow of a real patriotism, French Chauvinism. He was director of the French school of art at Rome from 1827 till 1835, he travelled in Algiers and Russia, and down till his death at Paris, January 17, 1863, honours were heaped upon him. See Durande, *Joseph, Carle, et Horace Vernet* (Paris, 1865).

Vernier, an auxiliary scale which facilitates the accurate reading of linear or angular scales. It was invented by Pierre Vernier (1580–1637), who spent most of his life in the service of the king of Spain in the Low Countries. Suppose we have a scale of inches graduated to tenths, and that we wish to measure accurately to hundredths. We must make a small scale, the vernier, with *ten* of its subdivisions equal either to *nine* or to *eleven* of the small divisions of the principal scale. It is evident that each division of the vernier is smaller (or greater) than each division of the scale by $\frac{1}{10}$ of that division—i.e. by $\frac{1}{100}$ of an inch. To use the instrument the vernier must be slid along parallel to the scale until its zero line comes opposite the position to be measured. The figure shows the position of the vernier for the reading 29·67. Here the zero of the vernier lies between the graduations 29·6 and 29·7. Running our eye up the scale we see that the seventh graduation on the vernier is exactly opposite a graduation on the scale. Hence the sixth on the vernier must be higher than the next lower graduation on the scale by $\frac{1}{100}$, the fifth by $\frac{2}{100}$, and so on to the zero of the vernier, which will be found accordingly to lie $\frac{7}{100}$ higher than 29·6. Verniers are not always constructed so simply as that just described; and on beginning to work with a graduated instrument the operator must by inspection discover the law of the vernier. For example, in the best forms of barometer the principle scale is graduated to half-tenths, and the vernier is so constructed as to have twenty-five divisions corresponding in total length to twenty-four on the scale. Each vernier division is less than each scale division by $\frac{1}{25}$ of $\frac{1}{20}$ of an inch—i.e. $\frac{1}{500}$ of an inch. The vernier graduations are named in order—0, 2, 4, 6, and so on to 50. Thus, if the vernier zero stands between 29·65 and 29·7, and if the vernier graduation 24 is exactly opposite a scale graduation, the reading is 29·65 + ·024, or 29·674. It may be that 24 lies a very little above a scale graduation, and the next vernier graduation, 26, a little below the next in order. The reading would then be 29·675. It is thus possible to read to thousandths of an inch, although the vernier is graduated so as to give only $\frac{1}{500}$ of an inch. The vernier has long superseded all other methods of accurate subdivision, and is an indispensable equipment of barometers, theodolites, sextants, and all astronomical and surveying instruments. See GRADUATION, and SCALE.



Vernon, a small town of the French department of Eure, on the Seine, 15 miles NW. of Mantes by rail. Pop. 7017.

Vernon, EDWARD, admiral, was born at Westminster in 1684, the son of a Whig statesman, who was secretary of state from 1697 to 1700. He entered the navy in 1701 and parliament in 1722; commanded at the storming of Portobelo (1739) and in the disastrous Cartagena expedition (1741); and died at Nacton, his Suffolk seat, 29th October 1757. See the *Memorial* by W. F. Vernon (1861).

Verona, an ancient city of Italy, capital of a province in the division of Venetia, stands on a plain at the base of the foot-hills of the Alps, 72 miles W. of Venice by railway. It stands on a bend of the Adige, by which it is divided into two unequal parts, connected by five bridges. The aspect of the town and of the landscape around is remarkably fine. Verona is a fortress of the first class, a member of the famous Quadrilateral (q.v.), and has always been considered a place of strength since it was surrounded with walls by the Emperor Gallienus in 265 A.D. After passing into the hands of the Austrians in 1815 it was greatly strengthened; and after 1849 they made every effort to render it impregnable. The walls are now obsolete, the strength of the city depending on a circle of outlying forts. Of its many interesting edifices the chief is the amphitheatre, built in the 2d or 3d century A.D. The building has been fairly well preserved, the interior having, however, been 'restored.' The lesser diameter of the building is 404 feet, that of the arena 146 feet; and the

edifice is calculated to have contained 22,000 people. Among Roman remains are gateways, part of a theatre, and some mosaics found in 1885. The streets of Verona are wide, especially the Corso; there are four principal squares, of which the Piazza dei Signori contains the palace of the Della Scala (1370) and the superb Palazzo del Consiglio (restored in 1873). The cathedral dates from 1187, and has an altarpiece by Titian; the Romanesque basilica of St Zeno is larger and more interesting, and belongs to the same century; and there are many other churches, some of them containing fine paintings. The palaces are also numerous and fine, a number of them by Sanmichele. The ancient castle of Theodoric is still a barrack; the Castle of the Scalas (1355) is also a barrack and arsenal. The picture-gallery is especially rich in pictures of the Veronese, Paduan, and Venetian schools. The most important masters of the Veronese school were Altichiero (14th century), Vittore Pisano or Pisanello (1380–1455), and Morone (1473–1529). Paul Veronese, though a native, belonged to the Venetian school. Among the glories of the place are the tombs of the Scala family, with their wondrous wrought-iron railing of separate links, dating from 1350 to 1380. There is much trade in corn, oil, and wine, especially transit trade with Germany by the Brenner railway, and manufactures of silk, woollens and cottons, furniture, musical instruments, &c. Pop. 60,768. The oldest inhabitants of Verona were Rhætians, who were conquered by the Celtic Cenomani. It afterwards fell into the hands of the Romans, and under the empire became one of the most flourishing cities in the north of Italy. Constantine took it by assault in 312; Stilicho defeated the Goths here in 402; Attila plundered it in 452; Theodoric the Ostrogoth defeated Odoacer here in 489, made it his residence, and figures much in mediæval legend as Theodoric of Verona (in German Dietrich von Bern). It was long the capital of the Lombards; afterwards it was torn by the struggles of Ghibellines and Guelphs, being the home of Shakespeare's Capulets and Montagues (q.v.). After the death of Ezzelino da Romano, a chief of the Montecchi, the city chose in 1260 Mastino della Scala as podestá, and from that date his family exercised a powerful and brilliant tyranny over the city for 127 years, the most powerful of the Scala princes (in Latin Scaligeri; as having in legend been first to mount a ladder—Lat. *scala*—in a siege) being Can Grande I. (died 1329), the patron and protector of Dante. Mastino II. died in 1351, Can Grande II. in 1359, Can Signorio in 1375. In 1387 the city fell under the power of Milan, in 1405 under that of Venice, and with Venice passed under Austrian domination till 1866. See Perini, *Storia di Verona* (1873–75).

Veronese, Paolo, the name by which Paolo Caliari (or Cagliari), a great artist of the Venetian school, is usually known, from his having been born at Verona, probably in 1528. A sculptor's son, he studied painting under an uncle, Antonio Badile, a respectable artist, and, after some work in his native city and Mantua, in 1555 settled in Venice, where he rapidly acquired both wealth and reputation. He had for contemporaries both Titian and Tintoretto, and, though fifty years Titian's junior, was held in equal admiration with these famous painters. The church of San Sebastiano, in Venice, contains many of his pictures (both frescoes and easel pictures, from the story of Esther, martyrdoms, &c.) which are reckoned the most important of his earlier period—the period before his visit to Rome (1563), when he first became acquainted with the masterpieces of Raphael and Michelangelo. The influence of the Roman school on his style was marked, new dignity, grace of pose, and ease of movement being added to his rich Venetian colouring; a specific decorative element is also hereafter more conspicuous. He was kept busy with innumerable commissions, some of which he executed elsewhere than at Venice (as at Vicenza and Treviso). He died in Venice, 19th April 1588, and was buried in San Sebastiano. Veronese is remarkable more for the fertility than for the depth or spirituality of his imagination. His design is generally noble, his composition rich, and his execution truthful. In the invention of details, especially, he is inexhaustible, and often overloads his pictures with ornament. One peculiarity of his works is the frequent introduction of splendid architectural backgrounds, which, however, were frequently painted by his brother Benedetto. The most celebrated of his works—many of them very large—is the 'Marriage Feast at Cana of Galilee,' now in the Louvre at Paris; it is 20 feet high, and 30 in length, and contains 120 figures, many of them portraits of contemporaries, and the details much more 16th-century Italian than ancient Jewish. Besides these may be mentioned 'The Calling of St Andrew to the Apostleship,' 'The Feast of Simon,' and (in the National Gallery) the 'Presentation of the Family of Darius to Alexander,' and 'St Helena's Vision of the Invention of the Cross'—the former purchased for 13,000, and the latter for over 3000 guineas. Veronese was the last of the great Venetian painters.

See Symonds, *Renaissance in Italy* (1877); Crowe and Cavalcaselle; and a monograph by Caliari (Rome, 1888).

Veronica. See Speedwell.

Veronica, St, was, according to the legend, one of the women who met our Lord on His way to Calvary, and offered Him her veil to wipe the sweat from His brow; when, wondrous to tell, the divine features were miraculously imprinted upon the cloth, and remained as a permanent picture of the face of our Lord. This miraculous picture is reported to have been preserved in Rome from about the year 700, and was exhibited in St Peter's on 8th December 1854. Milan and other places, however, dispute with St Peter's the possession of this most sacred relic; and many Catholic writers have supposed that the name 'Veronica' is but founded on an erroneous application of what was meant to designate not the personage, but the picture, which was called *vera icon* (Gr. *eikōn*), 'the true image' (i.e. of Christ). *Berenice*, however, is in the Clementines the name of the daughter of the Canaanitish woman healed by Jesus, with whom also Veronica (perhaps a form of the same name) has been identified. The Bollandist legend does not seem to be older than the 15th century. See Karl Pearson's monograph *Die Fronica* (Strasb. 1887), and *Dublin Review* (1885).

Verres, Roman proprætor in Sicily (73–71 B.C.), infamous for extortions which desolated the island. The inhabitants committed the care of his prosecution to Cicero, who had been quæstor in Sicily in 75. The orator collected his evidence in fifty days, and so tremendous was its weight that his opponent Hortensius threw up the cause after the first day. Verres did not wait for condemnation, but fled before the nine days' hearing of evidence was over. He found shelter at Marseilles, but nemesis reached him in proscription by Antony (43), greedy for his art-treasures.

Verrocchio, Andrea del, goldsmith, sculptor, and painter, was born at Florence in 1435, and died at Venice in 1488. First a goldsmith, he became a sculptor almost equally skilled in working marble and bronze. Only one extant picture can be certainly attributed to him, a Baptism of Christ in the Florentine Academy, and in this, according to

Vasari, an angel's head was by Leonardo da Vinci. Of his bronze statues the 'David' and the 'Unbelieving Thomas' in Florence, and the great equestrian statue of Bartolommeo Colleoni at Venice, are amongst the most notable.

Verrugas, a streamlet in a rocky ravine amongst the lofty mountains over and through which runs the Central Railway of Peru (see PERU, Vol. VIII. p. 79). Over a rocky ravine stood a bridge of three iron piers (the central one 252 feet high), which, built in 1873, was swept away by a flood in 1889. Its successor, finished in 1891, has but two piers, and the lofty central span is 585 feet long.

Versailles, a city of France, capital of the dept. of Seine-et-Oise, stands on a plain 11 miles SW. of Paris by rail. A city more of pleasure than of industry, long accustomed to find its sustenance in the expenditure of a luxurious court, and subsequently a place of residence for many foreigners, attracted hither by the salubrity of the climate, the fine promenades, and the economy of living, as compared with that in Paris, it has few manufactures and little trade. The town covers a large area in proportion to its population, and is of remarkably regular construction, consisting of long and straight streets, crossing at right angles. It is the see of a bishop, and contains a public library of 50,000 volumes, many palatial edifices, public fountains, spacious squares, and elm-planted avenues. The great attraction of Versailles is its palace, and the history of this structure may be said to be the history of the town. Louis XIII. built a hunting-lodge here, afterwards extended into a château. The site occupied by the palace is known to have been that of the ancient priory of St Julien. Louis XIV. devoted enormous sums to its embellishment, or rather reconstruction, under the care of Mansard (see RENAISSANCE, Vol. VIII. p. 642); and Louis XV. altered the arrangement of the interior. Here was signed in 1783 the peace of Versailles between England and the United States. Under Louis XVI. Versailles continued to be one of the usual residences of the court down to the period of the Revolution, which great event had its beginning here in the meeting of the States-general in May 1789. At this date the population was 100,000; the palace and its park, the perfection of formal landscape gardening, have been the model of many capitals. Louis-Philippe transformed the palace of Louis XIV. into a museum, to contain trophies of the victories of France. The approach to the palace is by the *Place d'Armes* and the *Cour d'Honneur*, in the latter of which are a large equestrian figure of Louis XIV. and other statues. The entire length of the palace is nearly 1400 feet. The collections embrace pictures of events in French history, portraits of French heroes, &c. The most interesting are the pictures by David which illustrate the career of Napoleon, those by Horace Vernet, and some by Ary Scheffer and Delacroix. The gardens, with their broad terraces and long alleys, are imposing, but formal; the fountains are on the grandest scale. From the middle of September 1870 till the conclusion of peace in 1871 Versailles was the centre of all the operations of the Germans. On September 20 King William and the Crown-prince entered the town; and there, on January 18, 1871, the former was proclaimed Emperor of Germany. On January 28 the capitulation of Paris was signed in Versailles; after the peace it was the seat of the National Assembly and government till 1879, and headquarters of the army during the Commune. Pop. (1876) 49,522; (1881) 48,324; (1891) 51,679.

See works by Laborde (1840), Gavard (19 vols. 1837–49), Dussieux (2d ed. 1887), Bosg (1887), and Laurent-Hanin (1885 *et seq.*).

Verse. See METRE, RHYME.

Versecz, a Hungarian town of 22,239 inhabitants, 45 miles S. of Temesvar by rail, with a brisk trade, especially in wine.

Verst, a Russian measure of length, containing 3500 English feet, and so nearly equal to two-thirds of a mile.

Verstegan, RICHARD (died about 1635), author and printer, was the descendant of a family from Guelderland settled in England, was educated at Oxford, but after becoming a Catholic established himself at Antwerp as a printer. He was an accomplished Anglo-Saxon scholar. Of his works the best known are *Theatrum Crudelitatum Hæreticorum* (Antwerp, 1587; often republished), with copperplates showing the hanging, quartering, &c. of the Catholic martyrs by the Protestants; *Odes in Imitation of the Seven Penitential Psalms* (1601); and *A Restitution of Decayed Intelligence in Antiquities* (1605), a work showing much erudition, and containing some quaint and ingenious speculation.

Vertebrata. In popular as well as in more exact classification it has been long recognised that mammals, birds, reptiles, amphibians, and fishes have certain important characteristics in common which distinguish them from molluscs, insects, crustaceans, worms, and other animals of simpler type. Yet it was not until 1797 that the distinctive characteristics were stated with some precision by Lamarck, who drew a firm line between 'backboned,' or vertebrate, and 'backboneless,' or invertebrate, forms. During the 19th century anatomists and embryologists have made the distinctions which Lamarck pointed out yet more precise, and the more important characteristics may be summed up as follows. (1) In vertebrates the central nervous system, viz. the brain and the spinal cord, lies on the dorsal surface of the body, and is tubular in structure. (2) In all young vertebrates there is formed along the dorsal surface of the gut, and therefore of hypoblastic origin, a supporting rod or notochord, which in the simpler forms may persist throughout life, but in higher forms is more or less completely replaced by the backbone—an axis developed from the mesoblastic sheath of the notochord. (3) In almost all young vertebrates several pairs of slits or clefts open from the pharynx to the exterior; in some amphibians, all fishes, and simpler forms they persist throughout life as respiratory organs, and are usually associated with feathery gills; in most amphibians they disappear during adolescence; in reptiles, birds, and mammals they are practically functionless vestigial organs, which in a few cases do not even open. (4) A great part—e.g. the retina—of the vertebrate eye arises as an outgrowth from the brain, whereas the eye of invertebrates develops as a direct insinking of the skin. (5) In vertebrates the heart is formed on the ventral surface, while that of invertebrates is dorsal. (6) Finally, vertebrates agree with annelids and arthropods among the invertebrates in being bilaterally symmetrical segmented animals. The segmentation is shown by the distribution of the nerves and ganglia, by the gill-clefts, by the series of vertebræ, by the muscle-segments and nephridia (kidney-tubes) in embryonic life at least.

But, while our knowledge of these characteristics has become more precise, it is no longer possible to draw a boundary line between vertebrates and invertebrates with a firm hand. It can no longer be said that fishes form the base of the vertebrate series, for hag and lamprey (Cyclostomata), though in many ways more primitive, are certainly vertebrates; the lancelet (Amphioxus), though perhaps degenerate, cannot be excluded from the alliance;

the tunicates, though almost always degenerate in adult life, are all vertebrates in their youth, and the worm-like Balanoglossus has also certain hardly disputable vertebrate characters. Moreover the influence of evolutionary conceptions has led zoologists to disbelieve in the rigid apartness of any type—a disbelief which is, moreover, strengthened by the discovery of vertebrate affinities among various invertebrates—e.g. annelids, nemerteans, and arthropods. In regard to the precise origin of Vertebrata there are several rival theories, but none of these has as yet found a solid foundation. See the articles SPINAL COLUMN and SKELETON, and those on the several divisions of vertebrates.

Classification of Vertebrata or Chordata.

Mammals.	
Birds	Sauropsida.
Reptiles	
Amphibians	Ichthyopsida.
Fishes	
Cyclostomata.	
Cephalochordata (Amphioxus)	Surviving offshoots of ancestral vertebrates.
Urochordata (Tunicates)	
Hemichordata (Balanoglossus)	

Vertigo (dizziness, giddiness, swimming in the head) 'is that condition in which a person suffers from a sense of failing equilibrium, of falling, or of rotating.' It 'may vary from a mere uncomfortable sense of oscillation, such as one feels after landing from a sea-voyage, to a condition in which the patient is quite unable to maintain his equilibrium, and either falls to the ground or is forced to support himself by clutching some fixed object.' In its most characteristic forms the patient feels either as if he were being turned round or as if surrounding objects were being moved round him. Its direct cause is probably either (1) disturbance of the cerebral circulation or (2) abnormal sensory impressions from the semicircular canals (see EAR) or eyes, from which the chief sensations governing equilibration are derived. A familiar example of (1) is the dizziness often experienced on assuming or rising from a stooping posture; of (2) that following two or three quick turns of the body on its own axis, or rapid movement in a small circle.

(1) In disease vertigo is met with in faintness or loss of blood, in cerebral congestion, epilepsy, and other brain diseases. It is often met with as a symptom of disturbed digestion, probably from reflex effect upon the circulation in the brain. (2) Vertigo connected with ocular disturbance generally depends upon some abnormal condition, either spasm or paralysis of one or more of the external muscles of the eyeball. It is much more commonly met with in diseases of the ear; in the cases grouped under the name of Menière's disease the semicircular canals are themselves the seat of disease; but frequently in disease of the middle ear, and even sometimes in disease of the external ear, vertigo is one of the symptoms complained of. The cause of vertigo, and therefore the treatment to be adopted in any particular case, must be decided by a careful study of the other symptoms with which it is associated.

Vertue, GEORGE, engraver and antiquary, was born in London in 1684, and, after studying under two engravers, in 1709 commenced business for himself. He was generously befriended by Kneller the portrait-painter; and his success in engraving a portrait of Tillotson at once placed him in the very front rank of his profession. In 1711, on the institution of the Academy of Painting, he enrolled himself as a member; but his contributions were few and unimportant. In his own more special department he wrought through life assiduously, confining himself for the most part to reproductions of portraits. Himself, from an early period, devoted to antiquarian research, which he prosecuted in journeys throughout England, he was appointed in 1717 engraver to the Society of Antiquaries. He died on 24th July 1756, and was buried in the cloisters of Westminster Abbey. In addition to his eminence in his art, he was a man of considerable general accomplishment; an adept in drawing and music, and with a competent knowledge of French, Dutch, and Italian. At his death his manuscripts were bought by Horace Walpole, who made free use of them in his *Anecdotes of Painting in England.*

Vervick. See WERWICQUE.

Verviers, a manufacturing town of Belgium, most picturesquely situated on the river Vesdre, 15 miles ESE. of Liége by rail. It is of recent growth, and depends almost wholly on its cloth manufactures. Pop. (1881) 41,692; (1891) 50,223.

Vervins, a small town (pop. 2858) in the French department of Aisne, 25 miles NE. of Laon. Here in 1598 an important treaty was concluded between Henry IV. (q.v.) of France and Philip II.

Vesalius, ANDREAS, anatomist, was born at Brussels, 31st December 1514, and studied at Louvain, Cologne, Montpellier, and Paris. He lectured at Basel, became surgeon to the imperial army in the Low Countries, and was professor of Anatomy successively at Padua, Pisa, Bologna, and Basel. In 1544 he became body-surgeon to Charles V., living in Madrid. He incurred great odium by opposing Galen and by dissecting human bodies; and went on a pilgrimage to Jerusalem, but died on the way at Zante, 15th October 1564. His *De Corporis Humani Fabrica* (1543) marks an epoch in anatomy. See B. W. Richardson in *Asclepiad* (1885), and G. M. Cullen in *Dublin Jour. of Med. Science* (1894).

Vesicants. See BLISTERS.

Vesica Piscis. See NIMBUS, and SYMBOL.

Vesoul, capital of the French department of Haute-Saône, 40 miles W. of Belfort by rail. It is surrounded by vineyards, has some cloth-weaving, trade in grain, &c., and a pop. (1891) of 9642.

Vespasian. TITUS FLAVIUS VESPASIANUS, the tenth of the twelve Cæsars, Roman emperor 70–79 A.D., was born of comparatively humble family near Reate, 9 A.D. He served as tribune in Thrace, as quæstor in Crete and Cyrene, in the reign of Claudius commanded a legion in Germany and in Britain, where he subdued the Isle of Wight, was consul in 51, and next proconsul of Africa, and in 67 was sent by Nero to reduce the Jews to subjection. An able soldier and honourable man, he is admitted by Tacitus even to have been 'but for his avarice equal to the generals of old days.' He was popular with his men, and when the struggle began between Otho and Vitellius he was proclaimed emperor by the legions in Alexandria, and soon after throughout all the East. Leaving the war in Judæa to his son Titus to complete, he reached Rome in 70, and soon restored the government and the public finances to order, besides showing an admirable example to a corrupt age by the simplicity and frugality of his life. After the fall of Jerusalem and his joint triumph with Titus, the temple of Janus was closed, and for nine years the wearied world had rest. Vespasian died in the summer of 79. His alleged avarice was most likely a mere wise economy, for we find him liberal enough to his subjects in distress, and to men of letters like Quintilian, as well as spending lavishly upon public works like the Colosseum (begun under him). He had a quick eye for men of virtue and capacity like Julius Agricola, whom he sent to Britain in 78.

He was tolerant and good-natured, plain and blunt in manners, with a rich vein of humour which never left him to the last: 'Methinks I am becoming a god' he whispered to the bystanders around his bed.

See the *Lives* of Suetonius and the *Histories* of Tacitus; but especially Dean Merivale's *History of the Romans under the Empire*.

Vespers. See BREVIARY.

Vespucci, AMERIGO, a naval astronomer, from whom America accidentally received its name, was born at Florence, March 9, 1451, and was at the head of a large Florentine firm in Seville in 1496. He fitted out Columbus' third fleet, and in 1499 himself sailed for the New World with Ojeda, and explored the coast of Venezuela (q.v.). In 1501–4 he was in the service of Emanuel of Portugal, and in 1503 discovered All-Saints' Bay, on the coast of Brazil, afterwards running south as far as Cape Frio. In 1505 he was naturalised in Spain, and from 1508 till his death, February 22, 1512, he was pilot-major of the kingdom. The accident which fastened his name on two continents may be traced to an inaccurate account of his travels published at St Dié in Lorraine in 1507, in which he is represented as having reached the mainland in 1497—before Cabot or Columbus. See his Letters (trans. Hakluyt Soc., 1894), the journal of his *Voyage from Lisbon to India* (trans. 1894), and a book on him by H. Harrisse (1895).

Vesta, a great Roman divinity, goddess of the hearth, identified with the Greek Hestia. The latter was one of the twelve great divinities of the Greeks, daughter of Cronos and Rhea. A virgin goddess, she watched over domestic life, and had her shrine in the inner part of every house, and in the *prytaneum* of every town considered as an aggregation of families. Here, as at a private hearth, the sacred fire ever burned in her honour, and from hence it was carried by colonists to their new home. Similarly the Roman Vesta, whose worship was introduced by Numa from Lavinium, whither Æneas bore the *Penates* and the sacred fire from Troy, had her round temple in the centre of the city, where she was worshipped under the symbol of the eternal fire, watched over by the Vestal virgins. This fire was renewed on the 1st of March, and if it went out a great national disaster might be looked for. It could only be rekindled by the primitive method of friction, or, as Plutarch says, by the use of the burning-glass. The duty of the six (at first four) Vestal virgins was to keep this sacred fire burning, every day to bring water from the sacred spring of Egeria for the purification and sprinkling of the temple, to make a sacrifice of salt cakes, to offer daily prayers for the well-being of the state, and to pour on the altar of sacred fire libations of wine and oil. They also preserved the *Palladium* (q.v.) and the six other mystic symbols of the welfare of the city. They were chosen by lot out of twenty selected by the *Pontifex*, when not more than ten years of age, and took a vow for thirty years, after which time they were free to return to the world if they chose. In the first ten years the Vestal virgin learned her duties, during the second she practised them, and during the third she taught them to the young vestals. A breach of the vow of chastity was punished by burial alive in the Campus Sceleratus. Their privileges were correspondingly great; they paid no taxes, owed obedience to the Pontifex Maximus alone, could will their own property, and drive in carriages through the streets, were attended by a lictor when they went abroad, and had places of honour at all public games. They gave evidence without oath, enjoyed the privilege of burial in the Forum, and had the keeping of many documents of state. If they met a criminal by chance on the way to execution he was free. Their house, the *Atrium Vestæ*, close to the temple, was large and magnificent, and they had public slaves appointed to serve them. It was excavated only in 1883–84 (Middleton's *Anc. Rome in 1888*). Their dress was entirely white; the chief characteristic feature being the *infula*, a coronet-shaped head-band with ribbons (*vittæ*) hanging from it, and covered at the time of sacrifice by a white veil (*suffibulum*). This was a white woollen hood, with a purple border, folded over the head and fastened below the throat with a *fibula*. The *Vestalia* or chief day of festival of Vesta was kept on July 9, after which the temple was closed for five days for cleaning.

See Preuner, *Hestia-Vesta* (Tüb. 1864); Maes, *Vesta e Vestali* (Rome, 1883); and J. G. Frazer in the *Journal of Philology* (vol. xiv.).

Vestments, SACRED. The use by the priesthood of a distinctive costume in public worship formed a part not only of the Jewish, but of almost all the ancient religions. Generally speaking, in the Christian church the sacred vestments represent the original costume of Rome and the East in the first centuries, retained unaltered by the clergy, whereas in the everyday world the costume varied in fashion, in material, in colour from year to year. There seems little room for doubting that from a very early time Christian ministers employed some distinctive dress in public worship; and Catholic writers even find traces in the beginning of the 5th century of the practice of blessing the vestments which were destined for the public services of the church. The vestments used in the celebration of mass by priests of the Roman Catholic Church are the Amice (q.v., originally worn over the head); the Alb (q.v.); the girdle, a linen cord tied round the waist, and confining the folds of the alb; the maniple, a narrow strip of embroidered silk, worn pendent from the arm; the Stole (q.v.); and the Chasuble (q.v.). The three last named are always of the same material and colour; but this colour, which appears primitively to have been in all cases white, now, and for many centuries, varies according to seasons and festivals, five different colours being employed in the cycle of ecclesiastical services—viz. white, red, green, violet, and black. Cloth of gold, however, may be substituted for any of these, except the last. Bishops, in celebrating, wear, besides the vestments of priests, two inner vestments, the dalmatic and tunic (those of the deacon and sub-deacon respectively), as also embroidered gloves and shoes, or buskins, together with the distinctive episcopal ornaments—the pectoral cross, ring, mitre, and pastoral staff, or, if archbishops, the crozier. Archbishops celebrating mass also wear the Pallium (q.v.). Bishops, when they celebrate pontifically, take their vestments from the altar, whereas priests put them on in the sacristy; but this is a late distinction. In other public services priests and bishops wear the Cope (q.v.), with a pendent cape or hood. In the ministration of the other sacraments, and also in administering communion privately, priests wear the Surplice (q.v.) with the stole, or it may even be the stole alone. In the Greek Church the *stoicharion*, *zoné*, *epitrachelion*, *epimanikia* (a square piece of cloth, stiffened, worn pendent from the girdle, and perhaps originally a napkin), and ample *phelonion* correspond respectively with the alb, girdle, stole, maniple, and chasuble. Greek bishops wear the *omophorion*, which corresponds with the later pallium, and also a pectoral cross, and carry a short pastoral staff; but they wear no ring, and, except by the patriarch of Alexandria, the mitre is not worn in the sanctuary.

The natural effect of the religious changes of the 16th century was to put aside the costume at the same time and on the same grounds with the ceremonies of the existing worship. This was done, however, by the different churches of the Reformers in very various degrees. The Calvinistic worship may be said to have dispensed with vestments altogether. The Lutherans generally retained with the cassock the alb, and in some countries the chasuble. In the Swedish Church full vestments are retained. In the English Church a variety of practice has existed. See SURPLICE. As to the rest of the costume, the first Prayer-book retained the Roman vestments with little change; and as the vestments and ornaments of 1549 were again enjoined in 1559, a so-called ritualistic movement in the English Church has since 1851 reintroduced in some places almost every detail of the Roman costume in the communion and other services, a revival which has in many instances been vigorously resisted. See PRAYER-BOOK, p. 380; and Marriott's *Vestiarium Christianum* (1868).

Vestris, MADAME, actress, was the granddaughter of Bartolozzi the engraver, and was born in London, 7th March 1797. Accomplished in music, French, and Italian, Lucia Elizabeth Bartolozzi married at sixteen Armand Vestris, ballet-dancer, member of an originally Florentine family that gave to France a series of distinguished cooks, actors, and ballet-dancers. Three years later she separated from her worthless husband and went on the stage in Paris (1815), attaining fair success. In 1820 she appeared at Drury Lane, soon became famous in *The Haunted Tower*, was even more popular as Phœbe in *Paul Pry*, and in light comedy and burlesque was uniformly successful. She was lessee of the Olympic when in 1838 she married Charles James Mathews, and she afterwards undertook the management of Covent Garden and the Lyceum. She retired in 1854, and died at Gore Lodge, Fulham, 8th August 1856.

Vestry (Fr. *vestiaire*, Lat. *vestiarium*, 'robing-room' or 'room where vestments are kept;' hence a meeting held in a vestry), in English parishes a meeting of all the ratepayers, assembled on three days' notice, to elect parish-officers—churchwardens, overseers, a vestry-clerk, and, if need be, a collector of rates—to assess church-rates, and to manage the property of the parish. The vestry had also the right to adopt the Free Libraries Act, the Lighting and Watching Act; but most of its powers were taken away by poor-laws, laws as to public health, and especially the Local Government Act of 1894—since which the vestry in rural parishes exists for ecclesiastical purposes only, and in urban parishes its powers may by an order be transferred to the urban district council. The incumbent is chairman of the vestry; the voting is by show of hands, but if a poll is demanded the ratepayer has votes in proportion to his rates. See PARISH, CHURCH-RATES, CHURCHWARDENS, POOR-LAWS.

Vesuvian, or IDOCRASE, a mineral composed essentially of silica (37 to 39 per cent.), alumina (13 to 16 per cent.), and lime (33 to 37 per cent.), and containing a small percentage of water and usually some oxide of iron. It occurs both massive and crystallised—the general form of the crystals being that of a rectangular prism terminated by faces of the protopyramid and basal planes. The edges of the prisms are often replaced. The hardness = 6·5, and specific gravity = 3·34 to 3·45. The mineral has a vitreous and sometimes resinous lustre, and varies in colour from brown to green; but is occasionally yellow, azure blue, or black. It was first found in dolomitic blocks ejected from Vesuvius and Somma, but occurs in granular limestone, serpentine, gneiss, and other rocks in regions where crystalline schists abound. It is often associated with garnet and pyrotoxene. It is not highly valued as an ornamental stone. The green-coloured varieties are known as *Volcanic Chrysolite*, and the brown as *Volcanic Hyacinth*.

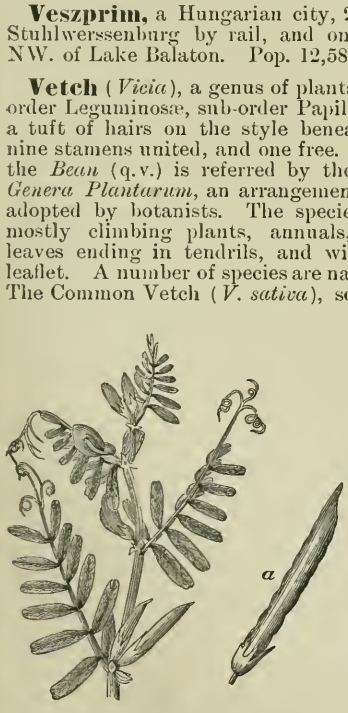
Vesuvius, the most striking object seen from the Bay of Naples, a mountain of dense tufa (pumice-stone and ashes), is supposed to have been heaved up from the submarine level where it was formed. Besides the shells which indicate its sea-origin, it contains erratic blocks of limestone from the higher Apennine-offshoot, Monte Somma, which, in an irregular semicircle, surrounds it on the north and east. The latter—the Mons Summanus of antiquity, once crowned by a temple of Jupiter—was the seat of volcanic activity long before Vesuvius, which first (63 A.D.) became convulsed by earthquakes, repeated at intervals till 79, in which year occurred its earliest known eruption (see POMPEII). This was followed by others, of which the more memorable are that in 472, when its ashes alighted in Constantinople; in 512, when they were wafted to Tripoli; in 1036; and in 1500; after which ensued a period of inaction, broken in December 1631 by a destructive outbreak which denuded the mountain of the forest-growth with which it had become clothed. The 18th century witnessed many of its eruptions, the most remarkable being that of 1793, when a lava-stream 12 to 40 feet thick swept over Torre del Greco and penetrated the sea to a distance of 380 feet, by which time its volume was 1204 feet wide and 15 feet high. This stream was so liquid that to leave the crater and enter the sea—a journey of 4 miles—it took only six hours. Another memorable outbreak was that of 1822, when the so-called 'smoke' from the crater rose to a height of 10,000 feet, emitting flashes of lightning, raining torrents of hot water, and flooding the villages of S. Sebastiano and Massa. In 1855 occurred a terrible eruption, in which the summit of the cone discharged a lava-stream which ravaged the fertile and highly-cultivated region below. On December 8, 1861, Torre del Greco suffered severely from another visitation, surpassed in turn by that of 1871–72, when the sudden emission of lava from a crater of 1855 killed twenty spectators on the spot. S. Sebastiano and Massa were again greatly damaged, the cone threw up fragments of rock to a height of 4000 feet, and the explosions were so loud that the whole country-side fled panic-stricken to Naples. The activity of the volcano, accompanied by distinct shocks of earthquake, lasted for a week. From the observations of many years the following characteristics of the volcanic activity of Vesuvius have been summarised by Professor Palmieri. (1) The filling up of the crater portends an imminent eruption, and its full discharge is followed by a period of repose. (2) The narrowing of the mouth of the crater by accumulated debris impedes the flow of the lava, and this impediment leads to the outburst of lateral openings which from their greater proximity to the source of heat emit the lava in a more liquid condition, whereby its flow becomes that of a continuous stream. (3) When the internal channel is blocked by solid debris, the effort of the elastic vapour to clear it is supposed to cause the earthquakes by which the greater eruptions are preceded and accompanied. (4) What is called 'smoke' from the crater is simply steam more or less blackened with incinerated dust. When this dust is in excess it accelerates the fall of the steam, which, having become water by condensation, descends like a mud-torrent, flooding the ground. This was a notable feature of the visitation in which Pompeii perished. (5) During an eruption what appears as flame shooting out of the crater is really the reflection of the molten

lava within the crater upon the steam and upon the ashes suspended in the steam accumulated above it. (6) The rapid condensing of vapour into water, and the conversion of this into steam, generates electricity, which explains the lightning-effects visible on the edges of the clouds overhanging the crater. Vesuvius is reckoned by geologists the most instructive object-lesson on volcanoes in general, and the university of Naples, by an admirable assortment of specimens of its structure, has greatly facilitated its study. Professor Sacchi numbers forty species of minerals found in it, of which augite, hornblende, mica, sodalite, breislakite, magnetic iron, and leucite are the most abundant. The fertility of its slopes, since Martial's famous epigram on the destruction of Pompeii, has passed into a proverb, its chief product being the wine called Lacrima Christi, red and white, the latter superior in bouquet. Its observatory (1844) has acquired a European reputation from the meteorologist Melloni, and still more from his successor, Professor Palmieri, who directed it with equal sagacity, skill, and daring from 1854 till his death in 1882. The so-called railway, but rather cable-tram, from the base to near the summit, was opened in 1880.

See the late Prof. Phillips' *Description of Vesuvius*, the papers of Dr Johnston-Lavis, and J. S. Lobley, *Mount Vesuvius: Historical and Geological Account* (1889).

Veszprim, a Hungarian city, 25 miles SW. of Stuhlwerssenburg by rail, and on a hill 5 miles NW. of Lake Balaton. Pop. 12,584.

Vetch (*Vicia*), a genus of plants of the natural order Leguminosæ, sub-order Papilionaceæ, having a tuft of hairs on the style beneath the stigma, nine stamens united, and one free. To this genus the *Bean* (q.v.) is referred by the authors of the *Genera Plantarum*, an arrangement not generally adopted by botanists. The species, however, are mostly climbing plants, annuals, with pinnate leaves ending in tendrils, and with no terminal leaflet. A number of species are natives of Britain. The Common Vetch (*V. sativa*), sometimes called by agriculturists Tare, frequent in cultivated ground in Britain and throughout Europe, and itself much cultivated as green food for cattle, has rather large purple, blue, or red flowers in pairs, axillary and almost sessile. In cultivation it varies considerably both in size and other particulars, as in the breadth of the leaflets, the number of them in a leaf, &c. Oats are sometimes sown along with it, to afford it a little support, and thus prevent its rotting in wet weather. *V. Cracca* and *V. sepium* are very common British species, the former with many-flowered stalks, bearing beautiful bluish-purple flowers, being one of the most beautiful climbing plants, and a chief ornament of trees, hedges, and bushy places in the latter part of summer. These and other species, natives of Britain or of different parts of Europe and the north of Asia, have been either occasionally cultivated as food for cattle or recommended for cultivation, and generally agree with the Common Vetch both in their qualities and in the mode of cultivation which they require. *V. biennis* and *V. narbonnensis* are amongst those chiefly cultivated in some parts of Europe. The species of vetch are very numerous, chiefly in the temperate parts of the northern hemisphere. For the Bitter Vetch, see OROBUS.



Common Vetch (*Vicia sativa*): *a*, seed-pod.

Veterinary Medicine. The ancients—more particularly Homer and Xenophon—wrote about horses and their management; Virgil's *Georgics* show close observation of the domestic animals and their ailments; and the Latin term *veterinarius* is as old at least as the 1st century A.D. Hippocrates, the father of medicine, wrote a treatise on the veterinary art; but its true founder was Vegetius, who wrote *De Arte Veterinaria*, 300 A.D. This work became the oracle of succeeding ages. He was sufficiently liberal-minded to give due credit to Columella and other writers who had preceded him. For many centuries after Vegetius but few writings are known to have appeared, and of these but few extracts now remain, collated by order of Constantine Porphyrogenitus. To a somewhat later date may belong the first application of iron shoes to horses' feet, and the maker of the shoes was entrusted with the medical care of the horse; hence the term *farrier*, 'a worker in iron,' still sometimes given to the veterinarian.

In the 16th century the necessity for a higher cultivation of the veterinary art appeared evident, and Francis I. ordered Constantine's collection to be translated from the Greek into Latin by Ruelli, a physician. From Latin it was soon translated into Italian, French, and German, and became dispersed over Europe; nearly at the same time the works of Vegetius appeared in several languages, and from this period the art made gradual progress. Gessner compiled from Aristotle, Pliny, Columella, Vegetius, and others; soon after Laurentius Ruffius wrote some celebrated works in Latin; and later on appeared the *Natural History of the Ruminantia* and the *Phenomena of Rumination* by Emiliano. During the 17th century the art continued to advance, and numerous treatises were written upon it, the most notable being Cæsar Fiarchi's work on horsemanship, in which is introduced the most rational mode of horseshoeing then practised—he condemned the use of calkings. Carlo Ruini (Bologna, 1598) published the *Infermità del Cavallo, e suoi Remedii*, from which Snape and Gibson in England, and most of the French authors, have copied their anatomical plates. In 1654 the *Grand Marechal François*, said to be composed by several authors, appeared, and in the latter end of the century Solleysel published an elaborate work. Solleysel, riding-master to the king of France, opposed many abuses, exposed the folly of burning the lampas—a cruelty practised even to this day—reprobated bleeding from the palate in fever, &c. He was extensively copied.

But the first attempt to elevate the art into a science occurred in 1761, when France set the example of establishing the first veterinary college under royal patronage at Lyons, the first professor being Bourgelat, who wrote numerous anatomical and medical works bearing on the infant science. Shortly afterwards (1766) a second school was established at Alfort near Paris, to which Bourgelat was transferred. Both of these colleges are still flourishing, and establishments of a similar kind were organised in the capitals of almost every European country, including London. Contemporary with Bourgelat flourished the elder La Fosse, who made numerous discoveries and improvements, usually communicated in the form

of memoirs to the Academy of Science in Paris. In 1754 these memoirs were published in one volume, which was quickly translated into other languages. His son proved a worthy successor to the illustrious father, in 1766 publishing his *Guide de Maréchal*, and in 1772 his greatest work, the *Cour d'Hippiatrique;* it contains sixty-five anatomical plates coloured after nature, with concise descriptions in letterpress. He afterwards published his *Dictionnaire d'Hippiatrique* in 4 vols. After the death of Bourgelat and the two La Fosses no great progress was made until after the Revolution, when the names of Hartman, Chabert, Huzard, and others stand prominently forward.

Reverting to the history of the art in Britain, we find that Thomas Blundeville (fl. 1561) was one of our earliest authors. He was succeeded by Mascal, Martin Clifford, and Burdon, and at this time Gervase Markham wrote his well-known but absurd *Treatise on Farriery.* In the time of Charles II. Snape's *Anatomical Treatise on the Horse* appeared. In the reign of George I. Solleysel's treatise was translated by Sir William Hope. About the middle of the 18th century appeared the works of Gibson, Bracken, Bartlet, Osmer, Taplin, and others. The majority of these writers were entirely ignorant of the *nature* of disease; in fact they were men of *receipes* and infallible cures, having but little knowledge of anatomy, physiology, or the allied sciences, although many of them were members of the medical profession; consequently glanders, farcy, blindness, pole-evil, &c. were rampant. The diseases of cattle were but little studied; hence the loss of animal life was very great. The importance of a more extended knowledge of the art as a science now began to be felt in England, and the Odiham Agricultural Society in 1791 formed the Veterinary College of London, with M. St Bel as professor. St Bel, a Frenchman who had studied under Bourgelat, died in 1793.

The professorship was now accepted by Coleman, a young surgeon, a friend of Sir Astley Cooper, Abernethy, Cline, Babington, and other eminent men. He paid great attention to sanitation and the prevention of diseases. Against the prevailing opinion he recommended fresh air in the treatment of lung diseases, and his ideas on ventilation were soon justified by marked decreases in such diseases as glanders and periodic ophthalmia. Coleman was assisted by a practical veterinarian named Moorcroft, who, however, withdrew and became eminent in India. Great interest was taken in the college and its work by John Hunter, Cooper, and others. Coleman was succeeded by Sewell, who recommended the frog-seton—a useless and barbarous practice—in navicular disease and excision of the nerve in chronic foot lameness. Delabere Blain, Percival, and Youatt were good anatomists, but, like their immediate predecessors and contemporaries, they advocated the heroic method of treatment. In fact the complicated but harmless recipes of past authors were thrown aside, and bleeding, physicking, and blistering were fully brought into operation. Sewell was succeeded by Spooner, who was followed by Simonds. After Sewell the heads have been Simonds, Spooner, Robertson, and Brown. Commencing with one professor in 1791, the college now possesses a staff of about a dozen professors and demonstrators, and, from a possibility of obtaining a diploma in a few months, it is now necessary that every student shall attend three scholastic years and pass first an educational—or provide recognised certificates—and three professional examinations. These conditions also apply to the Scottish colleges, and the students from all the schools are examined by one board of examiners, who are appointed for five years by the Royal College of Veterinary Surgeons.

The Edinburgh Veterinary College was instituted by Professor Dick, born in the White Horse Close, Canongate, and the son of John Dick, blacksmith and farrier. He attended lectures on anatomy and medicine at the university of his native city, and towards the end of 1817 he joined the London Veterinary College under Coleman. In 1819 he commenced to lecture in the Freemasons' Hall, Niddry Street, in connection with Mr Scott; but this proving a failure, Dick commenced an independent course in an unfurnished shop in Nicolson Street, one student only being the regular attendant. In 1823 Dick's efforts were patronised and to some extent supported by the Highland and Agricultural Society of Scotland, the lectures being delivered twice a week in the Calton Convening Rooms, and the attendance of students rapidly increasing. Professor Dick died in 1866, leaving his college in trust to the lord provost and magistrates, who in 1867 appointed the present writer to the principalship. He, however, in 1873 founded the New Veterinary College. In 1861 M'Call founded the Glasgow Veterinary College.

In 1844 the members of the profession holding the diplomas or certificates of the schools only obtained a charter from Her Majesty constituting them a body corporate with power to elect twenty-four members of council, who elect their own president and vice-presidents, and appoint examiners. This council now possesses further powers to regulate the curriculum of the teaching colleges, the subjects of examination, &c.

In the later half of the 19th century veterinary colleges have been founded in the United States, in the principal British colonies, and very recently in India. The first college established in Canada is the Ontario Veterinary College at Toronto; and in 1866 another college was instituted in Montreal, and is now the Faculty of Comparative Medicine and Veterinary Science of the M'Gill University. In Australia colleges have lately been instituted, and in India several schools are now in working order, presided over by army veterinary surgeons. The American Veterinary College at New York was incorporated and organised in 1875. Many of the American universities have created faculties of veterinary medicine, the best known of these being that of Harvard; others are those of Minnesota, Cornell, and Ithaca.

See George Fleming's *Veterinary Obstetrics, Operative Surgery, Animal Plagues,* and several other works, besides his edition of Chauveau and Arloing's *Comparative Anatomy of the Domesticated Animals* (1873); the present writer's *Veterinary Medicine* (10th ed. 1892) and *Veterinary Surgery* (10th ed. 1892); Finlay Dun's *Veterinary Medicines* (1873–78); Robertson's *Equine Medicines;* Smith's *Veterinary Hygiene* and *Veterinary Physiology,* &c. There are four periodicals devoted to the subject in Britain. See also, amongst articles in this work, the following:

Vetiver, the dried roots of the cuscus grass, an Indian Andropogon (see LEMON-GRASS, GRASS-OIL), which has a very agreeable and persistent odour, something like sandalwood. Baskets, fans, and mats are made of it.

Veto (Lat., 'I forbid'), in Politics, the power which one branch of the government of a country may have to negative the resolutions of another branch. In the United Kingdom the power of the crown in the act of legislation is confined to a veto.

The crown cannot of itself make any alterations in the existing law, but may refuse to sanction alterations suggested and consented to by the two houses of parliament. The royal veto is reserved for extreme emergencies; the last instance in which it was exercised was in 1707, when Queen Anne refused her assent to a bill relating to the militia in Scotland. The House of Lords may reject (and so for a time veto) bills passed by the Commons. In bills of supply the power of the House of Lords amounts merely to a veto, as does that of the House of Commons in bills affecting the peerage. The question as to a British veto on Irish legislation was one of the difficulties in the scheme of Home Rule for Ireland. In the United States of America the president has a qualified right to veto all laws passed by congress; but after that veto has been exercised the bill which he has rejected may become law by being passed by two-thirds of each house of congress. The same rule applies in most of the states, a two-thirds vote in both branches of the legislature passing a bill over the governor's veto. In others the proportion is three-fifths, and in several a simple majority suffices. The president's power of veto was in the earliest days of the republic very sparingly used, but is now resorted to with comparative frequency; while, as an extreme instance, in the state of New York, with a demoralised legislature, no less than 236 bills were vetoed by the governor in one session. The Swiss *referendum* includes the power of veto (see SWITZERLAND, p. 22). For the Polish *liberum veto*, see POLAND, Vol. VIII. p. 271. In revolutionary France in 1795 a Council of Ancients was created, with a power to veto the resolutions of the legislative body. For the Veto Act in the Scottish Church, see SCOTLAND, Vol. IX. p. 245, and FREE CHURCH. The veto is sometimes a name given to total prohibition in temperance legislation; see LIQUOR LAWS, TEMPERANCE.

Veuillot, LOUIS, publicist, born in 1813 at Boynes (Loiret), chose the profession of journalism, and filled several engagements on the provincial press. He visited Rome in 1838, returned to Paris a zealous adherent of the papacy, and, as editor of the *Univers*, soon signalised himself as an aggressive and uncompromising champion of the church. In 1842 he accompanied Marshal Bugeaud to Africa as his secretary, and on his return was made Chief-secretary to the Ministry of the Interior. He again edited the *Univers* in 1848; but his attacks on Napoleon III. led to the suppression of his paper from 1860 till 1867. During the Vatican Council he was a vehement supporter of Ultramontanism. Veuillot, besides polemical pieces, wrote novels, poems, books of travel; in 1857–76 he issued in 18 vols. *Mélanges Religieux, Historiques, Littéraires.* He died 7th April 1883.

Vevay, or VEVEY (Ger. *Vivis*), a Swiss town in the canton of Vaud, a favourite health-resort, remarkable for the beauty of its situation on the north shore of the Lake of Geneva, 11 miles E. of Lausanne by rail. It stands at the mouth of the gorge of the Veveyse. From the elevations about the town the fine view to the east commands the valley of the Rhone, backed by the magnificent rampart of the Alps of Valais. In the church of St Martin (date 1498) Ludlow, one of Charles I.'s judges, and Broughton, who read to him his sentence of death, are buried. There is some trade in milk, cheese, and wine; and Vevay cigars are largely made and exported. Pop. 8144.

Vexilla Regis. See HYMN, Vol. VI. p. 46.

Vézelay, a decaying town in the French dept. of Yonne, 5 miles SE. of Auxerre. Its ancient and curious abbey church was restored by Viollet-le-Duc in 1868. Hither Becket retired in 1168; here St Bernard preached the Crusade in 1145; and on the plain below Richard Cœur de Lion and Philip Augustus joined their forces in 1190 for the third crusade. Beza was a native. Pop. 612.

Viaduct. See BRIDGE.

Via-Mala, a remarkable gorge in the Swiss canton of Grisons, on the course of the Farther Rhine (see RHINE). The roadway (1823) is carried for nearly 2 miles partly in half-open galleries, partly in a tunnel; the rock-walls on either hand rising to 1600 feet, and sometimes but a few feet apart. The road crosses the river three times by bridges, and is about 160 feet above the river.

Via Media. See NEWMAN.

Vianna, a seaport of Portugal, at the Lima's mouth, 45 miles N. of Oporto by rail. Pop. 8816.

Viardot. See GARCÍA.

Viareggio, an Italian town on a beautiful site on the Mediterranean coast, 15 miles NW. of Pisa by rail. Malarious swamps have been drained, and great pine-woods shelter a health-resort. Here Shelley's body was cast ashore. Pop. 10,190.

Viaticum (Lat., 'provision for a journey'), Holy Communion administered to persons in danger of death. It may be received without fasting (as is required in all other cases) from the midnight previous; and it may be given frequently during the same sickness.

Viatka. See VYATKA.

Viaud, LOUIS-MARIE-JULIEN, a charming, but hardly a great writer, who, under his pen-name of Pierre Loti, quickly reached the heart of France, and climbed into a chair at the Academy as early as 1891. Born in a Huguenot home at Rochefort, 14th January 1850, he entered the navy at an early age, and was thus enabled to reap in his voyages round the world that harvest of exotic impressions which was yet to give him a literary stock-in-trade of a quite individual character. *Lieutenant-de-vaisseau* by 1881, he was a year in disgrace for a too truthful series of letters in *Figaro* on the conduct of the French soldiers at Hué in 1883. His first work, *Aziyadé* (1879), a series of pictures of life on the Bosporus, was weak and spoiled by affectation; the second, *Le Mariage de Loti* (1880), carried the imagination captive with all the charm of the coral seas. To Tahiti and the story of Rarahu followed Senegal and the story of Fatou-gaze in *Le Roman d'un Spahi* (1881); next with *Mon Frère Yves* (1883) Brittany and the seas of Southern Europe; and again in his masterpiece, *Pêcheur d'Islande* (1886), Brittany and the seas of the frozen North. To the standard of these two the later works have not attained: *Propos d'Exil* (1887); *Madame Chrysanthème* (1887); *Japonneries d'Automne* (1889); *Le Roman d'un Enfant* (1890), *Le Livre de la Pitie et de la Mort* (1891; Eng. trans. by T. P. O'Connor, 1892), *Fantôme d'Orient* (1892), *Le Desert* (1894), *La Galilée* (1895), *Ramuntcho* (1897). *Le Roman d'un Enfant* is a work of wonderful subtlety and charm, which for insight into the secrets of child-nature, for vivid truthful rendering of the impressions and experience of childhood, has no equal in literature. The simplicity yet intensity of his sensuous impressions, the pervading emotional sympathy with all nature, the tenderness and elemental melancholy in the mists of Brittany, suggest, but do not explain, the secret of the charm of Pierre Loti. But for depth of thought, broad views of human life, any real humour, we must look elsewhere.

Viborg, one of the oldest cities in Denmark, and capital of a district of Jutland, stands on a small lake, 28 miles W. of Randers by rail. Its 12th-century cathedral was rebuilt in 1726. Pop. 7653. There is also a Finnish Viborg.

Vibrio, a name given with much laxity to various kinds of more or less screw-shaped Bacteria (q.v.); also to small nematoid worms, such as cause car-cockles in wheat.

Viburnum, a genus of plants of the natural order Caprifoliaceæ, having a five-toothed calyx, a five-lobed, wheel-shaped, bell-shaped, or tubular corolla, five stamens, three sessile stigmas, and a one-seeded berry. The species are shrubs with simple leaves, natives chiefly of the northern parts of the world. *V. opulus* is the Guelder Rose (q.v.), or Snowball Tree, and *V. tinus* is the Laurustinus (q.v.), both well-known ornamental shrubs. *V. lantana*, sometimes called the Wayfaring Tree, is a native of the warmer temperate parts of Europe and Asia, not unfrequent in England, and often planted as an ornamental shrub. It is a large shrub or low tree, with large elliptic serrated leaves, downy, with star-like hairs on the under side. The young shoots are very downy. The flowers are small and white, in large dense cymes; the berries purplish black, mealy, and mucilaginous, with a peculiar sweetish taste. They are useful in diarrhœa and catarrh, and are used in Switzerland in the manufacture of ink. Bird-lime is made from the bark of the roots in the south of Europe, but is inferior to that made from the bark of the holly. The inner bark is very acrid, and was formerly used as a vesicant. The wood is white and hard, and is prized by turners. Tubes for tobacco-pipes are made of the young shoots. Two North American species, *V. edule* and *V. oxycoccus*, nearly allied to the Guelder Rose, produce berries of an agreeable acid taste, which are used like cranberries. The word *viburna*, from which the name is derived, was used by the ancients to denote any plant the branches of which were pliable and suitable for tying; some of the species are adapted by the toughness and pliability of their branches for that purpose.

Vicar (Lat., 'delegate'), in England, a parson of a parish where the tithes are impropriate (see Impropriation). In ecclesiastical usage the title is given to those who hold authority as the delegates or substitutes of others. A *vicar-apostolic* (formerly one to whom the pope delegated some remote portion of his jurisdiction) is now usually a titular bishop appointed to a country where either no sees have been formed or the episcopal succession has been broken. *Vicars-forane* are ecclesiastics to whom a bishop gives a limited jurisdiction in a town or district of his diocese—in effect, rural deans. *Vicars-general* in the Roman Catholic Church perform the work of archdeacons. They must be clerks, not laymen, but need not be in holy orders. *Vicars-choral* are assistants, cleric or lay, of the canons and prebendaries in the public services and music; they form a distinct corporation in English cathedrals of the old foundation, in twelve Irish cathedrals, and in St David's.

Vice-chancellor. See Chancery, Chancellor.

Vice-consul, a subordinate officer, to whom consular functions are delegated in some particular part of a district already under the supervision of a consul. A British vice-consul is selected by the consul under whom he is to act, and his name is transmitted for approval to the Secretary of State for Foreign Affairs. The vice-consul acts under the general supervision of the consul, corresponding with him in ordinary cases, but in some special cases with the Foreign Office. A consul is not at liberty to dismiss a vice-consul acting within his district without the sanction of the Foreign Secretary. See Consul (Mercantile).

Vicente. See Gil Vicente.

Vicenza, capital of an Italian province at the confluence of the rivers Bacchiglione and Retrone, 42 miles W. of Venice by rail. It is surrounded by a moat, and walls half in ruins, and contains many palaces and churches. The Piazza dei Signori, a remarkably fine square, contains a lofty and slender campanile, 270 feet high. Palladio was a native; and Vicenza owes to him many of its finest buildings, as the Palazzo della Ragione, the Olympic Theatre, and the prefect's palace, a rich and fanciful edifice. The Duomo, built in the 13th century, is Gothic; the nave of it is 60 feet wide; and in the chapels are interesting pictures. Manufactures of silk, linen, earthenware, paper, and velvet are carried on. The surrounding country, studded with mansion-houses, and rich in vineyards, is exceedingly beautiful. Pop. 27,694. Vicenza (anc. *Vicentia*, or *Victtia*) continued to be a municipal town of some consideration till it was laid waste by Attila, 452 A.D. It revived again under the Lombards, and became for a time, in the middle ages, an independent republic.—The province, which runs up to the Alpine ridges dividing Italy from the Austrian Trentino in Tyrol, contains on the north the *Sette Comuni*, seven village communes, which, formerly German, for a time formed a kind of republic under Venetian protection. In two of these villages German is still the principal language.

Vice-president. See President.

Viceroy, a title popularly given to any officer who is delegated by a sovereign to exercise regal authority in his name—as the Lord-lieutenant of Ireland, the Governor-general of India, popularly but not officially called viceroys. See also Khedive.

Vich, or Vique, a Spanish city, 40 miles N. of Barcelona by rail, with a modernised cathedral and some manufactures. Pop. 12,600.

Vichy, a small town in the heart of France, dept. Allier, stands on the Allier, in a fine valley surrounded by hills clad with vines and fruit-trees, 30 miles SSE. of Moulins by rail. Vichy is the most frequented bathing resort in France. The springs which rise at the foot of the volcanic mountains of Auvergne (q.v.) are of the alkaline class, somewhat acidulous, and the most efficacious of the kind that are known. They vary in temperature from 54° to 113° F., are used both for drinking and bathing, and are resorted to in cases of indigestion, chronic catarrh, gout, and especially liver disorders (see Mineral Waters). Millions of bottles of Vichy water are exported annually. The virtues of the *aquæ calidæ* of this place were known in Roman times, as is testified by the remains of marble baths and coins that have been dug up; but their modern repute arose only in the 19th century, being greatly promoted by the visits of Napoleon III. Now this town of (1891) 10,525 inhabitants is visited by from 20,000 to 30,000 persons annually. See Cormack, *Mineral Waters of Vichy: Excursions in the Environs* (1887).

Vicious Intromission. See Intromission.

Vicksburg, the largest city of Mississippi, stands on a high, uneven bluff above the Mississippi River, 235 miles by rail NNW. of New Orleans. Cotton is shipped and railroad cars and iron are manufactured. The place was strongly fortified by the Confederates during the civil war, and repulsed several attacks; but after a siege by land and water from May 18, 1864, it was surrendered to Grant on 4th July, with nearly 30,000 men. Pop. (1890) 13,373.

Vico, Giovanni Battista, jurist, philosopher, and critic, was born, the son of a bookseller, at Naples, 23d June 1668, studied law at the university, but devoted himself to literature, history,

and philosophy, and, after serving as tutor to the nephews of the Bishop of Ischia for nine years, became in 1697 the professor of Rhetoric at Naples. To this poorly paid appointment was added in 1735 the post of historiographer to the Bourbon king, Charles III. of Naples. He struggled most of his life with poverty and latterly with ill-health, and died 20th January 1744. His great work is his *Scienza Nuova*, of which the first edition appeared in 1725, but the work was completely recast in the second edition of 1730. A third edition appeared in 1744 after its author's death. The work is a treatise of the history of civilisation and of the evolution of law, and in virtue of it Vico is regarded as the founder of the philosophy of history. Though profoundly influenced by Bacon and Grotius, he differs widely from either of them, deriving law from conscience and conscience from the inspiration of God; God's providence is the basis of history. He also published orations, minor works, and a discourse on universal law. As a critic he anticipated Wolf in holding that Homer was not one but many poets.

There are editions of Vico's works by Ferrari (1835–37) and Pomodoro (1858–69), and a full selection by Michelet (Paris, 1835). See the monograph by Cantoni (Turin, 1867) and that by Professor Flint (1884).

Victor, Claude Perrin, Due de Belluno, and marshal of France, was born at La Marche (Vosges), 7th December 1764, and at seventeen enlisted in a regiment of artillery, and served eight years as a common soldier. He re-enlisted in 1792, and rose rapidly; for his conduct at the siege of Toulon in 1793 he was made general of brigade. He served with distinction in the Italian campaigns, especially covering himself with glory at Montebello and Marengo. Napoleon gave him the marshal's baton on the bloody field of Friedland (1807), and later the title of Duke of Belluno. From 1808 till 1812 he commanded the first corps d'armée in Spain, and lost the battles of Talavera and Barrosa. He commanded the ninth corps d'armée in the fatal Russian campaign, and covered the crossing of the Berezina. He fought at Dresden and Leipzig, lost the emperor's favour by neglecting to occupy the bridge of Montereau-sur-Yonne, and was severely wounded at Craonne. Louis XVIII. gave him the command of the second division, and to his shame the presidency of the military commission appointed to try such of his old companions in arms as had deserted to Napoleon during the 'Hundred Days.' He was minister of War from 1821 to 1823, and died at Paris, March 1, 1841. *Mémoires Inédits* was published in 1846.

Victor Amadeus. See Savoy.

Victor Emmanuel II., the first king of a united Italy, was the son of Charles Albert (q.v.) of Sardinia, and was born March 14, 1820. (For Victor Emmanuel I., king of Sardinia, see Savoy.) He early showed military ardour, and in command of the brigade of Savoy in the campaign of 1848–49 displayed great gallantry at Goito and Novara. On the evening of the latter battle his father, unwilling to bow to the onerous conditions offered by Radetzky, abdicated in favour of Victor Emmanuel, who, being the husband of the Austrian Archduchess Adelaide, and uncommitted to the views of the Italian Ultra-democrats, might hope to obtain more favourable terms from the victor. Victor Emmanuel thus ascended the throne of Sardinia, March 23, 1849. The events of his reign, his policy and that of his ministers, Azeglio, Cavour, and others, issuing in the reconstitution of the kingdom of Italy under the Sardinian dynasty, is already treated at Italy, Vol. VI. pp. 251, 252. The king had the wisdom to leave statecraft mainly in the hands of the able men who advised him, reigned as a strictly constitutional monarch, and retained to the last the simple tastes of a hardy (but not ascetic) mountaineer and huntsman. The 'Re Galantuomo,' as his people fondly called him, died January 9, 1878, and was buried in the Pantheon. He was succeeded by his son Humbert. His daughter Clotilde was, for the sake of the French alliance, but rather against the king's will, married to Prince Napoleon (see Bonaparte).

Victoria, Queen of the United Kingdom of Great Britain and Ireland and Empress of India, only child of Edward, Duke of Kent (fourth son of George III.), was born at Kensington Palace, 24th May 1819. Her mother, Victoria Maria Louisa (1786–1861), was the daughter of Francis, Duke of Saxe-Coburg, and sister of Leopold, king of the Belgians. Her first husband, the Prince of Leiningen, died in 1814; and in 1818 she married the Duke of Kent. The duke died in 1820, leaving his widow in charge of an infant daughter only eight months old, who had been baptised with the names of Alexandrina Victoria. The Duchess of Kent fulfilled the important duties which devolved upon her with more than maternal solicitude, and with admirable care and prudence; and by-and-by the Duchess of Northumberland was associated with her in the education of the young princess. The princess' father having belonged to the Whigs, her political education was naturally derived from the members of that party; and to Viscount Melbourne (q.v.) belongs the credit of having thoroughly instructed her in the principles of the British constitution. She ascended the throne of the United Kingdom on the death of her uncle, William IV. (q.v.), 20th June 1837; her uncle, the Duke of Cumberland, became king of Hanover, in virtue of the law which excluded females from that throne, and so the long connection between the crowns of England and Hanover was terminated. Victoria was proclaimed 21st June 1837, and crowned at Westminster, 28th June 1838. She found on her accession Viscount Melbourne at the head of the government; and on a change of administration (1839) she refused to change, in accordance with precedent, the ladies of the bedchamber, the result being that Peel resigned and Melbourne's administration was prolonged till 1841. The young queen was married at St James's Palace (10th February 1840) to Prince Albert (q.v.), Prince of Saxe-Coburg and Gotha, and second son of the then reigning duke.

The chief events of this long reign, whose jubilee was celebrated in 1887 and 'diamond jubilee' in 1897, may be traced in the articles on England, Great Britain, Ireland, the several colonies, India, and the successive premiers (see below), on the Corn Laws, Post-office, Reform, Jews, Army, Education, Volunteers, Crimean War, Abyssinia, Afghanistan, Zulus, Egypt, Transvaal. In 1876 'Empress of India' was added to the royal titles of the Queen. The death of the Prince-Consort in 1861 led his widow to live mainly in seclusion for several years, but, though she never afterwards took so prominent a part in public life, she never neglected any of her essential duties as queen. Other severe trials were the deaths of the Princess Alice (of Hesse), of the Duke of Albany, of the Duke of Clarence, and of Alfred, Duke of Edinburgh and Prince of Saxe-Coburg-Gotha. She herself died at Osborne House, 22d Jan. 1901, and was buried in Frogmore Mausoleum beside her beloved consort. No former monarch so comprehended the great truth, that the powers of the crown are held in trust for the people, and are the means and not the end of government. This policy entitled her to the glorious distinction of being the most constitutional monarch Britain

has ever seen. Not less important and beneficial the example set by her Majesty and the Prince-Consort in the practice of every domestic virtue. Their stainless lives, their unobtrusive piety, and their careful education of the royal children bore rich fruit in the stability of the throne. The progress made by the nation in the various elements of civilisation and in material prosperity was unparalleled; the empire was vastly extended and consolidated; and perhaps during no reign was there a greater measure of political contentment.

Her Majesty had four sons and five daughters: the Princess Royal, Victoria, born 1840, married 1858 to Frederick-William, afterwards Emperor of Germany (Vol. IV. p. 807); Albert-Edward, Prince of Wales, born in 1841, married in 1863 Alexandra, daughter of the King of Denmark, succeeded as Edward VII. 1901; Alice (q.v.), born in 1843, married in 1862 to the Grand Duke of Hesse, died in 1878; Alfred, born 1844, created Duke of Edinburgh 1866, married in 1874 the Russian Princess Marie, became Duke of Saxe-Coburg-Gotha in 1893, died 1900; Helena, born 1846, married 1866 to Prince Christian of Denmark; Louise, born 1848, married 1871 to the Marquis of Lorne (since 1900 Duke of Argyll); Arthur, born 1850, created Duke of Connaught 1874, married 1879 Princess Louise Marguerite of Prussia; Leopold, born 1853, created Duke of Albany 1881, married Princess Helena of Waldeck 1882, died 1884; Princess Beatrice, born 1857, married 1885 to Prince Henry of Battenberg (1858–96). The premiers of the reign were:

1835. Lord Melbourne.	1868. Mr Disraeli.
1841. Sir Robert Peel.	1868. Mr Gladstone.
1846. Lord John Russell.	1874. Earl of Beaconsfield.
1852. Earl of Derby.	1880. Mr Gladstone.
1852. Earl of Aberdeen.	1885. Marquis of Salisbury.
1855. Lord Palmerston.	1886. Mr Gladstone.
1858. Earl of Derby.	1886. Marquis of Salisbury.
1859. Lord Palmerston.	1892. Mr Gladstone.
1865. Earl Russell.	1894. Earl of Rosebery.
1866. Earl of Derby.	1895. Marquis of Salisbury.

See *Early Days of the Prince-Consort* (1867, by General Grey); *Leaves from the Journal of our Life in the Highlands* (1869, with the assistance of Sir Arthur Helps); *More Leaves* (1884); *The Life of the Prince-Consort* (5 vols. 1873–80, prepared under the Queen's direction by Sir Theodore Martin). Also books cited at ENGLAND, especially M'Carthy's *History of our Own Times* (5 vols. 1879–97), and T. Humphry Ward's *Reign of Victoria* (1887); with Lives of the Queen by Mrs Greenwood (1883), Macaulay (1887), Barnett Smith (1886), R. Wilson (2 vols. 1888), and Jeaffreson (1893); as also that by R. R. Holmes (1897; new ed. 1901).

Victoria, smallest in area of the members of the Australian Commonwealth, yet comes near New South Wales in population and commerce. The SE. coast was sighted by Captain Cook in 1770; the harbour of Port Phillip was discovered in 1801, and an unsuccessful attempt to form a settlement on its shores was made by Lieutenant-colonel Collins in 1804. But it was not till 1835 that the country around the harbour which gave its name to the whole district was colonised by Batman and Fawkner, and the neighbourhood of Portland Bay by Edward and Francis Henty, all of whom had crossed Bass Straits from Tasmania. The natural grasses were found to be unusually well suited for the growth of fine wool; large areas of land were taken up by sheep-farmers from the neighbouring colonies and Great Britain, and the seaport towns of Melbourne, Geelong, and Portland were founded. From 1836 till 1851 Port Phillip was administered by the government of Sydney, but in the latter year the district was constituted into the colony of Victoria, with a separate executive and legislature. Its boundaries, which have not been altered since they were originally determined upon, are, on the N. and NE., the Murray River from the point at which it enters South Australia in 141° E. long. to its source; on the W., the colony of South Australia; on the S., the ocean; and on the E., a line drawn from Cape Howe to the source of the Murray. Victoria occupies the south-east of Australia, and has an extreme length from east to west of 420 miles, while its greatest breadth is only 250, and its least only 150; its coast-line is 600 miles, and its area 87,884 sq. m. or 56,245,760 acres. Gold was discovered in 1851, and attracted a large number of immigrants; the first railway was opened in 1854; responsible government was introduced in 1857; in 1862 additional facilities were given for the acquisition of land for agricultural purposes; and in 1865 a protective policy was initiated with the object of stimulating local manufactures.

The geographical position of Victoria and the mountainous nature of a large portion of its area have made its climate generally cooler than that of any other colony on the mainland, with the exception of the mountains and high tablelands of New South Wales. A chain of varying height, the Dividing Range, traverses the greater portion of the colony from east to west at a distance of from 60 to 80 miles from the coast; the eastern portion, termed locally the Australian Alps, divides the watershed of the Murray from Gippsland, and has many peaks with an elevation of from 6000 to 6500 feet. Farther west the height of this mountain-range is much less—although there are isolated summits, such as Macedon, 3324 feet high. In some places, as in the neighbourhood of Ballarat, it dwindles into elevated plains of little more than 2000 feet above the level of the sea, surmounted by occasional hills 500 or 600 feet higher. Farther west the range is better defined, and is known locally as the Pyrenees and Grampians, the highest peak, Mount William, having an altitude of 3824 feet. A few miles beyond this lofty eminence the mountains cease altogether, and are succeeded by extensive plains; in addition to this main range there are many isolated mountains and hills scattered all over the colony.

Most of the rivers rise in this Dividing Range; those on the north find their way into the Murray, which has a total length, including bends, of 1300 miles, 980 of which form the northern boundary of the colony. The principal streams flowing north (going from east to west) are the Mitta Mitta, 175 miles long; Ovens, 140; Goulburn, 345; Loddon, 225; Avoca, 163; and Wimmera, 228; the last mentioned losing itself in Lake Hindmarsh. The southern streams are the Snowy, 300 miles long (180 of them in New South Wales), which flows into the ocean a few miles west of Cape Howe; the Latrobe, 135, falling into the Gippsland lakes; the Yarra, 150, into Port Phillip; the Hopkins, 155; and the Glenelg, 281, into the Southern Ocean. Many of these rivers are in the summer season mere chains of waterholes, and only the Murray and Yarra are navigable, although others, such as the Goulbourn and the Snowy, might easily be made so. The principal lakes are Victoria (45 sq. m.), King (24), Reeve (6), and Wellington (54), in Gippsland, all navigable and communicating with the ocean, Corangamite (90; salt), in the Western District, and Hindmarsh (47; brackish) and Tyrrell (66; salt), in the Wimmera or North-western District.

The principal ports and harbours are Port Phillip, area 800 sq. m.; Western Port; Portland Bay, near the South Australian border; Port Fairy and Warrnambool, between Portland Bay and Cape Otway; and Port Albert in Gippsland. The principal headlands, going from west to east, are Wilson Promontory, in 39° S., the most southerly headland in Australia; Cape Patterson; Cape Schanck; Cape Otway; Cape Nelson; and Cape Bridgewater. The only islands of any importance are Phillip and French Islands in Western Port.

W & R CHAMBERS LIMITED LONDON & EDINBURGH

The climate in the mountains is generally agreeable, and the rainfall sufficient. Originally the east of the colony, including Gippsland, was covered with forests, composed of lofty trees, some attaining a height of 300 to 400 feet, and many beautiful shrubs, of which the tree-fern was the most noteworthy. The remaining portion of the colony has the usual Australian characteristics, except that the country south of the Dividing Range, and a few miles to its north, suffers less from drought than districts farther removed from the influence of the ocean breezes, such as are to be found in New South Wales and South Australia. The country is covered during the spring and early summer with brilliant verdure, turned as the summer advances into a natural hay, which, however, in ordinary seasons affords excellent food for stock. The greater portion of Victoria was in its natural state an open forest, but in the western district there were large plains, and a portion of the extreme north-west is covered with a dense scrub of dwarf eucalyptus (mallee), which detracts from its value. Of late years it has been discovered that this mallee-covered land when cleared is well adapted for wheat. In the neighbourhood of certain volcanic hills in the western district the soil is generally extremely rich. At Melbourne the mean return for twenty-six years gives a maximum temperature of 105°, a minimum of 30°, a mean of 57° 3′, and an average annual rainfall of 25·26 inches. This latter is rather greater than at London or Paris, while the temperature corresponds with that of Bordeaux, Madrid, and Marseilles. North of the Dividing Range the temperature is rather higher and the rainfall rather less. Gippsland, in the south-east, contains many richly-grassed plains, and the forests when cleared are fitted for root-crops; the valleys of the north-east are fertile, and the hills are frequently full of mineral wealth. The northern and north-western districts contain rich natural pastures, and large areas available for the growth of wheat and vines. The central, southern, and south-western districts are suitable for pasture, root-crops, and grain. Most of the gold-fields are in the central districts. The flora and fauna of Victoria are identical with those of the southern districts of New South Wales, except that in the animal kingdom the platypus and lyre-bird are more plentiful, and that in the vegetable the tree-fern is more frequently met with, while the cabbage-tree palm and the cedar are practically unknown.

Geology.—Victoria seems to be formed of a great mass of Palæozoic rock, through which protrude large areas of granite and trap, and upon which repose, near the coast, belts of Mesozoic and Tertiary strata and volcanic products. The younger members of the Primary or Palæozoic series are by far the most widely distributed, and are in all respects the most prominent and important formations. With their associated granitic and plutonic or igneous and volcanic rocks, they occupy nearly nine-tenths of the surface of the country. Devonian sandstone, slates, and limestones occur in Gippsland; Secondary rocks are found in the Cape Otway district and in the country east of Western Port; the extinct volcanoes in the western and central district are remarkable and apparently recent; several are to be found south-west of the Dividing Range. Many of the plains are formed by overflows of basalt.

Productions.—Gold was first worked at Clunes in 1851, and shortly afterwards at Ballarat, Forest Creek, and Bendigo. Originally the workings, which now cover 1,500,000 acres, were shallow and alluvial, but most of the gold is now obtained from quartz reefs, some of which are followed to great depths, the deepest being 2500 feet. The total yield of gold up to 1898 was 61,850,000 oz., valued at near £250,000,000, half the produce of all Australasia. Copper, silver, tin, coal, and antimony have been found in considerable quantities. Brown coal is abundant, and it is believed that its existence will be made commercially valuable.

Agriculture and Live-stock.—Of the whole area of the colony, 24,000,000 acres belong to private individuals, while of the residue about 16,000,000 are let by the crown for grazing, and 11,500,000 are covered with mallee scrub. Large tracts have been irrigated either by the state or by private individuals. The number of cultivated holdings in 1898 was 35,000, and the extent of land under crop 3,260,000 acres—about half under wheat, the rest under oats, barley, potatoes, hay, and English grasses. The yield of wheat varies from over 10 bushels per acre in good years to 4 in bad years—thus, in 1894 it was 10·4; in 1896, 4·1; in 1898, 6·4. Oats vary according to the year, from an average of 11 bushels to 23. The area under vines increased from 20,000 acres in 1890 to 28,000 in 1898, producing about 2,000,000 gallons of wine, besides brandy and grapes. Hops and tobacco are also cultivated. All the English fruits grow in Victoria, with the addition of those of southern Europe, together with the loquat and the passion fruit; but it is not hot enough for the pine-apple, the banana, or the sugar-cane.

Railways.—These have their centre in Melbourne, and are divided into several systems, all belonging to the state. The total length is over 3000 miles, laid at a cost of £38,500,000. The railways connect the capital with all the principal towns of the interior, and by their junction with those of New South Wales and South Australia bring together Sydney and Adelaide.

Finance, Commerce, &c.—The fiscal policy is protective, and heavy duties are imposed upon almost all imported articles of consumption. Of late years the customs duties amount to 12 per cent. of the total value of the imports. Between 1893 and 1897 the total imports fluctuated from about £12,000,000 per annum to £15,500,000, the total exports increasing from £13,300,000 to £16,750,000. Of the imports, about £6,000,000 came from Great Britain, and rather more from the other Australian colonies; of the exports in 1897, £9,560,000 were to Britain, and only £5,000,000 to the neighbouring colonies. From Germany and from the United States the imports had a value of between £500,000 and £600,000; the exports thither were £480,000 and £185,000 respectively. The principal exports are gold (from £3,300,000 to £6,500,000 annually), wool (from £4,000,000 to £5,000,000), wheat (£90,000 to £700,000), live-stock (£270,000 to £350,000). The imports are, in order of value: wool, cottons, woollens, sugar and molasses, iron and steel, live-stock, and timber. There are about 3000 manufactories, the manufactures being almost wholly for home consumption. The shipping includes 260 sailing-vessels of 40,000 tons, and 150 steamers of 56,000 tons. Of near 2000 vessels of 2,500,000 tons that entered, and a corresponding number that cleared, the vast majority were colonial; only 360, of 850,000 tons, being British.

The revenue from 1894 to 1898 rose from £6,716,000 to £6,886,000; while the expenditure sank from £7,310,000 to £6,701,000. More than half the total revenue is derived from customs and duties; the next items being excise (£300,000) and income-tax (£180,000). The chief outlays are on the payment of the debt and the railways—post and telegraphs, public instruction, and police coming next. The total debt in 1898 was £47,060,000, mainly contracted for railways, water-works, school buildings, and other public works. The colonial defences

include a force of 5000 men, more than half being militia, the rest mainly volunteers, with a nucleus of 400 permanent soldiers. There is a naval force of over 300 officers and men. The colonial flotilla comprises a coast-defence ironclad and some half-dozen first and second class torpedo-boats. The colony contributes to the support of the Australian auxiliary war-ships. The police are under the control of the central government.

Political.—The executive government is in the hands of a governor chosen by the sovereign, who has a salary of £10,000 per annum, assisted by a ministry appointed by the governor, but responsible to the legislature, and only holding office so long as it commands a majority therein. The parliament consists of three estates: the governor; the legislative council of forty-eight members, who must possess, and are elected by persons who enjoy, a property qualification; and a legislative assembly of ninety-five members, who have no qualification, and are elected practically by universal suffrage of all male adult residents of British nationality; but persons possessing freeholds or leaseholds have a vote in each electorate in which they hold property. Members of the legislative assembly receive a salary of £300 per annum. Geographically, the colony is divided into thirty-seven counties, but for purposes of administration it consists of sixty urban municipalities, called cities, towns, or boroughs, and 134 rural municipalities or shires, in all of which every ratepayer has one or more votes according to the amount of rates paid by him. Victoria took active part in promoting the cause of Australian federation. Victoria and New South Wales, the colonies that enormously preponderate in population over the others, differed greatly in commercial policy, and mutual jealousy between them was inevitable. But with the passing of the Federal Enabling Bill through the legislative council of New South Wales in 1899 the principal difficulties were got over in the way of Australian federation under one Governor-general appointed by the Queen, one responsible ministry, a house of representatives proportionate to population, and a senate to which each of the present colonies (future provinces) sends two members

Education and Churches.—Educational establishments are of four kinds: the Melbourne University, with three affiliated colleges in connection with the Anglican, Presbyterian, and Wesleyan Churches, and in 1895–98 there were near 700 students attending lectures, and 120 to 130 graduates annually; technical schools and colleges, including five schools of mines; an agricultural college and working-men's college; and private and primary state schools. Primary education is free, secular, and compulsory, and 95½ per cent. of the children of school age are being educated at some portion of the year. The public library of Melbourne has 500,000 volumes, and there are public libraries or mechanics' institutes in every town. There is no state church, and no state assistance has been given to religion since 1875. Melbourne and Ballarat are the sees of Anglican bishops, and the Roman Catholic Church has an archbishop at Melbourne and bishops at Ballarat, Sandhurst, and Sale. The numbers of members of the principal denominations are, Episcopalians, 417,183; Roman Catholics, 248,591; Presbyterians, 167,027; Methodists, 158,040; Baptists, 27,882; Independents, 22,110.

The charitable institutions include hospitals, benevolent asylums, orphanages, all supported and managed on the voluntary principle, but subsidised by the state. A branch of the Royal Mint was opened in 1872. The savings-bank has 400 branches, with 350,000 depositors, and a balance of upwards of £8,000,000 to their credit.

The commercial depression under which Australia suffered early in the decade brought it about that in 1893–98 there was a decrease in the male inhabitants. The birth-rate has fallen off and the death-rate increased; the excess of births over deaths fell from 20,000 in 1893 to 11,500 in 1898; the amount of the public debt per head increased. The revenue raised by taxation stood in 1897 at the handsome figure of £2, 5s. per head of population. At the census in April 1891 the population was: males, 599,172, and females, 541,233, of whom 7761 males and 376 females, including half-castes, were Chinese, and 731, including half-castes, were aborigines. The most extraordinary feature in the census was the large proportion of the population who lived in the towns. Thus, 684,258 people resided in urban municipalities which had an area of only 632 sq. m., giving 1083 persons to the square mile, and only 456,147 in the rural municipalities, which had an area of 87,252 sq. m., or 5·2 to the square mile. The greater number of these townspeople lived in and around the capital, the population of greater Melbourne being 490,902; while 40,849 resided at Ballarat, 36,020 at Sandhurst, and 22,694 at Geelong, no other town having a population of 10,000.

Victoria. See HONG-KONG; also CAMEROONS.

Victoria, capital of British Columbia, is charmingly situated near the south-east extremity of Vancouver's Island. Esquimalt (q.v.) is 4 miles distant. Victoria possesses, besides the government buildings, a cathedral, public library, hospitals, electric trams and lighting, a fine park on Beacon Hill, and a number of factories. There is a Chinese quarter. Pop. (1881) 5925; (1891) 16,841.

Victoria, (1) a seaport of Brazil, capital of the state of Espirito Santo, on an island in Espirito Santo Bay, which admits ships drawing 14 feet. Pop. 5000.—(2) Capital of Tamaulipas state, in Mexico, prettily situated at the base of the Cordillera. Pop. 8000.—(3) A town of Guzman Blanco state, in Venezuela. Pop. 12,000.

Victoria, a genus of plants of the natural order Nymphæaceæ, resembling the common water-lily, but most nearly allied to the genus Euryale, and distinguished from it particularly by the deciduous tips of the calyx, and the sterility of the innermost stamens. Only one species is yet known, *V. regia.* Seen by Hänke about 1801, by Bonpland, D'Orbigny, and others, it was first described in 1832 by Pöppig, who observed it in the river Amazon; and it was found by Schomburgk and others in many rivers of the north-east of South America. Its leaves are peltate, circular in outline, float upon the water, and attain a diameter of 5 to 6 feet; have the margin turned up all round about 2 inches high; are of a purplish colour on the under side, and there exhibit a sort of wicker-work of very prominent veins, furnished with prickles. The flowers rise amongst the leaves upon prickly stalks. They are more than a foot in diameter, white, internally rose-coloured, and are very fragrant. The fruit is a capsule, almost globose, with a depression on the top about half the size of a man's head, fleshy within, and

divided into numerous cells, full of round farinaceous seeds, which are an agreeable article of food. The plant is therefore called *Maïs del Agua*,

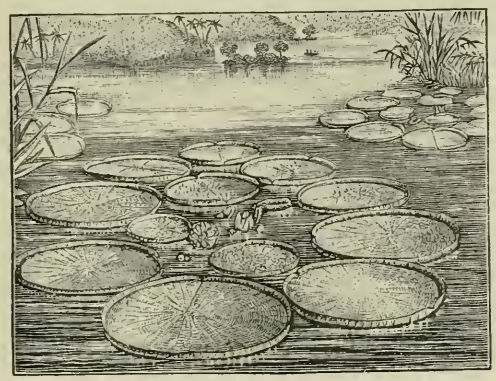

Fig. 1.—Victoria regia.

or Water Maize, in some parts of South America. To the cultivation of this plant special hothouses have been devoted at Kew, Chatsworth, Crystal Palace, and other places in Britain, and elsewhere in Europe, and it was successfully cultivated and flowered in a heated tank in the open air in a nursery at Chelsea in 1851 and a few years subsequently. It has been introduced into India from seeds produced in England.

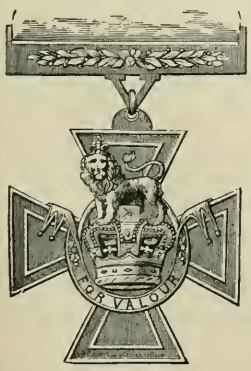
Victoria Bridge. See Bridge, p. 441.

Victoria Cave, 2 miles N. of Settle in Yorkshire, is situated in a cliff 900 feet above the Ribble. It was discovered in 1837; and exploration has revealed in it bones of the elephant, hyæna, rhinoceros, bear, deer, horse, badger, &c., with implements and pottery of Roman-Celtic date.

Victoria Cross, a decoration instituted at the end of the Crimean war in 1856, and conferred on members of the British naval and military services who have performed, in presence of the enemy, some signal act of valour or devotion to their country. Non-military persons who have served as volunteers against an enemy are also eligible. The general distribution of the crosses earned in the Crimean war (to 62 personally) took place in 1857; and the distinction has since been conferred from time to time. The Victoria Cross is in the form of a Maltese cross, and is made of bronze. In the centre is the royal crown, surmounted by the lion, and below, on a scroll, the words 'For Valour.' The ribbon is blue for the navy, and red for the army. On the clasp are two branches of laurel, and from it the cross hangs, supported by the initial 'V.' An additional act of exceptional bravery may be marked by a bar on the ribbon. The decoration is accompanied, in the case of non-commissioned officers and men, by a pension of £10 a year, and £5 is added for each bar. See works by R. W. O'Byrne (1880), W. Richards (1891), and M. Gerard (1891).



Victoria Cross.

Victoria Falls. See Zambesi.

Victoria Nyanza, a great fresh-water lake in East Central Africa, situated on the equator, and on the meridian of 33° E., has an area of over 30,000 sq. m., or about the size of Ireland. It lies about 3880 feet above sea-level. The geological evidence points to the origin of its basin having taken place at a very remote period, a number of terrace-like faults along the western shores suggesting a series of immense landslips as a probable cause of the formation of the hollow which now contains the lake. The traces of volcanic action do not seem sufficient to account for so large a depression. The prevailing rocks are gneiss and schists, with porphyritic granite at the south extremity, and some lava and ironstone towards the north. The igneous area is, upon the whole, barren and desolate looking, the remainder of the basin being clothed with luxurious tropical flora, exceedingly varied in character. This variety is, perhaps, most strikingly exhibited on some of the islands. The fauna is also varied, the number of alligators frequenting the waters being very large. Hippopotami, although less frequently met with, are exceedingly fierce, and are held in great dread by the native boatmen. The water is good and fresh, although somewhat insipid to the taste, and frequently assumes a dirty white colour. The lake is drained by the Nile, and its chief feeders are the Kajera, the Nzoia, the Shimiyu, and the Katonga. As these are all comparatively insignificant streams, and the evaporation from such a large body of water in an equatorial climate must be very great, it is supposed that the lake draws the larger part of its supply from springs in its bed. Tides have lately been noticed along the shores, the rise lasting from about half an hour to an hour in time; from such observations as have been made, the winds do not appear to exercise much influence upon this curious phenomenon. The natives assert that a periodical rise and fall in the level of the lake takes place at intervals of about twenty-five years, and the water-markings along the coast, noted by recent travellers, are believed to lend an appearance of truth to the statement. Cyclonic storms, accompanied by thunder and lightning, are common, and occur most frequently in the month of August. Fishing is mostly carried on by the use of the rod and line, except in Lower Kavirondo and among the Ba-Sesse people, where grass mats and basket traps are used as nets. The lake, whose native name is Ukerewe, was discovered by Speke in 1858, visited by him and Grant in 1861–62, and subsequently partly explored by Stanley (1875), Mackay, Thomson, and others.

Victoria University. See Owens College.

Victualling. All officers and men in the British navy are borne, when on full pay, on the books of one of H.M. ships, whatever the duties may be on which they are engaged, and are entitled to rations, or compensation in money if their rations are not issued. Every person actually serving on board a ship has his rations issued, and is then said to be 'victualled' on board. Should any officer or man be only borne on the books for pay, and be employed on other service away from the ship, he is not 'victualled,' but receives compensation

in lieu. All officers and men are entitled to the same rations, and to the same compensation in lieu; they are allowed to leave behind (i.e. not draw) a certain proportion of their rations, receiving a money allowance instead, except in the case of fresh meat and bread, which must always be taken up. The paymaster has charge of the victualling stores, and is responsible for the account. Under that head are included not only the provisions, but all the clothing, and the soap and tobacco. The victualling department is under the administration of an official at the Admiralty styled the Director of Victualling. There are three large victualling yards in England, the Clarence yard at Portsmouth, the Royal William at Devonport, and the Royal Victoria at Deptford, the last the largest and most important. From Deptford all the depôts abroad are replenished, while most of the biscuit and chocolate is made there, and beef salted. Deptford was first established as a dockyard and depôt for stores in 1573. The space occupied by the victualling-yard is about 19 acres, with a river frontage of 1700 feet, and mean depth of 1000 feet. The number of men employed varies, but during war upwards of a thousand would be required. Till 1869 the victualling-yards were under the charge of a captain-superintendent, but since then all these establishments have been placed under the civil administration of the Admiralty. The Clarence and Royal William yards are both supplied from Deptford, and re-issue to ships as required. There is also a large victualling establishment at Malta for the service of the Mediterranean squadron, and smaller depôts on other foreign stations. Fresh beef, bread, and vegetables are always obtained at other ports both at home and abroad from local contractors. The victualling of men in merchant-ships is now regulated by the Merchant Shipping Acts, and can be made the subject of inquiry either by magistrates or Board of Trade officials at home, or by the consular authorities abroad, in the event of any of the crew being discontented and lodging a formal complaint.

Victualling-bill, a customs document warranting the captain of an outward-bound vessel to ship such bonded stores as are needed for the voyage.

Vicuña (*Auchenia vicugna*), a species or variety of the South American genus Auchenia (allied to the camels), which also includes the llama, alpaca,

Vicuña (*Auchenia vicugna*).

and the guanaco. Unlike the first two, but like the last, the vicuña lives wild. It is somewhat smaller than a European red deer; its wool is light brown with some white beneath. It frequents the most desolate parts of the Cordillera, at great elevations, and delights in a kind of grass, the Ychu (*Stipa Ychu*), which abounds there in moist places. The small herds commonly include from six to fifteen females with one male. When the females are quietly grazing, the male stands apart, and carefully keeps guard, giving notice of danger by a kind of whistling sound, and a quick movement of foot. When the herd takes to flight, the male is said to cover their retreat, often pausing to observe the motions of the enemy. The vicuña is a very active animal, like the chamois or the antelope. The Indians seldom kill it with firearms, but set up a circle of stakes, about a mile in circumference, into which the vicuñas are driven. The soft wool is much valued for weaving.

Vida, Marco Girolamo, a 16th-century Latinist, was born at Cremona between 1480 and 1490, studied theology, was favoured by Leo X., who gave him a priory, and by Clement VII. was made Bishop of Alba, where he died 27th September 1566. He was at the Council of Trent, and was a friend of Cardinal Pole. Vida wrote Latin orations and dialogues, but is known mainly as a poet, remarkable for the grace of his Latin style rather than for his force of thought; his chief poems being *Christias* (1535) and *De Arte Poetica* (1527), others being on the silkworm and on the game of chess. There is a monograph by Lancetti (1840); and see Symonds, *The Renaissance in Italy.*

Vidocq, Eugène François, 'the detective,' was born a baker's son at Arras on 23d July 1775, and as a boy persistently robbed the till of his father's shop. He was sent to the house of correction, but signalised his release by decamping with £80. Of this a sharper relieved him at Ostend; and to keep himself in life he engaged himself to sweep the cages of a travelling menagerie. From this post he was advanced to that of tumbler and acrobat; and a further promotion was intended him to a supposed savage, eating raw flesh and drinking blood. As he chose to decline the appointment, his services were dispensed with, and he returned home. Entering the army, he attained the rank of corporal, and served with some credit in Belgium and elsewhere, till a wound disabled him. For some years he seems to have lived as a scoundrel at large, occupying himself in swindling and disreputable love-affairs. In 1796 he turned up in Paris, and being detected in forgery was sentenced to eight years as a galley-slave. Before his term of durance had expired he found means to escape, and became one of a band of highwaymen. They, on discovering that he was an escaped galley-slave, declined, it is said, any further acquaintance, whilst exacting from him a solemn oath not to betray them. Vidocq took the oath, and instantly delivered the whole gang into the hands of the authorities. Then repairing to Paris about 1808, he offered his services to the authorities there as a spy on the criminal classes. His advances were at first coolly received, but gradually he made his way; and in 1812 a 'Brigade de Sureté' was organised, with Vidocq as chief. Consisting at first of only four men, by degrees it was enlarged to twenty-eight; and its efficiency was something marvellous. Suspicions, however, grew rife that Vidocq was himself the originator of many of the burglaries he showed himself so clever in hunting out, and in 1825 he was superseded. He then started a paper-mill, and in 1832 a private detective office, which soon, however, was closed by the authorities. He died in Paris, May 1857. His *Mémoires* (1828), even if really by himself, are certainly untrustworthy.

Vienna (Ger. *Wien*), the capital and largest town of the Austrian empire, is situated in Lower Austria, on the Danube Canal (*Donau Kanal*), a south branch of the Danube. The small river

Wien flows through part of the town to join the canal. Vienna proper (pop. in 1880, 726,000; in 1890, 831,472) consists of the Inner City (*Innere Stadt*) and eight districts or sections completely surrounding it—viz. Leopoldstadt, Landstrasse, Wieden, Margarethen, Mariahilf, Neubau, Alsergrund, and Favoriten. These, with the exception of the last, an artisans' quarter, are enclosed by fortifications known as the Lines (*Linie*), though that name is now usually confined to the fifteen gates of the fortifications. Immediately beyond the Lines are nine populous suburbs included (since 1890) within the Vienna police-district, which has a total area of 51 sq. m., and pop. (1890) of 1,364,548. The irregular hexagon formed by the Inner City was until 1858 enclosed by an inner line of fortifications, the site of which is now occupied by the Ringstrasse, a series of handsome boulevards, 55 yards wide, which bound five of its sides. The sixth side is bounded by the Franz-Josefs Quay, on the Danube Canal. Though Vienna contains buildings of the 14th and even of the 13th century, it is, in its present form, essentially a modern city; nearly all the most conspicuous and pretentious public buildings date from the later half of the 19th century. Modernity too is characteristic of the Viennese; they are sprightly, good-tempered, and pleasure-loving, fond of music, dancing, and the theatre. The Inner City and the Ringstrasse are the handsomest and most fashionable quarters. In the former are the cathedral of St Stephen (1300–1510), with a tower 450 feet in height; the Hofburg or imperial palace, a large and irregular pile of very various dates; and many palaces of the nobility. On one side or other of the Ringstrasse rise the Exchange; the University (1874–84); the huge Gothic New Rathhaus (1873–83), built at a cost of over three-quarters of a million sterling; the Parliament House; the Supreme Law Courts; the Imperial Museums of Natural History and of Art (1872–86), twin buildings on either side of the imposing monument of the Empress Maria Theresa (unveiled 1888); the imperial Opera-house; the Academy of Art; the Austrian Museum of Art and Industry, &c. In other parts of the city are the Arsenal; the Josephinum, a medical college founded in 1784; the Votive Church, an admirable specimen of modern Gothic, built in 1856–79 to commemorate the emperor's escape from assassination in 1853; and many other handsome sacred and secular edifices. Vienna is well provided with public parks, the largest being the Prater (7 sq. m.), one of the finest parks in Europe, opened in 1766. In educational, scientific, artistic, and benevolent institutions the city is very rich. The university, founded in 1365 and renowned throughout the world as a medical school, has a teaching-staff of 350 and over 6000 students. The magnificent public picture-gallery, formerly in the château of Belvedere, now in the Museum of Art, is specially famous for its unrivalled examples of the Venetian school, Rubens, and Dürer. There are also several noted private galleries. The Public Hospital, with 2000 beds, is perhaps the largest hospital in Europe.

Vienna is the chief industrial city in the empire, the factories being mostly in the districts of Neubau and Mariahilf and outside the Lines. Machinery, scientific and musical instruments, artistic goods in bronze, leather, terra-cotta, porcelain, &c., bent wood furniture, meerschaum-pipes, &c. are among the noted manufactures of Vienna. As a centre of trade and finance Vienna is no less important. Grain, flour, cattle, seeds, wines, and manufactured goods of all kinds are annually handled here to an immense aggregate value. Over 2½ million pounds were spent in 1868–81 in regulating the channel of the Danube so as to render the river navigable at all times, and a new mercantile quarter is gradually springing up between the canal and the main stream. The chief local authority is the Gemeinderath, or city council (consisting of a burgomaster, two vice-burgomasters, and 120 councillors), which is assisted by local committees or councils in the various districts.

Vienna occupies the site of the Roman *Vindobona*, which was established in 14 A.D. as the successor of the Celtic settlement of *Vindomina*. The beginning of its present importance, however, dates only from the period of the Crusades, which directed a steady stream of traffic through it. In 1276 it became the capital of the Hapsburg dynasty. The famous siege of Vienna by the Turks lasted from July 14 to September 12, 1683, when it was relieved by John Sobieski of Poland.

Treaties have been concluded at Vienna in 1738, between the Emperor Charles VI. and the Infanta of Spain as to the kingdom of the Two Sicilies; in 1809, between Napoleon and the Austrians, after the defeat of the latter at Wagram; in 1864, settling affairs after the war of Prussia and Austria against Denmark; and in 1866, between Francis Joseph of Austria and Victor Emmanuel of Italy, ceding Venetia to Italy. The great Congress of Vienna (20th September 1814 to 10th June 1815) met to regulate the affairs of Europe after the overthrow of the Napoleonic empire, and restore the 'balance of power.' Alexander I. and Nesselrode were there in the interests of Russia; the king of Prussia was supported by Hardenberg; Castlereagh, and afterwards Wellington, represented Britain; Metternich was Austrian plenipotentiary; Talleyrand secured a hearing for France; Spain, Portugal, Sweden, Denmark, Rome, and the minor German states were also represented. The chief final outcome was that Austria obtained Lombardy, Venetia, Illyria, Dalmatia, Tyrol, Vorarlberg, Salzburg, and East Galicia; Prussia the province of Saxony, Posen, Swedish Pomerania, Westphalia, and the Rhenish Province; Hanover, extended in area and made a kingdom, fell to the Hanoverian dynasty in Britain; Britain secured Malta, Heligoland, Cape Colony, and Mauritius, and the protectorate of the Ionian Islands; Belgium and Holland were united as the Kingdom of the Netherlands; Norway was confirmed to Sweden; the Duchy of Warsaw (Poland) was made over to Russia, and the republic of Cracow was constituted; the neutrality of Switzerland was guaranteed, and Neuchâtel (under Prussian sovereignty) added to the confederation; the German confederation was constituted with numerous internal rearrangements; and the former ruling houses were reinstated in Naples, Sardinia (to which Genoa was annexed), Tuscany, and Modena, Parma being given to the ex-empress Maria Louisa; the papal see recovered nearly all its possessions; and France was restricted to very nearly the territory it possessed before the Revolution. The signing of the treaty (9th June) was hastened by the news of Napoleon's return from Elba. The Jews have been predominant in medicine and law professions, banking, the press, and many manufactures; and here also Anti-Semitism is very rampant.

See works by Weiss (1886), Waagen (1867), Lützow (1878), Forster, Seis, Bermann, Maurer, Winkler, &c.; histories by Hormayr (1824), Weiss (1882), and Bermann (1880); on the congress there are, besides the Acts (9 vols.), works by Flassan (Par. 1829) and Angeberg (Par. 1864).

Vienne, a dept. in the west of France, constituted mainly of the old province of Poitou, lies between Indre and Deux-Sèvres; area, 2691 sq. m.; pop. (1881) 340,295; (1891) 344,355. The Vienne, an affluent of the Loire, is the principal river, and has the Creuse as its chief tributary. The surface is mostly flat, with a gradual slope

toward the north. The country consists almost wholly of fertile plains, fine pasture-lands, and extensive forests. The mineral riches comprise iron, manganese, and quarries of stone, including lithographic stones. The dept. is divided into the five arrondissements of Poitiers, Châtellerault, Civray, Loudun, Montmorillon. Poitiers is capital.

Vienne, one of the most ancient towns of France, in the dept. of Isère (far away from the dept. of Vienne), on the left bank of the Rhone, 19 miles S. of Lyons by rail. The river Gère passes through the town, and here joins the Rhone, after having supplied motive-power to a number of mills and factories. Vienne was the chief town of the Allobroges, is mentioned by Cæsar, and by Martial, who terms it *opulenta Vienna;* in the time of the Roman emperors it was the rival of Lyons. Besides numerous water-conduits, &c. of Roman construction, there are a Corinthian temple of Augustus and Livia, remains of a theatre, and an obelisk, called L'Aiguille, 72 feet high; and the museum contains many relics of Roman antiquity. The cathedral of St Maurice, partly Romanesque, partly Gothic, was built in 1107–1251; St Peter's dates from the 6th century. The town was prominent under the Burgundian princes, and its archbishop disputed with his neighbour of Lyons the primacy of Gaul. In 1312 a council was held here, in which Pope Clement V. pronounced the suppression of the order of the Templars. There are manufactures of woollens, silk, paper, leather, and iron goods, and trade in grain and wine. Pop. (1872) 21,430; (1891) 22,814.

Vienne, Haute, an interior dept. of France, south-east of Vienne, bounded on the W. by the depts. of Vienne, Charente, and Dordogne. Area, 2130 sq. m.; pop. (1872) 322,447; (1891) 363,182. It is watered by the Vienne and its tributaries. The surface is for the most part level, though not fertile, but is traversed by ranges of low hills, including the Monts du Limousin. There is much cattle-breeding. Kaolin is the chief mineral produce, and much porcelain is made. The dept. is divided into four arrondissements—Limoges, Bellac, Rochechouart, and Saint-Yrieix; capital, Limoges.

Viersen, a town of Rhenish Prussia, 20 miles NW. of Düsseldorf by rail, with manufactures of plush, silk, cotton, and flax. Pop. (1890) 22,143.

Vierzon Ville, a French town in the dept. of Cher, 20 miles NW. of Bourges by rail, with manufactures of porcelain, glass, &c. Pop. 10,559.

Vieta, Franciscus (*François Viète*), a great French mathematician, was born at Fontenay-le-Comte, near La Rochelle, in 1540. He studied law at Poitiers, practised there as an advocate, was councillor of the *Parlement* of Brittany, under Henry IV., of that at Tours, next a privy-councillor to the king, and died at Paris in February 1603. We are told that he discovered the key to a Spanish cipher of over 500 characters. Schooten collected most of his writings (Leyden, 1646).

Vieuxtemps, Henri, violinist and composer, was born 20th February 1820 at Verviers in Belgium, began to give concerts in his thirteenth year, and after completing his studies at Vienna and Paris spent most of his time in travelling from place to place as a performer till in 1870 he became a teacher in the Brussels conservatoire. He retired in 1873, and died 6th June 1881. His works comprise concertos, fantasias, and dances for the violin. See Kufferath, *Henri Vieuxtemps* (Brussels, 1883).

Vigan, Le, a town of France, dept. Gard, 45 miles WNW. of Nimes by rail. Pop. 4350.

Vigevano, a town of Northern Italy, 20 miles NW. of Pavia by rail, with an old cathedral, silk manufactures, and some trade. Pop. 13,684.

Vigfusson, Gudbrand, Scandinavian scholar, was born in the district of Broadforth, Iceland, 13th March 1827, and studied at Copenhagen, where he lived from 1849 till 1864. In 1856 he was appointed one of the stipendiaries of the Arna Magnaean Commission. His master in the chosen work of his life was John Sigurdsson, to whom he dedieated his edition of *Eyrbyggja Saga* (Leip. 1864). Earlier and later works were his *Timatal* (1855), an essay in Icelandic on the chronology of the sagas; *Biskupa Sögur* (1858–78); the *Forn-Sögur* (with Th. Möbius, 1860); the *Flatejarbók* (with Unger, Christ. 1860-68); the *Icelandic Dictionary* (1873), undertaken by Cleasby, and carried on from 1864 by Vigfusson; the *Sturlunga Saga* (2 vols. Oxford, 1878); and the magnifieent *Corpus poeticum boreale* (with F. York Powell, 2 vols. Oxford, 1883). In 1864 he had settled in London, whence he moved to Oxford, where he was appointed in 1884 lector in Icelandic, and died January 31, 1889. He had received the doctorate from Upsala in 1877, the order of the Dannebrog in 1885.

Vigil, originally the wateh kept, with public prayer, on the night before a feast, is traceable in the very earliest centuries, and is one of the usages against which Vigilantius inveighs, and which Jerome vindieates in his reply, though he admits the abuses that often accompanied it, and which ultimately brought about its suppression. The old observance survives in the Roman Churcli now only in the Matins and Lauds and the midnight mass before Christmas, and the term is applied to the day and night preceding a feast, on certain of which fasting is obligatory (in England, on the vigils of Whitsunday, the Assumption, SS. Peter and Paul, All Saints, and Christmas). Vigils are marked in the Book of Common Prayer; no speeial services are appointed for them, but the collect of the next day is used at evensong. The 'watch-night' service at New Year (q.v.) is analogous.

Vigilance Societies, in the United States, include not only Regulators and other extreme exponents of Lynch Law (q.v.), but also the illegal associations which spring up from time to time in all parts of the country for the compulsory improvement of local morals, and the punishment of those who either refuse or fail sufficiently to reform their lives. Such organisations as the White Caps, at home in the eastern and central states, have for their professed objects the suppression of vice and idleness; they send formal warnings to those citizens whom they consider to be neglectful of their homes, too partial to card-playing, drinking, &c.; and if this warning be disregarded, inflict such punishment as whipping, destruction of property, &c. The methods of the modern White Caps are the same as those of the Ku-Klux Klan (q.v.).

Vigilantius, an opponent of monachism and of the worship of martyrs and relics, was born at Calagurris in western Gaul in the later half of the 4th century. Ordained a presbyter at Barcelona in 395, he journeyed to Jerusalem carrying a reeommendation from Paulinus of Nola to Jerome, whose whole theological system was as completely repellant to him as his vehement and intolerant temper. From Jerome's *Contra Vigilantium* we gather that he denounced the worship of martyrs and relics as a relapse to paganism, vows of celibacy and poverty as unnatural and ereating a fictitious scale of morality. See Lindner, *De Joviano et Vigilantio* (Leip. 1840).

Vignette, properly an ornament like vine-twigs and leaves with grapes; but the name is now given to any small engraving (as on the title-page of a book), design, or photograph which is not circumscribed by a definite border.

Vigny, Alfred Victor, Comte de, French author, born of ancient family during his parents' imprisonment in the prison at Loches (Indre-et-Loire), 27th March 1797, entered the army at the Restoration, and served fourteen years. Garrison life wearied a soul athirst for glory, but his pride found a solitary consolation in verse. As early as 1822 he published anonymously a small volume of verse, followed in 1824 by *Eloa, ou la Sœur d'un Ange*, an exquisite piece of mystic phantasy. Before the Revolution of July he had published his collected *Poèmes antiques et modernes* (1826), containing *Moïse* and *Dolorida; Cinq Mars* (1826), a historical romance; a translation of *Othello* (1829); and a drama, *La Maréchale d'Ancre* (1830). After that year he published only works in prose: *Stello* (1832), *Grandeur et Servitude Militaires* (1835), and a drama, *Chatterton* (1835)—the highest moment of his fame. From that time he ceased not to write but to print. He left a volume of verse—*Destinées*—published in 1864, which contains some of his finest and most virile work, and a collection of personal notes, printed with doubtful wisdom by Louis Ratisbonne under the title *Journal d'un Poète* (1867). While still young he attached himself to the Romanticists, with Hugo, Deschamps, Mme. Desbordes-Valmore, and Mdlle. Delphine Gay. But he was never a militant or thorough-going member of the party—'he retired,' says Sainte-Beuve, 'to his ivory tower before the heat of the day.' His *Cinq Mars* was a romance based on the most tragic of the crimes of Richelieu, inspired by Scott, but intended to be minutely true to history throughout. The author's connection with the theatre led to an equivocal friendship with Mme. Dorval, commencing about the close of 1830, but the woman's heart soon found poetry a poor substitute for passion, and the tragedy left the poor idealist stripped of his last illusion. In 1845 Vigny was gratified by election to the Academy, on which occasion he made a long and wearisome address, which was listened to with unconcealed impatience. Thereafter till the close he lived but little in the world, in familiarity with no one, not even himself, his thoughts wrapped up in a pessimistic gloom from which he found escape only by the avenues of art. His was that profoundest kind of moral misery which needs no external reason for its being, incurable because itself its own poison. He died at Paris after the long agony of cancer, 17th September 1863. Vigny's work was elegant but cold. No poet has had grander conceptions than the few fundamental ideas that inform his work, and it is not so much inspiration as meditation that gives the key-note to all his poetry. 'It is formed,' says M. Montégut, 'not as beautiful living things are born, by fervent generation, but in the way those lovely, precious, and cold things are produced—pearls, coral, the diamonds, to which they have a close affinity—by agglutination, slow cohesion, invisible condensation.' His fundamental defect as a poet has been well stated by M. Faguet to be not by any means want of imagination, but rather a certain richness and suppleness of imagination, the result of which is not only that one of the most vigorous thinkers amongst poets has produced so little, but also that his most perfect work is ever marred by incompleteness and inequality. Vigny the artist is inferior to Vigny the poet; his poetic execution to his creation of poetic ideas. Quite unlike Hugo, whose magnificent execution casts a splendid veil over a certain fundamental poverty of ideas. But if a poet's domain be small, it is something if it be all his own, and Alfred de Vigny the poet was at least original. Perhaps, when all is said, Montégut is right in putting the three novels which compose *Servitude et Grandeur Militaires* as his finest work. 'The form of this book is noble as its thought, and simple as the souls whose silent sacrifice and obscure heroism it relates. . . . The day on which he wrote it he took counsel only with his own inborn nobility of nature, and gave their *congé* to all his feelings of bitterness and melancholy, as if to a troop of importunate and troublesome guests who hindered him from discovering his true self. Is it not piquant to see given by the mouth of a misanthrope himself, to the pessimistic doctrines of the misanthropes on human nature, the most eloquent denial they have received in our time?' An exquisite if uncertain artist, Vigny remained true to his fundamental definition, 'L'art est la vérité choisie.' To him genius was a sublime and fatal gift, which imprisoned him in grandeur, solitude, and sadness; the whole universe an arena of infamy and wrong; the stern decrees of fate to be endured with stoicism if possible; their individual victims to be regarded with a pity, profound indeed, although half begotten of contempt. Vigny married an Englishwoman (Lydia Bunbury) in 1828, and the influence of English taste is as marked in his work as in that of his contemporary, Alfred de Musset; indeed Gautier, in speaking of what he calls 'the intellectual fatherland' of his contemporaries, expressly says 'Musset and Vigny are English.'

See the monographs by Maurice Paléologue, in 'Les Grands Ecrivains Français' (1891), and M. Dorison (1892); and the earlier studies by Sainte-Beuve, *Portraits Contemporains* (vol. ii.), *Portraits Littéraires* (vol. iii.), and *Nouveaux Lundis* (vol. vi.); and Caro, *Poètes et Romanciers;* but especially Émile Montégut, *Nos Morts Contemporains* (série i.), and Émile Faguet, *Dix-Neuvième Siècle: Etudes Littéraires.*

Vigo, a seaport on the north-west coast of Spain, on a deep bay or inlet, 20 miles SW. of Pontevedra by rail. Its beautiful situation and fine climate make it an admirable health-resort. Pop. (1887) 15,044. The Bay of Vigo has an inland sweep of 20 miles, and is 5 miles wide at its mouth. Vigo was taken by Drake in 1585 and 1589, and by Lord Cobham in 1719; and in 1702 the Spanish galleons, defended by a French fleet, were captured or destroyed by a British and Dutch force under Lord Ormonde and Rooke. See Cassiterides.

Vihara. See India (Architecture), p. 108.

Vijayanagar, a ruined city 8 miles in circuit, in Madras province, about 40 miles to the NW. of Bellary, in a plain encumbered with granite rocks, many of which have been rudely sculptured into a variety of forms. After having been for two centuries the metropolis of a powerful Hindu kingdom, Vijayanagar was sacked and ruined by the Mohammedans of the Deccan in 1565. At that date it is described as 24 miles round. The ruins of the ancient city, the building of which was begun in 1336, now cover 9 sq. m. The modern village on its site is called Hampi; pop. 700.

Viking (Dan.; Icel. *vikingr;* A.S. *wicing*), a name given to the piratical Northmen who infested the coasts of the British Islands and of France in the 8th, 9th, and 10th centuries. This word is quite unconnected with 'king,' being derived from the Scandinavian *vik*, 'a bay' (the same which appears in the names Lerwick, Berwick, &c.), and this class of marauders were so called because their ships put off from the bays and fiords. See Northmen.

Vikramaditya. See India, Vol. VI. p. 117.

Vilâyet. See Turkey, p. 330.

Vilkomir, a town of West Russia, in Kovno, 130 miles SE. of Riga; pop. 16,244.

Villafranca, a town of Italy, 9 miles SW. of Verona by rail, where in 1859 peace was concluded between Austria and France; pop. 3986.

Village Communities, the means by which many scholars contend that great part of Europe must have been brought into cultivation. A clan of settlers took a tract of land, built their huts thereon, and laid out common fields, which they cultivated in common as one family. The land was divided out every few years into family lots, but the whole continued to be cultivated by the community subject to the established customs as interpreted in the village-council by the sense of the village-elders. This may still be seen in the villages of Russia, and even in some parts of England may still be traced the ancient boundaries of the great common field, divided lengthwise into three strips (one fallow, the two others in different kinds of crop), and again crosswise into lots held by the villagers. This theory, often called the Mark system, was started by Von Maurer in Germany, but mainly owes its currency to Sir Henry Maine, who in his work entitled *Village Communities in the East and West* (1871) pointed out close parallels in the archaic land communities in India. The first serious attack upon the theory was made by Mr F. Seebohm, in his work *The English Village Community Examined* (1883; 4th ed. 1890), which labours to prove that the ancient village community was not originally free, but traces back to the Roman manorial system of a community in serfdom under a manor with its lord. Fustel de Coulanges dealt Von Maurer's theory a still more deadly blow by turning against him the evidence of the Leges Barbarorum and early chartularies on which his argument mainly relied. He proves also that the Russian *mir* does not represent agrarian communism, the soil belonging not to it but to some one else, and the peasants merely paying rent collectively as well as cultivating the land collectively. The primitive *Mark*, the association of the Mark (*Markgenossenschaft*), the original common-land (*Gemeinland* or *Allmende*)—all the evidence for these he weighs and finds wanting, contending that the whole imposing structure of argument has been erected out of a series of misunderstandings, national communism having been confused with the common ownership of the family, tenure in common with ownership in common, agrarian communism with village commons.

Mr Gomme considers Lauder and Kells as surviving types of the tribal community in its most primitive form; besides the example of Hitchin, from which Mr Seebohm started working back, he examines the cases of Aston village, in the parish of Bampton, Oxfordshire, Chippenham in Wiltshire, Malmesbury, and others, his conclusion being that the village community is no modern institution, but one beginning far back in the history of human civilisation, and probably a phase through which all peoples have passed. In the hill cultivation and settlement, of which many traces remain, he sees evidence of pre-Aryan influence analogous to similar customs surviving in India. The community in its tribal form was the prominent feature, the village of serfs the subordinate: groups of kindred occupying their several homesteads and the lands around; small villages of serfs occupying cottage homes massed together, and using the lands around them in intermixed or run-rig occupation. Thus Mr Seebohm's formula, defining the English institution as a manor with a village community in serfdom under it, he would rewrite as a tribal community with a village in serfdom under it.

See also Von Maurer, *Geschichte der Markverfassung* (1856); E. Nassé, *Agricultural Community of the Middle Ages* (1871); Laveleye, *Primitive Property* (trans. 1878); G. L. Gomme, *The Village Community* (1890); Fustel de Coulanges, *The Origin of Property in Land* (trans. 1891); Vinogradoff's essay (1895); Baden-Powell's *The Village Community of India* (1897); and F. W. Maitland's work on the origin of English Law (1895–97); also FEUDALISM, GAU, LAND LAWS, RUSSIA (Vol. IX. p. 37).

Villa'ni, GIOVANNI (?1275–1348), a Florentine chronicler often cited.

Villareal, a Spanish town of 12,887 inhabitants, 40 miles NE. of Valencia by rail.

Villari, PASQUALE, historian, was born at Naples in 1827, took part in the revolution of 1848, became professor of History at Florence in 1866, has repeatedly sat in the Italian parliament, and in 1891 became minister of Public Instruction. He has written on Dante, essays, &c.; his best-known works are the lives of Savonarola (2 vols. 1859; 2d ed. 1887) and of Machiavelli (3 vols. 1877–82), and *The First Two Centuries of Florentine History* (1894–96), translated by his wife, Linda Villari (*née* White), an English lady who has written a series of novels, tales, and sketches (*Camilla's Girlhood, A Double Bond, In Change Unchanged, On Tuscan Hills and Venetian Waters*, &c.).

Villars, CHARLES LOUIS HECTOR, DUC DE, marshal of France, one of the most illustrious of the great captains of Louis XIV.'s time, was born at Moulins, 8th May 1653. He distinguished himself in the wars of the Low Countries, on the Rhine, and in Hungary, fighting against the Turks. From 1699 till 1701 he represented France at Vienna, and by his sleepless vigilance foiled the tortuous policy of the Austrian ministers. On his return he was employed in Italy under Villeroi, and was for the first time (1702) raised to independent command, when he was sent to succour the Elector of Bavaria. Towards the close of 1702 Villars crossed the Rhine, defeated the Markgraf of Baden at Friedlingen, and next year again crossed the Rhine, traversed the Black Forest, and joined the Elector. His bold scheme for advancing upon Vienna was defeated by what he regarded as the stupid obstinacy of his colleague, the Elector; and after his skill and genius had been taxed to the utmost to keep the Austrians at bay, and he had been relieved, he returned in disgust to France. He was next commissioned to put down the insurrection of the Camisards (q.v.). Villars was then sent to watch over the north-eastern frontier, which he successfully defended against Marlborough, who retreated; upon which Villars entered Alsace and captured the enemies' reserves of supplies and artillery. In 1708 he defeated all the attempts of Prince Eugene to penetrate into France. In 1709 he was sent to oppose Marlborough in the north; but at the commencement of the battle of Malplaquet (q.v.) he was severely wounded, and rendered unfit for service. But in 1711 he headed the last army France could raise, and with it fell upon the British and Dutch under Albemarle, who were entrenched at Denain (24th July 1712), carried their entrenchments sword in hand, and captured the most of them; he then turned upon Prince Eugene, and drove him under the walls of Brussels. This magnificent series of successes saved the honour of France, and brought about the peace of Rastatt (q.v.), which Villars signed as plenipotentiary, 6th May 1714. After the peace he became the principal adviser on military affairs and on questions of foreign policy; was a strong opponent of Law's financial measures; but through the intrigues of Fleury lost favour at court. The outbreak of war in 1732, however, brought out the old hero from his retirement, and he went to head the French army in the Milanese. The campaigns of 1733–34 showed that the weight of years had left Villars' military genius and spirit untouched; but discontent with his ally, the king of Sardinia, determined him to solicit his recall;

and he accordingly set out for France, but fell ill at Turin, and died 17th June 1734.

See his *Mémoires* (ed. by De Vogüé, 2 vols. 1884–87), and the biographies by Anquetil (1784), Giraud (1881), and De Vogüé (1888).

Villarsia, a genus of plants of the natural order Gentianaceæ, the species of which are widely distributed over the world, and are either aquatic or marsh plants, with entire leaves and yellow flowers. *V.* (*Limnanthemum*) *nymphæoides* is a native of England, but rare; it is more common in many parts of Europe, from Denmark to the Mediterranean, and is very abundant in Holland, often covering large tracts of the canals with its beautiful flowers and leaves. *V. indica* is regarded as a valuable medicine in India, being given internally to persons bitten by cobra. Several species from South Africa and Australia are cultivated in British aquariums for the beauty of their flowers.

Villefranche, or Villafranca, a small port in the French dept. of Alpes Maritimes, 3 miles E. of Nice. The harbour, which is defended by forts, is much used by ships of war. The climate is very fine. Pop. 3295.—(2) Villefranche de Rouergue, in Aveyron, 70 miles NE. of Toulouse by rail, has a pop. of 7588.—(3) Villefranche-sur-Saône, in the dept. of Rhone, 20 miles NW. of Lyons, has cotton manufactures and a pop. of 12,463.

Villehardouin, Geoffroi de, marshal of Champagne, the first, and far from the least, of French historians, was born about 1160 at Villehardouin in Aube, took a distinguished part in the so-called Fourth Crusade—the complicated and entirely secular operations in alliance with Venice that established the Latin empire of Constantinople—became marshal of 'Romanie,' seigneur of Messinople in Thrace in 1207, and was dead before 1213. His famous *Conquête de Constantinople* relates with order and clearness the course of events from the preaching of the crusade in 1198 down to the death of his patron, the Marquis de Montferrat, in 1207. It is probable, as Gaston Paris says, that he did not write himself, and that we should take in its proper sense—which is not always the case in Old French—the word *dicter* which he uses several times in speaking of the composition of his book. The style is vigorous, direct, often singularly strong and graphic without effort or even consciousness; yet preserving from the preceding age something of the epic tone, it recalls the *Chanson de Roland* just as Herodotus recalls Homer. Sincere history as it is, it is of far greater value as literature than history, for it throws the strongest light upon the thoughts and feelings of the crusaders, especially the leaders. Strange to say, it is supplemented here by another prose narrative of a sharer in the crusade, Robert de Clari, whose book is much less admirable in style, but reveals the inner life of the crusaders of lower rank.

Editions are by Du Cange (1657), Dom Brial (1823), and especially N. de Wailly (1872; 3d ed. 1882). See Sainte-Beuve's *Causeries du Lundi*, vol. ix.

Villein. See Slavery.

Villemain, Abel François, scholar and critic, was born at Paris, June 11, 1790, and at twenty was appointed professor of Rhetoric at the Lycée Charlemagne, shortly after at the École Normale. He filled the chair of Eloquence at the Sorbonne (1816–26), held various government offices under Louis XVIII., was made a peer in 1831, and served as minister of Public Instruction under Soult and Guizot, retiring in 1840. He was long perpetual secretary of the French Academy, and died 8th May 1870.

His principal works are the invaluable *Cours de Littérature Française* (1828–30), *Mélanges* (1823) and *Nouveaux Mélanges* (1827), *Souvenirs Contemporains d'Histoire et de Littérature* (1853), *Choix d'Études sur la Littérature Contemporaine* (1857), *La Tribune Contemporaine, M. de Chateaubriand* (1857), *Essais sur le Génie de Pindare et sur la Poésie Lyrique* (1859). His *Histoire de Cromwell* (1819) and *Lascaris, ou les Grecs du XV. Siècle* (1825), brought him great popularity.

Villemarqué. See La Villemarqué.

Villena, a town of Spain, 25 miles NW. of Alicante by rail, with manufactures of linen and soap, and a pop. of 14,450.

Villeneuve, the name of numerous French towns, the largest Villeneuve-sur-Lot, or d'Agen, in Lot-et-Garonne, 15 miles N. of Agen by rail, with trade in wine and fruit and a pop. of 9339.

Villeneuve, Pierre Charles Jean Baptiste Sylvestre de, Nelson's antagonist at Trafalgar, was born at Valensoles (Basses-Alpes), December 31, 1763, entered the navy in his fifteenth year, and passed as captain at thirty. Captain of division by 1796, he commanded the rear division at the battle of the Nile, and saved his own vessel, the *Guillaume Tell*, and four others. Vice-admiral in 1804, he next year took command of the Toulon squadron. At Cadiz he was joined by the Spanish fleet under Gravina, and, in order to keep the British fleet from the coasts of Europe, bore away westwards across the Atlantic, reaching the Antilles on 14th May. A month later he sailed back, still pursued by Nelson. At the Azores he fought an undecided battle with Sir Robert Calder, and, unable to reach Brest, again returned to Cadiz, where he was strictly blockaded by Nelson. This completely ruined Napoleon's scheme for the invasion of England, and Villeneuve, knowing that he was about to be superseded, determined to fight Nelson before his successor could arrive at Cadiz. On that memorable day of English glory Villeneuve's flag-ship, the *Bucentaure*, was dismasted and forced to strike. The admiral lay a prisoner in England till April 1806. On the journey to Paris he stopped at Rennes to learn how the emperor would receive him. On the morning of April 22 he was found dead in bed, with six knife-wounds in his heart. See Nelson.

Villeroi, François de Neuville, Duc de, French marshal, was born 7th April 1644, and educated at court with Louis XIV., but was banished to Lyons for a love-affair. In 1680 he returned to court, and in 1693 became a marshal, having distinguished himself at Neerwinden. As commander in the Netherlands in 1695–96 he showed great incapacity; and sent in chief command to Italy in 1701, he was there defeated and taken prisoner by Prince Eugene. Again he commanded in the Netherlands, but was defeated by Marlborough at Ramillies. Madame de Maintenon got him made guardian to Louis XV. Orleans sent him to live on his estate in 1722, because of his intrigues; but he was subsequently governor of Lyons, and died at Paris, 18th July 1730.

Villiers. See Buckingham (Duke of).

Villiers, Charles Pelham, corn and poor-law reformer, was born January 19, 1802, a younger brother of the fourth Earl of Clarendon (q.v.). He was educated at Haileybury and St John's College, Cambridge, and was called to the bar at Lincoln's Inn in 1827. He was returned for Wolverhampton as a Free Trader in 1835, and sat its constant and consistent member for about sixty years, being again returned unopposed as a Liberal Unionist in 1892. He made his first motion in favour of Free Trade in 1838, and thereafter year by year till triumph was won. Chairman of the Select Committee on Public Houses, he sat with cabinet rank as President of the Poor-law Board (1859–66). The Union Chargeability Act (1865)

is but one of the many measures of reform due to his powerful advocacy. His jubilee as member for Wolverhampton was celebrated in 1885, and even the honours of the dead were paid to him there still living—a marble statue was unveiled by Earl Granville in 1879. He was still M.P. in 1897, but died 16th January 1898.

Villon, François, was born in or near Paris in 1431. From himself we learn that in gratitude he adopted the name of his 'more than father,' Maistre Guillaume Villon; his own, as M. Longnon has established, was François de Montcorbier. Of his life we may say with M. Jannet that, 'though we know little more than he tells us himself, we know only too much.' We know nothing of it before 1455 or after 1461, and the dismal story of the interval derives what coherence it has from the researches of M. Vitu and M. Longnon. In 1455 he was a needy master of arts of, apparently, blameless life; but having the ill-luck to kill a priest in a street squabble, he took to flight, lay for some months in hiding, and was sentenced to banishment. The sentence was eventually rescinded on proof that he had been savagely attacked and forced to defend his life; but the affair no doubt influenced his career. Distress may have driven him into partnership with scoundrels, or he may have found that justifiable clericide had disposed of his prospects with the Sorbonne. He was also in trouble with a love-affair, and in his *Petit Testament* he talks of going to Angers to escape from a hopeless passion. This was in 1456, and in the next year it came out, through the confession of a friend of his, Guy de Tabarie, that he was one of a gang of burglars who, among other feats, had broken into the Collége de Navarre and stolen 500 crowns, and that he was then at Angers planning another operation of the same sort. Brought under the notice of the police, he was in course of time caught, put to the question, and with five others sentenced to be hanged. It was on this occasion that he wrote the grim ballade-epitaph on himself and his comrades swinging in the wind and feasting the crows on the gibbet, and the no less famous quatrain misquoted by Rabelais. He appealed, however, and by some friend's interest the sentence was commuted to banishment from the kingdom. He found an asylum under the Duc de Bourbon at Roussillon in Dauphiné; but early in 1461 he was back again at his old game, and passed the whole summer in a cell, or rather pit, in the prison of the Bishop of Orleans at Meung-sur-Loire. What his crime was is uncertain; tradition says sacrilege, but M. Longnon suspects it was a burglary at Montpipeau. This time he owed his life to Louis XI., who passed through Meung, October 2d, and ordered a gaol-delivery in honour of his accession. Here Villon passes from our sight. Rabelais has a story of his 'vieux jours,' but before the century was out he had evidently become one of those legendary characters to whom stray stories are affiliated, as is shown by the *Repeues franches*, and by the other story told by Rabelais, which is at least two centuries older than Villon. That he survived his release many years is most unlikely. He speaks of himself as a dying man, and it is clear from his own words that he was a wreck, shattered by debauchery, prison-life, and torture, and from one passage it would seem far gone in consumption. Nor is it likely that the writer of the *Grand Testament* would have left no trace of his existence.

Villon's works consist of the *Petit Testament*, written at Christmas in 1456, the *Grand Testament*, begun, and perhaps finished, soon after his release in October 1461, and some forty or fifty short pieces, chiefly ballades, many of which are imbedded in the *Grand Testament*. Of the *Jargon* ballades some, the second for instance, are clearly his, but his claim to the whole is doubtful. Readers of Villon generally pass through three stages of feeling with regard to him. The first introduction is usually through selected specimens, like 'The Ladies of bygone Days,' his mother's 'Prayer to our Lady,' the 'Epistle to his Friends,' and fascination is the inevitable consequence. Unrestricted acquaintance is almost sure to lead to disgust with his revolting realism and the atmosphere of rascality one is forced to breathe in his company. This is the feeling which finds eloquent expression in Mr R. L. Stevenson's striking essay, but, as he himself admits in his preface, it is one that may be modified afterwards. Not that anybody will make a serious attempt to clear Villon: poor François is beyond the help of paradox or whitewash; but there is still room for pity. The undercurrent of profound sadness that runs through all his seeming recklessness does not make itself fully felt at the first or second reading, nor yet the pathos that lies in the glimpses he gives of a sense of his own degradation. The repulsion is perhaps as strong as ever—'but yet the pity of it!' Some there are, indeed, who are not repelled but rather attracted by the infamy of Villon's life; for there is an eccentric school of thought that, in its blind hatred of all that it dubs as the conventional and the respectable, is ready to accept even crime as a mark of genius. Others, again, maintain that Villon the poet was born of Villon the burglar and blackguard, though it is not clear upon what grounds they rest their assertion that if he had not been a gaol-bird he would have been songless. This much, however, may be said for him, that at the worst he was a better and an honester man than the vapouring scoundrels, apt pupils of Victor Hugo's philosophy, who pose as victims of a corrupt social system and make society responsible for their own vicious propensities. Villon was no *poseur*. He had the manliness to acknowledge that the miserable bed he lay upon was of his own making.

The first dated edition of Villon's poems is of Paris, 1489; but the earliest is possibly an undated one. By 1542 twenty-seven editions had been printed. That of 1533 was edited by Clement Marot. His poetry did not suit the taste of the 17th century, but in the 18th there was a reaction. The best modern editions are those of Paul Lacroix, 'Bibliophile Jacob' (1854-66-77), Pierre Jannet (1867-73-77-81-84), Louis Moland (1879), Auguste Longnon (1892). A very faithful English translation by Mr John Payne was printed by the Villon Society in 1878, and an expurgated edition of the same published 1881. See also A. C. S. Vitu, *Notice sur François Villon d'après des Documents nouveaux* (1873); A. Longnon, *Étude biographique sur François Villon* (1877); W. Bijvanck, *Specimen d'un Essai sur les Œuvres de François Villon* (1882); A. Vitu, *Le Jargon du XV^e^ Siècle* (1884).

Vilno, or Vilna, capital of a government in the west of Russia, on the Vilia, 430 miles SW. of St Petersburg by rail, with a trade in timber and corn; pop. (1895) 109,570, mainly Poles, but with many Jews. The city was the chief town of the Lithuanians and the capital of their grand-duke. The government has an area (10,421 sq. m.) larger than Switzerland. Pop. 1,304,738.

Vimeiro, also spelt Vimieiro and Vimiera, a town of 1800 inhabitants in the Portuguese province of Estremadura, 30 miles N. of Lisbon. Here Wellington defeated Junot, 21st August 1808.

Vinaroz, a small port of Spain, 45 miles NE. of Castellon by rail; pop. 9851.

Vinca. See Periwinkle.

Vincennes, an eastern suburb of Paris, just outside the fortifications, whose park, the Bois de Vincennes, is the pleasure-ground of eastern Paris.

The ancient castle founded in the 14th century by Philip VI. was long a residence of the kings, then became a state-prison, and in 1834 was made a fort of the inner line of fortifications, and extended and strengthened. In its moat the Duc d'Enghien was shot. In the Bois are exercise grounds for infantry and artillery. There are in Vincennes barracks, hospitals, and a good deal of varied manufacturing industry.

Vincennes, capital of Knox county, Indiana, on the navigable Wabash, 52 miles by rail N. of Evansville. It contains a Roman Catholic cathedral, steam flour-mills, &c., and is the oldest town in the state, being settled by the French in 1735. From 1800 to 1813 it was the capital of the Northwest Territory. Pop. (1890) 8853.

Vincent, St, deacon and martyr, born at Hulsea in Spain, was under Diocletian's persecution imprisoned and tortured at Valencia, dying in 304. His day is the 22d January.—For the island, see St Vincent.

Vincent de Beauvais. See Encyclopædia, Vol. IV. p. 335.

Vincent de Paul, one of the most eminent saints of the modern Catholic Church, was born of humble parentage at Pouy near Dax in Gascony, 24th April 1576. He studied at Toulouse, and was admitted to priest's orders in 1600. On a voyage which he was making from Marseilles to Narbonne his ship was captured by corsairs, and he with his companions sold into slavery at Tunis. His master, a renegade Savoyard, yielded to the exhortations of Vincent, and resolved to return to the Christian faith, so, escaping from Barbary, they landed in France in 1607. Having gone thence to Rome, he was entrusted with a mission to the French court in 1608, and became almoner of Henry IV.'s queen, Marguerite de Valois. As pastor of Clichy and of Chatillon, he formed associations for helping the sick, visited prisons and galleys, and in 1619 was appointed almoner-general of the galleys. The tale is told, but lacks authority, that in 1622 he took the place and wore the fetters of a galley-slave, whose heart he had failed to reach otherwise. Meanwhile he had laid the foundation of what eventually grew into the great and influential congregation of Priests of the Missions, an association of priests who assist the parochial clergy by preaching and hearing confessions periodically. The rules of this congregation were finally approved by Urban VIII. in 1632; and in the following year the Fathers established themselves in the so-called Priory of St Lazare, in Paris, whence their name of *Lazarists* is derived. From this date his life was devoted to the organisation of works of charity and benevolence. To him Paris owes the establishment of the Foundling Hospital. The noble Sisterhood of Charity (see Sisterhoods) was of his founding, and Vincent was entrusted by St Francis of Sales with the direction of the newly-founded order of Sisters of the Visitation. He died at the age of eighty-five, at St Lazare, September 27, 1660, and was canonised by Clement XII. in 1737. His festival is held on the 19th July.

There are English Lives by C. A. Jones (1873) and R. F. Wilson (1873), and French by Maynard (3d ed. 1886), Chantelauze (1882), Bougaud (1889; trans. 1899), &c.

The Society of Vincent de Paul was founded at Paris in 1833 by eight young men, of whom Ozanam (q.v.) was one, for the purpose of helping the poor, and chose St Vincent de Paul as patron. The society, which has branches in all parts of the Catholic world, devotes itself to relieving the poor, founding and managing libraries for their use, establishing crêches for children and dispensaries, visiting prisoners, and finding employment for men out of work. Occasionally sums of money are raised by the society to relieve distress in cases of famine, &c.

Vindhya Mountains. See India, p. 99.

Vine, the Vitis of the botanist, is a genus of which there are a number of species; they are found over a wide range of the northern hemisphere, the majority in temperate Asia, as well as in North America, but none are found in Europe. The genus belongs to the Vitæa section of the order Vitaceæ (q.v.). It has pentamerous flowers (five-toothed, five petals, and five stamens); the petals are attached to the discs at the base of the ovary, but,

Vine (*Vitis vinifera*).

contrary to general rule, they adhere at the top and form a cap, which is thrown off by the stamens as they elongate and expand; the latter adhere for a time to the base of the fruit. All the species are furnished with claspers by which to lay hold for their support on any object within their reach. Some have leaves greatly lobed, others have them nearly plain.

The *Vitis vinifera*, the European wine-yielding grape-vine, is that which has greatest economic and commercial importance. It is found on the shores of the Caspian Sea, and it grows wild throughout the lower Caucasus and in Armenia. The cultivation of this plant has occupied much of man's time and attention in all nations that have attained to any degree of civilisation, from the very dawn of history, and it is spreading more rapidly at the present time than ever it did at any previous one. The endless variety of grape-vines in cultivation seems to indicate that the *Vitis vinifera* is not a true species, and this view is confirmed by the circumstance that seed taken from any variety of grape does not reproduce the parent, as it should do if it were an unbroken species, but one widely different, and as a rule very inferior to the parent, except in exceedingly rare instances, when a step in advance may take place. The writer has raised hundreds of vines from seeds taken from the finest grapes in cultivation, the rare exception being a variety equal or superior to the parent, and the rule being a reversion to a very inferior type; it is questionable if any of our high-class grapes are to be found in an uncultivated state in any part of the world. The plant has evidently been developed by the ingenuity of man at some very remote date, of which there is no record, just as our apples, plums,

pears, peaches, and many other fruits and vegetables have been; and if man's constant care were withdrawn from their cultivation they would soon disappear from the earth, leaving it in possession of their wild progenitors.

By many Persia is thought to be the home of the grape-vine, and excellent wine is still made there and exported. In European graves of the Bronze Age (q.v.) grape stones have been found, and in Greece and Italy the culture is primeval. The culture of wine on a commercial scale is dealt with in the article WINE and in the articles on the wine-growing countries—Italy, France, Hungary, Germany, the Madeira and Canary Islands, and in later times Cape Colony, Victoria, South Australia, and the United States, especially California. In Europe now the line of open-air culture of the vine on a large scale passes from the country just north of the Loire in France through Belgium, central Germany, and Silesia; but in the middle ages wine was largely produced north of this—in North France, Holland, and in England—either because the climate was warmer, or because consumers were content with poorer wine.

The cultivation of the grape-vine was introduced into England by the Romans. At the date of the Norman Conquest there is evidence that the vine was pretty extensively cultivated in the south and south-west of England for the production of wine until about the middle of the 18th century, when for this purpose its cultivation was given up, and it was grown for dessert purposes against walls and dwelling-houses with considerable success, and continues to be so grown up to this date. For this mode of cultivation the Royal Muscadine, Sweetwater, and Black Hamburgh are amongst the most suitable. All the finer sorts of grapes, such as Frontignans, Muscats, Gros Colman, and many others of the higher classes of grapes, can only be cultivated in Britain in hothouses, and at the present date enormous quantities are so cultivated in Britain and the Channel Islands, some growers sending from 50 to 100 tons to market annually. This great supply has depressed the price of grapes by more than one-half since 1882, very much to the public benefit, for it is now recognised that for man, whether in health or sickness, there is no more wholesome or grateful food than good grapes, acting as they do favourably on every organ of the body. An attempt has been made by the Marquis of Bute to establish what may be called an open field vineyard on his Cardiff Castle estate in Wales, for the production of wine. The vineyard was planted in 1875, and 40 gallons of wine were made in 1877 and more in 1878. But in the cold wet summer of 1879 the crop was a failure, as also in 1880 on account of the wood not being ripened the year before. In 1881 the wine was of the best quality, like a first-class still champagne, and was all sold at 60 shillings a dozen: 1882 and 1883 were complete failures; but since 1884 more or less wine has been made every year, though quantity and quality vary much with the season. In 1893, 14 acres produced 40 hogsheads (in respect of quantity 70 per cent. of a full crop in Germany), which was sold for £3000; and some of this again was resold at 115 shillings a dozen.

The soil most suitable for the vine in Britain is a good calcareous, wheat soil. Turf taken from such land, stacked in narrow ridges for a winter, may be chopped down in the spring, and if clay is in excess, it should have burned clay or old lime rubbish mixed with it in the proportion of 1 to 10. The best manure for a vine border is one into which finely-ground bones, horn shavings, and other phosphatic manures enter, not forgetting potash. It is well to avoid stable manure, as that very frequently breeds fungi. On the other hand, cow manure sours the soil, and should also be avoided.

The writer, while investigating the system of vine-culture on the banks of the Rhine, found that growers there confined the cultivation to soil nearly all made up of the scoriæ and debris of the rocks, and avoided soil which in England was found most suitable; but the explanation was that, while the soils in question would grow grapes well, they did not yield wine of the desired bouquet.

The vine is easily propagated in a variety of ways—by layers, by cuttings, by eyes; also by budding, inarching and grafting, as well as by raising from seed. The common method of establishing vineyards for open-air cultivation in grape-growing lands—as in California—is to trench the soil where the land is hard, and to plant young canes at distances of from 3 to 4 feet apart, and 4 to 5 feet between rows, placing a stake to each young vine for its support. In the second year fruit can be produced, though it is better for the ultimate success of the vineyard not to crop till the third. Another method—more laborious and costly, and showing in greater ultimate advantage—is to put the vine cuttings in 'nursery rows,' to let them form roots there (as with gooseberry cuttings), and then transplant. Much of the labour required for growing grapes either in the open or under glass is devoted to pruning and training the plants. Various systems of pruning are in use, for securing greater vigour in the plant, to obtain more and better fruit, to keep up a constant supply of fruit-bearing wood, and to maintain the fruit-bearing portion, not on the extreme branches only, but near the ground. Nothing can well be less like the great vines grown under glass than the ordinary vine of a French or German vineyard, the vines being kept to some 3 or 4 feet in height, so that the uninitiated thinks rather of a raspberry garden than of a vineyard. In Italy greater luxuriance is allowed, and vines are even trained on trees pruned for the purpose.

The vine is very fruitful, and would soon exhaust itself by over-production; hence the clusters have to be carefully thinned. The extent to which thinning is necessary depends on the strength and size of the plant. The berries on the clusters also usually require thinning, according to circumstances; thus a cluster of Black Hamburgh with 120 berries may with advantage be reduced to half the number. The vines most suitable for cultivation under glass for early forcing, so as to give ripe grapes in June, are the Black Hamburgh, Buckland's Sweetwater, Foster's White Seedling, and Royal Muscadine. Those who desire to have grapes of the very highest flavour should plant the Frontignans—black, white, or grizzly, the Muscat of Alexandria, Black Muscat, and Duke of Buccleuch. For a late house to yield grapes all winter and into the spring, the following sorts may be planted: Black Alicante, Gros Colman, Lady Downes, and Mrs Pince.

Of vine diseases, some are caused by insects, beetles, weevils, caterpillars and larvæ of various kinds; of these the most destructive is the Phylloxera (q.v.); of various fungoid diseases, Oïdium has been most harmful.

The great Hampton Court vine, planted in 1769, fills a house 66 feet long by 30 wide, and bears annually as many as 1700 small bunches (Black Hamburgh). Nearly twice the size is the vine at Cumberland Lodge, Windsor Park, which produces a crop of 2000 bunches, averaging three-quarters of a lb. each. The Breadalbane vine in Perthshire covers a house 172 feet long by 25 broad.

At the international exhibition of the Royal Caledonian Horticultural Society in 1875 a single bunch of the Raisin de Calabria was shown, weighing 26 lb. 4 oz.; and at the same exhibition was

shown a cluster of White Nice only a few ounces lighter. These are coarse varieties of grapes, it is true; but at the Belfast Exhibition in 1874 a bunch of the Black Hamburgh was shown which weighed 21 lb. 12 oz., and this is a grape of high quality.

In the United States, especially California, the development of viticulture has been great and rapid. Early attempts were made to grow foreign grapes in the open air, but none of these met with success east of the Rocky Mountains. Till the Californian grape industry developed, the growing of foreign grapes in the United States was under glass, and for dessert purposes. Four native American vines (of some ten found wild) are used for wine-making, the most important being *V. Lambrusca*. In 1890 there were 400,000 acres under vines, three-fourths of which were producing wine, and the total produce was about 40,000,000 gallons. In California alone the acreage of vines was 150,000 acres, seven-eighths of which were devoted to wine. American vine-stocks, as being less liable to suffer from the phylloxera, have with advantage been introduced into France for grafting on. On the Murray River, in Australia, a vast extent of land is being irrigated and planted with vines, the fruit of which is being converted into raisins and wine. See VICTORIA, SOUTH AUSTRALIA.

See D. Thomson, *Fruit Culture under Glass* (2d ed. 1881); Barron, *Vines and Vine Culture* (new ed. 1887); and the present writer's *Practical Treatise on the Grape Vine* (1862; 10th ed. 1890). There are American works by Haraszthy (1863), Hyatt (1867), and Husmann (1880), and innumerable works in French, German, and Italian. See also WINE, and books there cited.

Vinegar is that form of Acetic Acid (q.v.) which is generally preferred for culinary purposes, and which is made by the fermentation of vegetable substances. In Great Britain it is manufactured on a large scale by the fermentation of malt; on the continent of Europe it is as largely made from low wines which have turned sour. Malt vinegar, or British, as it is sometimes called, is made by brewing a weak wort from malt exactly as for Beer (q.v.). To 100 gallons of this, at a temperature of 70° F., are added 4 gallons of yeast, and well stirred through for eight or ten minutes. This mixture is allowed to ferment actively for two days, and is then transferred to the stoving-room; here it is distributed into a number of tubs, which when filled are covered over with coarse canvas. This room is dark, and is heated by stoves, and the heat is constantly sustained for weeks until the conversion of the wort into vinegar is complete. The process of acetification is accelerated by introducing into the casks with the wort either the residuary fruit used in making domestic wine or the foot-stalks and skins of grapes. This *rape*, as it is called, acts as a kind of ferment. Various other processes are used by different manufacturers for the purpose of producing it quicker. Much vinegar is also made of beer which has become sour; it is, however, very inferior in quality. Vinegar prepared by these methods contains a large amount of foreign matters, which can be got rid of by simple distillation; the acid liquid which comes over constituting what is known in pharmacy as *distilled vinegar*. What is sold commercially as distilled vinegar is simply acetic acid distilled from wood (see PYROLIGNEOUS ACID), and diluted with five times its volume of water. This constitutes also the vinegar used by pickle manufacturers; it is quite as wholesome as common vinegar, but wants its agreeable flavour; its preservative powers are, however, much greater, and its price very much less. The addition of ammonia serves to distinguish French from English vinegar: with the former the colour is purplish; with the latter there is either no change or it is brownish.

As a condiment vinegar is an ingredient of a large number of sauces, and of ketchups and pickles; and although it cannot be regarded as an essential article of food, its applications in cookery are numberless. Young ladies with an undue tendency to corpulency are said sometimes to drink vinegar freely with the view of improving the figure; but, as vinegar only causes thinness by injuring the digestion, it is obviously not worth while to run the risk of exchanging slight fullness of habit for chronic dyspepsia.

Aromatic Vinegar consists of strong acetic acid, holding in solution camphor and the oils of cloves, lavender, rosemary, and lemons. It is very fragrant and volatile, and must be kept in well-stoppered bottles. It was formerly regarded as a valuable prophylactic of all infectious diseases, but is now only used as an external stimulant, the vapour being applied by a smelling-bottle to the nostrils in cases of fainting. See *Acetic Acid and Vinegar* (Technological Manuals, 1885), and W. T. Braunt's *Manufacture of Vinegar* (1889).

Vinegar-eels. See EEL.

Vinegar Hill (389 feet high), close to the town of Enniscorthy, in County Wexford, scene of the complete defeat of the Irish rebels by General Lake, June 21, 1798. They had held their camp here for about a month, and disgraced their cause by ruffianly outrages on the lives and property of the loyalists in the surrounding country. About 400 of the rebels were cut down, the remainder fled in headlong rout to Wexford, whither Lake marched the day after, killing all whom he found with arms. See Lecky's *History of England in the Eighteenth Century*.

Vinegar-plant (*Penicillium glaucum*), a fungus of the sub-order Hyphomycetes, but somewhat resembling those known by the name of Mould (q.v.). It forms a flocculent mass or web, which is tough and crust-like or leathery, and when examined by the microscope is seen to consist of a *mycelium* of branched threads, with the branches somewhat tangled, and the spores disposed in patches about the pencil-shaped ends of fertile threads. It is found on decaying bodies and in fluids undergoing the acetous fermentation, which it greatly promotes, and indeed readily occasions, a small piece placed in sugar and water soon changing it into vinegar. Advantage is sometimes taken of this property for making vinegar.

Vinet, ALEXANDRE RODOLPHE, Swiss divine and critic, was born at Ouchy near Lausanne, June 17, 1797, studied there, was appointed at twenty to the chair of French Language and Literature in the gymnasium of Basel, in 1835 in the university itself. He had been ordained in 1819, and in 1837 he accepted the chair of Practical Theology at Lausanne. His attitude to the question of the relation between church and state was shown already in his prize essay for the Paris Société de la Morale Chrétienne, *Mémoire en Faveur de la Liberté des Cultes* (1826), and he soon found himself involved in the struggle against state interference. He withdrew from the Vaud canton association of clergy (1840), but after the democratic attack of 1845 upon the 'fanatics' without, and the Evangelicals within, the state church, resigned his chair, and at the close of the year joined the newly-formed Free Church of Vaud. Meantime he had been appointed professor of French Literature in the Lausanne Academy, but this office he was compelled to resign in 1846. He died at Clarens, 4th May 1847. Vinet was an eloquent and earnest preacher, clear and brilliant, evangelical and orthodox, yet an advocate of

the utmost liberty and toleration of opinion and practice in matters of religion, with separation from the state. He possessed fine critical insight and a profound knowledge of French literature, and his *Chrestomathie Française* (1829), his study of Pascal (1848), his *Études* on the literature of the 19th century (3 vols. 1849–51), his *Histoire* of 18th-century literature (2 vols. 1853), the *Moralistes des XVI. et XVII. Siècles* (1859), and his *Poètes du Siècle de Louis XIV.* (1862) take rank with the best contemporary work of their kind. It was at his initiative that Sainte-Beuve came to Lausanne to deliver his famous lectures on Port-Royal. In ethics Vinet owned Pascal and Kant as his masters.

The chief of his books that have been translated into English are *Christian Philosophy* (1846), *Vital Christianity* (1846), *Gospel Studies* (1851), *Pastoral Theology* (1852), *Homiletics* (1853), *Studies in Pascal* (1859), *Outlines of Philosophy and Literature* (1865). See the studies by E. Scherer (1853), Chavannes (Leyden, 1883), the Lives by E. Rambert (1875), Louis Molines (1890), and Laura M. Lane (in English, 1890), and his Letters, edited by C. Secretan and E. Rambert (2 vols. 1882), and by E. de Pressensé (1890).

Vingt-et-Un, a game of cards, the aim in which is to get as near as possible to the value of twenty-one (hence the name) without exceeding it. The game is played with the whole pack, the ordinary cards being reckoned according to the number of pips on them, while the court-cards are ten, and the ace is one or eleven, as the holder may elect.

Vinland ('Wineland'), the name given to the chief settlement of the early Norsemen in North America. It is undoubtedly represented in modern times by part of Massachusetts and Rhode Island. The first that saw it was Bjarne Herjulfson, who was driven thither by a storm in the summer of 986 A.D., when making a voyage from Iceland to Greenland, of which country his father, Herjulf, and Eric the Red were the earliest colonists. But Bjarne did not touch the land, which was first visited by Leif the Lucky, a son of Eric the Red, about 1000 A.D. One part of the country he named Helluland ('Stoneland'); another Markland ('Woodland'), the modern Newfoundland and Nova Scotia; a German in his company having found the grape (most probably the *Vitis vulpina*) growing wild, as in his native country, Leif called the region Vinland. The natives from their dwarfish size they called *skraelings*. Two years after Leif's brother, Thorwald, arrived, and in the summer of 1003 led an expedition along the coast of New England southwards, but was killed the year following in an encounter with the natives. The most famous of the Norse explorers, however, was Thorfinn Karlsefne, an Icelander, who had married Gudrid, widow of Thorstein, a son of Eric the Red, and who in 1007 sailed from Greenland to Vinland with a crew of 160 men, where he remained for three years, and then returned, after which no further attempts at colonisation were made. Rafn, in his *Antiquitates Americanæ* (Copenh. 1837), published the first full collection of the evidence which proves the pre-Columbian colonisation of America. Both he and Finn Magnusen labour to show that Columbus derived his first hints of a new world from the accounts of these old Icelandic expeditions. Finn Magnusen is believed to have established the fact that Columbus did visit Iceland in 1477, fifteen years before he undertook his expedition across the Atlantic, and so may have heard something of the long-abandoned Vinland.

See also Wilhelmi's *Island, Hvitramannaland, Grönland, und Vinland* (Heidelberg, 1842); *The Finding of Wineland the Good*, by Arthur Middleton Reeves (1890); and *America not Discovered by Columbus*, by Professor R. B. Anderson (Chicago, 1891).

Vinnitza, a Russian town, in Podolia, stands on the Bug, 120 miles SW. of Kieff; pop. 18,733.

Viol (Ital. *viola;* Late Lat. *vitula*, from *vitulari*, 'to celebrate a festival:' *fiddle* is a doublet), a musical instrument played with a bow, which was the immediate precursor of the violin. It is to be seen represented on monuments as far back as the close of the 11th century. The back was flat; there were larger bends in the sides than in the violin; and frets, like those of the guitar, were placed on the neck of the instrument, to show where the fingers of the left hand should be put to produce the desired notes. There was great variety in the number of strings: in Germany three, four, and five were all common; in Italy there were usually six. The strings were tuned by fourths and thirds. There were four sizes of viol in use, *treble* or *discant*, *tenor* or *viola da braccio*, *bass* or *viol da gamba*, and *double bass* or *violone*, and they were often played together in concerted music. Their tone was rather penetrating than powerful. The treble viol was rather larger than the modern violin. The viol da gamba held its place longer than the smaller viols, but was superseded by the violoncello. The *viol d'amore* was a tenor viol, with from seven to fourteen sympathetic metal strings, stretched under the fingerboard, tuned to a scale. A 'chest of viols,' consisting of six instruments of various sizes, was in the 16th and 17th centuries to be found in most houses of any pretension in England. See BASS, DOUBLE BASS.

Viola, also called ALTO VIOLA, or TENOR VIOLIN, a larger description of violin, to which the part between the second violin and bass is generally assigned. It has four gut strings, the two lower covered with silvered copper wire. It is tuned in fifths, the first or upper string sounding A on the second space of the treble clef, and the others the D, G, and C successively below. The compass is from the latter note to about C on the second leger-line above the treble clef; and the music is generally written on the alto clef, or on the G clef if high.

Violaceæ, a natural order of exogenous plants, of which from 200 to 300 species are known, natives both of temperate and tropical countries, those belonging to the former being generally herbaceous, and those belonging to the latter generally shrubby. They have simple leaves with persistent stipules. The calyx consists of five persistent sepals, usually elongated at the base; the corolla of five hypogynous petals, unequal in the sub-order Violeæ, and equal in the sub-order Alsodeæ. There are five stamens inserted in a hypogynous disc, the filaments prolonged beyond the anthers. The ovary is one-celled, generally with many ovules, the style single, with an oblique stigma. The fruit is a three-valved capsule, with many seeds. The best-known species are the violets. Emetic and purgative properties prevail in the order, and some of the South American species yield valuable medicines; see IPECACUANHA. Yet the leaves of the Lobolobo (*Conohoria* or *Alsodeia lobolobo*) are used in Brazil as spinach.

Violet (*Viola*), a genus of herbaceous plants, mostly perennial, of the natural order Violaceæ. They have a short stem, or are stemless, having in the latter case a short root-stock (rhizome); the leaves are alternate, and have long stalks; the flowers have five petals, different in form and size, the lowest having a spur behind. About 100 species have been described, natives chiefly of northern temperate countries. Several species are much cultivated in gardens, some, as *V. tricolor*, on account of their beautiful flowers; others, as *V. odorata*, on account of their fragrance. *V. tricolor*,

the Pansy, Pansy Violet, or Heart's Ease, is very abundant in fields, meadows, woods, &c. in Britain and in most parts of Europe, and the north of Asia; it is also found in North America, although it has probably been introduced there from the Old World. It is a very variable plant, its flowers differing much in size and colour, but is readily distinguished by its large lyrato-pinnatifid stipules. The stem is somewhat triangular, branching, and diffused. In

Flowers of *a*, Sweet Violet (*Viola odorata*); *b*, Fancy Pansy (*V. tricolor*); and *c*, Bedding Viola (*V. cornuta*).

some of its most common forms this plant is a mere despised weed, with small flowers; other wild forms have much larger flowers; and to it are referred the large and beautiful garden pansies, the varieties of which are innumerable. The Pansy (Fr. *pensée*, probably from the drooping attitude of the flower, suggestive of thoughtfulness) is one of the finest of florists' flowers (see Vol. IV. p. 694), and no flower has been more improved by cultivation. There are two classes or types of pansy, the Show Pansy, in which the colours are either white, yellow, or purple, alone or in combination, and the Fancy, in which crimson or maroon is added to the other colours and the flowers are beautifully blotched or shaded, having a clear margin of the ground colour surrounding them, as shown in No. 2 of the illustration. No. 3 shows one of the original parents of the popular Bedding Violas, the varieties of which are very numerous. By intercrossing with the pansy and other showy species greater variety and brightness of colour prevails now than formerly when purple was the principal tint. Another species has of late years been introduced into cultivation, *V. altaica*, a native of Siberia, and by itself, or by hybridisation with *V. tricolor*, has become the parent of many garden pansies. The finest garden pansies are not preserved or propagated without great difficulty, and require most careful cultivation, without which they quickly relapse to their wild forms. Florists demand that a pansy shall have a round, flat, and very smooth edge, the petals thick and velvety, the three front petals alike in their ground colour, the lines or pencillings in the centre bright and distinct, the two back petals—which always differ in colour from the others—perfectly uniform, the flower measuring at least an inch and a half across. The Sweet-scented Violet (*V. odorata*) is common in grassy places in England and throughout Europe and the north of Asia. The flowers are either of a deep blue colour or more rarely white. Several other species, with pale blue flowers, and destitute of smell, are common in meadows and woody glades in Britain and other parts of Europe. The Dog Violet (*V. canina*) is one of the most common ornaments of hedgebanks. North America has a number of species, one of which, *V. blanda*, is sweet scented. The Himalayas produce a number of species very similar to those of Europe. The roots of several species of violets were formerly used in medicine. They contain a bitter alkaloid, *Violine*, which acts as an emetic and purgative. The petals of the sweet-scented violets are used for the preparation of *Juice* or *Syrup of Violets*, which is used as a gentle purgative for children, and also as a chemical test, being reddened by acids, and rendered green by alkalies. The Dog-tooth Violet (q.v.; *Erythronium dens-canis*) has no connection with this genus, but is a very beautiful flower of the natural order Liliaceæ. —The so-called Violet-powder, used for purposes of the toilet and nursery, is very fine starch perfumed with orris-root or other perfume.

Violet Stones, stones found upon certain mountains, as on the Brocken and the Riesengebirge, which, in consequence of being covered with Violet Moss, emit a smell like that of violets. Violet Moss (*Chroolepus Iolithus*) consists of simple articulated threads, and spreads over the stones in the form of a delicate incrustation.

Violin (diminutive from *viol*), the smallest but most important of the stringed musical instruments played with the bow. Like other bow-instruments now in use, it consists of a wooden sonorous chest, formed of two slightly arched surfaces, known as the back and belly, united by sides or ribs, and with a curve or hollow on each side in the middle of the length; a neck or finger-board attached to the chest; and strings, fastened at one end to the belly by a tailpiece or projection of wood, and at the other to turning-pins at the head or extremity of the neck, by which they can be tightened or loosened at pleasure. The strings thus passing over the belly are raised up from it by a bridge, which is supported in the interior by the sound-post; and on the belly there are two sound-holes opposite each other, of a form resembling the letter *f*, or rather the long *ſ*. The sounds are produced by drawing a bow across the strings, the upper surface of the bridge being convexly curved, so as to enable the bow to be drawn along each string separately, without coming in contact with the rest. The modern violin has four strings of gut, the lowest covered with fine silvered copper wire, or sometimes, in the best instruments, with silver or even gold wire. These strings are tuned in fifths, the highest or first string sounding E on the fourth space of the treble clef, and the other three the A, D, and G in succession below. The bow, made of horsehair, is held in the right hand, and the sounds of each string, other than the open notes, are obtained by stopping—i.e. pressing it with the finger against the fingerboard at certain distances, thus shortening the vibrating portion, and raising the pitch of the sound. Very high notes are produced by the Harmonics (q.v.) of the string, which, instead of being pressed against the fingerboard, is touched lightly, the sound resulting from the vibration being not, as in ordinary cases, of the part of the string between the point of stopping and the bridge, but of a harmonic section of it. A peculiar modification of tone is produced by the application of the *mute*, or *sordino*, a little instrument placed on the bridge. A violin or other bow-instrument is occasionally played *pizzicato*—i.e. with the fingers, as a harp or guitar. The compass of the violin is about three octaves and a half, from G below the treble clef to C above the fifth leger-line above it, with all the intermediate chromatic intervals; but the highest notes are apt to be harsh and squeaking. Great players command a few notes higher, chiefly by harmonics. Though chiefly an instrument of melody, it is to a limited extent capable of harmony by double stops—two notes may be struck together, and three or four notes may be played in arpeggio. No instrument can compare with the violin in power of expression and execution. It has an unlimited command over a very wide range of sounds, to which any degree of piano and forte, of staccato and legato, can be imparted. In orchestral music there are always two different violin parts known as first and second violin (see ORCHESTRA); and the same is generally the case when the violin is

used in concerted music, the usual arrangement of stringed quartett music being for two violins, viola, and violoncello.

The origin of the violin has been variously traced. The generally accepted view derives it from the one-stringed *Ravanastron*, the simplest of the numerous oriental stringed instruments played with a bow, which is traditionally the invention of Ravana, king of Ceylon, 5000 B.C., and is still played by Buddhist begging monks. From India these instruments of varied form found their way, through Persia, Arabia, and Spain, to the rest of Europe about the close of the 11th century. The French *Rebeck*, resembling the oriental *Rebab*, is the type of them, and from it sprang the Viol (q.v.), the immediate precursor of the violin. Another account derives the violin from the classic lyre, as well as the *Crwth* of the Welsh, which was latterly played with a bow. It is not impossible that both theories may be correct. The bow has not been conclusively accounted for, being variously supposed to have been primarily a military bow, a plectrum, and a second monochord lute applied to the first. The earliest violins seem to have been those of Gasparo di Salò in Lombardy (*c.* 1560), followed by the rest of the makers called the Brescian school, including Maggini and the Zanettos. In the 16th and 17th centuries the family of the Amati (q.v.) at Cremona, including Andrew, his sons Jerome and Antonio, and Nicolo, son to Jerome, produced violins the wonder of succeeding times, whose tone and quality more recent makers have in vain sought to equal. Antonio Stradivari (1649–1737), also of Cremona, pupil of Nicolo, if possible surpassed the Amati, and for a time the repute of Cremona was kept up by the families of the Guarnieri and Ruggieri. Next to the Cremonese violins, in the estimation of connoisseurs, stand those of the Tyrolese makers, Jakob Stainer (1621–83), and Matthias Klotz and his sons. Villaume of Paris is the most celebrated modern maker. Experience has shown that the minutest details of form and proportion, and the material of which each separate part is made, are matters of vital importance to the quality of the violin. The great makers seem by a succession of delicate experiments and observations to have attained to acoustical qualities of high perfection, which their careful workmanship and extreme dexterity enabled them in all cases unfailingly to reproduce. The prices of the best violins of Stradivari and Guarnieri del Gesù range from £200 to £500, but several have exceeded the latter figure; one was sold at Stuttgart a few years since at the fancy price of £2050. The cost of the raw materials of a violin, comprising seventy different parts, has been estimated at about 4s. 6d.

Two great schools of violin-playing originated in Italy—that of Corelli (q.v., 1653–1713), to which belong by direct tradition Joachim and Sarasate, and that of Tartini (q.v., 1692–1770). Among other players of note of different schools may be mentioned Lully (1633–87), Paganini (1784–1840), Spohr (1784–1859), August Wilhelmj (born 1845), Laub (1832–75), Ole Bull (1810–80), Henri Wieniawski (1835–80), and Mme. Normann Neruda (Lady Hallé, born 1840).

The violin has a whole literature of its own, of which a bibliography was compiled in 1892 by Mr E. Heron-Allen. See his *Violin-making* (1885), C. Engel's *Researches into the Early History of the Violin Family* (1883), G. Hart, *The Violin: its famous Makers and their Imitators* (1873; new ed. 1887), G. Dubourg, *The Violin* (1878), J. Broadhouse, *The Violin: its Construction practically considered* (1892), Dr Phipson's *Biographies of Eminent Violinists* (1877), the foreign works of Ruhlmann and Fétis, and Mr E. G. Payne's articles in Grove's *Dictionary* and in the *Encyclopædia Britannica*.

Viollet-le-Duc, Eugène, architect, was born in Paris, 24th January 1814, and studied with especial care the ancient monuments of Provence, Italy, and Greece. In 1814 he was director of the restoration of the Sainte Chapelle, and from this time on was the great 'restorer' of ancient buildings in France, both secular and ecclesiastical; displaying unquestioned zeal and learning, but, from the point of view of those who suspect wholesale 'restorations,' a lack of piety for the actually old. He served as an engineer in the defence of Paris, and was a prominent advanced republican politician till his death, 17th September 1879.

Of his numerous works the best known was his great dictionary of French Architecture (1853–69). There have been translated into English works on military architecture, how to build a house, the annals of a fortress, the habitations of man in all ages, on restoration, and a volume on Mont Blanc. See monographs by Sauvageot (1880) and Saint-Paul (1881).

Violoncello (diminutive from Ital. *violone*, 'large viol or double bass'), a large instrument of the violin class, held by the performer between his knees. It has four gut strings, the two lower of them covered with silvered copper wire, and is tuned in fifths, the first or upper string sounding A on the fifth line of the bass clef, and the others the D, G, and C successively below. Its compass is from the latter note up to A on the second space of the treble clef, but soloists play an octave higher. Its signature is usually the bass clef, the tenor or treble clef being used for the higher notes. The quality of its tone is even more sympathetic than that of the violin, and instruments by the old makers command equally high prices. It superseded the viol da gamba in the early part of the 18th century.

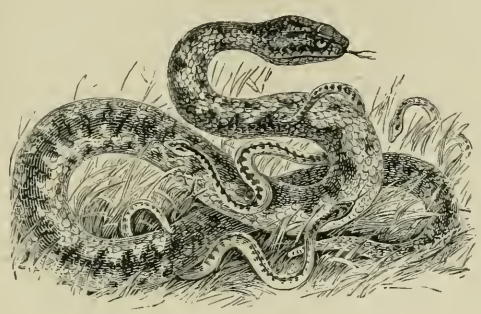
Vionville, a small village of Lorraine (pop. 450), 20 miles W. of Metz, famous for the great cavalry battle (sometimes named from the adjoining village of Mars-la-Tour) of 16th August 1870, when the French were driven back on Metz.

Viotti, Giovanni Battista (1753–1824), violinist and composer, born in Piedmont, studied in Turin, and in 1780 played in Germany, France, England, and Russia with eclat. He settled in Paris, but in 1795–1815 was in London, where, after another sojourn in Paris, he died. He composed concertos, sonatas, and stringed quartetts, and influenced musical taste by his own admirable playing and by his teaching.

Viper (*Vipera*), a genus of venomous snakes, representative of the family Viperidæ. This family includes many important forms—e.g. the Common Adder (*Vipera* or *Pelias berus*); the Asp (*V. aspis*), extending as far north as Sweden; the African Horned Viper (*V. cerastes*) and Puff-adder (*Clotho* or *Echidna arietans*); the Indian Daboia or Russell's Viper (*Daboia russellii*); and the Indian *Echis carinata*. The head is relatively broad, somewhat triangular, and generally covered with scales; the eye has a vertical pupil, and there is no pit between it and the nostril; the maxilla bears on each side one functional fang, usually with several reserve-fangs beside it; the poison is virulent. The vipers are widely distributed through the Old World and in Australia; the majority are African. As far as is known they are viviparous.

The common viper or adder is the only poisonous snake indigenous to Britain. It lives especially on dry heaths and waste places, often among stones and brushwood; it is commoner in Scotland than in England, and does not occur in Ireland. It is widely distributed throughout Europe. Often confused with the innocent Grass-snake (*Tropidonotus natrix*), it may be distinguished by its markings. It has two diverging marks between and

rather behind the eyes, a spot on each side of the hinder part of the head, a row of confluent rhomboidal spots running zigzag along the upper surface the whole length of the body and tail, and a row of small irregular, almost black, triangular spots on each side. The under parts are of a lead colour. The characteristic markings are almost invariable; but the ground colour varies considerably, from nearly olive, rich deep brown, or brownish yellow, to almost black. Thus in some parts of England a 'Black Viper' is occasionally met with; its ground colour a rich black, and the markings of a more intense black than the rest.



Common Viper or Adder (*Vipera* or *Pelias berus*).

There is also the 'red' and the 'blue-bellied,' and an almost white viper, with black markings. The viper seldom exceeds two feet in length. It feeds on mice, frogs, small birds, and other small animals, which are killed by its poison-fangs, and swallowed entire. It hibernates during several months of the year, and several may then be found twined together in a torpid state. It is a good swimmer, and may occasionally be seen on lakes such as Loch Lomond, crossing from one island to another. The young are produced in early summer, from ten to fifteen or more at a birth. The eggs have soft, thin envelopes, and are hatched within the oviduct. The young viper is coiled up so closely in the egg as to appear almost a solid mass, but the moment it is set free it is active, and ready to throw itself into an attitude of defence.

Young Viper's Position in the Egg.

It has often been alleged that in times of danger the young of the viper seek refuge in their mother's open mouth, and find temporary protection in her œsophagus; but, although this unlikely habit is not impossible, the fact is not supported by sufficient evidence. The viper is naturally shy of man, but when trod on or provoked is of course ready to defend itself by biting. The bite is painful, and, though not dangerous to healthy adults, is apt to be attended with more serious consequences in the case of children or those of weak constitution. Fatal cases are exceedingly rare. For remedies, see SNAKES, p. 532; and for the proverbial deafness of the adder, see SNAKES, p. 529.

The name Viper (Lat. *Vipera*) is manifestly a contraction of *Vivipera* for *Vivipara*. The name Adder arose from writing *an adder*, for *a nadder*. The A.S. is *nædre*, Old Eng. *naddere*, *neddere*, or *addere*, Scot. *nether*. Pliny, Galen, and other ancient writers ascribe great medicinal virtues to broth made of vipers, and to the flesh of the animal. Vipers twined together in hibernation were supposed to produce the *Ovum Anguineum*, to which virtues were attributed; and *snakestones* as charms were at one time common in Britain. They were either marbles or glass beads of various forms, supposed to cure vipers' bites, and to be otherwise useful.

Viper's Bugloss (*Echium*), a genus of plants of the natural order Borragineæ, having a calyx with five deep segments, an almost bell-shaped corolla, with dilated throat, and irregular limb, very long unequal filaments, and a bifid style. The species are large herbaceous plants or shrubs, rough with tubercles and hairs. Their flowers are often very beautiful. The Common Viper's Bugloss (*E. vulgare*), a large annual plant, is a native of Britain and of most parts of Europe, growing in dry places, not unfrequently in cornfields. Its flowers are at first reddish, and afterwards blue. It derives its name, Viper's Bugloss, from spots on its stem, which somewhat resemble those of the viper; and the property of healing vipers' bites was therefore ascribed to it. Other herbaceous species are found in the south of Europe, North and South America, and other parts of the world. Shrubby species are found chiefly in the Canaries and South Africa.

Viper's Bugloss (*Echium vulgare*).

Virchow, RUDOLF, pathologist and publicist, was born 13th October 1821 at Schivelbein in Pomerania, studied at Berlin, and in 1843 became prosector at the Charité there. In 1847 appointed a university lecturer, next year in the revolutionary fervour he got into disfavour, and was invited in 1849 to Würzburg as professor, but in 1856 returned to Berlin as professor and director of the pathological institute. He founded, edited, and contributed to several important medical journals, took part in numerous commissions, and speedily became one of the foremost pathologists in Europe, making very important contributions to many departments of pathological and physiological science. He rendered important services to archæology and anthropology in connection with such subjects as lake-dwellings and cave-men, skulls from Trojan graves and Egyptian tombs; and as a politician has long been one of the most influential leaders of the advanced liberals of Prussia, where in 1862 he was first elected a member of the Prussian chamber. Of his innumerable works on medical and anthropological science *Cellular Pathology as based on Histology* (1850; 4th ed. 1871; Eng. trans. 1860) is the most famous. Others are *Famine Fever* (trans. 1868), *Freedom of Science* (trans. 1878), *Infectious Diseases in the Army* (1879), *Post-mortem Examinations* (trans. 1878), and treatises on trichiniasis, hygiene and sewerage, barracks, &c. He has exercised great and beneficent influence in the improvement of asylums and hospitals. See W. Becher, *Rudolf Virchow* (Berlin, 1891).

Vire, an ancient and pretty town of Normandy, in the dept. of Calvados, on the Vire, 35 miles SW. of Caen. It stands on a rock, is built of granite, and is surrounded by hills, between which are the beautiful valleys of Vire—*Vaux de Vire* (see VAUDEVILLE). Pop. (1891) 6635.

Virgil (Publius Vergilius Maro), the first of Latin poets and one of the three or four chief poets of the world, was born at Andes near Mantua on the 15th of October 70 B.C. The plain of Lombardy then lay outside of the limits of Italy, and formed a province known as Cisalpine Gaul. The population was mainly Celtic, but was already permeated by the Latin language and civilisation; and Julius Cæsar, when he admitted it to full Roman citizenship in Virgil's twenty-first year, was adjusting rather than extending the natural limits of Italy. The name Vergilius is apparently Celtic, and in Virgil's Celtic blood modern critics have found the origin of his romantic and melancholy temper, and of the deep sense of natural beauty and the spiritual meaning of nature, in which he stands alone among Greek and Latin poets.

Virgil's father owned a small property in his native place, where, besides the ordinary work of a farm, he occupied himself in forestry and bee-keeping. He was well enough off to give his son the education which was generally confined to a wealthier class. The boy was sent to school at Cremona and Milan, and at the age of sixteen went to Rome and studied rhetoric and philosophy under the best teachers of the time. His studies were probably interrupted by the civil war; at all events, we know nothing of the next years of his life till 41 B.C. The victorious triumvirs were then providing for the immense armies which had been disbanded after the battle of Philippi by settling them on confiscated lands throughout Italy. Virgil's farm was part of the confiscated territory of Cremona; but his reputation as a rising poet had already brought him under the notice of the governor of the district, Asinius Pollio, himself a distinguished man of letters. By Pollio's advice he went to Rome, with special recommendations to Octavianus; and though his own property was ultimately not restored to him, he obtained ample compensation from the government, and became for a few years one of the circle of endowed court-poets who gathered round the prime-minister Mæcenas. In 37 B.C. the *Eclogues*, a collection of ten pastorals modelled on those of Theocritus, were published, and received with unexampled enthusiasm. Soon afterwards Virgil withdrew from Rome to Campania. The munificence of Mæcenas had placed him in easy and even affluent circumstances. He had a villa at Naples, and a country-house near Nola, within easy reach of it; and he seems to have lived almost entirely in this neighbourhood during the seven years in which he was engaged on the composition of the *Georgics*, or *Art of Husbandry*. This poem, which is in four books, and deals with tillage and pasturage, the cultivation of trees, especially the vine and olive, and the breeding of horses, cattle, and bees, appeared in 30 B.C., and confirmed Virgil's position as the foremost poet of the age. The remaining eleven years of his life were devoted to a larger and in some respects more uncongenial task, undertaken at the urgent and repeated request of the emperor, the composition of a great national epic. During these years he lived a secluded life, chiefly in Campania and Sicily; he seems also to have travelled in Greece, and to have paid occasional visits to Rome, where he had a house in the fashionable quarter on the Esquiline. The subject he chose was the story of Æneas the Trojan, the legendary founder of the Roman nation and of the Julian family, from the fall of Troy to his arrival in Italy, his wars and alliances with the native Italian races, and his final establishment in his new kingdom. By 19 B.C. the *Æneid* was practically completed, but Virgil had set apart three years more for its final revision. In the summer of that year he left Italy with the intention of travelling in Greece and Asia; but at Athens he fell ill, and returned only to die at Brundusium a few days after landing, on the 21st of September. He had almost completed his fifty-first year. In his last illness he expressed a wish to burn the *Æneid*, and he left directions to that effect in his will. By the command of Augustus these directions were disobeyed, and it was published as we now possess it. At his own wish he was buried at Naples, on the road to Pozzuoli, his tomb for many hundreds of years after being worshipped as a sacred place.

In person Virgil was tall and dark, shy and silent in manner, and suffering from delicate health throughout his life. No authentic portrait of him exists. He never married, and from his will it would appear that a half-brother was the only near relation whom he left. His sincerity and sweetness of temper won the warm praise of Horace, who is not lavish of praise, and the fastidious purity of his life in an age of very lax morality gained him the same name of *the lady* by which Milton was known at Cambridge.

Besides the three works already mentioned, a few juvenile pieces of more or less probable authenticity are extant under his name. These are the *Culex* and the *Moretum*, both in hexameter verse, the former an 'epyllion,' or short poem of narrative and description in the epic manner, the latter an idyll freely translated from the Greek of Parthenius; the *Copa*, a short elegiac piece; and fourteen little poems in various metres, some serious, others trivial, which come under his name at the head of a collection of minor Latin poetry incorporated in the Latin Anthology. These pieces are not printed in most editions of Virgil, nor are any of them certainly authentic, though some of them passed as his among scholars within a century after his death. The *Ciris*, a piece of the same kind as the *Culex*, is now agreed to be by a contemporary imitator.

The supremacy of Virgil in Latin poetry was immediate and almost unquestioned. The enthusiasm excited by the *Eclogues* rose partly from the recognition in them of a new sense of romantic beauty, partly from the feeling that a Roman artist had at last appeared who could be set beside the great artists of Greece. In the hands of Lucretius and Catullus the intractable Latin tongue had proved able to express impassioned argument and vivid emotion; in the *Eclogues* it assumed a richness, harmony, and sweetness till then quite unknown. The promise shown in the *Eclogues* was more than fulfilled in the *Georgics*. In no work of ancient or modern art is there a more sustained splendour, an ampler music of language, a more magical fusion of thought and feeling. The workmanship of the *Æneid* is more unequal; but in its great passages there is the same beauty, with an even fuller strength and range. Virgil left the Latin language to his successors as an instrument of which he had sounded the full compass and developed the entire capacity; subsequent Latin poetry has to be estimated by the degree in which it falls short of his. There were some in ancient as in modern times who continued to prefer the direct force and austere simplicity of Lucretius to Virgil's rich and intricate harmonies; but for the world Virgil was the imperial poet, the great voice of Rome.

In estimating Virgil's place among the great poets of the world different natures will lay stress on different qualities as constituting the essence of the highest poetry. Virgil is not comparable to Homer in dramatic force and in the fresh charm of his story; he has not the concentrated passion of Pindar and Dante; and the lyrical cry of direct

emotion, such as thrills us in Sappho or Catullus, belongs to a different order of art from the majestic sadness, the serene and harmonious cadences, of poetry enriched with all the associations of art and learning, and wrought by patient labour into the most exquisite finish. But what Virgil has in a degree that no other poet has ever equalled is pity; the sense of 'tears in things,' to which in the most famous of his single verses (*Aen.* i. 462) he has given imperishable expression, and which fills with strange insight and profound emotion those lonely words and pathetic half-lines where he has sounded the depths of beauty and sorrow, of patience and magnanimity, of honour in life and hope beyond death.

The reputation of Virgil from his own time till now is probably unparalleled in its continuity. His works were established classics even in his lifetime, and soon after his death had become, as they still remain, the school-books of western Europe. By the 3d century his poems ranked as sacred books, and were regularly used for purposes of divination. The purity and piety in which he is eminent beyond other Latin poets, together with the mystical interpretation of the fourth *Eclogue*, which found in him an unconscious channel of divine inspiration and a 'prophet of Christ among the Gentiles,' made his fame almost as high in the Christian as in the pagan world; of all the testimonies borne to his matchless power in stirring the deepest human emotions the subtlest and most eloquent are those of two princes of the Catholic Church nearly fifteen centuries apart from one another—Augustine and Newman. In the dark ages his fabled powers as a magician almost eclipsed his real fame as a poet; but with the revival of learning he resumed his old place; for Dante and Petrarch, and for the whole of the earlier and later Renaissance, he was the first of the world's poets. In the earlier part of the 19th century his reputation for the first time suffered serious eclipse. The spiritual upheaval of the age which followed the French Revolution turned for inspiration to fresher sources; and in the general anarchy of taste which followed Virgil fell out of fashion among readers too capricious or too impatient to feel his charm. Criticism has now returned to a juster view, and the most recent estimates of Virgil, both in France and England, are also the most appreciative, not only of his immense learning and of the wonderful truth and refinement of his descriptions, but of his eminence in all the essential qualities of poetry. Of his consummate mastery of metre and diction there has never been any question; even those who have thought least of his dramatic power or imaginative insight have acknowledged the finished beauty of his language, and the stately and haunting music of his verse, to which the noblest of tributes has been given by Lord Tennyson, himself the most Virgilian of modern poets.

There are extant MSS. of Virgil of as early a date as the 4th century. Virgil was first printed at Rome by Sweynheym and Pannartz in or before the year 1469, the edition consisting of 275 copies. Of the many hundreds of subsequent editions the most important are those of Heyne (1767–75; enlarged in subsequent editions and afterwards re-edited by Wagner) and Ribbeck (1859–68). Both of these include the minor poems. The standard English edition is that of Conington and Nettleship (4th ed. 1881–83), and there are good smaller editions by Kennedy, Papillon, and Sidgwick. The commentary by Keightley is almost indispensable in reading the *Georgics*. Among verse translations that of Dryden still holds a high place; others which deserve special mention are those of Lord Justice Bowen (incomplete), Mr William Morris (*Æneid*), Calverley (*Eclogues*), and Rhodes (*Georgics*). There are prose translations by Conington and by the present writer. The best estimates of Virgil as a poet are those of the late Professor Sellar in *The Roman Poets of the Augustan Age*, of Sainte-Beuve in his *Étude sur Virgile*, and of Mr F. Myers in his *Classical Essays;* and beyond all, Lord Tennyson's lines 'To Virgil' in *Tiresias and other Poems*.

VIRGIL THE MAGICIAN.—Not the least remarkable circumstance in the history of Virgil is the reputation of the magician which the mediæval imagination persistently associated with his name. His undisputed supremacy and the peculiar fascination of his poetry made easy the notion of a wisdom and mystic meaning wrapped up in his verses, and as early as the 3d and 4th centuries we find Christian authors like Minucius Felix, Lactantius, and Augustine separating him from all other pagan writers. Messianic prophecy was read into his fourth Eclogue, and Virgil and the Sibyl were actually introduced into the liturgy of the church, along with the Messianic prophecies of the Old Testament, as witnesses to a coming Messiah. Had not St Paul visited Virgil's tomb at Naples, and did not Statius owe his conversion to the fourth Eclogue? Centos were manufactured out of the *Æneid* giving the whole of sacred history in epitome. And already under the Roman empire it was customary enough to discover one's fortune by selecting lines at random from his epic—the famous *Sortes Virgilianæ* (q.v.). Ultimately in the *Divina Commedia* of Dante the 13th-century Virgil became a representative of enlightened reason, a gifted genius standing midway between paganism and Christianity. This deep half-religious veneration for Virgil, together with the scholastic conception of his superior wisdom, especially in mathematics and medicine, helps us to understand Dante's conception of the *vates sacer;* in the contemporary *Dolopathos*, a special version of the Seven Wise Masters (q.v.), we see the mythopœic process at work, the name of Virgil taking the place of the sage Sindibad.

It was out of Neapolitan folklore that the legendary reputation first grew, gaining many strange accretions from all sides on its course. But the earliest literary accounts were not Italian. The first writer to mention it is John of Salisbury in his *Polycraticon de Nugis Curialium et Vestigiis Philosophorum* (1156), who describes Virgil as making for Marcellus a fly that would destroy all other flies. But the first artistic treatment of the theme is seen in the letters of Conrad of Querfurt, afterwards Bishop of Hildesheim, the representative of the Emperor Henry VI. at Naples. He tells us he had seen the palladium of Naples (a model of the city enclosed in a narrow-necked bottle) and many other talismans and charms wrought by Virgil's skill—the most useful, the statue of an archer pointing an arrow at Vesuvius, which prevented its eruptions. These stories occur again with additions in Alexander Neckam's *De Naturis Rerum*, in the *Otia Imperialia* of Gervase of Tilbury, the French poem *Image du Monde* (1245), where the famous brazen head appears, as well as the first thread of love. In the rhymed *Weltbuch* of Johann Enenkel of Vienna (1250) we read how Virgil, finding the devil imprisoned in a glass bottle, released him after he had learned all his magic arts. His first task was the creation of a perfect woman. But not content with her he made love to a married woman of Rome who befooled him by a pretended assignation, and left him exposed to public ridicule hanging half up to her window in a basket. This last was an exceedingly popular mediæval story, and was even carved on the misereres of churches. In the *Roman de Cleomadés* of Adenés li Rois (*c.* 1290) we find the first mention of Virgil's figure holding the mirror at Rome which showed if treason was hatching anywhere—the famous *Salvacio Romæ*—as well as the copper statue of an

archer whose arrow pointed at the public fire kept it alive; his magic garden we first meet in Padre Giordano's contemporary Life of San Guglielmo of Vercelli. The old stories again occur in the French romance of the *Renard Contrefait* (*c.* 1319); his compacts with the devil, with much detail, in the 14th-century German poems *Reinfrit von Braunschweig* and the *Wartburg-krieg*. The earliest attempt in Italy to weave all the varying legends into a collected form is the prose *Cronica di Partenope* of Bartolommeo Caracciolo (1382). In the *Proeess of the Seven Sages* (1330), the English form of the *History* thereof, the ninth tale is devoted to the 'nigramancie' of Virgil at Rome, and the same reappears in the *Gesta Romanorum* (No. 27). The latest stages of the legend may be seen in *Le Myreur des Histors*, written at Liége by Jean d'Outremeuse in the 14th century; the English *Lyfe of Virgilius* (1510; reprinted in W. J. Thoms's *Early English Prose Romances*); its French version, the *Faicts Merveilleux;* and in the Spanish *Romance of Virgilius* (1550). In the *Faicts* Virgil makes a statue the sight of which ensures the virtue of women. His own wife and other licentious Roman ladies try to break it, but in vain. He carries off the beautiful daughter of the Soldan of Babylon, baffles her father by sorcery, builds Naples, and establishes there a school of necromancy.

Professor Comparetti thinks these legends of popular and Neapolitan origin, but recognises in them two elements, the first exclusively Neapolitan connected with the notion of a special intimate affection of Virgil for the city; the second consisting of the distinct and not merely Neapolitan belief in certain public talismans attributed to Virgil, analogous accretions of legend being associated with most monuments of antiquity. Mr J. S. Tunison, in his *Master Virgil* (Cincinnati, 1888), labours to prove that the legend is originally of northern not southern origin, and of literary rather than popular genesis, the first writers who related tales of Virgilian magic being Norman Latinists of England and France.

See Zappert, *Virgil's Leben und Fortleben im Mittelalter* (Vienna, 1851); Roth in Pfeiffer's *Germania* (vol. iv. 1859); Milberg, *Mirabilia Vergiliana* (Meiss. 1867); Professor Dom. Comparetti, *Virgilio nel Medio Evo* (2 vols. 1872; Eng. trans. 1895: see *Quarterly Review*, July 1875); and Professor A. Graf, *Roma nella Memoria e nelle Immaginazioni del Medio Evo* (2 vols. 1882-83).

Virgil, Polydore. See Vergil.

Virginal, or Virginals. See Harpsichord.

Virginia, a middle Atlantic state of the American Union, separated from Maryland by the Potomac River and Chesapeake Bay, and also by an arbitrary line 25 miles in length across the eastern shore; on the south it adjoins North Carolina for 326 miles and Tennessee for 114 miles; on the west and north-west are Kentucky (115 miles) and West Virginia (450 miles, in a very irregular line). The greatest length from east to west is 475 miles, and the greatest width from north to south 190 to 200 miles. It has a land area of 40,125 sq. m. and a water area of 2325 sq. m.

Copyright 1892 in U.S. by J. B. Lippincott Company.

The surface of the state consists of a series of belts extending from north-east to south-west parallel to the trend of the coast on the east and the ranges of the Appalachian Mountains on the west. These divisions rise one above another from the coast westward, forming a stairway of ascending elevations. They differ in aspect, soil, climate, geological structure, and products. The tidewater region, penetrated by the waters of the ocean, of Chesapeake Bay and its inlets, and of the tributary streams, is divided into numerous peninsulas, and has a coast-line of nearly 1500 miles. The peninsula of the eastern shore and the Norfolk peninsula are low, rising but 20 or 30 feet above sea-level, and form the first in the series of ascending steps. The other peninsulas rise higher, forming the second and third terraces. Westward from the head of tidewater lies the middle country, an undulating plain from 25 to 100 miles wide, broken in places into ridges by outliers of the Appalachian Mountains and by the transverse valleys of the streams. The fifth ascent is the Piedmont plateau, having an elevation of from 300 to 500 feet, and diversified by numerous valleys and 'coves' formed by the broken coast-ranges and projecting spurs of the Blue Ridge. This eastern range of the Appalachians forms the next division, and for two-thirds of its length within the state simply constitutes the divide between the Piedmont country and the Great Valley to the west. In the south-west it expands into a broad plateau, which, extending into North Carolina, forms the culminating portion of this mountain-system. The range consists of a series of domes connected by long ridges with many side spurs. The height of the mountains increases toward the south-west, as does that of the surrounding country. The Great Valley lies between the Blue Ridge and the western Kittatinny or North Mountains. Though this valley is continuous it has four watersheds and contains the minor valleys of the Shenandoah, the James, the Roanoke, the Kanawha, and the Holston or Tennessee rivers. The last of the belts belongs to the Appalachian mountain-region, and is styled 'Appalachia.' It may be described as a series of long narrow valleys 2000 feet or more above the sea, enclosed between the long parallel ranges of the Alleghany Mountains. About six-sevenths of the state is drained by the streams of the Atlantic system. The important rivers are the Potomac, Rappahannock, York, James, Blackwater, and Roanoke. The remaining seventh is drained mainly by the Kanawha or New River, the Holston, and the Clinch, which are tributary to the Ohio. Virginia is famous for the number and value of its mineral springs. The Natural Bridge, in Rockbridge county, and the many caverns are among the objects of interest to tourists.

With its diversified surface and its position near the sea Virginia has a climate which varies with the locality. Except in the swampy portions of the tidewater district it is remarkably pleasant and healthful. The mean annual rainfall is from 40 to 45 inches, and is well distributed throughout the year. The soils are mostly fertile, and the state contains extensive forests. Along the shores of the tidewater region and in the marshes waterfowl of various kinds are abundant, and elsewhere partridges or quails, pigeons, grouse, wild turkeys, and other game birds are found. Deer are numerous in many sections. The fisheries are important, and supply large quantities of fish, which are shipped to other states. Oyster-culture is engaged in. Indian corn, oats, and barley are extensively grown. The products of market-gardens and orchards are especially valuable on account of the facility with which they may be carried to the great Atlantic seaports. Tobacco has always been a staple crop in this state, and the 'Virginia leaf' is noted throughout the world for its excellence. Among the mineral products are marls, choice sands and clays, granites, limestones, marbles, and other building stones, iron, lead, and zinc ores in abundance, gold in the middle region, at one time worked quite extensively, and bituminous and anthracite coal. The coal-field which occurs in the Triassic sandstones in the vicinity of Richmond yields, besides a bright, black, bituminous coal, a remarkable natural coke; but the most

thoroughly worked coal area is the Pocahontas field in the south-west. The mining and manufacturing interests of the state are rapidly increasing. Facilities for transportation are excellent. The enormous water-front affords ample opportunities for reaching all the leading markets by steamers and sailing-vessels, and in 1898 there were within the state 3668 miles of railroad.

Virginia has 100 counties. There are thirty towns having a population of more than 2000. The most important cities are Richmond, the capital, Norfolk, Petersburg, Lynchburg, Roanoke, Alexandria, Portsmouth, and Danville. The state maintains an excellent system of public schools, and private schools, academies, and colleges are numerous. Among the more important institutions of higher learning are the University of Virginia, the Agricultural and Mechanical College, the Virginia Military Institute, Emery and Henry College, Roanoke College, Hampden and Sydney College, Washington and Lee University, and Richmond College.

The history of Virginia is perhaps more romantic and heroic than that of any other state of the Union. It was here that the first lasting colony was established by the English. At Jamestown was held the first representative assembly in America. With its early period are associated the names of Captain John Smith and Pocahontas. Such was the prosperity of the colony that at the end of the colonial period Virginia was the most populous and wealthy of the thirteen colonies. In the protest against the Stamp Act and the encroachments of Great Britain Virginia took the lead, and in the revolutionary struggle furnished such noted sons as Washington, Jefferson, Patrick Henry, the Lees, and Madison. At Yorktown the surrender of Cornwallis put an end to the contest. In the civil war Virginia furnished the commander of the Confederate forces, General Robert E. Lee, and on its soil the last battle was fought, and the final surrender was made. Of the first twenty-one presidents of the country seven were natives of Virginia. Pop. (1800) 880,200; (1860) 1,596,318; (1870, after the separation of West Virginia) 1,225,163; (1880) 1,512,565; (1890) 1,655,980 (640,867 coloured); (1900) 1,854,184.

See books on the history of Virginia by R. R. Howison (1846–48), Campbell (1860), Stith (1866), Cooke (1883), O'Neill (1885), Drake (1894), and P. A. Bruce (1896).

Virginia. See CLAUDIUS (APPIUS).

Virginia, UNIVERSITY OF, at Charlottesville, Albemarle county, Virginia, 4 miles from Monticello, the seat of Jefferson, by whom it was planned and organised. It was chartered by the state in 1819, opened in 1825, and has over 300 students and a library of 40,000 vols.

Virginia, WEST. See WEST VIRGINIA.

Virginia City, capital of Storey county, Nevada, is built, 6200 feet above the sea, on the eastern side of Mount Davidson, 21 miles by rail NNE. of Carson. It owes its existence to its silver-mines, the principal being the Comstock Lode (q.v.) and the Big Bonanza. Pop. (1880) 10,917; (1890) 6377.

Virginia Creeper (*Ampelopsis* [*Parthenocissus*] *quinquefolia*), an American vine, known also as American Ivy, Woodbine, &c., often grown on the fronts of houses in Britain and continental Europe as an ornamental creeper. The tendrils terminate in a peculiar kind of sucker, and the autumnal foliage is rich in varied colour of light and dark green, brown, red, and yellow.

Virginian Deer. See CARIACOU.

Virginian Quail. See QUAIL.

Virginian Stock. See STOCK.

Virginia Water, an artificial lake, nearly 2 miles long, formed in 1746 by the Duke of Cumberland in the Great Park at Windsor, is 5 miles S. of the castle, and is mainly in Surrey, but partly in Berks.

Virgin Islands, a group of islands in the West Indies, about fifty in number, but only a few of them of any considerable size or importance. The total area is about 260 sq. m., and the population is near 45,000. Three of the islands, St Thomas, Santa Cruz, and St John, belong to Denmark, having a total area of 120 sq. m. and a pop. of 34,000. Bieque or Crab Island, Culebra, and other dependencies of Porto Rico (total area, 184 sq. m.; pop. about 6000) were ceded by Spain to the United States in 1898. The others are British; total area, 58 sq. m.; pop. (1881) 5287; (1891) 4639, of whom only about 150 are whites. The chief of the British Islands, which form a district of the colony of the Leeward Islands, are Tortola, Virgin-Gorda, and Anegada. The exports have a value of near £5000, and the imports of from £3000 to £7000. Extensive tracts of land, possessed by the emancipated blacks, form good pasturage for cows, sheep, and goats; cotton, sugar, and fish are the other principal products.

Virgin Mary. See MARY.

Virgin's Bower. See CLEMATIS.

Viriathus, a Lusitanian herdsman, who became a guerilla leader against the Romans, escaped the treacherous massacre by the proprætor, Ser. Sulpicius Galba (151 B.C.), soon mustered a large force, and defeated army after army of the Romans. At length he hemmed in the consul, Q. Fabius Servilianus (141), in a defile, and forced him into unconditional surrender, on condition that the Lusitanian independence should be assailed no further. But next year Q. Servilius Cæpio treacherously resumed the war against Viriathus, and ended it by successfully bribing some of his officers to murder him.

Viridian is a bluish-green pigment of much depth and purity. It is a hydrated sesquioxide of chromium, and is a valuable modern addition to the artist's palette. Neither light nor sulphuretted hydrogen gas has any action upon it, and it mixes with other colours without injuring them.

Virtues. See CARDINAL VIRTUES, and SEVEN.

Virus (Lat., 'slime,' 'poison'), specially the contagium of an infectious disease. See CONTAGION, INFECTION, DISEASE, GERM, SNAKES, POISON, VENOMOUS BITES, and the articles on the infectious diseases.

Viscacha, or BIZCACHA (*Lagostomus trichodactylus*), a species of Rodent belonging to the same family as the Chinchilla (Chinchillidæ), occurring over an immense territory on the South American Pampas and adjoining country from the Uruguay River to the Rio Negro. It is a gregarious burrower, nocturnal in its habits. Twenty or thirty live together in their villages of deep burrows, around which they keep a patch of close-cropped turf in good order, so that their numerous enemies are descried at sufficient distance to allow the slow-footed rodents time to scuttle into the pit-like mouths of the burrows. The earth brought up from the burrows forms a mound from 15 to 30 inches above the plain; and so numerous are the 'Vizcacheras' in some parts of the Pampas (especially the settled parts) that one cannot ride half a mile without seeing one or more of them. Burrowing owls and other birds also make themselves at home on the mounds of the viscacha. In unsettled regions the tame familiar rodent has deadly enemies in the puma and the jaguar. The fox, on the other hand, often establishes himself in

a viscacha's burrow, and is not regarded by the full-grown natives with dread, though he lives largely on the young viscachas that get in his

Viscacha (*Lagostomus trichodactylus*).
(From Hudson's *Naturalist in La Plata.*)

way. The viscachas often ruin much of a sheep-farmer's best pasture. A full-sized male is 22 inches in length to the root of the tail, the female somewhat smaller. See Hudson's *Naturalist in La Plata* (1892).

Vischer, PETER, artist in bronze, was born at Nuremberg in 1455, and died there 7th January 1529. Among his most notable works are the tomb of Duke Ernst in the Dom at Magdeburg, St Sebald's shrine at Nuremberg, and a relief in the cathedral at Ratisbon; and in virtue of these and other works he was reckoned by contemporaries as the next artist to Albert Dürer. His sons, Hermann, Hans, and Peter Vischer the younger, were also distinguished as sculptors and workers in bronze.

Visconti, a Lombard family who for nearly 200 years exercised supreme sway over Milan (q.v.).

Viscosity is the property of matter which is in evidence when the relative motion of parts of any body or substance decays on its being left to itself. The gradual cessation of waves on the sea or of wind in the air, the dying away of sound, the frittering away of the energy of a tuning-fork are illustrations of the effect of viscosity. The property is possessed by all substances, gaseous, liquid, and solid. The kinetic theory of gases gives a very simple explanation of viscosity in fluids, or fluid friction as it is also called. Suppose, for example, that there are two contiguous layers of gas flowing with different speeds. This fact will not prevent the individual molecules diffusing across the interface that separates the two regions. Thus the one layer will on the whole gain momentum, and the other lose it, in the direction of motion of the latter. The tendency will be to an equalisation of momentum of the two regions, and the rate at which this takes place across unit area is the measure of the viscosity. Although the molecules of a liquid have not so great freedom of individual motion as have those of a gas, still it is easy to see that a similar interaction will take place between contiguous finite portions moving relatively to one another. The action will no doubt involve dissociation or the breaking up of groups of molecules which assume other and for the moment more stable configurations. According to Maxwell's theory of the constitution of bodies, the difference between a liquid and a solid is that in the former all the groups of molecules readily break up, while in the latter only a small number do so. But it is evident that, if only one of a vast number of molecular groups so yields to the stresses acting on it, the perfect elasticity of the substance will be destroyed. The substance on recovering will not be able to give back the energy spent in deforming it. Any vibrating solid, such as a tuning-fork or wire undergoing torsional oscillations, loses more or less rapidly its energy of motion. In ordinary circumstances this loss is largely due to the resistance of the air, which is ultimately determined by its viscosity. But even if the vibrations were executed in a perfect vacuum there would still be decay of motion in virtue of the viscosity of the solid material itself. The amount of viscosity will depend upon the number of molecular groupings, which break up under influence of the imposed stresses and assume new configurations of stability. See ELASTICITY, FRICTION, STABILITY. It is interesting to note that the kinetic theory of gases implies, almost of necessity, the existence of viscosity, which is simply the diffusion of momentum.

Viscount (Old Fr. *viconte*, *visconte;* Lat. *vice*, 'in place of,' and *comes*, 'earl'), originally the officer who acted as deputy to the earl, the *vicecomes*, who ultimately became the sheriff (always Latinised by *vicecomes*). The hereditary title of viscount is a degree of nobility unconnected with office. It was first granted in England to John Beaumont, created a peer by the title of Viscount Beaumont in 1440. A viscount is now the fourth degree of nobility in the United Kingdom, intermediate between earl and baron, and has not been very largely conferred. The coronet is described at CORONET. A viscount is styled 'Right Honourable;' his wife is a viscountess; and all his sons and daughters are styled 'Honourable.' See COURTESY TITLES.

Vishni-Volotchok, a town of Russia in the government of Tver, 230 miles SE. of St Petersburg by rail. Pop. 11,590.

Vishnu, 'the Preserver,' the second god of the Hindu triad, now the most worshipped of all Hindu gods. Originally in the oldest Vedas a sun-god, he gradually increased in influence at the expense of other gods (see INDIA, Vol. VI. p. 105, 106), and in the later Purána (q.v.) is the supreme god. Always a friendly god, he became specially the friend and benefactor of man in his *avatars* or incarnations, of which in some reckonings there were ten, in others twenty-two—as fish, tortoise, boar, &c. But his chief incarnations were the seventh as Ráma, hero of the Rámáyana, and the eighth as Krishna, the more human hero of the Mahábhárata. The Vishnuite doctrines were gathered into one body in the 11th century as the Vishnu-Purána (see SANSKRIT). Innumerable sects of Vishnuites grew up, Vaishnavas, some of whom are named after reforming teachers, such as the Chaitanyas (see SANSKRIT). Of twenty principal sects and a hundred minor brotherhoods some are merely local, others are wealthy bodies and wide-spread, and one has grown into a warlike nation, the Jains (q.v.).

Visible Speech, a system of alphabetic characters, each of which represents the configuration of the mouth that produces the sound. It is the invention of Mr A. Melville Bell (q.v.), and was first published in 1867. Mr Bell's grouping of fundamental sounds according to the shape of the resonant cavities of the mouth in speaking has been already discussed at PHONETICS (Vol. VIII. p. 140). A special characteristic of the system is that the letters or symbols used, of which about thirty are radical, are mostly to a certain extent pictorial of the action of the organs which produce the sound. Thus a simple circle o represents breath issuing from the *open* throat (aspiration); while

the *narrowing* of the glottis which produces vocal murmur is symbolised by ı, from which, by modifiers to indicate guttural, palatal, 'primary,' 'wide,' &c., all the vowel-symbols are formed. Contraction in the mouth is indicated by a ɔ, and the *part* of the mouth in which the contraction takes place is shown by the direction in which the symbol is turned—thus ɔ denotes contraction in the *back* of the mouth (Scotch and German *ch* in *loch*), ɔ denotes lip-contraction. Complete stoppage is indicated by drawing a line across the opening, giving a symbol resembling ɒ, which turned this way would represent the sound of *p*, while ɑ would represent *k*. The symbols for vocality, nasality, &c. are similarly incorporated into the consonant symbols.

Visigoths. See Goths.

Vision, the act of seeing, that faculty of the mind by means of which, through its appropriate material organ, the Eye (q.v.), we perceive (see also Perception) the visible appearances of the external world. Vision is mainly concerned with the colour, form, distance, and tridimensional extension of objects. It is caused by impact of ether-waves on the retina of the eye (see Eye); but if these waves be longer or shorter than a certain limit (see Colour) there is no visual impression produced by them. The apparent colour of an object depends partly on the wave-length or wave-lengths of the incident light-waves, single or mixed, and partly upon the state of the eye itself, as in Colour-blindness (q.v.), or after taking santonine, which makes external objects look yellow, or in jaundice. The apparent brightness of an object depends upon the amplitude of the light-waves which pass from it to the eye; and the smallest perceptible difference of brightness always bears a nearly constant ratio to the full intensity of the bright objects (Fechner's psychophysical law). As between different colours, the eye perceives them with different intensities, even when the physical intensity is the same: thus yellow appears brighter in a bright light than an equally intense red: and as light fades away the different colours fade away unequally, so that the ratio in Fechner's law above referred to is different for each colour: red and yellow disappear first, blue last; and thus in a dim light the blue is the brightest.

The leading problems in the theory of vision are, however, those which deal with the nature of our perception of distance and of three-dimensional extension. According to Bishop Berkeley, whose views (*On the Theory of Vision*) have met with the widest acceptance, we do not by means of sight perceive either that external objects are outside ourselves or their distance from us; but this knowledge is derived from touch and from our experience of motion from place to place; and as our experience is in general uniform, we come to associate the visible with the tangible so readily that we fancy we directly *see* visible objects. As regards the distance of any given point, Bishop Berkeley maintains that this cannot be seen, 'for distance being a line directed end-wise to the eye, it projects only one point in the fund of the eye; which point remains invariably the same, whether the distance be longer or shorter.' This may be true, and yet the eye may be obliged to put forth perceptibly different efforts in order to discriminate points situated at different distances. Rays proceeding from the distant point form a cone, whose base is the pupil of the eye; and in order to make this divergent cone converge on a point in the retina a distinct effort of focussing or accommodation is necessary for each distance. That the distance may be judged by means of the necessary effort of accommodation may be seen by taking a small thin-edged lens, holding it at arm's length, and viewing distant objects through it. A small inverted image of the distant objects is seen; but on trying to ascertain at what distance this image is situated, the necessary accommodation teaches us that it is situated between the eye and the lens. The effort of accommodation appropriate to each distance is the same whether the rays have actually come from the apparent distant point or not, so long as they approach at a certain angle of divergence: hence rays from clouds reflected in still, turbid water, and continuing their divergence after reflection, approach the eye, and are dealt with by it, as if they had proceeded from a great depth below the surface of the water. Similarly the apparent depth of objects under water is diminished because the amount of divergence of the rays is altered by refraction; and the apparent distance of an object is increased by repeated reflection because after such repeated reflection the rays originally diverging from the object reach the eye diverging as if they had come from a more distant point, the virtual apex of the incomplete cone of ultimately reflected rays.

The axis of the double cone of rays, first divergent as it approaches the eye, and then convergent upon the retina within the eye, fixes the direction of the apparent position of the point (which may or may not be the real position, according to circumstances), and the strain to which the eye is subjected in accommodation measures the apparent distance in that direction.

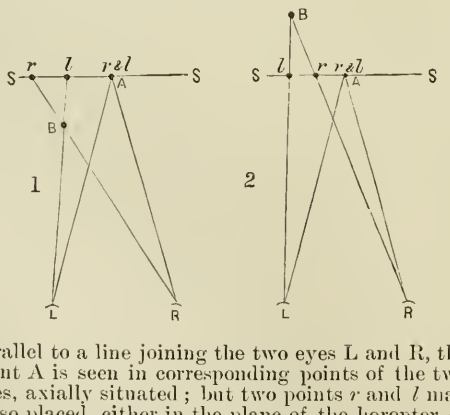
Further, we have not only to do with the effort of accommodation, but also with the varying amount of convergence of the two eyes, or of their 'optic axes,' required in order to fasten the gaze upon a more or less distant point; and this will be found to keep pace with the amount of accommodation required by each eye in order to ensure accurate focussing on the retina.

According to the Berkeleian view, however, these considerations involve geometrical questions the nature of which is known to few and is not consciously realised. But, on the contrary, it may be said that these operations of the eye being different for each distance of the object, and being felt to be so—as, for instance, where we look out through a window and feel that the sensation of looking out through the window is different from that of concentrating the gaze upon the window-bars—there is no need for the geometrical discussion of the problem; the facts of sensation are sufficient. Berkeley said that this difference of sensation does not come into play until the increased divergency becomes so great as to be associated with confused vision; and he maintained that this association was merely accidental, as was, in his view, shown by certain experiments with lenses, in which the withdrawal of the eye from a convex lens produced an apparent approach of the object looked at. This experiment was, however, shown by Wheatstone to be entirely explicable on the basis of an enlarged retinal image. Still the illusions produced by virtual images of objects, the rays reaching the eye *as if* they had come from points to which no physical reality corresponds, show that we rely in general upon the evidence of the sensations of adjustment which accompany vision for the materials as to our judgment of direction, of distance, and of externality; but we interpret these through our tactile experience. In the case of smoke and vapour, which are not tangible, we have a certain amount of experience as to the space and position occupied by them; and in the case of such an object as perfectly polished glass, which is invisible or practically so, we are left to the sense-fallacy that where the sight affords us no information, owing to the absence of any light-rays

entering the eye from the object, the inference is drawn, as the basis of previous experience, that there is no tangible object to be taken into consideration. Similarly, with objects too minute for touch, we interpret the indications of sight—e.g. those arrived at with the aid of a microscope—as showing, by analogy, that if we could apply a sufficiently refined sense of touch we would feel the object to give rise to sensations corresponding to its external aspect. The two sets of sensations, visual and tactile, are essentially independent of one another; but the distance of an object and its external form in three dimensions are learned by comparing the sensations of touch, in the widest sense, with the sensations accompanying vision while the object is still beyond reach: and the experience acquired in infancy becomes a possession of the adult philosopher who has forgotten the mental processes by which he attained it. A mountain in a clear atmosphere, say in Colorado, may appear to a British eye to be small and near, when in reality it is high and far; but it does not take long to 'educate the eye'—that is, to furnish the mind with a store of experience sufficient as a basis for more accurate inferences.

On ordinary optical principles a point above the direct line of vision comes to a focus at a point of the retina below its centre, and *vice versâ*. If the retina could be looked at by another person it would be found that an image of the object is formed on the retina, and that this image is inverted. It has been much questioned how this inverted image can produce the sensation of direct vision. We may observe in the first place that the question is somewhat nugatory, since the individual never becomes directly aware of the inversion or, it may be, even of the existence of the physical image in his own retina; and secondly, that the individual has come strongly to associate, by experience, the top of an object with the act of looking up in order to see it, and *vice versâ*. Any increase in the magnitude of the retinal image is generally associated with approach of the object, and in the exceptional cases in which this result can be brought about by means of lenses, even where the real distance is increased, the object *seems* to approach; this seeming to approach being the result of an unconscious process of reasoning. The mind, on the basis of tactile experience, interprets any given object as being of a known or ascertained size: if it comes to look larger, it is inferred that it has come nearer.

As to single vision with two eyes, the figure shows that if L and R represent the two eyes and SS a line (the 'horopter') drawn through the point A where the optic axes LA and RA intersect, and



parallel to a line joining the two eyes L and R, the point A is seen in corresponding points of the two eyes, axially situated; but two points r and l may be so placed, either in the plane of the horopter or outside it, that the two eyes together perceive them as one point B. This point is in fig. 1 nearer to the eye and in fig. 2 farther from the eye than the horopter SS itself. If now, in fig. 1, a diagram be made representing l and A and another representing r and A; and if the former be laid before the left eye and the latter before the right eye, the two optic axes being made to converge so that the image of A is formed in corresponding points in the two eyes, the points l and r will appear to blend into one, situated nearer the eye than A or farther from it; and this explains the action of the stereoscope, and also the 'pseudoscopic' effect produced when the pictures are reversed (see STEREOSCOPE). The impression of relief is thus produced by rays falling on non-corresponding points of the retina. If the retinal pictures are identical, the optic axes being convergent, the image is seen in the plane of the horopter: thus if a small-patterned wall-paper be looked at and then the eyes made to squint slightly, the wall-paper will appear to approach, for the horopter (SS, figs. 1 and 2) is now nearer to the eye, and *vice versâ*. Professor S. P. Langley estimates that the amount of Energy which is necessary, in the form of incident Light, to produce vision ranges from $\frac{1}{10^{10}}$ erg (= 1·13562,700,000th foot-pound) for the extreme red to $\frac{1}{1000^{1}0000}$ erg for the green of the spectrum.

The subject of vision is a very large one, and the reader may be referred to Von Helmholtz's *Physiological Optics*, part iii. (German or French editions), which contains copious bibliographical references; and also to Berkeley's *Theory of Vision;* Wheatstone, *On the Physiology of Vision;* Samuel Bailey's Review of Berkeley's *Theory of Vision*, and a review of this work by J. S. Mill, *Dissertations and Discussions;* T. K. Abbott's *Sight and Touch;* Von Helmholtz's *Popular Lectures;* and Sully 'On Vision,' *Mind*, Nos. ix. and x.

Visions. See APPARITIONS, SPIRITUALISM, THEOSOPHY.

Visitation. The Festival of the Visitation, to commemorate the visit of the Virgin Mary to her cousin Elizabeth, is observed by Roman Catholics on the 2d July. For the Order of the Visitation, see FRANCIS OF SALES, and SACRED HEART OF JESUS. Visitations are amongst the duties of archbishops, bishops, and archdeacons. For Visitations by Heralds, see HERALDRY, Vol. V. p. 660.

Vison. See MINK.

Visp (or VISPACH; Fr. *Viège*), a village of 900 inhabitants in the Canton de Vaud, at the opening of the Visp valley to the Rhine, 42 miles E. of Martigny, on the railway which in 1891 was continued to Zermatt.

Visscher, CORNELIS (1629–58), a Dutch copperplate engraver, famous for his portraits and for engravings after Guido Reni, Brouwer, and Ostade. —His brother JAN (1636–92) was also distinguished in the same branch of the profession.

Vis'tula (Lat.; Polish, transliterated, *Vistla;* Ger. *Weichsel*), the great river of Poland when it was yet a kingdom, rises in Austrian Silesia, near the frontier of Galicia, at the height of 3600 feet above sea-level, amongst the outliers of the Carpathians. Formed by three head-waters, the White, the Little, and the Black Vistulas, the Vistula flows north-west a few miles to the village of Wisla, where its course is marked by a fall of 180 feet, and thence to the town of Schwarzwasser, where it leaves the mountains. At this point the Vistula turns north-east, and flows in this direction past Cracow, to its confluence with the San, 10 miles below Sandomierz, forming throughout nearly the whole of this part of its course the boundary between Galicia and Russian Poland. From its confluence with the San the river turns to the north, enters Poland, which it traverses in a general north-west direction, passing

Warsaw, Plock, and Lipno. Leaving Poland, it enters Prussia near Thorn, flowing west-north-west to its junction with the Bomberger Canal, thence north-north-east past Kulm and Graudenz, where it turns north, and flows in that direction to its embouchure in the Baltic Sea, which it enters by several mouths. About 10 miles below Marienwerder it throws off an arm called the Nogat, which, taking a north-east direction, and after flowing 32 miles, enters the Frisches Haff by about twenty mouths. The main stream continues to flow north for 115 miles, dividing, however, into two branches, one of which flows into the Frisches Haff, the other into the Gulf of Danzig at Weichselmunde, 3 miles below Danzig. The Vistula receives from the right the Bug, the San, the Dunajec, and the Wieprz; from the left, the Pillza and Brahe. The Vistula is 650 miles in entire length. It becomes navigable at Cracow for small vessels, and for large vessels at the confluence of the San; and its lower course, which is carefully and laboriously dredged and regulated, is the great outlet of the commerce of the Polish provinces.

Vis Viva, a term introduced by Leibnitz and still occasionally found in modern treatises on dynamics. It is measured by the product of the mass of the moving body into the square of its speed, and is therefore twice the quantity now known as the Kinetic Energy (see ENERGY).

Viswamitra. See VEDA.

Vit, VINCENZO DE, distinguished Latinist and editor of the enlarged edition of Forcellini's *Lexicon Totius Latinitatis* (6 vols. quarto, Prato, 1858–79), a Paduan by birth (1811) and an ecclesiastic by profession, was a canon of Rovigo, and town-librarian, when in 1850 he joined the brotherhood of Rosmini, to whom he dedicated the *Lexicon*. On his jubilee in 1888 Leo XIII. sent him a gold medal. His minor writings on history, archæology, and philology have been collected in a uniform edition published at Milan and Florence. The 11th vol. (1892) is entitled *Domodossola; or the Roman Province of the Alpes Atrectianæ*, the existence of which he maintains against Mommsen. His greatest original work is the *Onomasticon*, containing all proper names down to the 5th century. Thirty-six years' labour had just brought him to the end of O, closing the fourth volume, when he died 17th August 1892. He also left ready for the press a supplemental seventh volume to Forcellini, giving in 1000 pages in double columns all the words in recently discovered inscriptions or codices.

Vitaceæ, also called AMPELIDEÆ, a natural order of polypetalous plants, of which the common vine may be regarded as the type. About 440 species are known, natives of warm and temperate climates, all shrubs, mostly climbing; with simple or compound leaves, with or without stipules, the lower leaves opposite, the upper ones alternate; the flower-stalks racemose, opposite to the leaves, sometimes (as in the vine), by abortion, changing into tendrils. The only plant of the order of much value, in an economical point of view, is the Vine (q.v.); but species of the genus Cissus and of Ampelopsis are sometimes planted for ornament. See VIRGINIA CREEPER.

Vitality. See LIFE. Vitalism is the doctrine that attributed the functions of vitality, of the living organism, to a vital force distinct from the chemical and other purely physical forces that act in and on it.

Vital Statistics, an important division of the great subject of Statistics (q.v.), which deals with the facts and problems concerning population in one or more countries. The absolute numbers of the people at various dates, the rate of increase, density, proportion of sexes, marriage-rate, ages at marriage, birth-rate, illegitimacy, death-rate, mortality at different ages, mortality in different occupations, causes of death, accidents, emigration and immigration, religions of the people, and many other subjects fall within this head. These various points are dealt with in many articles throughout this work, as in the relevant sections in the articles on Great Britain and on the other countries, and in the articles named at STATISTICS. See also works there cited; books on vital statistics by Neison, Farr, and Newsholme; and the census reports and the statistical returns of the various countries.

Vitebsk, capital of a government in the west of Russia, on the Western Dwina, 380 miles S. of St Petersburg by rail. It trades in grain, flax, sugar, and timber with Riga. Pop. 64,676, very many of them Jews. The government has an area (17,440 sq. m.) larger than Switzerland.

Vitellius, AULUS, Roman emperor for nearly the whole of the year 69 A.D., was born in 15 A.D., and through flattery and his congenial vices was successively a favourite of Tiberius, Caligula, Claudius, and Nero. Appointed by Galba to the command of the legions on the Lower Rhine, he allowed himself to be by them proclaimed emperor at Colonia Agrippinensis (*Cologne*) in the beginning of 69. He sent beforehand into Italy his generals, Fabius Valens and Cæcina, who closed the reign of Otho by the victory of Bedriacum. During his reign Vitellius gave himself up without restraint to beastly gluttony, spending, it is said, no less than nine hundred millions of sesterces (£7,000,000). Meantime Vespasian was proclaimed in Alexandria, and the legions of Illyricum under Antonius Primus declared for him. Cæcina betrayed his master, and Primus defeated the armies of Vitellius in two battles, then marched on the city. Vitellius was dragged through the streets and murdered, 21st or 22d December 69.

Viterbo, a city in a volcanic region on the slopes of Monte Cimino, 50 miles NW. of Rome by rail, with an ancient cathedral, many fine palazzi (in the bishop's palace several elections of popes took place), an unusual number of beautiful fountains, some manufactures and a pop. of 15,279. See ETRURIA.

Vitex, a genus of trees or shrubs of the natural order Verbenaceæ, the fruit a drupe, with a four-celled stone. *V. Agnus castus*, the Chaste Tree, a native of the countries around the Mediterranean, is downy, with digitate leaves white on the back, and has an acrid fruit, the seeds of which have been used as an external application in cases of colic. It derives its name from the practice of Grecian matrons to strew their couches with its leaves, especially during the sacred rites of Ceres, in order to banish impure thoughts; for which

Chaste Tree
(*Vitex Agnus castus*).

purpose a syrup, made of its fruit, was also used in convents in the south of Europe. The shrub is hardy in the south of England. Of the seventy-five species of vitex some yield excellent timber.

Viti Islands. See FIJI.

Vitré, an ancient town of Brittany, in the dept. of Ille-et-Vilaine, on the Vilaine, 24 miles E. of Rennes by rail. It is still surrounded with ramparts, and contains the ruined castle of the Tremouilles. Rochers, the residence of Madame de Sévigné, is 3½ miles south. Manufactures of cloth and hats are carried on. Pop. 9207.

Vitrified Forts. See HILL-FORTS.

Vitrina, a genus of land molluscs forming a connecting link between the slugs and true snails. But one species is known in Britain, *V. pellucida*, the glass-snail. It is exceedingly hardy, and has often been observed crawling upon the snow.

Vitringa, CAMPEGIUS, divine and commentator, was born at Leeuwarden in 1659, studied at Franeker and Leyden, and became professor at Franeker, first of Oriental Languages and then of Theology. The most eminent pupil of Cocceius, he died 31st March 1722, leaving innumerable commentaries on Scripture and other erudite works (mostly in Latin), of which his commentary on Isaiah (1714–20) and the *De Synagoga Vetere* (1696) were the most important.

Vitriol (derived from the Latin *vitrum*, 'glass') is a term which the early chemists applied to glass-like salts, distinguishing them by their colours into blue vitriol, green vitriol, and white vitriol. *Blue vitriol* is sulphate of copper (see COPPER). *Green vitriol* is the popular name for sulphate of iron (see IRON). For *white vitriol*, see ZINC. *Oil of vitriol*, or simply *vitriol*, is a name popularly given to commercial Sulphuric Acid (q.v.), the former in consequence of its oily appearance, and of its being formerly obtained from green vitriol. *Elixir of vitriol* is the old name for the aromatic sulphuric acid of the Pharmacopœia.

Vitrophyre, a porphyritic variety of volcanic glass. See OBSIDIAN, PITCHSTONE.

Vitruvius Pollio, a North Italian, possibly from Verona, educated under Julius, and employed by Augustus Cæsar as a civil architect and military engineer. To his patroness Octavia, sister of Augustus, he owed the competence which enabled him to write at leisure his ten books *De Architectura*. These, dedicated to Augustus, treat (1) of the principles of architecture; (2) of building materials; (3) of temples; (4) of columnar arrangement; (5) of public edifices; (6) of urban and rural architecture; (7) of house-decoration. The 8th book deals with water-supply and aqueducts; the 9th with gnomonics; and the 10th and last with mechanics. Borrowing largely from Greek authorities, he supplemented these by matter of his own, and illustrated the whole with diagrams, unfortunately lost. His professional far exceeded his literary skill—his style being bald, clumsy, and often obscure. His work, however, is the one Latin treatise on architecture, and has had many editors, commentators, and interpreters. The best text is that of Rose and Müller-Strübing (1867), with a good index by Nohl (1876); while his most satisfactory expositor is the mediæval Italian Fra Giocondo (1435–1515), now unearthed from unaccountable neglect. Reference should also be made to Mr J. H. Middleton's lectures.

Vitry-le-François, a town of France, and fortress of the fourth class, in the dept. of Marne, on the river Marne, 127 miles E. by S. of Paris by rail. The first site was at Vitry-en-Perthois; but it was burned by Charles V. in 1544, and François I. rebuilt the town on its present site. Pop. 7984.

Vittoria (*Vitoria*), capital of the Basque province of Alava, stands on an elevation, 120 miles NE. of Valladolid by rail. The cathedral dates from the 12th century. Paper, cabinet-work, carriages, and earthenware are manufactured. Pop. (1878) 25,039; (1887) 27,660; (1897) 30,514. Vittoria is memorable for the decisive victory which was here gained by Wellington over the French under Joseph Bonaparte and Jourdan, June 21, 1813.

Vitus, ST, a reputed martyr under Diocletian, the son of a Sicilian pagan, but converted by his nurse Crescentia and her husband Modestus. All three perished together, in Lucania or at Rome, the festival falling on June 15th. The relics of St Vitus are preserved at Corbey and at Prague. He is invoked against sudden death, hydrophobia, prolonged sleep, and the complaint commonly called the Chorea or Dance of St Vitus; some authorities make him also the patron of comedians and dancers. It is said that in Germany in the 17th century it was a popular belief that good health for a year could be bought by bringing gifts to his image and dancing before it on his festival—a practice especially in vogue at his chapels at Ulm and Ravensberg. Hence we are asked to believe that the Dance of St Vitus, becoming a familiar phrase, was confounded with the nervous disorder.

Vivandière, in the French and some other continental armies, a female attendant in a regiment, who sells spirits and other comforts, ministers to the sick, marches with the corps, and contrives to be a universal favourite. From the Algerian campaigns onward the vivandière wore a modified (short-petticoated) form of the regimental uniform; but this arrangement has been forbidden by government. Familiar from Ouida's *Under Two Flags*, the *Daughter of the Regiment*, &c., the vivandière has been largely superseded in her functions by the *Cantinier* (see CANTEEN).

Viverridæ. See CARNIVORA.

Vives, JUAN LUIS (generally known as Ludovicus Vives), humanist, was born at Valencia in Spain, 6th March 1492. He studied philosophy at Paris, but, disgusted with the empty quibblings of scholasticism, turned to the study of the classics at Louvain, where he taught and wrote against scholasticism. Thence he was summoned (1523) to England to be the tutor of the Princess Mary, and he taught at Oxford. He was imprisoned for opposing the king's divoree, and after 1528 lived mostly at Bruges, where he died, 6th May 1540. Amongst his works are *Satellitium Animi* (1524; new ed. Vienna, 1884), *De Disciplinis*, *De Ratione Discendi*, *Linguæ Latinæ Exercitatio* (1539; very often reprinted), an important edition of Aristotle's *De Anima*, works on Virgil's *Bucolics*, on the support of the poor, and in defence of Christianity. He was suspected of Protestant tendencies.

Vivisection, a term employed to designate operations or painful experiments performed on living animals, with the view of increasing our physiological knowledge. The term, properly limited to cutting operations, is now regularly applied to any physiological experimenting on animals, as by ligature, exhibition of poisons, inoculation with disease, subjection to special conditions of atmospheric pressure, temperature, food, &c. Experiments on living animals were made by Galen and the Alexandrian school, and were long unhesitatingly regarded as a valuable source of physiological and pathological knowledge, and as an important means of advancement for the surgical art. But since attention was called in the 19th century to the needlessly cruel and frequent experiments of Magendie and other continental physiologists a controversy has arisen, the outcome of which is a wide-spread belief, especially

amongst the non-medical and non-scientific public, that vivisection is in every shape and form odious and cruel, and that in no case should it be practised or sanctioned. It is contended even that vivisection has not been so advantageous to science as is commonly represented; some affirm that it has served no good purpose that could not be arrived at without it; many hold that, even were it proved of unquestionable benefit, it is illegitimate and wrong to subject the lower animals to pain for our purposes; furthermore, it is taught, vivisection carried on for whatever purpose, and under whatever conditions, can only serve to brutalise the performer and all spectators of such cruelty.

The replies are not less numerous and zealous than the impeachments. It is admitted that painful vivisection should not be performed in order to illustrate facts already known, or to give surgical dexterity. Most physiologists are agreed that it is desirable to practise vivisection only when knowledge may be thus obtained that is otherwise unattainable; that great care should be taken not to injure sensitive nerves; that the operation should, whenever possible, be given under anæsthetics; and that after vivisection the animal, if seriously injured, should be quickly put to death. It is pointed out that the bulk of anti-vivisectionists are quite content that animals should be killed for food, or as vermin; many have no scruples about shooting game or fishing, though much pain is thus inflicted.

Amongst valuable results obtained from vivisection it is usual to mention our knowledge of the circulation of the blood, the functions of the nervous system, of the lacteals, of the liver, the processes of digestion, the meaning of the heart-sounds in heart diseases, the practicability of the transfusion of blood, the pathology of tapeworm and *trichina spiralis*, and the knowledge which enables surgical and medical skill to deal with those suffering from diabetes and some forms of epilepsy, to use electro-therapeutics, and to relieve suffering of many different kinds. At the Royal Commission of 1876 on this subject, out of forty-seven skilled witnesses only two were of opinion that experiments are not necessary for original research. But to relieve wide-spread anxiety parliament in 1876 gave its assent to a bill to amend the law relating to cruelty to animals, the purpose of which was the restriction, or better regulation, of vivisection. The act requires that every one performing a painful experiment upon a living animal (which must be with a view of advancing physiological knowledge, or knowledge which will be useful for saving or prolonging life, or alleviating suffering) must hold a license from the Home Secretary, and be under the supervision of inspectors appointed to see that the provisions of the act are carried out. Persons holding a conditional license are allowed to perform such experiments only in a registered place, while the same rule applies to experiments performed for the sake of instruction (which, however, are permitted only under certain stringent limitations). Special protection is afforded to horses, asses, mules, dogs, and cats. The act does not apply to invertebrate animals. In 1891 the number of licensed places was 59, of licenses 153, and of experiments 2361 (1406 being inoculations or hypodermic injections).

Agitation for the total prohibition of vivisection has nevertheless been maintained in Great Britain by not a few zealous persons, and several active societies for the purpose, with numerous branches, conduct a vigorous propaganda. The Vivisection Act is strongly objected to on the ground that it legalises cruelty under specific conditions, and that the inspection under its provisions is inevitably unsatisfactory, the inspectors being, as a rule, in sympathy with the experimenters. It is impossible fully to state the case for and against vivisection here; reference must be made to the copious literature of the subject. Both the British Medical Congress and the International Medical Congress pronounced unanimously in favour of vivisection, properly regulated, and insisted on its value both to physiological science and to medical and surgical practice.

See the arguments for and against Pasteur's method of inoculation in the article HYDROPHOBIA; numerous articles in the *Nineteenth Century*, *Contemporary Review*, *Fortnightly Review*, *Nature*, and the *Spectator*; against vivisection, the publications of the Victoria Street Society (including a paper by Lord Coleridge), Miss F. P. Cobbe's *Modern Rack* (1889) and other works on the subject, Nicholson's *Rights of an Animal* (1879), and Lawson Tait's *Uselessness of Vivisection* (1883); in favour of properly regulated vivisection, most handbooks of physiology, Hermann's *Vivisection Popularly Discussed* (trans. 1877), Gore's *Morality of Vivisection* (1884), and *Physiological Cruelty*, by Philanthropist (1883).

Vizagapatam, a port on the Bay of Bengal, 100 miles N. of the mouth of the Godavery; pop. 34,487.

Vizeu, a city of Portugal, 50 miles NE. of Coimbra, with a fine cathedral; pop. 6956.

Vizianagram, an Indian town with a fort and a college, 35 miles NE. of Vizagapatam; pop. 30,881.

Vizier, or VEZÎR (Arabic *wazîr*, 'bearer of a burden'), a title bestowed on the chief-minister of the first Abbaside calif, in the 8th century, for centuries denoted the president of the council of ministers and principal adviser of the calif, and consequently the second person in authority of the Moslem empire. The various princes who founded dynasties under the califate also had their viziers, and the dignity and authority of the office varied considerably, till sometimes it came to represent little more than a clerkship. A famous family of viziers was that of the Barmecides under the early Abbaside califs, and another was that of the Kiuprilis under the Ottoman sultans. The dignity of vizier was introduced among the Turks during the reign of their second sultan, Orkhan, and the title was at first confined to the sultan's prime-minister; but the prime-minister's title was afterwards changed into *vezîr-azam*, 'grand vizier,' and the title of vizier was given to all the Turkish ministers of state, as well as to provincial governors. In 1878 the title of grand vizier was abolished, that of President of the Council of Ministers being substituted. This dignitary, whether under the old name or the new, is, after the sultan, the most important personage of the empire, and is the head of the administration; but he is subject as formerly to more serious control from the intrigues of the palace than from the new 'constitution.'

Vlaardingen, a town of Holland, 5 miles W. of Rotterdam, near the New Maas, with a shipping trade and large herring-fleet. Pop. 12,059.

Vladikavkaz, capital of the Terek province of Cis-caucasia, at the foot of the main Caucasus chain, and at the opening of the valley of the Terek. It is the terminus in this direction of the Russian railway system, and is on the only carriage road through the Dariel pass to Tiflis and the south of the mountains. There is a fortress here, and considerable trade. The population has rapidly increased from 8000 to 46,345 in 1895 (Cossacks, Armenians, and a motley representation of various Asiatic races).

Vladimir, capital of a government in the heart of Russia, stands on the left bank of the Kliasma, 120 miles NE. of Moscow by rail. It was founded in the 12th century, was the seat of a principality (see RUSSIA), and in the 14th century practically capital of Russia. It contains many historical

remains, as the Kreml, the 'Golden Gate,' built in 1158, ruins of old fortifications, and many ancient churches. It is now a decayed provincial town. Pop. 19,305. The government has an area (18,864 sq. m.) as large as the kingdom of Servia; pop. (1897) 1,570,733.

Vladimir. See RUSSIA, p. 40; and for VLADIMIR MONOMACHUS, p. 42.

Vladivostok, a small town near the farthest frontier of Asiatic Russia, near the north limit of Corea, on Peter the Great Bay in the Sea of Japan. It has one of the finest harbours in the world, is a naval station, has an arsenal, and is the terminus of the overland part of the telegraph as well as of the Siberian railway (the end section of which was in operation in 1896). The yearly imports amount to about £300,000, and are steadily increasing. Founded in 1861, it had in 1895 a population of 34,500, mainly military, naval, and official.

Vliessingen. See FLUSHING.

Vodena, a town of Turkey, on a mountain-slope, 46 miles WNW. of Saloniki; pop. 15,000.

Voetius, GISBERT (1588–1676), a pillar of Calvinistic orthodoxy, was professor at Utrecht, and, a member of the Synod of Dort, strenuously opposed the Arminians. His chief work was the *Selectæ Disputationes Theologicæ*. Other representatives of this family of Voet or Voetius (pron. *Vootius*) were eminent as scholars, jurists, and poets.

Voghe'ra, a town of Northern Italy, 16 miles by rail SW. of Pavia; pop. 12,794.

Vogler, GEORG JOSEPH, composer, usually styled the Abbé (Browning's Abt) Vogler, was born at Würzburg, June 15, 1749, the son of a violin-maker. A musician from his cradle, he studied at Bamberg, Mannheim, Bologna, and Padua, was ordained priest at Rome in 1773, and made Knight of the Golden Spur, and protonotary and chamberlain to the pope. Returning to Mannheim, he established there his first school of music; his second was that at Stockholm, where in 1786 he had been appointed Kapellmeister. After years of wandering and brilliant successes as a player on his 'orchestrion' at London and half over Europe, he settled as honoured Kapellmeister at Darmstadt, and opened his third school, the chief pupils of which were Gänsbacher, Weber, and Meyerbeer. Here Vogler died, May 6, 1814. His compositions are now forgotten, still more so his new theories of music, and indeed many, with Mozart, count him but a charlatan. His name best survives in Robert Browning's poem in the *Dramatis Personæ* (1864), a splendid imaginative expression of the function of the art of music. See the study by Schafhäutl (Augsb. 1887).

Vogt, CARL, naturalist, was born in Giessen, 5th July 1817, and had his education there and at Bern, two of his teachers being Liebig and Agassiz. In 1847 he became professor of Zoology at Giessen, but soon lost the post from his extreme politics, whereupon (1852) he accepted the chair of Geology at Geneva. He headed an expedition to the North Cape in 1861. Chosen in 1878 a member of the Swiss National Assembly, he showed himself a thorough-going Materialist, and a champion of Darwinism in its fullest consequences. Of his many books may here be named the *Lectures on Man* (Anthropological Society, 1864), *Zoologische Briefe* (1851), *Altes und Neues aus dem Tier- und Menschenleben* (1859). He died 6th May 1895.

Voice (Lat. *vox*), an audible sound produced by the larynx, and affected by its passage outwards through the mouth and other cavities (see LARYNX, PALATE, SOUND). When so modified in particular ways it becomes speech or song. The main differences between these two latter are that speech is more limited in compass or pitch, that it is less sustained in respect of pitch, and is not confined to the notes of a musical scale, that it is associated with a less clear or open passage for the breath, and that it presents certain utterances (consonantal, aspirate, guttural, &c.) which have not a purely musical character. The larynx is the organ by which the so-called vocal sounds (or primary elements of speech) are produced; and it was in former times keenly debated to which class of musical instruments the larynx might best be compared. As Dr Witkowski says (*Mechanism of Voice, Speech, and Taste*, Lennox-Browne's translation): 'Galien compares it to a flute, Majendie to a hautboy, Despiney to a trombone, Diday to a hunting-horn, Savart to a bird-catcher's call, Biot to an organ-pipe, Malgaigne to the little instrument used by the exhibitors of Punch, and Ferrein to a spinet or harpsichord. The last named compared the lips of the glottis to the strings of a violin; hence was given the name *Vocal Cords*, which they still retain. The current of air was the bow, the exertion of the chest and lungs the hand which carried the bow, the thyroid cartilages the *points d'appui*, the arytenoids the pegs, and lastly, the muscles inserted in them the power which tensed or relaxed the cords.' But the vocal cords are very different in their structure from strings, and no string so short as the vocal cords are could produce a clear bass note. They more resemble in their action a pair of reeds; not such an instrument as a clarionet, in which the vibrations of the column of air of any determinate length overpower the single reed, and compel it to vibrate only in rhythm with themselves, but such an instrument as may be constructed with two strips of india-rubber laid across the mouth of a wide tube so as to present a mere chink between them. But the larynx contains within itself a great power of adjustment, such as is possessed by no musical instrument; the tension of the vocal cords can be varied; the vibrating portion of the vocal cords can be shortened; the distance between them can be varied; their form can be altered, as by blunting their free edges or by flattening their whole structure; and they can be prevented from vibrating in their whole breadth, the vibrations being then confined to their margins merely: and these adjustments may be combined so as to suit different pressures of air from the lungs. Further, above and below this primary sounding apparatus there are adjustable cavities, which act as resonators, and thus (see SOUND) affect the quality of the sound produced. The actual action of the larynx as a sounding instrument has only been clear since Garcia introduced (1855) the laryngoscope (see LARYNX) as a means of observing what went on during actual vocalisation; and a flood of light has been thrown on the subject by the researches of Czermak, Merkel, Madame Seiler, and Behnke. The *crico-thyroid* muscles pull the thyroid cartilage and the cricoid cartilage together; the vocal cords are thus tightened: and the *posterior crico-arytenoid* muscles aid in this. The *thyro-arytenoid* muscles relax the vocal cords, and twist the arytenoid cartilages round so as to make their attachments to the vocal cords come over towards one another instead of lying at some distance from the middle line; and they can also so act as to press portions of the vocal cords together, and thus shorten the free vibrating edges; and further, they can squeeze their own inner portions thin, and thus flatten and thin the vibrating part of the vocal cords. The *posterior crico-arytenoid* muscles, in addition to aiding in tightening the vocal cords, twist the arytenoid cartilages so as to widen the back part of the chink between the vocal cords;

while the *lateral crico-arytenoids* as well as the *thyro-arytenoids* perform the reverse operation, and thus narrow the chink, and are assisted in this by the *arytenoidens* muscle, which directly pulls the arytenoid cartilages together. These muscles in combination effect the various adjustments above spoken of. In a state of rest the glottis lies open, and respiration is unimpeded; in deep breathing the chink is still wider, but as soon as we wish to utter a note the two arytenoid cartilages rapidly approach one another, and the glottis-chink is narrowed. At the same time the superior or false vocal cords approach, but never touch one another. If the vocal cords meet one another before the current of air flows to produce the tone, there is a disagreeable jerk or click at the commencement of the note; if the air flows before the vocal cords have sufficiently approximated, there is an aspirate, and the 'attack' or beginning of the note is uncertain; the two actions ought to coincide in time, and then the 'attack' is clear and precise, for the vocal cords are brought to the right place for vibration at the very time when the air begins to tend to set them in motion.

In different larynxes much depends on the relative sizes of the vocal cords; thus a man with a bass voice has longer vocal cords than a child or a woman; but as between basses and tenors, tenors and contraltos, or contraltos and sopranos, the higher voice may sometimes appear to have the longer vocal cord: on the other hand, slenderness of structure makes up for greater length, and when the vocal cords are long and slender, the voice is 'flexible,' for the cords readily enter into vibration. Further, a narrow larynx is conducive to high pitch, and so is not only the size but also the form of the female larynx, in which the upper part, above the false vocal cords, and between them and the hyoid bone, is comparatively flat. In children the larynx is small, and the voice high-pitched; but the larynx grows very rapidly at puberty; and as its different parts do not then grow with proportionate rapidity, the muscular control is uncertain, and the voice, especially in boys, breaks.

In one and the same larynx different parts or regions of the scale are produced by different laryngeal mechanism: and those notes of the scale which are produced by the same mechanism (Behnke) are said to be produced in the same *register*. The registers of the voice have given rise to a great deal of discussion, most of which appears to have arisen from independent attempts to express sensations in words. It appears, however, from the laryngoscopical evidence (for which see Lennox-Browne and Behnke, *Voice, Song, and Speech*) that the whole mechanisms can be divided into three groups, or 'thick,' 'thin,' and 'small' registers, as Mr Curwen happily named them before the laryngoscopical evidence had come to hand. In the first the vocal cords vibrate as thick masses; in the second they vibrate in their thin edges only; in the third the vibrating chink of the glottis is much reduced in length. The lowest or thick register usually extends through the interval  in bass voices, through  in tenors, through in contraltos, and through  in sopranos. Very curiously, it thus terminates at the same note in all voices. This register is usually divided into lower thick and upper thick. The 'lower thick' usually extends through  in basses,  in tenors,  in sopranos; and in this division the vocal cords are very bulky and thick, the *posterior* portions of the arytenoid cartilages are closely approximated, but the chink is wide and elliptical in the lower notes, less so in the upper; and the false vocal cords are far apart. In the 'upper thick' the arytenoid cartilages have rotated into complete contact with one another, so as to shorten the vibrating portion of the vocal cords: the thyroid bends down on the cricoid cartilage: the vocal cords are being stretched so that the chink between them is very narrow; and the epiglottis rises as the pitch rises. When the upper limit of this register has been reached the strain on the parts is extreme. Beyond this register comes the thin (the 'male falsetto'), which is in the female and does not go beyond

the normal mechanism for notes between  and  .

The strain of the chest-notes, or thick register, is now relieved: the thyroid cartilage returns: the vocal cords lie still and somewhat slack at first, and the vibration is confined to their membranous edges: they are separated by a narrow chink which is at first longer than before: as the pitch rises the crico-thyroid muscle goes on acting until the thyroid and cricoid cartilages are again in apposition: and this lasts, in tenors, contraltos, and sopranos alike, through the interval  . When the note C is reached still higher notes are attained by a gradual shortening of the vocal chink, which becomes elliptical, and is gradually reduced in size. But beyond F or F♯ the soprano voice has still another register, the 'small' register. In this only the front part of the vocal cords vibrates; the vocal chink is reduced to a small aperture in front, which contracts as the pitch rises, while the hinder portions of the vocal cords are pressed tightly together. These different mechanisms produce perceptibly different qualities of tone; and the art of the vocalist is, largely, to use higher registers for lower notes, so that he may be able to strike the same note in more than one way, and thus have at command the means of smoothly passing from one part of the scale to another without *jödelling* or appearing to sing with different voices on different notes. One means of doing this in some cases is by the use of a *voix mixte*, in which the laryngeal position of the lower thick register is associated with the vibrating mechanism of the lower thin. For voice-production and voice-cultivation reference must be made to the special manuals mentioned below.

The resonating cavities and appurtenances connected with the larynx form a complex system consisting of the pockets lying between the true and false vocal cords (the effect of which cannot be very great, but which must be affected by the position of the false vocal cords), the vestibule of the larynx, the epiglottis (which directs the sound-waves towards different parts of the resonating system, and affects the colour or *timbre* of the tone produced), the pharyngeal cavity, the nasal cavity, and the mouth. When the sound-waves find a clear air-way over the tongue and under the soft palate the tone is clear; when the soft palate hangs down, so that some of the air escapes by the nose, the tone is nasal; when the tongue does not lie flat and out of the way the tone is throaty and strained; when the lips obstruct the sound-waves the tone becomes muffled. The quality of tone is also very much affected by the control which the speaker or singer may have over the breath: he should have his lungs well filled with air by abdominal respiration, and be able to attack the

sound clearly with a minimum expenditure of breath, and direct the sound-waves well forward, keeping the resonating cavities large and clear; under these circumstances the voice carries through a maximum distance with a given effort, especially if, in the case of a speaker, he raises not the pitch of his voice, but its loudness when the occasion requires it: and under such conditions the pressure of air in the windpipe can be raised to a considerable height, and the voice rendered clear and telling without exhausting exertion.

Modifications in the form of the resonating cavities result, by resonance, in those modifications of *timbre* (or the relative predominance of particular harmonics of the fundamental note; see SOUND) which we call *vowels*. In pronouncing *u* (= *oo* or Italian *u*) we round the lips and draw down the tongue, so that the cavity of the mouth assumes the form of a bottle without a neck; if the lips be opened somewhat wider and the tongue be somewhat raised, we hear *o;* if the lips be wide open and the tongue in its natural flat position, we hear *a;* if the lips be fairly open and the back of the tongue raised towards the palate, the larynx being raised at the same time, the vowel produced is *e;* and if we raise the tongue still higher and narrow the lips, we hear *i*. Each of these resonance-chamber forms has its own dimensions and its own resonance-pitch; and of these *u* has the lowest pitch, as may be heard by whispering the vowels, or by means of a series of tuning-forks successively reinforced by the cavity of the mouth as a resonator; for which reason it is easier to sing *u* and *o* on low than on high notes. Diphthongs are produced by continuing the laryngeal sound during the transition from one vowel-mouth-form to another. Consonants are produced by various interruptions, total or partial, of the outflowing stream of air. If the air be completely stopped by the lips and soft palate, we have *p* when the obstruction is suddenly removed; the same action, accompanied by a certain continued sound in the larynx, and a heavier air-pressure within the mouth, gives *b;* if the air be checked by the lips, but not by the soft palate, so that it passes through the nose alone, we have *m;* if it be checked by the soft palate and by bringing the point of the tongue to the front of the palate, or to the gums, we have *t;* the same with continued laryngeal sound and greater air pressure gives *d;* the action for *d*, modified by allowing a little air to escape over the soft palate through the nose, gives *n;* if the air be checked by the soft palate and by bringing the middle or back of the tongue to the arch of the palate, we have (silent) *k* and (if there be laryngeal sound) *g;* the latter, but with the nasal passage open, gives *ng*. In other cases a continuous stream of air is made to escape under some pressure past an obstacle, and thus to sibilate; if it be driven through a narrow chink between the upper front teeth and the lower lip, the larynx being silent and no air escaping through the nose, we have *f;* the same, with greater air-pressure and a laryngeal sound, gives *v;* the true aspirated *p* and *b* (air driven with or without voice through a very narrow and small lip-chink) do not exist in English, but the latter fairly represents the German *w* in *wasser*; if the tongue be pressed tightly against or between the front teeth and air be driven through these, we have, without voice, *th* in *thin*, or with voice *th* in *then;* if in the last instance the contact be loose, we have *s* and *z* respectively; if the tongue be put in the *t* position and a little reverted, we have for tight contact *ch* and *j* (*judge*), and for loose contact *sh* and *zh* (French *juge*); if it be put in the *k* position we have for loose contact, voiceless, the Scotch *ch* in *loch;* if in the *ng* position, the Dutch *ch*, voiced, in which the soft palate vibrates, and the Welsh *ch*, voiceless. In *l* the tip of the tongue is fixed, and its sides oscillate, while a laryngeal tone is being produced; in the Welsh *ll* the position and action are the same, while a strong current of air is employed, and the larynx is silent. In *r* the tip of the tongue vibrates against the front teeth so as intermittently to shut off the air-stream, while laryngeal tone is maintained; in Welsh *rh*, as in Rhyl (Greek *ῥ*), the action is the same, with a strong current of air and larynx silent. In a 'burred' *r* (Northumberland, Parisian French, North German) the air is interrupted by vibrations of the soft palate. The aspirate *h* is produced by narrowing the air-passages, by raising the tongue and using a momentary strong current of air at the beginning of the vowel. It not unfrequently happens that there is difficulty experienced in co-ordinating the requisite movements of larynx, tongue, and mouth, which are usually automatic, and depend upon the will to attain, by imitation, a given result; in such a case a person stutters his consonants or stammers his vowels. In many such cases the respiration is not under control, and attention to this may enable the defect to be remedied.

Voiron, a town of the French dept. Isère, 15 miles NW. of Grenoble by rail; pop. 8227.

Voiture, VINCENT, poet and letter-writer, was born at Amiens in 1598. He enjoyed the favour of the Duke of Orleans, Richelieu, and the king, and died 26th May 1648. His brilliant sonnets and *vers de société* were the delight of the salons during his lifetime, but were unpublished till after his death; his letters are as perfect in their way as those of Balzac. The first edition of his *Œuvres* appeared in 1650; later editions are those of Ubicini (1855) and Roux (1856); and Uzanne edited the letters in 1880.

Volapük, a name made up (out of *vol*, shortened from the English *world*, and *pük* for *speak*) for a universal language invented in 1879 by Johann Martin Schleyer, a Swabian pastor afterwards engaged in teaching in Constance. The vocabulary is mainly based on English (to the extent of about a third, Latin and the Romance tongues furnishing about a fourth), and the grammar is simplified to the utmost. Declension is in every case accomplished by the addition of the vowels *-a*, *-e*, and *-i* to the root for genitive, dative, and accusative respectively; *s* is the sign of the plural; and verbs are conjugated by help of *-ob*, *-om*, *-ol*, and *-of* (for I, thou, he, she, &c.). The cause was taken up in many lands, and within ten years there were grammars of Volapük prepared in twenty languages by the author (besides a mass of others), and dictionaries innumerable; while there were over twenty papers published in Volapük, and associations in most civilised lands for the practice and extension of this artificial tongue. Subsequently the progress of the system was

checked. The most practical disciples limited their aims to making Volapük a convenience for commercial correspondence, a kind of extended international code. There are grammars in English by the inventor, by Harrison, Kerckhoffs, Kirchhoff, Sprague, &c., and dictionaries by Krause, Wood, Linderfelt, &c.

Volcanoes. A volcano is a more or less conical hill or mountain, usually truncated, and communicating with the interior of the earth by a pipe or funnel, through which issue hot vapours and gases, and frequently loose fragmentary materials and streams of molten rock. The pipe or funnel may be a vertical hole blown out by the subterranean forces through otherwise continuous and undisturbed rock-masses, or it may be an aperture upon a line of fracture or rent in the earth's crust. In the former case the volcano will usually be small; and should several such volcanoes occur in the same neighbourhood they will generally be irregularly distributed. There is reason to believe that all the larger volcanoes occur upon lines of fracture, and their linear arrangement or grouping along more or less well-defined belts harmonises with this view. All modern volcanic eruptions appear to take place from isolated points or foci, but in earlier ages molten matter seems frequently to have welled up and overflowed from long lines of fissure. These last are termed *fissure-eruptions*.

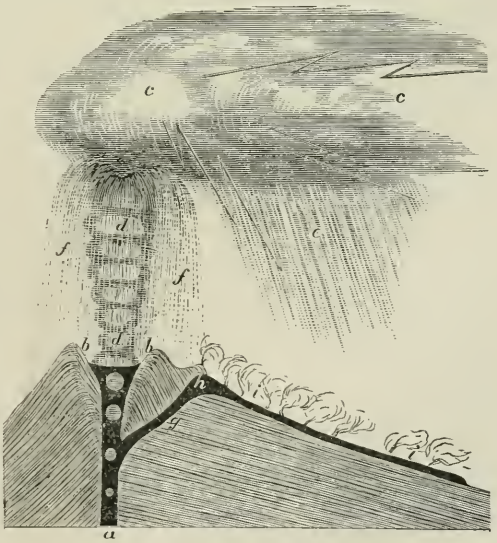
Copyright 1892 in U.S. by J. B. Lippincott Company.

During successive eruptions the heavier portions of the loose fragmental materials—blocks, cinders, &c.—fall back within and around the vent, while lava streams from the crater, now in one direction, now in another. Thus in time a cone is built up, consisting of rudely alternate sheets of fragmental materials and lenticular flows of lava, which are all inclined outwards from the orifice of eruption. Some volcanoes are made up entirely of loose ejectamenta, but such cones are generally small, varying in size from mere monticules up to hills nearly 1000 feet in height. The stones composing volcanoes of this kind occasionally consist in large measure of the debris of the underlying rocks, such as sandstone, shale, limestone, &c., which have been ruptured, shattered, and blown into the air by exploding vapours. More usually, however, the loose materials are slags and cinders discharged from a mass of lava occupying the throat of the volcano. After a more or less prolonged ejection of slags and cinders torn from the upper surface of the lava, the latter sometimes rises into the crater and makes its escape by breaching the cone. Many of these cinder-cones are the products of only one eruption. Just as we have cinder-cones composed wholly or chiefly of fragmental materials, so we have volcanoes built up almost exclusively of lava. Some of these are of insignificant size, others are among the largest volcanoes of the world. The form assumed by a lava-cone depends chiefly upon the character of the molten rock. If the lavas be extremely viscous and tenacious they usually cool and consolidate immediately round the vent, and thus tend to form a more or less abrupt cone. Some cones of this kind have no craters—the tenacious mass having welled up and stiffened around and over the orifice so as to form a dome-shaped hill. Good examples occur in Auvergne, Bohemia, Hungary, and the Isle of Bourbon. The more liquid lavas give rise to flattened or depressed cones. The great volcanoes of Hawaii are built up almost entirely of sheets of lava which are extremely liquid at the moment of eruption, and hence readily flow away and spread themselves out as they go. By far the great majority of volcanoes, however, are composite in character—i.e. they are built up partly of lava and partly of fragmental materials—sometimes the one and sometimes the other predominating. Etna and Vesuvius are excellent examples of composite cones.

While some volcanoes occur upon the ridges of vast mountain-ranges, others are met with at much lower levels. Many have commenced their eruptions upon the bed of the sea, such as Etna and Vesuvius, which were in their younger days submarine volcanoes, and the same is the case with the vast cones of the Sandwich Islands. Submarine volcanoes have even come into existence in modern times. In 1796 a column of vapour was seen to rise from the North Pacific Ocean about 30 miles to the north of Unalashka. The ejected materials eventually raised the crater above the sea-level, the fiery crest of the islet thus formed illuminating the region for 10 miles around. Six years afterwards, when a few hunters landed on the new island, they found the ground in places too hot to walk upon. Repeated eruptions have since increased the dimensions of the island, until now it is several thousand feet in height, and between two and three miles in circumference.

Some volcanoes are much more active than others. A few may be said to be in a state of permanent eruption, such for example as Stromboli, which has been constantly active since the time of Homer; Izalco (in Salvador, Central America), which had no existence before 1770, has continued active ever since, and is now some 2500 feet in height. Other examples of constantly active volcanoes are those of Masaya and Amatitlan in Nicaragua, Sangay in the Andes of Quito, Cotopaxi, Sion in the Moluccas, and Tofoa in the Friendly Islands. Many volcanoes, such for example as Vesuvius, continue in a state of moderate activity for longer or shorter periods, and then become quiescent or dormant for months or, as the case may be, for centuries, when they wake up to renew their labours. The eruption that succeeds prolonged repose is usually correspondingly violent or paroxysmal. Such was the famous eruption of Vesuvius that destroyed Herculaneum and Pompeii. Similarly in our own day the terrible outburst of Krakatoa in the Straits of Sunda took place after a repose of 200 years.

The general phenomena of a paroxysmal eruption are illustrated by the accompanying diagram. The



Diagrammatic Section of Volcano.

neck or funnel of the volcano is shown at *a*, and the crater at *b*, *b*. Lava (represented as occupying

the funnel) is highly charged with steam or water-gas and other vapours, and these, as the molten matter surges up, continually escape from its surface with violent explosions and rise in globular clouds, *d*, *d*, to a certain height, after which they dilate into a dark turbid cloud, *c*. From this cloud showers of rain, *e*, are frequently discharged. Large and small portions of the lava are shot upwards as the imprisoned vapours explode and make their escape, forming a fiery fountain of incandescent drops and fragments (*bombs*, *slags*, *cinders*), and, along with these, pieces of the rocks forming the walls of the funnel and crater are also violently discharged; the cooled bombs, slags, cinders, angular blocks, and smaller stones (*lapilli*) falling back in showers, *f*, upon the external slopes of the cone or into the crater, from which they are again and again ejected. Lightning, probably induced by the intense friction of the escaping steam, often plays round the borders of the dark cloud. The lava at last bubbles over and flows away in torrents, either from the lip of the crater or from a rent or fissure in the side of the cone. In the diagram it is represented as escaping by a lateral fissure, *g*, *h*, and streaming down the slope, while jets of steam and other vapours, *i*, escape from its surface. The outflow of lava marks the crisis of the eruption, and after a final ejection of stones and dust the volcano relapses into a quiescent state. In some paroxysmal eruptions of great violence the liquid lava is entirely blown out in the form of hot dust by one or more tremendous explosions. This appears to be the case when a considerable body of water is suddenly introduced to the heated reservoir. Such paroxysmal eruptions often result in great changes in the appearance of a volcano. The upper part of the cone disappears, and a vast yawning cauldron takes its place. This is no doubt due to the shattering of the walls of the crater by gaseous explosions, and to the undermining action of the surging lava. Much of the broken material is blown outwards, but the chief portion of the missing rock-masses has often given way and fallen into the eviscerated volcano. The cones of Etna and Vesuvius have frequently been modified in this way. Thus in 1822 the summit of the latter was reduced by 800 feet. Again, the entire summit of Papandayang in Java was blown off during a great eruption in 1772. The same appears to have been the case with Bandaisan in Japan—one of the principal peaks of which (Kobandai) was greatly reduced in height by the terrible eruption of 1888. It is estimated that 1,587,000,000 cubic yards of rock were blown from the top of the mountain and scattered over an area of 27 sq. m. The great eruption of Tarawera in New Zealand (1886) showed that both ejection and engulfment accompany paroxysmal action. Enormous quantities of material were scattered over the surrounding regions, and after the eruption there appeared in the south-western slope of Tarawera a sunken area 2000 feet long, 600 feet wide, and 250 to 800 feet deep. Many volcanoes after such prodigious action have become apparently extinct. One of the most remarkable eviscerated volcanoes of the kind is the island of Palma, one of the Canaries, from 3 to 4 geographical miles in diameter. The caldera or depressed interior is surrounded by precipices from 1500 to 2000 feet in height. These form an unbroken wall, except at the south-western end, where a deep gorge permits the passage of the torrent which drains the caldera. In not a few cases the calderas of eviscerated volcanoes are occupied by deep lakes. Examples in Europe are the Laacher See and other *maars* of the Eifel country; Albano, Nemi, Bracciano, Bolsena, Avernus, and others in Italy; Lac Paven in Auvergne; the beautiful lakes of San Miguel (Azores), &c. Similar crater-lakes are met with in many other parts of the world, such as the lake of Gustavila in Mexico, and Crater Lake in Oregon, which has a circumference of 20 miles, and is surrounded by precipitous walls rising from 1500 to 3000 feet in height. Occasionally eviscerated volcanoes are entered by the sea, when their craters appear as nearly land-locked lagoons or natural harbours. Such is the Lago del Bagno in Ischia.

Although actual extinction appears in many cases to have followed a paroxysmal eruption, yet it is well known that this is by no means a general rule. The structure of numerous volcanoes makes this sufficiently evident. Thus Vesuvius is a cone standing in the caldera of a much larger cone, which is known as Monte Somma. The latter had evidently been eviscerated at some distant prehistoric period, and the younger cone of Vesuvius dates its origin from the time of the Plinian eruption. Since that time it has continued to increase—its growth, however, having ever and anon been interrupted by paroxysmal action. Should the volcano maintain a condition of moderate activity, the time must come when it will occupy the whole of the caldera of Monte Somma, and the latter will then become obliterated under newer ejections of lava and fragmental materials. This cone-in-cone structure is conspicuous in many other volcanoes. It is seen, for example, in Tenerife, the peak rising as a great cone from a vast caldera which is surrounded by the abrupt wall-like precipices of the older cone. The volcano of Bourbon rises in like manner in the midst of an old crater-ring, 4 miles in diameter; and the Pico de Fogo, one of the Cape de Verde Islands, is another example of the same structure. The craters of volcanoes which are situated in or upon the margin of the sea are occasionally, as we have seen, converted into harbours, the water finding access by a breach in the cone. When such volcanoes wake up, a new cone or cones by-and-by appear as islets in the centre. This type of half-submerged cone-in-cone is exemplified by the Santorin Islands (Greek Archipelago), where Aspronisi and Thera are remains of a great crater-ring, in the centre of which we see the Kaimeni Islets—the product of recent eruptions. A still more perfect example of the same structure is afforded by Barren Island in the Bay of Bengal.

A volcano, as we have seen, is composed of successive sheets of erupted material, inclined outwards in all directions from the focus of eruption. This structure is eminently weak, and, subject as an active volcano is to constant vibration and frequent earthquake movements, the cone is often modified by the displacement and collapse of large rock-masses. Indirectly, however, the fracturing of the mountain is the means of strengthening the structure—for lava frequently rises in the rents and crevices that radiate outwards from the funnel, and thus forms veins and dykes which serve to brace and bind together the various parts of the volcano. In the case of volcanoes which have attained a great height it not infrequently happens that lava ceases to rise to the central crater, and is ejected through such rents and fissures lower down on the flanks of the cone or even near its base. Sometimes this seems to indicate approaching repose or even extinction. A time comes in the life of all volcanoes when they cease to erupt either lava or fragmental materials. But for a long period they continue to give out acid gases and vapour. This is called the *solfatara stage*. Eventually the last traces of volcanic heat disappear, and springs of cold water may issue from the mountain and the ground in its vicinity. Such

springs are often highly impregnated with mineral matter, and frequently effervescent with carbonic acid. Many of the natural effervescent mineral waters of commerce come (or used to come) from regions of extinct volcanoes. Such waters, however, are now imitated—the artificial production, owing to its greater sparkle, being in more demand than the natural.

The amount of materials discharged during a volcanic eruption varies considerably, not only in different volcanoes, but in one and the same. A prodigious quantity of lava issued from Skaptar Jokul (Iceland) in 1783. It formed two main streams which flowed for distances of 40 and 50 miles respectively, and varied in thickness or depth from 600 to 1000 feet. Enormous lava-floods have likewise issued from the volcanoes of the Sandwich Islands. In prehistoric times lava seems in many cases to have issued from long vertical fissures, and deluged wide regions. Some of these inundations of lava are well seen in western North America, as in the great basalt plain of Snake River, Idaho. The basaltic plateaus of Antrim and the Inner Hebrides, of the Faroe Islands, and of Iceland are believed to be the denuded remains of successive massive-eruptions like those of Idaho. The volcanic plateaus of Abyssinia and the Deccan (Hindustan) have had a similar origin. As a rule the volcanoes which emit lava in greatest volume are comparatively quiet in their action. The lava simply rises and is poured out, the crater is depleted of its liquid contents, and the eruption ceases. This is the case with the volcanoes of Hawaii. While the lava is bubbling and boiling in the crater jets of the incandescent liquid are shot up more or less continuously, forming the so-called 'fire-fountains,' but the terrible explosions which accompany the paroxysmal eruptions of such volcanoes as Etna and Vesuvius are unknown in Hawaii. Hence in that region the cones are built up chiefly of lavas. The Javanese volcanoes are examples of the explosive type of volcano. In these loose ejectamenta predominate, and frequently no lava flows out. In Vesuvius and similar volcanoes we seem to have, as it were, a mean between the *quiet* and *explosive* types. The enormous energy displayed during an explosive eruption is shown by the heights to which stones and ashes are projected. According to Sir W. Hamilton, jets of lava mixed with stones and scoriæ were in 1779 thrown from Vesuvius to a height of 10,000 feet, giving the appearance of a column of fire. The fine ashes of Krakatoa are said to have been carried by the uprush of gas and vapours to the amazing height of 17 miles. Remarkable solar phenomena, seen in Ceylon, South Africa, and Brazil, were attributed to the presence in the upper atmosphere of this fine dust; while in Britain gloriously coloured skies before sunrise and after sunset, months after the eruption, were attributed to the same cause. In 1845 the dust from Hecla was in ten hours lying thick on Orkney and Shetland. Ashes from Consequina fell, in 1835, in Jamaica, 700 miles off; and fine dust covered the ground 30 miles south of the volcano to a depth of 10 feet. During the great eruption of Tomboro ashes and cinders were ejected sufficient to make three mountains, each equal in size to Mont Blanc, or to cover all Germany 2 feet deep. Owing to the heavy rains which so frequently accompany eruptions, destructive torrents are formed. In many cases this water is increased by that derived from melting snows, or from the bursting open of subterranean reservoirs, or the sudden emptying of crater-lakes. Sweeping down the slopes of the mountain, the water carries along coarse and fine debris, and, reaching lower levels, often flows onward for many miles, not as a mere torrent of muddy water, but as a great inundation of soft pasty mud. Such muds are termed *mud-lavas*. Mention has already been made of the acid gases, &c. which are given off during eruptions. Occasionally hydrogen and other combustible gases are present and burst into flame. But the 'flames' that seem to issue from a crater are usually the reflection of the glowing lava illuminating the clouds of vapour, scoriæ, and ashes.

Even during its period of activity a volcano is subject to excessive denudation, and becomes seamed and scored with ravines, radiating outwards from the upper part of the cone, and deepening as they proceed towards the low grounds. Long after the volcano has become quite extinct the process of denudation is continued, until the mountain has become so reduced in size and altered in form that its volcanic character is apparent only to geologists. Extinct volcanoes, showing every stage in this process of decay, are met with abundantly in many parts of the world which are no longer disturbed by volcanic action. Often all that has been left is the choked-up pipe or funnel, with, it may be, some of the loose ejectamenta surrounding it, and a few portions of the old lava-flows. As examples in Scotland may be cited Arthur Seat, Largo Law, the Eildon Hills, Rubers-law, &c. These are the mere stumps or roots of what must have been volcanoes of moderate dimensions. Now and again all that remains of a volcano is the plugged neck or funnel, such as North Berwick Law, Edinburgh Castle Rock, Loudoun Hill, the Dunian, &c.

Active volcanoes are fortunately limited to particular regions of the earth, where they are distributed at intervals, and are generally arranged in a linear direction. The Pacific Ocean is bounded by an almost unbroken line of active volcanoes—the 'belt of fire.' The coast-lands of the Atlantic, on the other hand, show hardly any, and only a few appear in adjacent islands. But the Caribbean Sea and the Mediterranean—those great transmeridional depressions—wash the shores of lands which show active and recently extinct volcanoes in considerable numbers. The volcanoes of western Asia are probably closely related to the Mediterranean depression, as those of north-east Africa appear to be to that of the Red Sea. Note also must be made of the several volcanoes and volcanic islets that rise from the depths of the great ocean basins.

The causes of volcanic action have formed a fruitful theme for chemists, geologists, and physicists, but none of the conclusions arrived at is wholly satisfactory. Sir H. Davy suggested that if immense quantities of the metallic bases of the earths and alkalies were present in the interior of the earth all the phenomena of volcanic action would be produced by their oxidation from contact with air and water. This view he subsequently abandoned, but it was again taken up and advocated by Daubeny and others. Some writers, again, have maintained that the chief cause of volcanic action is the introduction of water to the highly heated interior of the earth. In some cases—those of quiet eruptions—the water or steam is supposed to be absorbed by the lava in a gradual manner; in other cases—those of explosive eruptions—the water is believed to be suddenly introduced in considerable volume. Both these actions doubtless take place, but steam, however much it may intensify an eruption, can hardly be its ultimate cause. Some lavas, it is true, emit immense quantities, but others again appear to contain a much smaller supply; and we cannot believe that the enormous volumes of lava which flow quietly away from such lofty volcanoes as those of Hawaii have been forced up from below by the mere pressure

of the moderate amount of steam which they contain. The most probable view is that volcanoes are closely related to those earth-movements which have resulted in the flexing and fracturing of strata. All the greater wrinkles of the earth's surface—its ocean-basins, continental plateaus, and mountains of elevation—owe their origin to the sinking-in of the crust upon the cooling and contracting nucleus. The crust yields to the enormous tangential pressure by cracking across and wrinkling up, in various linear directions, and it is along these lines of fracture and flexure that molten matter and heated vapours and gases are enabled to make their escape to the surface. So far, then, geologists are generally agreed as to the close relation that obtains between fracturing, folding, and volcanic action. But beyond this agreement ceases. By some it is believed that the earth is a practically solid globe—that, notwithstanding its high temperature, the interior is kept in a solid state by pressure. But as the earth parts with its heat it contracts and the crust is fractured and wrinkled up, and the pressure being relieved in this way the solid matter becomes liquefied and is forced upwards through fissures, partly by pressure and partly by the action of imprisoned steam. Others, again, think it is more probable that a liquid or viscous substratum separates the cooled crust from the solid nucleus, while some still favour the old hypothesis of a comparatively thin crust enclosing a liquid or viscous interior. According to these two latter views lava is extruded through rents and fissures formed by the yielding of the crust to tangential pressure—the lava being forced to the surface by the weight of the subsiding crust in adjacent regions. Great mountain-chains adjoin areas of dominant depression, and it is conceived that the viscous-liquid matter of the interior is displaced underneath the sinking regions while an equivalent weight is forced up through fissures in the mountain-chains, and continues to be discharged until equilibrium is restored. In this view the interstitial steam or water-gas which plays so important a part in volcanic eruptions is not the inciting cause of activity. Its presence renders the viscous matter more liquid, and its expansion doubtless increases the force of volcanic eruptions; but the extrusion of lava from the fluid or viscous interior would take place even if no steam were present. But as steam is invariably present in volcanic discharges, and as it could hardly have been derived from the supposed liquid or viscous interior, it is possible that the lava in its upward progress absorbs water from the supplies always circulating through the rocks of the crust. It is certainly remarkable that all the great volcanoes are situated within or along the margins of what are believed to be sinking areas; and the same would appear to have been the case in earlier stages of the world's history. As the continents have increased by successive ridging up of their borders, and the shore-lines of the globe have advanced seawards, the lines of chief volcanic action appear to have advanced with them. Even the few volcanoes that occur in inland regions seem to be situated within or in close proximity to subsiding areas, so that they really form no exception to the general rule. Once more, there is reason to believe that all the notable volcanoes and volcanic islets of the great ocean basins rise from the backs of ridges and swellings of the crust.

See the articles EARTH, EARTHQUAKES, GEOLOGY (with books there cited), LAVA, ETNA, HAWAII, ICELAND, VESUVIUS, &c.; works on volcanoes by Scrope, Daubeny, Judd, Hull (1892), Dana on those of Hawaii (1892), A. Geikie on *The Ancient Volcanoes of Great Britain* (1897), T. G. Bonney (1899). And see IGNEOUS ROCKS.

Vole (*Arvicola*), a genus of rodents typical of the sub-family Arvicolinæ, which also includes the lemmings (Myodes), the musk-rats (Fiber), and several related genera. The genus Arvicola includes over forty species distributed over Europe, Asia, and North America—all more or less like rats and mice. In Britain there are three—the Water-vole (*A. amphibius*), the Field-vole (*A. agrestis*), and the Bank-vole (*A. glarcolus*). The

The Field Vole (*Arvicola agrestis*).

water-vole is about the same size as the brown rat, and rat it is often called. It has dark brown or black fur, a tail about half the length of the body, and very strong hind feet, with five rounded pads on their lower surfaces. It burrows by the banks of streams and feeds for the most part on vegetable food. In summer the female has three or four litters of two to seven young. The water-vole does not occur in Ireland. The field-vole, or short-tailed 'field-mouse,' is about the size of a common mouse, but the body is plumper and the tail shorter. It has brownish-gray fur; its hind feet have six pads. It lives in fields and woods, feeds on vegetable food, is very prolific, and often does much damage. The bank-vole is like the field-vole, but has a 'more or less rusty or rufous-coloured back, larger ears, and a longer tail.' Its habits are like those of the field-vole.

Plagues of field-voles have repeatedly occurred in various parts of Britain. Thus in 1876 they destroyed much pasturage on the Borders and in Yorkshire, and in 1892 they did very serious damage to farms in the south of Scotland. In Roxburgh and Dumfries the plague is said to have extended over 80,000 acres, and a royal commission inquired into the subject. Mild winters and the destruction of the vole's natural enemies —owls, kestrels, stoats, weasels, &c.—are doubtless among the causes of the plague. Various attempts by means of poison, traps, pitfalls, and the like have been made to get rid of the plague; and in Greece Professor Löffler has attained some success by infecting them with a contagious disease. It seems, however, most likely that ultimate success will depend on a restoration of the balance of nature disturbed by the destruction of the 'vermin' which in natural conditions keep voles and similar animals in check.

Volga (a Slav word for 'river'), the greatest river in Russia and the longest in Europe, having a course of over 900 miles in length as the crow flies, or, following its principal sweeps and sinuosities, a length of 2400 miles from its source in a small lake among the Valdai Hills to its mouths in the Caspian Sea. It has a drainage area of 592,300 sq. m., over which there is an annual rainfall of 152 cubic miles, and its annual discharge equals 44 cubic miles, poured into the Caspian Sea

through 70 mouths. About the middle of its course it has a width of over a mile. It is navigable from near its source, and a wide-spreading system of canals and its numerous tributaries combine to make the river one of the most important waterways in the world. By means of artificial cuttings it communicates with the White Sea, the Euxine, the Baltic, and the Gulf of Finland, as well as with the Don, the Dniester, the Dnieper, the Dwina, and other rivers. As many as 15,000 vessels, including over 500 steamers, navigate the waters of the Volga, and are all engaged in the river trade, a considerable and growing part of which comes from northern and central Asia, but by far the larger portion is derived from the internal commerce of Russia in Europe. Most of the goods exhibited at the great fair of Nijni Novgorod are transported to and from their destinations by means of these river-boats. Traffic almost entirely ceases in winter, when the waters are frozen, the ice-bound stream being only used by such travellers as are compelled to journey during that inclement season, and who drive over the ice and snow in sledges. The fisheries of the Volga are of great importance, sturgeon, carp, and pike being captured in immense numbers by means of the net, the hook, and the harpoon. At the first approach of winter the fish make for the sea, but such is the quantity that large shoals, unable to advance through the crush in front, remain jammed in thick masses in the deeper pools, and are frozen over, until, at the breaking up of the ice, they fall an easy prey to the fishermen. Seal-hunting, near the shores of the Caspian, also employs a number of persons.

The scenery along the upper banks is of a monotonous forest character, marshes and swamps occupying a considerable area to the left, where the ground is low. On the right the land is higher, often rising abruptly from the stream, but farther down the country becomes almost flat, the soil generally being composed of shingle and sand, and here navigation is somewhat impeded and rendered difficult by shoals and banks. This is a steppe region, where trees disappear, but short grass affords excellent pasturage, until, near its mouth, the river enters a desert area. The principal tributaries of the Volga are the Oka, the Kama, the Mologa, the Sheksna, the Unja, the Vetluga, and the Viatka. These are generally navigable for some distance above their mouths, and afford water trade routes to numerous towns at a considerable distance from the main river. The chief towns on the banks of the Volga are Jaroslav, Kostroma, Nijni Novgorod, Kazan, Simbirsk, Stavropol, Samara, and Tzaritzen. These all live as it were by means of the river, and are mostly flourishing places. See German monographs by Roskoschny (Leip. 1887) and Lender (St Petersburg, 1889).

Volhynia, a government in the west of Russia, bounded on the W. by the Polish provinces, from which it is separated by the river Bug. The surface in the north of the government is low, and plains and morasses, covered with forests, abound; in the south there are hills and fertile corn-bearing land. The area (27,743 sq. m.) is larger than that of Greece; pop. (1885) 2,264,867; (1897) 2,907,902. The capital is Zhitomir.

Volition. See WILL.

Volkslied. See SONG.

Volney, CONSTANTIN FRANÇOIS CHASSEBŒUF, COMTE DE, was born at Craon in Mayenne, 3d February 1757. He lost his mother at two, and his youth was solitary, taciturn, and joyless, his health feeble. He studied at Paris medicine, history, and the oriental languages, adopted the name of Volney for that of Chassebœuf, and travelled in Egypt and Syria (1783–87), publishing his *Voyage* (2 vols. 1787), one of the most exact and valuable works of the kind ever published, all personal details being eliminated 'to economise the time of readers'—a circumstance unique in the literature of its class. Volney was elected to the Constituent Assembly in 1789. A Liberal in politics and religion alike and a fast friend of real liberty, he was too honest and outspoken for the times, and was thrown into prison, from which he was freed only after the downfall of Robespierre. His reputation chiefly rests on his famous work, *Les Ruines, ou Méditations sur les Révolutions des Empires* (1791), a characteristic *philosophe's* essay on the philosophy of history. He filled the chair of History in the short-lived École Normale, and lived in the United States (1795–98), collecting the materials for his *Tableau du Climat et du Sol* (2 vols. 1803). In his absence he had been elected to the Institute, and soon after he was admitted to the Academy. Napoleon gave him a seat in the senate, and made him Count, and Commander of the Legion of Honour; Louis XVIII. made him a peer. Almost his latest writing, *Histoire de Samuel, Inventeur du Sacre des Rois* (1819), shows all his anti-religious bias, and his acuteness of mind, and at the same time all those 18th-century limitations of which he was happily unconscious. Volney died at Paris, 25th April 1820. His *Œuvres Complètes* fill 8 vols. (1821). See E. Berger's *Étude* (1852), and Sainte-Beuve in *Causeries du Lundi*, vol. vii.

Volo, a port of Thessaly, on the Gulf of Volo, 37 miles by rail SE. of Larissa. Pop. 11,029.

Vologda, capital of a north-eastern province of Russia (stretching to the Urals), stands on both banks of the river Vologda, 260 miles NE. of Moscow by rail. It has considerable trade, and a pop. (1895) of 17,391. The area of the government (155,498 sq. m.) is a fifth larger than that of Great Britain and Ireland. Pop. (1897) 1,365,587.

Volsci, an ancient Italian people, extending from the south-western slopes of the Apennines to the sea, along both banks of the Liris (*Garigliano*), whose capital was Suessa Pometia, and, after its destruction by the Romans, Satricum and Antium. The Volsci were a brave and warlike people who waged almost incessant war with the Romans for 200 years previous to 338 B.C., when they were finally subdued, their territory incorporated into Latium, and they themselves created Roman citizens. The legend of Coriolanus (q.v.) is connected with the Volscian wars. See ROME, TARQUINIUS SUPERBUS, ANTIUM, UMBRIA.

Volsk, a town of Russia, on the Volga's right bank, 70 miles NE. of Saratoff. Pop. 37,044.

Volsungs, a famous heroic race in old German legend, its founder Volsung or Walsung, the grandson of Odin, and its brightest ornament Volsung's son, Siegmund. Sigfried or Sigurd, hero of the Nibelungenlied (q.v.), is of the same stock. The tale is enshrined in the Old Icelandic Volsunga-saga, which has been followed by W. Morris in his *Story of Sigurd the Volsung.*

Volt (derived from Volta), the unit of electromotive force now in universal use among electricians. It is defined legally in terms of the ohm and ampere (see ELECTRICITY). An instrument for measuring voltage is called a voltmeter. The *voltameter* is an instrument for measuring current, as explained at Electricity (q.v.).

Volta, a river of Upper Guinea which, rising in the Kong mountains or highlands behind the Ashantee country, runs southward between Ashantee and Dahomey, and reaches the Bight of Benin through the eastern part of the British Gold Coast.

To left and right of its mouth it forms great lagoons, and on the bar across the mouth a heavy surf runs.

Volta, ALESSANDRO, physicist, was born at Como, of a noble family, 19th February 1745, and in 1774 he was appointed professor of Natural Philosophy at Pavia, the duties of which office he discharged till 1804, when he retired to his native town to spend the rest of his days; and having been summoned to show his discoveries to Napoleon, and received medals and titles at home and abroad, he died 5th March 1827. It was he who mainly developed the theory of current electricity along purely physical lines (see ELECTRICITY); the term *voltaic* is justly used in many cases instead of *galvanic* (see GALVANI); he it was who discovered the electric decomposition of water, and invented a new electric battery, the electrophorus, and an electroscope. He also made many investigations on heat and gases. His works fill 5 vols. (1816); and there are monographs on him by Bianchi and Mochetti (1829–32), and by Volta (1875).

Voltaire, FRANÇOIS MARIE AROUET DE, was born on 24th November 1694 in Paris, where his father, François Arouet, held a responsible post in the Chambre des Comptes. His mother, who died during his childhood, was well-born and a friend of the famous Ninon de L'Enclos. His godfather, the Abbé de Châteauneuf, exerted a pernicious influence on the precocious boy, and taught him to scoff at religion. In his ninth year he entered the Collége Louis-le-Grand, the chief French seminary of the Jesuits. He soon distinguished himself as a versifier, and the college authorities thought worthy of print his ode to St Geneviève. Although it was devotional in tone, the letters of his schoolboy days are those of a youthful sceptic. Before he had entered his teens he was introduced to Ninon de L'Enclos, who was so struck by him that she left him a legacy of 2000 francs with which to buy books. Leaving college at seventeen, he was destined by his father for the bar, but the study of law disgusted him. His poetic talents, lively conversation, and already pronounced scepticism procured him a welcome from the so-called 'Society of the Temple,' among the members of which were the Anacreontic Abbé de Chaulieu and the Duc de Sully, with other men of rank. Alarmed by the dissipated life which he was leading, his father gladly saw him admitted into the suite of his godfather's brother, the Marquis de Châteauneuf, who after the treaty of Utrecht was appointed French ambassador to Holland; but in consequence of an intrigue with a young lady Arouet, after a few months' stay at the Hague, was sent home in disgrace. In obedience to the command of his exasperated father he entered the office of an attorney, but his stay in it was short, and in a few months more he obtained notoriety as the author of a satire on his successful rival in the poetic competition for a prize offered by the French Academy. After the death in 1715 of Louis XIV. Arouet was suspected of lampooning the regent, the Duc d'Orleans, and was banished for several months from Paris. The evidence that he was the author of a subsequent lampoon, accusing the regent of detestable crimes, satisfied the authorities of his guilt, and he was thrown into the Bastille (May 1717), where he was confined for nearly a year. Meanwhile he had written his tragedy *Œdipe*, and had begun a poem, the hero of which was Henry IV. of France. With his liberation from the Bastille he assumed the name of Voltaire, which is supposed to be an anagram of Arouet l(e) j(eune). *Œdipe* was performed in Paris (18th November 1718) and was triumphantly successful. His next dramatic attempts were, comparatively, failures, and he devoted himself to the completion of his poem on Henry IV., which was to be published by subscription. But he had selected for a hero a prince whose chief distinction was the championship of the Protestant cause, and the poem contained praises of religious toleration and an unflattering description of the papacy. All this induced the authorities to refuse the sanction needed for publication. Voltaire had the poem surreptitiously printed at Rouen (1723) and smuggled into Paris, when, as *La Ligue ou Henri le Grand*, *Poème épique*, it was widely read and greatly admired. Voltaire was pushing his way at court, and being patronised by the newly-wedded queen of Louis XV., when there occurred the catastrophe which drove him from France. A certain Chevalier de Rohan-Chabot, a scion of the great house of Rohan, addressing him contemptuously as a parvenu, Voltaire retorted with spirit, and seems to have written and circulated some caustic epigrams on the man who had insulted him. The chevalier's revenge was to have Voltaire cruelly beaten by his hirelings. The authorities refusing him proper redress, Voltaire resolved on challenging the cowardly author of the outrage, with the result that Voltaire was once more thrown into the Bastille. After a short imprisonment, he was liberated on the condition that he would proceed forthwith to England, where he landed about the end of May 1726.

Voltaire brought with him letters of introduction to several persons of station. Bolingbroke, with whom he had been intimate in France and who was now in England, made him known to Pope and his circle. He made the acquaintance of Peterborough, Chesterfield, the Herveys, and heard from the Duchess of Marlborough anecdotes of the times of Queen Anne. He became more or less intimate with Young, with Thomson, and with Gay. Having learned to read English with ease, and even to write it intelligibly, he acquired some knowledge of Shakespeare and Milton, Dryden and Butler, and a familiarity with what Pope had written, with Addison's *Cato*, and with the so-called dramatists of the Restoration. He was strongly attracted to Locke among philosophers, and he mastered the elements of Sir Isaac Newton's astronomical physics. Bolingbroke's conversation and the writings of the English Deists furnished him with many of the weapons of which he made use in his subsequent attacks on the theology of Christendom. George II.'s consort, Queen Caroline, accepted his dedication to her of the *Henriade*, the new form of *La Ligue* (the publication of which had been one of the objects of his visit to England); and the list of subscribers to it included with the king and queen a number of the nobility and gentry. When he was permitted to return to France early in 1729, after a residence of nearly three years in England, he took with him, among other fruits of his literary industry in exile, his *History of Charles XII.* and the materials for his *Letters on the English.* The letters were full of contrasts, certain to offend the ruling powers in France, between English liberty, political, and especially intellectual, on the one hand, and French despotism of every kind on the other.

On his return to Paris Voltaire laid the foundation of what became great wealth, by the sagacious purchase of shares in a government lottery, and by speculations in the corn-trade, to the profits of which were added a few years afterwards those arising from large army contracts. He formed a very close intimacy with Madame du Châtelet (q.v.), a lady of distinguished connections, very clever, accomplished, and scientific, whose husband was a cipher. He had a château, Cirey, in Champagne, and thither Voltaire fled in the summer of 1734, an order having been issued for his

arrest on the publication, unauthorised by him, of his *Letters on the English*, accompanied as they were by heterodox comments on Pascal's *Thoughts*. Soon he and Madame du Châtelet made Cirey their headquarters. At Cirey Voltaire continued *La Pucelle*, a shameless libel on Joan of Arc; wrote dramas, *Merope* and *Mahomet* among them; poetry, philosophical and other; his *Treatise on Metaphysics;* much of his *Siècle de Louis Quatorze* and *Les Mœurs et l'Esprit des Nations*, with his *Elements of the Philosophy of Newton*. Here he fitted up a laboratory and studied physics and chemistry; and here he received (August 1736) the first letter written to him by his admirer, the Crown-prince of Prussia, afterwards Frederick the Great. Since the appearance of his *Letters on the English* he had been out of favour at court. But he wrote at the instance of his friend the Duc de Richelieu a dramatic piece, the *Princesse de Navarre*, which was performed on the occasion of the Dauphin's marriage (February 1745); and its adroit adulation pleased Louis XV. This and the patronage of Louis's new mistress, Madame de Pompadour, procured him the appointments of royal historiographer and of gentleman-in-ordinary to the king, as well as his election to the French Academy—distinctions which he sorrowfully owned were due to anything but his really meritorious contributions to the literature of his country. The court favour which he now enjoyed proved to be fitful. In 1747 an imprudent speech at a court card-party drove him to take refuge with an old friend, the Duchesse de Maine, for whose amusement he now wrote *Zadig* and others of those oriental tales which are among the most popular of his writings. When he was allowed to reappear at court, some injudiciously expressed flattery of Madame de Pompadour excited the indignation of the queen, and Voltaire had again to migrate. Oddly enough he and Madame du Châtelet became the welcome guests at Lunéville of ex-King Stanislaus, the French queen's father. A *liaison* with a young officer resulted in the death (September 1749) of Madame du Châtelet after she had given birth to a child of whom her new lover was the father.

The king of Prussia had more than once urged Voltaire to reside permanently at his court. But Voltaire would not consent unless he were to be accompanied by Madame du Châtelet, and to this arrangement Frederick had an insuperable objection. By her death a chief obstacle was removed. In July 1750 Voltaire found himself at Berlin, with the office of king's chamberlain, a pension of 20,000 francs, and board and lodging in one of the royal palaces. But the friendship of the king and the poet was soon disturbed. Voltaire entered into some questionable financial and other operations in association with a Berlin Jew. The result was a lawsuit, and during the proceedings disclosures discreditable to Voltaire irritated the king against him. Frederick was still more gravely offended by Voltaire's satirical criticisms on Maupertuis, whom the king had made president of his Academy of Science and for whom he had a great regard; and in March 1753 Frederick and Voltaire parted, never to meet again. The chief literary result of Voltaire's stay in Prussia was the completion and publication of his *Siècle de Louis Quatorze*.

Soon after leaving Prussia Voltaire was arrested and kept for several weeks in confinement at Frankfort, partly through the bungling of Frederick's representative in that city, who had been instructed to recover from Voltaire a volume, privately printed, of the king's poems. Voltaire avenged himself by writing the well-known and malicious sketch of Frederick's character and account of his habits, which, however, was first printed, and then surreptitiously, after the writer's death. After various wanderings Voltaire settled, early in 1755, near Geneva. From Les Délices, as he called his first Swiss home, he removed about 1758 to Ferney (q.v.), which was in French territory, some 4 miles from Geneva on the northern shore of the lake. During the first five years of his settlement in Switzerland appeared his greatest historical work, *Les Mœurs et l'Esprit des Nations*, his pessimistic poem on the earthquake of Lisbon, and its prose-pendant, the famous *Candide*. The suspension of the *Encyclopédie* by the French government, and the sentence of the parliament of Paris condemning to be burned by the public executioner a harmless poem of his own on natural religion, impelled Voltaire to issue his celebrated declaration of war against L'Infâme. In 1762 appeared the first of those writings assailing the Christian faith which flowed from his pen until the end of his life. In the same year occurred at Toulouse the judicial murder of Jean Calas (q.v.), falsely accused of having, from Protestant zeal, killed one of his sons to prevent him from becoming a Roman Catholic. Voltaire exerted himself strenuously, and at last successfully, to have the sentence annulled, and to rescue other members of the Calas family from the punishment to which, as unjustly convicted accomplices, they had been condemned. This and similar efforts on behalf of victims of French fanaticism procured Voltaire the gratitude of numbers of his countrymen, the applause of other nations, and, ever since, the admiration of many to whom his attacks on Christianity have been and are utterly repugnant. It is not so well remembered that even in theology he endeavoured to exert a conservative influence, and that he was regarded as a reactionary by the adherents of the atheism which during his later years became fashionable in France. The unadulterated atheism of Baron d'Holbach's *System of Nature*, issued in 1770, he vehemently opposed; and five years before the appearance of that work Horace Walpole reported from Paris the speech of a French lady who said contemptuously of Voltaire: 'He is a bigot, he is a Theist' (*Il est bigot, c'est un déiste*).

The varied activity of Voltaire in his old age was immense. Among the works which he composed while domiciled in Switzerland were histories of *Russia under Peter the Great* and of the *Age of Louis XV.;* the *Dictionnaire Philosophique*, still often dipped into; a *Treatise on Toleration;* and *Fragments on the History of India;* besides tales, philosophical treatises, and tragedies and comedies. He kept up an enormous correspondence, resuming that with Frederick, and entering into a new one with the most friendly of his crowned admirers, the Empress Catharine of Russia, whom he urged with great but fruitless fervour to drive the Turk out of Europe, and to revive, as far as it could be revived, the ancient glory of Greece. He looked keenly after his many and widely-spread investments, made so successfully that his later income was computed to amount to what would now be £20,000 a year. He farmed, reclaiming waste land, planting, rearing poultry, and breeding horses. What is more striking, he established at Ferney a watch-making industry which competed with that of Geneva, and which he fostered by appeals on its behalf to all and sundry, from the Empress Catharine downwards.

The death in 1774 of Louis XV. removed the principal obstacle to a visit of Voltaire to Paris, but it was not paid until 1778, when he was in his eighty-fourth year, and then ostensibly to superintend the arrangements for the performance of his last tragedy, *Irène*. After an absence of thirty-four years he arrived in Paris in February 1778, and was welcomed enthusiastically by all that

was most distinguished socially and intellectually. When he drove out the progress of his carriage was obstructed by the pressure of immense and acclaiming crowds: 'It was he who defended the Calas' was the reply of one among them who was asked by his neighbour the reason for the prevalent excitement. Frantic, literally, was the enthusiasm, which a house crowded to suffocation displayed for hours on the occasion of his visit to the Comédie Française to witness the representation of *Irène;* one of the leaders of the applause being the Comte d'Artois, afterwards Charles X. These and other excitements, telling on the infirm frame of the old man, brought on an attack of illness which was aggravated by an injudicious administration of opiates. Delirium alternating with torpor supervened, but with intervals of lucid consciousness. A few hours before his death two priests entered the sick-room, and to a professional appeal from one of them he replied, 'Let me die in peace.' The end came on the night of the 30th May 1778.

Of the numerous French biographies of Voltaire much the best is the elaborate work of Gustave Desnoiresterres, *Voltaire et la Société du XVIII^e^ Siècle* (2d ed. 8 vols. 1887); and Bengesco's *Voltaire: Bibliographie de ses Œuvres* (4 vols. 1882-91) may also be consulted. An American life of Voltaire by the late James Parton (1881) is copious and displays industry. Mr John Morley's *Voltaire* (1872; new ed. 1886) is more a criticism than a biography. Strauss's six lectures appeared in 1871 (4th ed. Bonn, 1878). There is a biography of Voltaire by General Hamley in the 'Foreign Classics' (1877), and another by the writer of this article in the 'Great Writers' series (1892). See also J. Churton Collins's *Bolingbroke, and Voltaire in England* (1886).

Volterra (anc. *Volaterræ*), a Tuscan town of 5500 inhabitants on a hill 35 miles SW. of Pisa by rail, with important Etruscan and other remains. See ETRURIA, Vol. IV. p. 446.

Voltri, a coast town of Italy, 9 miles W. of Genoa by rail. Pop. 6358.

Volumes, LAW OF. See CHEMISTRY, p. 150.

Volumetric Analysis. See ANALYSIS.

Voluntaryism, the polity of those who insist on the absolute separation of church and state, disapprove utterly of church endowments and state grants for religious purposes, seek the disestablishment and disendowment of established churches, and recognise alone as consistent with true religious liberty and equality the support of churches and clergy by the voluntary payments by the members. Most Nonconformists are more or less voluntaries. For the 'Voluntary Controversy' in Scotland, see UNITED PRESBYTERIAN CHURCH; and for the arguments for and against state churches, books cited at STATE RELIGION.

Volunteers. The volunteer movement of Great Britain is unique in the history of nations. In 1859, on the occurrence of a menace to Great Britain, which for the first time for a long period seemed to indicate a possibility of invasion, the volunteer spirit spontaneously rose up. General Peel, who was then war minister, realised its importance, and by his advice it was resolved to accept the services of those who might offer themselves. No promise of pecuniary aid to meet necessary expenses, far less of pay or of reward, was held out. If volunteers would equip themselves with uniform, accoutrements, and arms, and supply themselves with military instructors, all at their own expense, the state would accept their services. These were the conditions. The volunteers were to find everything, and then the state would consent to use them. The response was an astonishment to the world, and not least to Great Britain herself. An armed force rose up as if by magic. Men of all professions and trades thronged to enrol themselves, devoting much of their leisure time to their volunteer work, submitting to the discipline of drill in a hearty and vigorous manner, and paying at something like the rate of £8 per man for arms, uniform, and accoutrements, in addition to instructors' salaries, rent of rooms and ground, and other necessary expenses. In a very few months the numbers swelled above 100,000, artillery and riflemen, and daily offers of service came from new companies, notwithstanding the fact that the alarm which first awakened this martial spirit had died away, and there was no longer any immediate prospect of hostilities to stimulate and keep alive the enthusiasm that had been evoked. It became apparent that the spirit was one inherent in the national character, and had not been created but only aroused by the event which has always been directly associated with its origin. It demonstrated, what observant men had known before, that the British, although they are not a military nation—indeed hate militarism—are yet at bottom a warlike race. Within little more than a year of the first enrolments the Queen was able to see assembled two great bodies in Hyde Park and in Queen's Park, Edinburgh, numbering in all about 80,000 soldiers, who had been taught the elements of military drill, and were able to move in large bodies without confusion. The expectation at first had been limited to some thousands of sharp-shooters, who might be useful for hanging on to and harassing an enemy, and thus giving a certain amount of external aid to the efforts of the army. So restricted was the idea of the capabilities of the force that a special drill-book, known as the Green Book, was issued for volunteers, in which the company was taken as the largest unit. There was no idea of volunteer battalions taking their part as integral portions of brigades. They were only to be administratively in battalions, but in training the companies were to be the units. Their role was to be that of irregulars, not of soldiers who would take their places in the British line, and fight side by side with the enlisted forces of the crown. But the numbers, the drill, and the capacity for organisation shown by the new force made its consolidation into the larger unit of the battalion a thing of course, and its conformity to the drill of the army a necessity. Indeed this had worked itself out even before the Green Book was ready for issue. When it was issued it was already utterly unsuitable to the existing state of things. In all the large towns battalions were already organised and in active training; and the administrative organisation was in a very short time confined to the country districts. Even in their case, after the lapse of a few years, consolidation took place, and for many years the volunteer force has been administered, exercised, and dealt with from headquarters in battalions, just as are the regiments of the regular army and the militia. It has now found its place—and that no mean one—as part of the organised defences of the country, and in 1888 a further step was taken in its organisation in district brigades, each under a brigadier-general, who would command it as a separate unit in the event of its being mobilised for service.

As might have been expected, the volunteers, who gave their services and provided at their own expense all that was required for equipment and drill, could not be expected thus to tax themselves in perpetuity while giving their actual time and labour without pay or reward. Accordingly the question soon arose, Is this force worth the expense to the country of providing the necessary armament, clothing, and equipment? The question was made the more urgent by its becoming apparent that the

moneyed and well-to-do classes, who at first formed the great bulk of the volunteer force, were not so patriotic in time of peace as to continue to enrol themselves, and sacrifice comfort and time in drilling and practising at the target for the country's defence. It is unpleasant to be compelled to record that year after year the numbers of the leisured, the professional, and the middle-class volunteers diminished, that it became impossible to keep up companies recruited from these ranks, that many of them ceased to exist as such and were replaced by companies of artisans, and that many which maintained their existence did so only by taking into their ranks their employees in the lower grades of their profession. Merchant companies enlisted their shopmen, solicitors' companies enrolled their clerks, barristers' companies dissolved, and gradually the whole character of the force was changed. It became, as regards the rank and file, a workingmen's force. The great mass of those now enrolled are men dependent upon weekly wages or small salaries for their subsistence, to whom the expense of providing uniform and accoutrements would be altogether prohibitive. Further, those who in the early days of the movement had contributed liberally to the funds of the corps in their district ceased to do so. The novelty of the movement was gone, and those whose enthusiasm was not strong enough to induce them to serve ceased to yield to appeals to their purses. The volunteer force had during its earlier years been too much petted and praised, and its rapid development into a great force had raised among a certain class of military men some degree of jealousy and a not altogether unjustifiable feeling of distrust. There could have been nothing worse for the volunteers than that they should be told that they were as good as the soldiers of the army, and that economists —falsely so called—should laud them to the skies in order to urge that their existence justified a reduction in the regular forces. The evils which followed this period of foolish flattery were those which might have been expected. The flatterers got a little tired of their toy, and cold indifference followed too warm attentions. The force itself did not develop with that vigour which follows good discipline and judicious correction. It was a critical time, and was seen to be so. Fortunately it was met with wisdom. Those responsible for the maintenance of the defences of the country saw that it was an institution worth preserving and capable of high development. Accordingly it was resolved, with the universal approbation of the nation, to relieve the volunteer of outlay, and to supply that which should be necessary to clothe him, and pay the expenses of organisation and management of the corps, while at the same time bringing the force into closer association with the military authorities, and exacting a distinct standard of efficiency as a condition of the payment of the grant. The good effect of this alteration was at once apparent. Efficiency rose in a marked degree, and the officer element in the force steadily improved. The demand for higher efficiency necessarily led to many of the older officers retiring, and giving place to younger men, better suited for training and manœuvre, and who were in a true military sense the commanders of the volunteers under them.

The occurrence of the Franco-German war gave a new stimulus to the volunteer spirit, and it began to be the custom to place volunteer battalions in brigade with the regular troops at manœuvres on a large scale. This was first done in 1872, when a very large force was assembled on Salisbury Plain, on which occasion many provisional battalions, made up of volunteers from different corps, took their full part in the work, and earned the encomiums of all who saw them for their plucky marching, adaptability to camp-life, and general excellence in discipline. This was followed up in the following year by extensive manœuvres on Dartmoor and at Cannock Chase; and from that time onwards in every year a very large number of volunteers have been under canvas, until in the year 1892 every district of the country saw volunteers camping out either in battalion or brigade, no fewer than 13,000 being assembled at one time at the camp of Aldershot.

A great change has also come over the character of the work done by volunteers. In the first decade of the force's existence its work was for the most part confined to mere elementary drill of the barrack-square type, and its equipment limited to what was necessary for mere show parade; but a very great change has taken place in these particulars. The prolonged existence of the force, and the fact that at the end of twenty years it was found in full vigour, and increased in numbers practically to a quarter of a million in strength, made its impression on the governing minds of the country and army. The Queen in 1881 again gave the volunteers an opportunity of appearing before her in strength. The English review in Windsor Park was a magnificent display, but the Scottish review in Queen's Park, Edinburgh, was the most remarkable event in the history of the force. It was held in such a deluge of rain that all present were for many hours soaked to the skin, and the greater number had to be entrained and conveyed to distant places in that state. The discipline of the force stood the test well, and this event, which was at the time regarded as a great misfortune, was indeed a most fortunate occurrence. It was well that the qualities of the volunteers when assembled in very large bodies should be put to the test, and in no other way could it have been so effectually done. From that day forward the military mind has had a much higher appreciation of the *morale* of the volunteers, and their capabilities for disciplined action, than it ever had before. Of course, it is only the capacity for high discipline that is spoken of, for discipline is not merely a matter of character, it must be developed by training.

In connection with the army reforms of 1872–81 the volunteers were incorporated formally with the territorial regiments of their districts, so that the corps in each district are now the volunteer battalions of its regiment. But the greatest compliment ever paid to the volunteers was not, however, to be found in the praises of generals or the plaudits of the public. It was in a new demand made upon it, a demand which never could have been made had those at the head of the army not considered the force to be one capable of high usefulness. In 1886 it was officially intimated that the volunteers must pass a certain standard of efficiency in musketry, take steps to provide themselves with accoutrements and equipment, not merely to enable them to appear upon parade or at a sham-fight with a few blank cartridges, but to be ready to march at once, and that upon the fulfilment of these conditions their certificate of efficiency must depend. To these demands the volunteers had no objection, except this, that they thought it hard that, giving their services gratuitously in time of peace, they should be called upon to provide, at their own expense, the equipment of which the state would have the use in time of war. And although in some places money was raised by private subscription, it was felt both by the volunteers and the public that this was not a seemly mode of raising money for what was essentially a national purpose. Accordingly, after one government had been narrowly saved from an adverse

vote, and another had a vote carried against it in the House of Commons, it was resolved to devote a sufficient sum from the public funds to furnish the volunteers with an efficient war equipment. Therefore to-day every volunteer rifleman is provided with greatcoat, water-bottle, haversack, and means of carrying a full supply of ammunition, so that in the event of mobilisation every man can be turned out ready to march.

In the case of the artillery also a great step has been taken. Until 1888 they had no field-guns, and were exercised only at fort-guns. But now a large number of mobile guns have been issued to them, and they are exercised so as to move with the other troops. A new development has also taken place in the organisation of submarine mining corps, which with the existing engineer corps would be of great value.

Further, for many years the officers of the volunteer force have been examined in drill to pass as lieutenants and for promotion to the higher ranks, and have had the opportunity of attending school and receiving special certificates on passing out. They have also had the opportunity of entering for examination in tactics, and many of them have gained the higher certificates. Among the rank and file mounted contingents have been encouraged, signallers and stretcher-bearers and military cyclists are regularly trained, and in 1892 the issue of machine guns was sanctioned. Tactical societies have been established in many cities throughout the country, both for officers and non-commissioned officers, in which Kriegspiel (q.v.) is played, and lectures on tactics, military history, and other kindred subjects are delivered. It is only further necessary to mention the National Artillery and Rifle Associations, and their kindred local gatherings. Queen Victoria opened to the force in 1881 a certain number of decorations of the Order of the Bath, and also by sanctioning, in 1892, a special decoration (V.D.) for officers, and a medal for non-commissioned officers and privates, of twenty years' service. Volunteers bore a distinguished part with the regular forces in the Transvaal war of 1899–1901.

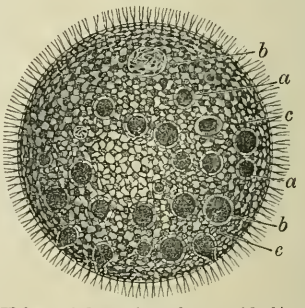
The force, which now numbers about a quarter of a million, is in full vigour, and, as more than one-fifth of the whole on an average is changed every year, it is obvious that besides the existing force there must be at least a million and a quarter more who have had the training and are still of suitable age for service, who, should the occasion ever arise, can be more quickly trained than raw recruits for the country's defence. Thus there is a great reserve. The weak point at present is that in many places it is difficult to obtain suitable officers. This is the result of the apathy of the upper classes already spoken of. Indeed it is to be feared that as regards both the commissioned rank and the rank and file there is often not only apathy but veiled or open discouragement to young men to become volunteers. This is cause for deep regret on the part both of parents and employers, and it is earnestly to be hoped that it may be overcome. If the volunteer force is to continue to flourish it can only be in the warmth of the nation's fostering regard. Men cannot *volunteer* when their services are not wanted or valued, and no mere official recognition will prevent the life going out of a national movement. The blood to keep it warm must come from the nation's heart.

In the United States the place of the volunteers is filled by the state militia (see ARMY, p. 437). In Germany 'volunteers' has quite a different meaning (see ARMY, p. 436; and GERMANY, p. 177). For the relation to the regular army, see ARMY, MILITIA, YEOMANRY. There are histories of the movement by Stephen (1881) and Woodburne (1881); and see Spencer Wilkinson, *The Volunteers and the National Defence* (1896).

Volusenus, FLORENTIUS (Florence Wilson, or Wolsey), a distinguished Scottish humanist, was born near Elgin at the opening of the 16th century. Having received his early education in Scotland (probably at Aberdeen), he seems to have proceeded to the university of Paris. Like his contemporary and personal friend George Buchanan, he cultivated classical learning in preference to the logic and philosophy of the schoolmen, and attained a mastery of Latin which gives him a place with the first scholars of his time. After acting as tutor to a son (spoken of as a nephew) of Cardinal Wolsey, he eventually became principal of a school at Carpentras, near Avignon, a position he owed to the favour of Cardinal Sadoleto. In 1546, on his way home to Scotland, Volusenus (we have no authority for the name *Wilson*) died at Vienne in Dauphiné, lamented by Buchanan in a Latin quatrain, which proves the strength of their friendship. His chief work is his *De Animi Tranquillitate*, written in the purest classical Latin, every page of which reveals the essential refinement and moral beauty of his nature. See Irving, *Lives of Scottish Writers*, and *The Bannatyne Club Miscellany*, vol. i.

Volute, in Architecture, the spiral ornaments of the Ionic and Corinthian capitals, probably derived from Assyrian architecture, in which it is also used. See illustration at COLUMN; also EVOLUTE.—The volute shells, forming the Gasteropod family Volutidæ, are chiefly tropical shells, many of them of great beauty and much valued by collectors. The only common British species is *Voluta tornatilis;* valuable ones are *V. imperialis, V. musica,* and *V. junonia.*

Volvox, a genus of simple organisms which some authorities regard as animals and others as plants, but which are in fact not very emphatically the one or the other. They consist of green flagellate cells, united by protoplasmic bridges in a hollow spherical colony, and occur in ponds, canals, and clear fresh-water pools. Botanists claim them as Algæ, referring them to a family of the order Coccophyceæ; zoologists claim them as animals, as colonial flagellate Infusorians. Each unit of the colony is somewhat like the common Hæmatococcus; and sometimes there may be as many as 12,000 forming one ball, which then measures about 1 mm. in diameter. Volvox is a very beautiful organism, and is full of interest to the biologist. Thus, as regards reproduction, one may be found quite asexual in its multiplication, another may be described as parthenogenetic, a third produces special male and female cells, while in others the sexes are separate. Within one species all these phases may occur, epitomising the whole evolution of sex. As a very simple many-celled organism Volvox also gives some hint as to transition from Protozoa to Metazoa. Nearly related are the genera Eudorina, Pandorina, Gonium, and Stephanosphæra.



Volvox globator (much magnified): *a*, female cells; *b*, stages in development of male cells; *c*, ordinary flagellate cells.

Volvulus. See COLIC.

Vomer, a bone which, in the human skeleton, forms part of the middle partition of the Nose (q.v.). It exhibits many modifications in the different classes of Vertebrata.

Vomiting. The physiology of vomiting has already been discussed (see DIGESTION, Vol. III. p. 817); and it only remains to indicate its significance in disease, and its treatment. It is much more common and more easily induced in children than in adults, and generally speaking in men than in women. In some cases it is entirely salutary—e.g. when poison, or food irritating in quality or excessive in quantity, has been taken, and it should be encouraged and not checked. It is common, especially in children, as a symptom of the onset of many acute diseases. When persistent or recurrent it most frequently depends upon disease of the digestive organs, particularly the stomach. But this is by no means necessarily the case; during the early months of pregnancy vomiting ('morning sickness') is so common as hardly to be abnormal; in consumption, Bright's disease (see under KIDNEYS), and disease of the brain (tumour, abscess, meningitis) it may be for a time the most prominent, or even almost the only symptom. (In the vomiting attending brain disease, rarely under other circumstances, nausea, or the sensation of sickness, may be entirely absent.) It is obvious therefore that it is of the greatest importance to discover in the first instance the real cause of the vomiting, and attempt to remove it by suitable treatment. Some of the means most generally useful in checking vomiting may, however, be mentioned. Food should be administered in a liquid form, and in very small quantities at a time (e.g. milk diluted with an equal quantity of potash-water, or lime-water, not more than a wine-glassful at once), or even for a time withheld altogether. Small pieces of ice sucked or swallowed, and a mustard poultice or fly blister applied to the pit of the stomach are often useful. Of drugs, preparations of bismuth, hydrocyanic acid, creasote, chloroform, lime-water, ipecacuan wine (in doses of a single drop every hour), opium, and morphia are among the most valuable.

Vom'ito Negro ('Black Vomit'), an acute form of Yellow Fever (q.v.).

Vondel, JOOST VAN DEN, a great Dutch poet, born at Cologne, November 17, 1587, kept a hosier's shop in Amsterdam, and died there, 5th February 1679. Of his thirty-three plays the most interesting is *Lucifer* (1654), which suggests in some points a parallel with *Paradise Lost*, on which a preposterous case of borrowing has been constructed by Mr Gosse (*Studies in North. Lit.*, 1879), and still more by Mr George Edmundson (*Milton and Vondel*, 1885). The latter pursues his gratuitous task still further, finding in *Samson Agonistes* plagiarisms from a classical drama of Vondel's *Samson; or Divine Vengeance*.

Lennep edited his complete works (12 vols. 1850–69). See the studies by Baumgartner (Freib. 1882); Looten (Bruss. 1889); and the bibliography by Unger (Amsterdam, 1888). See also Vol. V. p. 745.

Voodoo. See NEGROES.

Voragine, JACOBUS DE. See GOLDEN LEGEND.

Vorarlberg, the western portion of Tyrol (q.v.).

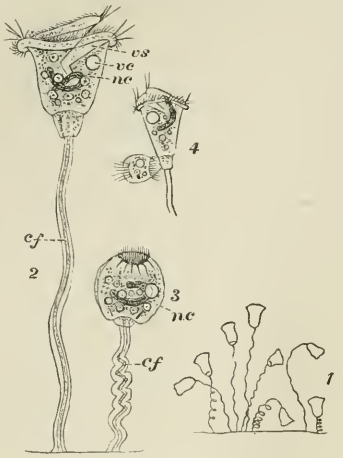
Voronej, or VORONEZH, capital of a Russian government of the same name, stands on the right bank of the Voronej, 300 miles SE. of Moscow by rail, with considerable trade; pop. 56,403. The government has an area (25,443 sq. m.) as large as the kingdom of Greece; pop. (1895) 2,755,530.

Vörösmarty, MICHAEL. See HUNGARY, p. 8.

Vortex, in the ordinary meaning of the term, is a whirlpool. We find illustrations of it, on a large scale, in tornadoes, waterspouts, and whirlpools, and, on a smaller scale, in eddies of air or water produced by conflicting currents. If we draw the half-immersed blade of a teaspoon gently along the surface of tea or coffee we shall see two small eddies following in the wake of the edges. These eddies are the visible ends of a half ring of whirling liquid, which is formed originally as a fringe to the blade of the spoon. Similar effects may be observed in rowing as the oar is lifted out of the water at the end of the stroke. The general characteristic of such eddies is a rotational motion of the smallest visible portion in the centre. From this we readily pass to the scientific conception of vortex motion in fluids. Imagine a continuous frictionless fluid, which cannot therefore be molecular, for that would imply Viscosity (q.v.); and suppose any small spherical element to become solidified. If this elementary sphere is found to be rotating about any axis, there is vortex motion in the fluid at the region occupied by the element. If there is no vortex motion, the elementary sphere will have no rotation however complicated the motion of the fluid may be. Von Helmholtz, who first investigated the properties of vortex motion, showed that where vortex motion once exists in a frictionless fluid it must always exist, and where at any instant it does not exist it never can exist. Moreover a vortex with ends cannot exist in the fluid. Either it must form a closed ring or it must continue through the fluid until it stops at the boundary. These properties mathematically proved for the perfect frictionless fluid cannot be fully realised in practice. Indeed the possibility of forming vortex rings depends on the existence of viscosity; and the same viscosity finally destroys the vortex motion so produced. Vortex smoke-rings are often formed at the firing of a gun or mortar or even from the funnel of an engine, or on a smaller scale by a puff of tobacco smoke emitted from the mouth of a skilled smoker. Vortex rings may be produced with great ease by projecting them through an orifice in one side of a closed box whose opposite side is made of cloth or sheet india-rubber or other elastic material. To make the rings visible we may produce inside the box a cloud say of sal-ammoniac; and at every tap on the elastic side of the box a very evident vortex ring will be ejected. When one such vortex ring is following another, the one in front will open out and let the other shoot through it. This one in its turn will open out and slacken speed, while the one that is now behind will contract and accelerate its pace and pass through the other and again get in front. Von Helmholtz showed that this action would go on indefinitely in the perfect fluid. The laws governing the collision and vibration of vortices may also be illustrated by means of smoke rings in air. Lord Kelvin's conception of the material atom as a vortex ring of simple form, or of any degree of beknottedness, is one of the brilliant conceptions of the present era. Such a vortex atom in a frictionless plenum is as indestructible as the hard Lucretian atom, and yet is capable of vibration. See ATOM, HYDRODYNAMICS.

Vorticella, or BELL-ANIMALCULE, a genus of ciliated Infusorians belonging to the order Peritricha, in which the cilia are restricted to a fringe around the mouth. During most of their life the little animals are attached to the stems and leaves of plants in fresh-water pools, a group being just visible to the unaided eye as a whitish fringe. Each is a bell-shaped unit borne on a hollow stalk containing a contractile filament, whose activity causes the stalk to change frequently and instantaneously from a state of complete extension to a state of spiral contraction. Around the mouth of the bell there is a spiral fringe of cilia, which, by their lashing activity, waft food-particles into the mouth. A vorticella often reproduces by division, one of the halves being set adrift, furnished with a

posterior circlet of cilia. Or it may be that after division into two one of the halves, still undetached, divides rapidly into eight small units,



Vorticella (after Howes):

1, general appearance of a group, magnified; 2, single individual fully extended; 3, the same with spirally contracted stalk; 4, liberation of half of a divided unit; *nc*, nucleus; *vs*, mouth; *ve*, vacuole; *cf*, contractile filament of stalk. Nos. 2, 3, 4, highly magnified.

which, becoming separate, swim off (also with posterior cilia), and conjugate with sedentary individuals of normal size. There is here one of the early hints of sexual dimorphism.

Vortigern, the British prince who is reported by Bede, Nennius, and Geoffrey of Monmouth to have invited the Saxons into Britain to help him against the Picts, and to have married Rowena, daughter of Hengist (q.v.). His allies soon became, according to the legend, enemies even more dangerous than the Picts, and soon destroyed the British princes. Samuel Ireland (q.v.) fathered his 'historical' play of *Vortigern* on Shakespeare.

Vos, Cornelis de (1585–1651), a painter who adhered to the manner of the older Dutch school, and became famous for portraits, and religious and mythological pieces.—His brother Paul (1590–1678) painted animals and hunting scenes.

Vosges (Lat. *Vogesus*, Ger. *Vogesen* or *Wasgau*), a range of mountains in the north-east of France and the west of Germany, run from south to north, on the left bank of the Rhine, from the borders of Switzerland to Mainz, and separate Alsace from the French departments of Vosges and Meurthe and the German Lorraine. The range runs parallel with the Black Forest, on the right bank of the Rhine, which it much resembles in picturesque well-wooded appearance and geological structure. The highest summits, which are in the southern portion, run from 4100 to close on 4700 feet high, and form the western border of this part of the Rhine basin. See H. W. Wolff's *Watering-places of the Vosges* (1891) and *The Country of the Vosges* (1892).

Vosges, a dept. in the north-east of France, formed out of the south part of the old province of Lorraine, is bounded on the E. by German Alsace. The surface is mountainous, the hills being well wooded, while the western plain is very fertile. There are iron, silver, lead, copper, cobalt, zinc, manganese, and antimony mines. The dept. has an area of 2266 sq. m. and a pop. (1891) of 410,196 (in 1886, 413,707). It is divided into the five arrondissements Épinal, Mirecourt, Neufchâteau, Remiremont, Saint-Dié. The capital is Épinal.

Voss, Johann Heinrich, scholar and poet, was born of poor parents at Sommersdorf in Mecklenburg, 20th February 1751. At first a tutor, he began in 1772 to study at Göttingen, and there joined the famous Dichterbund. From theology he soon turned to Greek and Roman antiquities under Heyne. In 1778 he went from the editing of the *Musenalmanach* at Wandsbeck to be rector at Otterndorf. Here he prepared his translation of the *Odyssey*. In 1782 he became rector of Eutin, whence in 1789 he issued his translation of Virgil's *Georgics*. His controversies with Heyne form his *Mythologische Briefe* (2 vols. 1794); in answer to Creuzer he wrote *Antisymbolik* (2 vols. 1824–26). In 1802 he settled in Jena, was called in 1805 to Heidelberg, and there died, March 29, 1826. At Heidelberg he translated Horace, Hesiod, Theocritus, Bion, Moschus, and Tibullus; other translations were Aristophanes and (with the aid of his two sons) Shakespeare—a work far inferior to Schlegel's. His original idyllic poem, *Luise* (1795), rests secure of immortality. See biographies by Paulus (1826) and by Herbst (2 vols. 1872–76).

Vossius, Gerard Jan, a great 17th-century scholar, was born of Dutch parents near Heidelberg in 1577. He studied at Leyden, and became in 1600 rector of the school at Dort, in 1615 of the theological college of Leyden. His *Historia Pelagiana* (1618) offered a modest apology for the Arminians, which brought down upon him the wrath of the orthodox. He anticipated his dismissal by resignation. Laud procured him a prebend without residence worth £100 a year. In his book *De Historicis Latinis* (1627) he made a prudent recantation. In 1632 he was appointed to the chair of History in the newly-founded *Athenæum* at Amsterdam, and here he died, 27th March 1649. All his life he had toiled with ceaseless industry, of which the chief monuments are *Aristarchus sive de Arte Grammatica*, *De Historicis Græcis*, *Commentariorum Rhetoricorum sive Oratoriarum Institutionum Libri VI.*, *De Veterum Poetarum Temporibus Libri II.*—Isaac Vossius, his son, was born at Leyden in 1618. He travelled in England, France, and Italy, collecting many valuable manuscripts, and in 1648 took up his abode at the court of Queen Christina of Sweden, but returned to Holland in 1658. In 1670 he settled in England, and here, although a scoffer and a libertine, was appointed by Charles II. a canon of Windsor. He died there in 1688, and it is recorded that on his death-bed he refused to take the sacrament until one of his colleagues argued that he ought to do so for the credit of the chapter.

He was the first to edit the six shorter epistles of Ignatius (1646). Other works were editions of the geographer Scylax, Justin, Pomponius Mela, and Catullus, besides contributions to chronology.

Vostitza, a Greek town on the Corinthian Gulf, 25 miles by rail E. of Patras; pop. 5311. The old name of *Aigion* is sometimes given to it.

Voters. See Abduction, Registration, Representation, Parliament.

Vow (Lat. *votum*), a voluntary promise made to God, and, as such, carrying with it the most stringent obligation to its fulfilment. Vows, as religious acts connected with the notion of sacrifice, were common to all the religions of antiquity. In Israel they were regarded at times as absolutely irrevocable—the vow of Jephthah is a case in point—but the laws of Leviticus provided for their commutation or redemption by money (Lev. xxvi.). The practice of vows did not cease in apostolic times (Acts, xviii. 18; xxi. 23), and in the later and mediæval church the system received a very extensive development. The Protestant churches,

by a reaction against the abuse of monastic vows, discarded the practice altogether. In the Roman Church, however, vows are held to be of divine institution and intimately connected with the most perfect state of the Christian life. A vow is defined by Catholic theologians to be a promise to God *de meliori bono*—i.e. the matter or object of the vow must be, in moral worth, superior to its opposite. Thus, a vow to marry would be ordinarily null, for the married state is not considered to be in itself better than the unmarried. Vows are mostly concerned with the evangelical counsels as distinguished from the precepts of the Christian law, and with acts of supererogation or of conduct not otherwise obligatory. But a vow to observe a precept gives to it a greater moral value, invests its observance with the character of divine worship, and obtains for it higher merit. Certain important vows, the vow of chastity, of entering a religious order, or making pilgrimage to the Holy Sepulchre, to Compostella, &c., are 'reserved to the pope'—i.e. cannot be dispensed from except by authority from the holy see. Otherwise the making of simple vows is left to the discretion of the individual, and dispensation from them for a just cause can be obtained from the bishop or religious superior. The church, however, takes under her special charge, or is said in a solemn manner to accept certain vows which on that account are called *solemn* as distinguished from *simple* vows. The three solemn vows of poverty, obedience, and chastity, involving complete and irrevocable surrender, essentially constitute the 'religious' state. A solemn vow of poverty deprives the subject of all dominion over property. More important is the distinction in reference to the vow of chastity. A simple vow of chastity renders subsequent marriage illicit but not invalid, while a solemn vow nullifies marriage. Yet all monks and nuns do not take solemn vows. In certain newly-instituted communities, and in some countries where the civil legislation interferes with the observance of these vows in their integrity, simple vows are taken. By recent papal decrees simple vows are substituted at least for a period even in the older orders. In the Society of Jesus a certain select number only after many years are admitted to the three solemn vows, and to these vows is then added a fourth, of special obedience to the pope. By a peculiar exception, however, the vow of chastity taken by a Jesuit after his noviciate, though a simple vow in other respects, is made to annul marriage. It should be noted that a priest at his ordination makes no explicit vow of chastity; but the celibacy to which he is bound is treated canonically as a vow, implied in his acceptance of sacred orders. A vow differs from a promissory oath inasmuch as the oath is said to merely call God to witness to the reality or sincerity of the *promise* at the time it is made. The neglect to fulfil it is commonly thought to contract no greater guilt than what is already involved in the non-fulfilment of the natural promise.

The casuistry of vows is treated in all works of moral theology. But see especially the latest editions of Ferraris, *Bibliotheca* (art. 'Votum').

Vowel. See LETTERS, PHONETICS, VOICE.

Vranja, a town of Servia, in the portion ceded by Turkey in 1878, 60 miles S. of Nisch by rail. Pop. (1890) 11,399.

Vryburg, capital of British Bechuanaland, near one of the head-streams of the Vaal River (a tributary of the Orange), and 145 miles N. of Kimberley by rail (1890). Pop. 5000.

Vulcan, the old Italian god of fire, confounded with the Greek Hephæstus (q.v.).

Vulcanite. See INDIA-RUBBER.

Vulcano. See LIPARI ISLANDS.

Vulgate, the edition of the Latin Bible which, having been sanctioned by the usage of many ages in the Roman Church, was pronounced 'authentic' by the Council of Trent. The name was originally given to the 'common edition' of the Septuagint used by the Greek Fathers, and thence transferred to the 'Itala' or the 'Old Latin' version of both Old and New Testaments current during the first centuries in the Western Church. It finally passed to the present composite work, which gradually took the place of the 'Old Latin.' The relation of the component parts of this venerable version to the orignal texts will be best understood by a description of the work of St Jerome, from whose hand it mainly proceeded. In the time of Pope Damasus, towards the end of the 4th century, the text of the 'Old Latin,' the origin of which is lost in obscurity, had fallen into considerable confusion. It was a very literal representation of the Greek, rude in style and full of provincialisms. Every one, it seems, who had a smattering of Greek thought fit to make alterations; and so great became the variety of recensions that it is still a matter of dispute whether there was not at their basis a number of independent translations rather than a single version often retouched. To remedy the evil Jerome, at the request of Damasus, 382 A.D., undertook a revision of the New Testament. He corrected the Gospels thoroughly, though with great caution, and the rest more cursorily, with the aid of Greek codices which were then reputed ancient and trustworthy. The critical value of the result as a primary witness to the Greek text in its best state in the 4th century has recently been generally recognised. Jerome next turned his attention to the Psalms. He at first merely corrected the Latin from the 'common edition' of the Greek, and this revision, called the 'Roman Psalter,' completed in 383, was introduced by the pope into the Roman liturgy, and is to this day used in the Ambrosian or Milan rite and in St Peter's at Rome. Shortly afterwards Jerome made a more thorough revision by the aid of Origen's Hexapla; and it is this, the so-called 'Gallican Psalter,' which is now read in the Vulgate. The rest of his revision of the 'Old Latin' does not concern us here, as it forms no part of the present Vulgate, and indeed has, with the exception of the Book of Job, entirely perished. After the death of Damasus Jerome was induced by the urgency of private friends to undertake a more serious task, a new translation of the Old Testament from the Hebrew. This he accomplished in Palestine, where he had perfected himself in Hebrew with the assistance of learned Jews, during the years 390–405 A.D. To this work he added a free translation of the books of Tobit and Judith from the Chaldee version of the original Hebrew, now lost. The other books of the Greek canon, afterwards incorporated with the rest of his work—viz. Wisdom, Ecclesiasticus, and Maccabees—were left by him untouched; and these, with, in a somewhat less degree, the Psalms and the New Testament, are of especial value to the linguist, preserving as they do, quite apart from their Grecisms, many lexical and grammatical forms, relics of the dialect of the people, which are not found in the classical or literary language. The new translation met at first with much opposition. The Fathers had been accustomed to regard the Septuagint as an inspired version, and Jerome's departure from that version appeared to be a dangerous innovation. It won its way by degrees, and by force of its intrinsic worth. Gregory the Great says that in his time the Roman see made use of both versions. Venerable Bede speaks of St Jerome's as '*our* edition;' and soon the 'Old Latin' fell into disuse and neglect. so that, notwithstanding the keen researches of scholars, a complete

copy of the pre-Hieronymian Old Testament cannot now be made up from the surviving fragments.

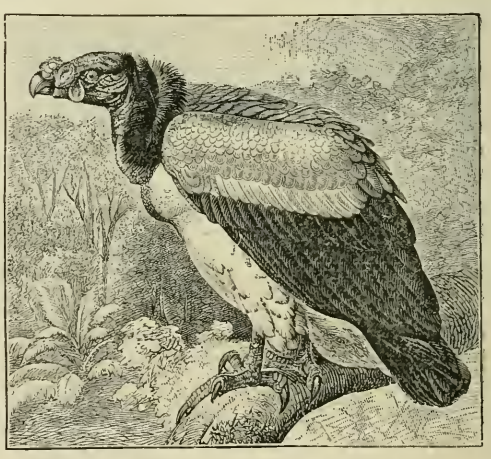
In the course of the middle ages the Vulgate necessarily contracted some corruption. Charlemagne, with the aid of Alcuin, took pains to procure and disseminate a pure text; and later on, with the same object, the university of Paris and some of the religious orders compiled *Correctoria*, or lists of common errors with their corrections. The numerous editions printed in the 15th century were of no critical value, but in the first half of the following century several attempts were made to provide a revised and authoritative text, the most important editions being those of R. Stephens (1528, and later) and of the Louvain theologians (first under the care of Henten of Malines in 1547, and secondly with the co-operation of Lucas of Bruges and the printer Plantin, 1574). Meanwhile the carrying out of the Tridentine decree, that the Vulgate should be printed as correctly as possible, was undertaken by the popes, who appointed commissions of cardinals and learned men for the purpose. Nearly forty years passed, however, before their labours were brought to a close. Sixtus V. in 1590 first issued the long-expected work, together with a bull in which he ordered this edition to be received as 'true, lawful, authentic, and unquestioned;' but he had of his own judgment made many important changes in the readings proposed by the commission, and these met with so little approval that the edition was after Sixtus' death almost immediately recalled, the work again submitted to a papal congregation for revision, and finally issued in 1592 as the authoritative text by Clement VIII. This Clementine Bible differed from the Sixtine in some 3000 readings. A few errors of the press were corrected in a second impression in 1593; and others, again, in the third and last official impression of 1598, to which standard all copies should be conformed.

The precise import of the term 'authentic' applied to the Vulgate has been much discussed by Roman theologians. It is, however, clear that the council intended to make no comparison of the Vulgate with the original texts, but, considering it to be convenient that, among the several *Latin versions* then current, one should be guaranteed as authentic—i.e. substantially representing the original, and free from all error in faith or morals—declared the Vulgate edition tested by long usage within the church to be such. The Vulgate thus defined to be an authentic version could not be the particular Clementine edition, which was not then in existence, but the Vulgate generically, or in its purest form. Although the official text is capable of improvement, it is agreed by the best judges that the Clementine editors made use of ancient manuscripts with discernment, and proceeded throughout on sound critical principles.

The best general history of the Vulgate is that of Kaulen, *Geschichte der Vulgata* (Mainz, 1868). The fullest account in English will be found in Westcott's article in Smith's *Dictionary of the Bible*. Several codices and fragments of the 'Old Latin' were published in the Benedictine Sabatier's *Vetus Italica* (3 vols. folio, Paris, 1751) and in the fine work of the Oratorian Bianchini, *Evangeliarium Quadruplex* (2 vols. folio, Rome, 1748). Many other manuscripts have been published separately by Tischendorf, E. Ranke, and others. See especially *Old Latin Biblical Texts*, published since 1891, by Bishop John Wordsworth. The character of the Latinity of the pre-Hieronymian texts has been fully investigated by Rönsch, *Itala und Vulgata* (Marburg, 1869), and by Ziegler, *Lateinische Bibelübersetzungen vor Hieronymus* (1879). The *Codex Amiatinus*, the principal manuscript of the Hieronymian Vulgate, highly valued by the Clementine editors, has been published, the New Testament by Tischendorf (Leipzig, 1854) and Old Testament by Heyse and Tischendorf (Leip. 1873). The work done by the Roman Congregations has been well brought to light by Ungarelli, *Dissert. de N. T. et Historia Vulg. Edit. à Conc. Trident.* (Rome, 1847), and by Vercellone, *Dissertazioni accademiche* (Rome, 1864). The various readings of ancient Vulgate manuscripts have been critically examined by the same Vercellone in his two volumes, *Variæ Lectiones* (Rome, 1860–64), an important work, which unfortunately was carried no further than to the end of the Book of Kings. The variations between the Sixtine and Clementine editions have been treated controversially by Cox in his *Bellum Papale*, but more thoroughly in the rare work of Bukentorp, *Lux de luce* (Colonia, 1710). All that can be said of the imperfections of the Vulgate in relation to the original texts will be found in Sixtini Amama, *Anti-barbarus Biblicus* (1656).

Vulpius, Christiane. See Goethe.

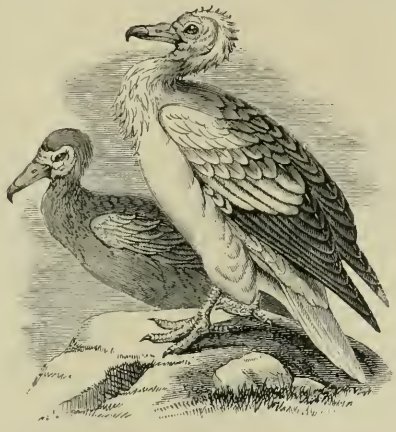
Vulture, any member of the family Vulturidæ included among the Birds of Prey in the sub-order Falcones. By some naturalists the family is subdivided into the Old-World vultures (Vulturinæ) and the New-World vultures (Sarcorhamphinæ), while by others the latter, which are distinguished by a perforated nostril and the absence of an 'after-shaft' to the feathers, are regarded as a distinct family, Cathartidæ. In all the vultures the head and neck are more or less bare, the beak is long and curved only at the tip; the legs and feet are large and powerful, but the toes and claws are relatively weak. They are thus well adapted for walking and feeding on the ground, but are unable to carry off their prey like the eagles and hawks. The wings are very strong, and their powers of swift and sustained flight are remarkable. Vultures are widely distributed throughout temperate and tropical regions, and the general habits of the various species are very similar, though they differ greatly in their choice of haunts. Thus one species frequents the rocky peaks of the Alps and another sweeps over the great plains of Africa; the King Vulture



The King Vulture (*Sarcorhamphus papa*).

dwells alone with his mate in the densest parts of the South American forests, while Pharaoh's Chickens pick up a living as street scavengers in the towns of the East. The chief food of the vultures is carrion; they rarely attack any living animal unless under great stress of hunger, when a wounded or feeble lamb or hare is sometimes killed. There has been much discussion as to whether vultures scent or sight their prey, but experiment has shown, apparently conclusively, that their sense of smell is not unusually acute, and that they rely chiefly on their extreme keenness of vision, while the sudden descent of one bird serves as a signal to many others. When a

carcass is discovered by one, others arrive quickly on the scene from all points of the compass, though none may have been visible a few minutes before. Tearing off the skin with their powerful beaks they gorge themselves greedily on the flesh and



Egyptian Vulture (*Neophron percnopterus*).

entrails till nothing is left but the skull and larger bones. Smaller birds only venture to look on and watch for stray morsels which may be let fall, but in the neighbourhood of towns the vulture's claim is sometimes—not often successfully—disputed by wandering dogs. After a full meal vultures may remain without food for many days. The young birds, which are carefully tended for several months, are fed by regurgitation of food from the crop of the parents. One of the commonest European species is the Griffin Vulture (*Gyps fulvus*), which occurs in Spain, among the Alps, and in the Mediterranean region generally. It makes a rough nest of branches and grasses, usually in a cavity or on a ledge of an almost inaccessible cliff. One or at most two eggs are laid early in March, and the parents share the labour of rearing and tending the young. The adult bird measures 3½ feet in length; the general colour is light brown with black markings, and there is a white ruff on the lower part of the neck. The Eared Vulture (*Otogyps auricularis*), an inhabitant of Africa, receives its name from folds of skin on the head resembling ear-lappets. The Egyptian Vulture (*Neophron percnopterus*) is often called Pharaoh's Chicken from its frequent occurrence in ancient Egyptian hieroglyphics, where it is used as an emblem of parental love. It is very common throughout northern Africa and Persia, and breeds frequently in the south of Europe. More than one specimen has been killed in England. The Egyptian vulture is raven-like in form; its wings are pointed, its bill slender, and half covered with a naked cere. The adult bird is little over 2 feet in length; its plumage is white with black wing-feathers. The young birds are dark brown. Some account of the New-World vultures will be found in the article CONDOR.

Vulturnus (mod. *Volturno*), a river of Campania, on whose banks stood the city of *Vulturnum* —both names that often occur in Roman history.

Vyasma, a town of Russia, 110 miles ENE. of Smolensk by rail. Pop. 13,148.

Vyatka, capital of a Russian government on the river Vyatka, 280 miles NE. of Nijni-Novgorod. Pop. 24,998, largely engaged in the corn-trade and in making wax and tallow candles. The area of the government (59,117 sq. m.) is larger than that of Roumania. Pop. (1897) 3,082,788.

Vyernyi. See SEMIRETCHINSK.

Vyrnwy, a river which rises on the borders of Merioneth and Montgomery and joins the Severn 8½ miles above Welshpool. By engineering operations, begun in 1881, the waters of the upper Vyrnwy have been impounded for the water-supply of Liverpool; and when the new supply was laid on, 14th July 1892, there was an artificial lake of 1121 acres, 4¾ miles long by 1½ broad, and containing 2103 million cubic feet of water. The retaining wall consists of cyclopean stones, is 100 feet high, and is sunk 60 feet below ground. By the track the water follows, the distance is 68 miles from Liverpool.

W

the twenty-third letter of our alphabet, is, like *æ*, a ligature rather than a letter, as is implied by the name, *double u*. In very early West Saxon MSS. the sound is represented by *uu*, a digraph for which the Northumbrian rune ƿ, called *wen*, was substituted, and not entirely disused till the 13th century, except in Anglo-Norman MSS., such as Domesday Book, where the French scribes used *un* for medials, and for initials the capital form VV, which, when ligatured, became our W. The sound, which is nearly that of the Greek digamma and of the Roman consonantal V, is produced by rounding the lips as in uttering *u*, and at the same time contracting the aperture and drawing in the cheeks, so that the breath cannot escape without friction. When the sound is voiced we have *w*, as in the words 'we' or 'wen,' the corresponding unvoiced sound being *wh*, as in 'when,' 'which,' or 'what.' The A.S. *hw* has now become *wh*, the aspiration being almost lost in southern English, but in the north the old sound has been preserved, and we still hear *hwieh* and *hwat* instead of 'which' and 'what.' In the old combination *wr* the symbol *w* has been preserved, but its sound has been lost, as in the words 'wright,' 'wrench,' 'wrong,' 'wrist.' The combination *ew* has become *qu*, as in 'quoth' from *cwæth*, 'queen' from *cwén*, and 'quench' from *cwencan*. The *w* is occasionally intrusive, as in 'whole' from *hál*, and 'whore' from *hóre*. The intrusive *w* is probably due to analogy, and is useful as distinguishing the words from the homophones 'hole' and 'hoar.' A final *w* is vocalic, as in 'few' and 'new,' where the spellings are survivals from the A.S. *feáwa* and *níwe*, in which *w* was a consonant. Here the consonantal sound has been lost, owing to the loss of the final colliding vowel. The lips were rounded to pronounce *u*, and then contracted to pronounce the following vowel, and when this disappeared only the sound of *u* was left. So in the French *oui* the sound of *w* is produced by rounding the lips to pronounce *ou* (our *u*), and then narrowing them for the *i*. We find *w* in a few modern French loan-words, such as 'whist' and 'whisky,' but the sound is usually represented by *ou*, as in 'Edouard.' In old French loan-words an initial *w* was represented by *gu*, as *Guillaume* for William. In modern Welsh a vocalic *w*, when short, has the sound of *oo* in 'good;' when long, of *oo* in 'boon.'

Waagen, Dr Gustav Friedrich, a well-known art-critic, born at Hamburg in 1794, and died at Copenhagen, 15th July 1868.

Waal, an arm of the lower Rhine (q.v.).

Wabash, capital of Wabash county, Indiana, on the Wabash River, 89 miles by rail NNE. of Indianapolis, with machine and sash works, railway-shops, &c. Pop. 5105.—The Wabash River rises in western Ohio, flows across Indiana, then turns south and separates it for 200 miles from Illinois, and falls into the Ohio River after a course of 550 miles. The Wabash and Erie Canal, which also passes the town, is the longest (476 miles) in the States. It runs from Toledo, Ohio, to Evansville, Indiana.

Wace (no authority for the common prænomen Robert), a celebrated Anglo-Norman poet, born in Guernsey most probably about 1100, enjoyed the favour of the Norman kings of England, was given by Henry II. a prebend at Bayeux, and died about 1175. His two long romances, the *Geste des Bretons* or *Brut* and the *Roman de Rou*, are among the best monuments of Norman French in point of language, and even literature. The former (ed. by Leroux de Lincy, 2 vols. Rouen, 1836–38) is a free versification of the History of Geoffrey of Monmouth. The *Roman de Rou* is a history of the Dukes of Normandy down to 1107, three-fourths of its 16,000 verses written in octosyllabic verse rhyming in pairs (ed. by Pluquet, Rouen, 1824; more adequately by Dr Hugo Andresen, 2 vols. Heilbronn, 1877–79).

Wace, Henry, theologian, was born in London, 10th December 1836, and educated at Marlborough, Rugby, King's College, London, and Brasenose College, Oxford, graduating in 1860 with a second-class in both classics and mathematics. He served curacies at St Luke's and St James's; was lecturer of Grosvenor Chapel, chaplain of Lincoln's Inn (1872–80), when he became its preacher; and acted as professor of Ecclesiastical History in King's College (1875–83). In 1881 he became a prebendary of St Paul's, in 1883 chaplain to the Archbishop of Canterbury and principal of King's College. He was Boyle lecturer—*Christianity and Morality*—(1874–75), Bampton lecturer—*The Foundations of Faith*—(1879), and was select preacher at Cambridge (1878), at Oxford (1880–82), honorary chaplain to the Queen (1884), and chaplain-in-ordinary (1889). His name is best known as the joint-editor with Sir W. Smith of the great *Dictionary of Christian Biography* (4 vols. 1877–87), and as himself the editor of the *Speaker's Commentary on the Apocrypha* (2 vols. 1886).

Other books are *The Gospel and its Witnesses* (1883), *Student's Manual of the Evidences of Christianity* (1886), *Some Central Points of Our Lord's Ministry* (1890).

Waco, 'the geyser city' of Texas, capital of McLennan county, on the Brazos River, crossed by a suspension bridge, 186 miles by rail NW. of Houston. It is the seat of Baylor University, contains female and commercial colleges, boasts sixteen warm artesian wells (104° F.), manufactures woollens, mattresses, and sadlery, and has a large trade in country produce. Pop. (1890) 14,445.

Wadai, a state of the central Soudan (q.v.), between Bagirmi and Dar-Fûr, with a pop. of from 3 to 6 millions; capital, Abesher.

Wadding, Luke, historian of the Franciscan order, was born at Waterford, 16th October 1588, studied at Lisbon, became a Franciscan and professor at Salamanca. In 1618 he settled in Rome, where he founded a college of Irish Franciscans, and wrote the *Annales Ordinis Minorum* (8 vols. 1626–40; new ed. 1731–47) and the *Scriptores Ordinis Minorum*, besides editing Duns Scotus. He died 18th November 1657.

Waddington, William Henry, French statesman, was born in Paris, 11th December 1826,

son of a naturalised English cotton manufacturer. He had his education at Rugby and Trinity College, Cambridge, and took a classical first-class, with a Chancellor's medal, in 1849. And more English still, he was notable in football at Rugby, and rowed No. 6 in the university boat-race of 1849, when Cambridge won. He next returned to France, and devoted himself to the study of antiquities, extending his journeys to Asia Minor, Syria, and Cyprus. In 1865 he was elected to the Academy of Inscriptions and Belles Lettres. In February 1871 he was returned by Aisne to the National Assembly, giving a steady support to Thiers. From 1876 till 1885 he sat as senator for Aisne. He served in 1876–77, as minister of Foreign Affairs (1877), plenipotentiary at the Berlin Congress (1878), president of the Council (1879), and was ambassador at London from 1883 to 1892. He died 13th January 1894.

Wade, GEORGE, field-marshal, was born in 1668, obtained his first commission in the Engineers in 1690, and rose to be lieutenant-general of the Ordnance and a member of the Privy-council. During the critical period of the pacification of the Highlands after 1715 he commanded the royal forces in Scotland, and assisted in disarming the clans; and to him is due the execution (1720–30) of the great military roads through the Highlands, some of which have continued to be the main lines of communication. He also suppressed a riot in Glasgow, and repaired Edinburgh Castle. In 1744 he commanded in the Netherlands, and returned in 1745 to be at the head of the royal forces in Yorkshire during the Rebellion. His army was the first evaded by the Pretender on his southward march. General Wade died 14th February 1748.

Wade, SIR THOMAS FRANCIS, Chinese diplomatist and scholar, was born in 1818, educated at Harrow, entered the army in 1838, and served till 1847. Chinese secretary at Hong-kong in 1855, he was attached to the missions of Lord Elgin and Sir Frederick Bruce (1857–61), became Chinese secretary to the Legation at Pekin in 1862, and in 1871 minister plenipotentiary there, being made K.C.B. in 1875. He died 31st July 1895.

Wadelai, a town on the Upper Nile, 40 miles N. of the Albert Nyanza. Emin Pasha made it one of the fortified stations of his Equatorial Province, and at one time his principal residence.

Wading-birds. See BIRDS, GRALLÆ.

Wadset, the earliest form of giving security in land in Scotland; superseded by the modern Bond and Disposition in Security. See HERITABLE.

Wady, an Arabic word signifying a river, a river-course, a ravine, or valley. See NAMES, p. 378.

WADY HALFA is a place (pop. 3500) on the right bank of the Nile, just below the second or great cataract. After the reorganisation of Egypt after the Soudanese rebellion this was taken as the southward limit of Egypt. It is named from a gorge where halfa grass or Esparto (q.v.) grows.

WADY MUSA is the modern name of PETRA.

Wafers, thin discs of dried paste, mostly coloured, used for attaching papers together, and formerly for sealing letters. They are made by mixing fine wheaten flour with water and any non-poisonous colouring materials, so as to form a mixture not thicker than thin cream. A small quantity of this is poured on one of a pair of steel plates, each 15 inches by 10 inches, which form the head ends of a large pair of tongs or pincers, and have their inner surfaces well polished. The act of closing the plates on each other spreads the paste into a thin sheet which, while held between them, is partially baked by turning the blades for a brief time over a fire. The newly-baked sheets are too brittle to form wafers, so that they require to be placed for a little while in a damp cellar to absorb moisture. This dulls the glaze on their surface, but it is restored by pressing them between sheets of tinplate in a screw-press. A dozen sheets of the prepared paste are now piled on each other, and an operator with a hand punch, the size of a single wafer, cuts out twelve or more at a blow, and repeats the operation till the whole of the pile is punched. One person can make a large number of wafers, and the number of workmen now engaged in their manufacture in Great Britain probably does not exceed half a dozen. See also HOST.

Wager, in English law, means a promise to give money or money's worth on the happening of an uncertain event. Every contract of insurance is in the nature of a wager, but such contracts are permitted, because they serve useful purposes. Sporting wagers were enforceable at common law, unless they were of an indecent or otherwise improper character: thus, a wager on the life of Napoleon was held void, as tending to weaken the patriotism of an Englishman, and to encourage the assassination of a foreign sovereign. By an Act of 1845 all agreements by way of wagering are rendered null and void *as between the parties;* but the enactment does not apply to any subscription for a prize to be awarded to the winner in any lawful sport. Where a person employs an agent to bet for him, or to enter into transactions contrary to Leeman's act (passed to prevent gambling in shares), no action can be brought on the bet or bargain made by the agent; but if the agent pays, the principal remains liable to indemnify him. These rules apply to all wagers; but there are certain forms of agreement which are not only void but illegal. Acts were passed in 1665 and 1710 to discourage betting on games, and an Act of 1835 provides that any security given for a gambling debt shall be void, and that money paid to the holder of such security may be recovered by action. As the loser of a bet cannot be legally compelled to pay, the debt is only what is called a debt of honour; but sporting men are usually more scrupulous in paying such debts than in meeting the claims of their lawful creditors. By the criminal law penalties are imposed on persons who keep or use houses for betting purposes, and magistrates may authorise the police to break into such houses and arrest persons found therein. Persons who win money by cheating at cards, &c. are liable to be indicted for obtaining money by false pretences; persons playing or betting in the street may be punished as rogues and vagabonds. See Anson, *Law of Contract*, for a clear statement of the law relating to wagers. In the law of Scotland wagers are treated as *pacta illicita*, and debts incurred by wager are not enforced. In the United States gaming contracts are in most states void, and money paid or property delivered on such considerations may generally be recovered back. In 1892 an act was passed rendering it penal to incite infants (below the age of 21), by means of circulars, advertisements, letters, telegrams, or otherwise, to bet, wager, or borrow money—the penalty being fine or imprisonment with or without hard labour. See BETTING.—For Wager of Battle, see BATTLE.

Wages, the part of produce which goes to the labourer. The 'wages-fund' theory formulated by Mill is that as there is at any given time in a country a determinate amount of capital available for the payment of labour, therefore the average wage depends on the proportion of this fund to the number of persons who have to share in it. Ricardo's 'iron law of wages,' taken in connection with his theory of Rent (q.v.), is generally somewhat exaggerated by socialists into the doctrine

that wages cannot exceed what is absolutely necessary for the maintenance of the labourer (see LASSALLE); really his teaching was that the labourers cannot for any considerable time earn more than is necessary to enable their class to live in the degree of comfort which custom has rendered indispensable, and to perpetuate their race. But for the controversies on wages, reference must be made to the works cited at POLITICAL ECONOMY, to MARX and SOCIALISM, to Walker's *Wages Question* (1877), and to Leone Levi's *Wages and Earnings of the Working Classes* (1885). Wagner. Richard Wagner's personality has been so overshadowed by and almost merged in the great controversy which his schemes of reform in opera raised that his life and character are often now sorely misjudged—just as his music long was—by those who have not the time, the inclination, or the ability to understand the facts and the issues. Before briefly stating then the theories he propounded and their development, as shown in successive music dramas, it will be well to summarise the story of a life (1813–83) during which he was called to endure so much vicissitude, trial and temptation, suffering and defeat.

Born in Leipzig on the 22d May 1813, the youngest of nine children, Wilhelm Richard was only five months old when his father died. His mother's second marriage entailed a removal to Dresden, where, at the Kreuzschule, young Wagner received an excellent liberal education. At the age of thirteen the bent of his taste, as well as his diligence, was shown by his translation (out of school hours) of the first twelve books of the *Odyssey*. In the following year his passion for poetry found expression in a grand tragedy. 'It was a mixture,' he says, 'of Hamlet and Lear. Forty-two persons died in the course of the play, and for want of more characters I had to make some of them reappear as ghosts in the last act.' Weber, who was then conductor of the Dresden opera, seems to have attracted the boy both by his personality and by his music, but it was Beethoven's music which gave him his real inspiration. From 1830 to 1833 many compositions after standard models are evidence of hard and systematic work, and in 1833 he began his long career as an operatic composer with *Die Feen*, which, however, never reached the dignity of performance till 1888—five years after Wagner's death. After some time spent in very unremunerative routine work in Heidelberg, Königsberg, and Riga (where in 1836 he married), he resolved in 1839 to try his fortune in Paris with *Rienzi*, a new opera, written on the lines of the Paris Grand Opera and with all its great resources in view. From the month's terrific storm in the North Sea, through which the vessel struggled to its haven, till the spring of 1842, when Wagner left Paris with *Rienzi* unperformed and heartsick with hope deferred, his lot was a hard and bitter one. Berlioz in similar straits supported himself by singing in the chorus of a second-rate theatre; Wagner was refused even that humble post. In 1842 *Rienzi* was accepted at Dresden, and its signal success led to his appointment as Kapellmeister there (January 1843). In the following year the *Flying Dutchman* was not so enthusiastically received, but it has since easily distanced the earlier work in popular favour. The story was suggested to his mind during the stormy voyage from Riga, and it is a remarkable fact that the wonderful tone-picture of Norway's storm-beaten shore was painted by one who till that voyage had never set eyes on the sea. In 1845 his new opera, *Tannhäuser*, proved at first a comparative failure. The subject, one which had been proposed to Weber in 1814, attracted Wagner while he was in Paris, and during his studies for the libretto he found also the first suggestions of *Lohengrin* and *Parsifal*. The temporary failure of the opera led him to the consideration and self-examination which resulted in the elaborate exposition of his ideal (in *Opera and Drama* and many other essays). 'I saw a single possibility before me,' he writes, 'to induce the public to understand and participate in my aims as an artist.' *Lohengrin* was finished early in 1848, and also the poem of *Siegfrieds Tod*, the result of Wagner's studies in the old Nibelungen Lied; but a too warm sympathy with some of the aims of the revolutionary party (which reigned for two short days behind the street barricades in Dresden, May 1849) rendered his absence from Saxony advisable, and a few days later news reached him in Weimar that a warrant was issued for his arrest. With a passport procured by Liszt he fled across the frontier, and for nearly twelve years the bitterness of exile was added to the hardship of poverty. It is this period which is mainly responsible for Wagner's polemical writings, so biting in their sarcasm and often unfair in their attacks. He was a 'good hater;' one of the most fiendish pamphlets in existence is the *Capitulation* (1871), in which Wagner, safe from poverty (thanks to the kindness of Liszt and the munificence of Ludwig II. of Bavaria) and nearing the summit of his ambition, but remembering only his misfortunes and his slights, gloated in public over the horrors which were making a hell of the fairest city on earth. There is excuse at least, if not justification, to be found for his attacks on Meyerbeer and others; there are considerations to be taken into account while one reads with humiliation and pity the correspondence between Wagner and his benefactor Liszt; but it is sad that an affectionate, humane, intensely human, to say nothing of an artistic nature, could so blaspheme against the first principles of humanity.

In 1852 the poem of the *Nibelungen Ring* Trilogy was finished. In 1854 *Rheingold* (the Introduction or *Vorabend*) was ready, and *Die Walküre* (part i.) in 1856. But 'tired,' as he said, 'of heaping one silent score upon another,' he left *Siegfried* unfinished, and turned to the story of *Tristan*. The poem was completed in 1857, and the music two years later. At last in 1861 he received permission to return to Germany, and in Vienna he had the first opportunity of hearing his own *Lohengrin*. For three years the struggle with fortune seems to have been harder than ever before, and Wagner, in broken health, had practically determined to give up the unequal contest, when an invitation was sent him by Ludwig II., the young king of Bavaria. 'Come here and finish your work.' Here at last was salvation for Wagner, and the rest of his life was comparatively smooth. In 1865 *Tristan und Isolde* was performed at Munich, and was followed three years later by a comic opera, *Die Meistersinger*, the first sketches of which date from 1845. *Siegfried* (*Nibelungen Ring*, part ii.) was completed in 1869, and in the following year Wagner married Cosima, the daughter of Liszt, and formerly the wife of Von Bülow. His first wife, from whom he had been separated in 1861, died at Dresden in 1866.

A theatre built somewhere off the main lines of traffic, and specially constructed for the performance of Wagner's later works, must have seemed the most impracticable and visionary of proposals in 1870; and yet, chiefly through the unwearying exertions of Carl Tausig (and after his death of the various Wagner societies), the foundation-stone

of the Baireuth theatre was laid in 1872, and in 1876, two years after the completion of the *Götterdämmerung* (*Nibelungen Ring*, part iii.), it became an accomplished fact. The first work given was the entire Trilogy; and in July 1882 Wagner's long and stormy career was magnificently crowned there by the first performance of *Parsifal*. A few weeks later his health showed signs of giving way, and he resolved to spend the winter at Venice. There he died suddenly, 13th February 1883, and was buried in the garden of his own house Wahnfried at Baireuth.

Wagner's life and his individuality are of unusual importance in rightly estimating his work, because, unlike the other great masters, he not only devoted all his genius to one branch of music —the opera—but he gradually evolved a theory and an ideal which he consciously formulated and adopted, and perseveringly followed. It may be asked whether Wagner's premises were sound and his conclusions right; and also whether his genius was great enough to be the worthy champion of a cause involving such revolutions. Unless Wagner's operas, considered solely as music, are not only more advanced in style, but worthy in themselves to stand at least on a level with the greatest efforts of his predecessors, no amount of proof that these were wrong and he right will give his name the place his admirers claim for it. It is now universally acknowledged that Wagner can only be compared with the greatest names in music. His instrumentation has the advantage in being the inheritor of the enormous development of the orchestra from Haydn to Berlioz, his harmony is as daring and original as Bach's, and his melody is as beautiful as it is different from Beethoven's or Mozart's. (These names are used not in order to institute profitless comparisons, but as convenient standards; therefore even a qualification of the statement will not invalidate the case.)

His aim (stated very generally) was to reform the whole structure of opera, using the last or 'Beethoven' development of instrumental music as a basis, and freeing it from the fetters which conventionality had imposed in the shape of set forms, accepted arrangements, and traditional concessions to a style of singing now happily almost extinct. The one canon was to be dramatic fitness. In this 'Art Work of the Future,' as he called it, the interest of the drama is to depend not entirely on the music, but also on the poem, and on the acting and staging as well. It will be seen that Wagner's theory is not new. All or most of it is contained in the theories of Gluck and others, who at various periods in the development of opera consciously strove after an ideal music drama. But the times were not ripe, and therefore such music could not exert its proper influence. The twin arts of music and poetry, dissociated by the rapid advance of literature and the slow development of music, pursued their several paths alone. The attempt to reunite them in the end of the 16th century was futile, and only led to Opera (q.v.) which never needed, and therefore did not employ, great poetry. In Germany music was developed along instrumental lines until the school arrived at its culmination in Beethoven; and when an opera composer stopped to think on the eternal verities the result must always have been such a prophecy of Wagner's work as we find in Mozart's letters:

October, 1781.—Verse indeed is indispensable for music, but rhyme is bad in its very nature. . . . It would be by far the best if a good composer, understanding the theatre and knowing how to produce a piece, and a clever poet, could be united in one. . . .'

Other, but comparatively unimportant, features in the Wagner music drama are, e.g., the use of the *Leitmotiv* or Leading Motive—found occasionally in Gluck, Mozart, Weber, &c., but here first adopted with a definite purpose, and the contention for mythological rather than historical subjects—now largely admitted. But all Wagner's principles would have been useless without the energy and perseverance which directed his work, the loving study which stored his memory with all the great works of his predecessors, and above all the genius which commands the admiration of the musical world.

Wagner's works show a remarkable and progressive development. *Rienzi* is quite in the grand opera style of Meyerbeer, Spontini, &c. The *Flying Dutchman* is a deliberate departure from that style, and in romantic opera strikes out for itself a new line, which, followed still further in *Tannhäuser*, reaches its stage of perfection in *Lohengrin*. From this time dates the music drama, of which *Tristan* is the most uncompromising type, and which by virtue of wonderful orchestration and the intense pathos of the beautifully-written poem is the most fascinating of all. The Trilogy (*Walküre*, *Siegfried*, *Götterdämmerung*, with the *Rheingold* as introduction) is a very unequal work. It is full of Wagner's most inspired writing and most marvellous orchestration; but it is too long and too diffuse. The plot also is strangely confused and uninteresting, and fails alike as a story and as a vehicle of theories, morals, or religion. *Parsifal*, with its sacred allegory, its lofty nobility of tone, and its pure mysticism, stands on a platform by itself, and is almost above criticism, or praise, or blame. The libretto alone might have won Wagner immortality, so original it is and perfect in intention; and the music seems to be no longer a mere accessory to the effect, but the very essence and fragrance of the great conception.

The Wagner literature is enormous, and varies from immoderate enthusiasm to fanatical hatred. The best life on the whole is that of Adolphe Jullien, *Richard Wagner: sa Vie et ses Œuvres* (1886); Mr Dannreuther's exhaustive article in Grove's *Dictionary* is temperately written. See also Francis Hueffer, *Richard Wagner and the Music of the Future* (which attracted much notice in 1874) and *Richard Wagner* ('Great Musicians' series, 2d ed. 1883); *Correspondence, 1841–61, between Wagner and Liszt* (Eng. trans. by Hueffer, 2 vols. 1888); *Wagner's Letters to Dresden Friends* (Eng. trans. 1890); Gustav Kobbe, *Wagner's Life and Works* (New York, 1890); A. R. Parsons, *Parsifal* (1891); F. Praeger, *Wagner as I knew Him* (inaccurate, 1892); German Lives by Wolzogen, Pohl, Chamberlain (Eng. trans. 1897), Finck (1896), and others; French works by Jullien (1886) and Ernst (1893). Of Wagner's prose works (10 vols. 1871–73; new ed. 1888) vols. i.–vi. had in 1893–98 been translated under the auspices of Mr W. A. Ellis.

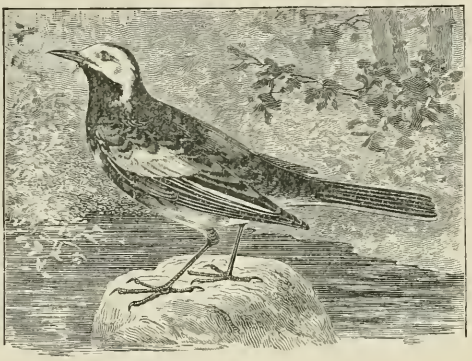
Wagner, Rudolf, physiologist (1805–64), professor successively at Erlangen and Göttingen, and author of *System of Physiology* (Eng. trans. 1844) and *Comparative Anatomy* (trans. 1845).

Wagram (*Deutsch-Wagram*), a village 10 miles NE. of Vienna, where, on the 5-6th July 1809 the Austrians were defeated by Napoleon (q.v.).

Wagtail, a family (Motacillidæ) and a genus (Motacilla) of Passerine birds. The family, which includes the true wagtails and the Pipits (q.v.), is distinguished from the thrushes, warblers, crows, shrikes, waxwings, and starlings by the absence of the bastard or first primary; from the finches by the slenderness of the bill; from the swallows by the slenderness of the bill and the greater length of the legs; and from the larks, probably its nearest allies, by having the tarsus scutellated only in front, and having an additional spring moult, which, however, does not extend to the quills and tail-feathers. In distribution it is almost cosmopolitan, being absent only from the Polynesian subregion. It is most abundantly represented in the Palæarctic, Ethiopian, and

Oriental regions; least so in the Nearctic, only one species of wagtail entering the New World, but pipits being more represented.

The genus Motacilla, the true wagtails, includes about thirty species, of which eight are European and five British. They frequent open and well-cultivated districts, where they are found on banks of streams and ponds and in pastures. They are almost exclusively terrestrial in habits, and run



Pied Wagtail (*Motacilla yarrelli*).

gracefully and swiftly along the ground, constantly jerking the long tail up and down. Their flight is very undulatory; they have little power of song. Their food consists of insects and small shellfish. Their nests are built in holes in rocks or on the ground. The Pied Wagtail (*M. yarrelli* or *lugubris*) is from 7 to 8 inches long, and has beautifully-marked white and black plumage. It is found all over the western part of Europe, and is generally distributed as a resident throughout the British Islands, visiting and nesting in the extreme north of Scotland and, sparingly however, in the Hebrides and Orkneys, and known in the Shetlands and St Kilda on its spring and autumn migrations. Although a British resident bird it is partially migratory, especially in the northern districts; even in England there is a general movement northwards in spring and southwards in autumn. It breeds in April, the nest being made of moss, dry grass and roots, and placed in a hole in a bank, wall, rock, tree, or even in an open field. The cuckoo often selects this nest in which to lay her egg. The young differs considerably from the old bird in plumage. This species was long confounded with the White Wagtail (*M. alba*), found over the whole of Europe, northern Asia, India, Burma, and North Africa, occurring not uncommonly in England, more rarely in Scotland, and very rarely in Ireland. In general habits, food, and haunts it closely resembles the pied wagtail, but it has been known to breed in the burrow of a sand-martin. The Gray Wagtail (*M. melanope* or *boarula*), the Yellow Wagtail (*M. rayi*), and the Blue-headed Wagtail (*M. flava*) are the other British species. A variety of this last occurring in Alaska is the only true wagtail found in the New World. Cuvier classed wagtails with yellow coloration in a genus Budytes; and for the gray wagtail Kaup established the genus Calobates.

Wahâbis, a puritanical sect of Moslems, whose political influence, widely felt over the Mohammedan world, centred from the beginning in Nejd (see ARABIA, Vol. I. p. 364). The founder's aim was to restore primitive Mohammedanism. He disapproved the superstitious veneration of Mohammed, denounced magnificence in mosques, ceremonies, or personal attire, the use of spirituous drinks or tobacco, usury, card-playing, &c., and insisted on sexual purity, almsgiving, daily prayer, &c. After the break-up of the Wahâbi power by Mehemet Ali and Ibrahim Pasha the survivors fled into the central deserts of Arabia, whence they have occasionally since emerged in threatening force. Thus in 1828 they made war (unsuccessfully) with the Porte, and in 1863 extended their domain again to the Persian Gulf. Now they are confined to the neighbourhood of El Riâd. There are a considerable number of Wahâbis in India, though they hesitate to describe themselves as such to the authorities, having been always fanatical enemies of British influence, and repeatedly (as in 1863–64) guilty of treasonable intrigues. Patna is their main centre in India. They hold themselves aloof both from Shîites and Sunnites, though in faith they are substantially Sunnite.

See Corancez, *Histoire des Wahabys* (1810); Burkhardt, *Notes on the Bedouins and Wahabys* (1834); the travels in Arabia of Palgrave, Doughty, Pelly, &c.; and Sir W. W. Hunter, *Our Indian Musalmans* (1871).

Wahsatch Mountains. See UTAH.

Waigatz, or VAIGATCH. See NOVA ZEMBLA.

Waikato, the principal river of the North Island of New Zealand, flows first into Lake Taupo, and then out of it northward to Manakau Harbour, with a total course of 170 miles. Between the upper Waikato, Lake Taupo, Mount Ruapehu, and the west coast lies the mountainous and picturesque 'King Country,' occupied mainly by Maoris under their king, who until 1884 resolutely opposed the survey or settlement by Europeans of the lands within their *aukati* or frontier.

Wainewright, THOMAS GRIFFITHS, essayist, forger, and poisoner, was born at Chiswick in October 1794. Left an orphan, he was brought up at Turnham Green by his grandfather, Dr Ralph Griffiths (1720–1803), the founder of the *Monthly Review*, and was educated under Charles Burney. He had held a commission in the Guards when, about 1820 or earlier, he took to writing tawdry art criticisms and miscellaneous articles for the periodicals, especially the *London Magazine*. He married on £200 a year, and, soon outrunning his means, first committed a forgery (1824), and then poisoned with strychnine his uncle (1829), his mother-in-law (1830), a sister-in-law (1830), and a Norfolk acquaintance at Boulogne (1831). The sister-in-law (Wainewright's wife was an accomplice in her murder) had been fraudulently insured for £18,000, but two actions to enforce payment failed; and Wainewright, venturing back from France to London in 1837, was arrested for his old forgery, and sentenced to life transportation. Even in Newgate he bragged of still holding 'the position of a gentleman,' and in Van Diemen's Land canted about 'Art and the Ideal.' There he painted portraits, ate opium, and at last died of apoplexy in Hobart Town hospital about 1852. The 'kind, light-hearted Wainewright' of Charles Lamb (1823) is depicted by 'Barry Cornwall' as short and fattish, 'with mincing steps and tremulous words, his hair curled and full of unguents, and his cheeks painted like those of a demirep,' a collector of richly-bound works on occultism and poisoning. He is the 'Varney' of Lytton's *Lucretia* (1846), and the 'Slinkton' of Dickens's *Hunted Down* (1860).

See his *Essays and Criticisms*, edited, with a memoir, by W. C. Hazlitt (1880), B. W. Procter's *Autobiography* (1877), and Oscar Wilde's *Intentions* (1891).

Waits, originally watchmen who sounded horns, and afterwards bands of musicians and singers, especially carol-singers at Christmas time.

Waitz, GEORG, historian, born at Flensburg, 9th October 1813, studied law and history at Kiel

and Berlin, became professor at Kiel in 1842, member of the German National Assembly in 1848, and professor at Göttingen in 1849, where he formed an active school of young historians who devoted themselves especially to mediæval Germany. In 1875 he became member of the Academy in Berlin, and director of the reorganised *Monumenta Germaniæ historica*, and died 24th May 1886. To native acuteness of intellect Waitz added laborious industry, with the consequence that the permanent value of his work remains secure.

Here may merely be named *Deutsche Verfassungsgeschichte* (vols. i.–viii. Kiel, 1843–78), *Schleswig-Holsteins Geschichte* (2 vols. 1851–54), *Ueber das Leben und die Lehre des Ulfila* (1840), and *Grundzüge der Politik* (1862). Many papers of his appeared in the *Forschungen zur Deutschen Geschichte* (established 1860). Other works were on Dahlmann's *Quellenkunde zur deutschen Geschichte* (edd. 3–5), and an edition of Caroline Schelling's Letters (1871). See Steindorff, *Bibliographische Uebersicht über Georg Waitz's Werke* (1886), and Kluckhohn, *Zur Erinnerung an Georg Waitz* (1887).

Waitz, Theodor, anthropologist, was born at Gotha, 17th March 1821, studied philology, mathematics, and philosophy at Leipzig and Jena, became a lecturer in 1844 at Marburg, and professor extra-ordinary of Philosophy in 1848, and died March 21, 1864.

His greatest work is the monumental *Anthropologie der Naturvölker* (vols. i.–iv. Leip. 1859–64; vols. v.–vi. by Gerland, 1870–71). The Anthropological Society of London published a translation of the first volume in 1863. Other works were *Grundlegung der Psychologie* (1846), *Lehrbuch der Psychologie als Naturwissenschaft* (1849), *Allgemeine Pädagogik* (1852), and a critical edition of the *Organon of Aristotle* (1844).

Waitzen (Magyar *Vácz*), a Hungarian town on the Danube, 20 miles N. of Pesth by rail, with a cathedral on the model of St Peter's. Pop. 13,199.

Wake. Lykewakes were in Scotland condemned by the General Assembly in 1645 and 1701, but survived this legislation in Aberdeenshire and the Highlands. See Funeral Rites.

Wake, William, Archbishop of Canterbury (1716–37), was born at Blandford in Dorsetshire, in 1657, studied at Christ Church, Oxford, and was successively preacher to Gray's Inn, rector of St James's, Westminster, Dean of Exeter (1701), Bishop of Lincoln (1705), and Primate (1716), dying at Lambeth, 24th January 1737. Of great learning and industry, he has bequeathed his name to posterity in the *Genuine Epistles of the Apostolic Fathers* (1693). He maintains the authenticity of them all; but though his preliminary dissertation may be antiquated, the translations are still excellent. In these he was aided by Dr Johann Ernst Grabe (1666–1711), a native of Königsberg, who became a chaplain of Christ Church, Oxford, and edited the *Septuagint*, a *Spicilegium* of Fathers, Justin, and Irenæus.

Wakefield, the capital of the West Riding of Yorkshire, stands on the Calder at a convergence of railways, 9 miles SSE. of Leeds, 27 SSW. of York, and 19 NW. of Doncaster. In 1888 it was constituted the seat of a bishopric—its cathedral the fine Perpendicular parish church, which, enlarged and reconsecrated in 1329, and again enlarged about 1470, was restored in 1857–86 from designs by Sir G. G. Scott at a cost of £30,000, and has a tower and spire 247 feet high. On the nine-arch bridge over the Calder is an interesting chapel founded in 1357 by the townsmen of Wakefield, a building in the beautiful flowing Decorated style; it also was restored in 1847. At the grammar-school, chartered in 1591, and removed to new buildings on a different site in 1855, were educated Dr Radcliffe, Archbishop Potter, the Benedictine Cressy, and Bentley, the first two of whom were natives. The town-hall, French Renaissance in style, was erected in 1880 at a cost of about £72,000; and other buildings are the corn exchange, fine art institute, Clayton hospital, and lunatic asylum. Though not the great 'clothing town' it was formerly, Wakefield still has considerable manufactures of woollens, worsteds, and hosiery, as also of agricultural implements, machinery, &c. It was made a parliamentary borough in 1832, the boundary being extended in 1885. Pop. (1851) 22,065; (1881) 33,240; (1891) 37,269, of whom 33,146 were within the municipal area. The chief event in the history of Wakefield is the Yorkist defeat in the Wars of the Roses (q.v.) on 30th December 1460. The diocese includes parts of the old area of Ripon and York.

See works by Sisson (1824), Scatcherd (1843), Buckler (1843), Lupton (1864), Taylor (1886), Clarkson (1887), J. W. Walker (1888, 1890), and Peacock (1892).

Wakefield, a manufacturing town of Massachusetts, 10 miles N. of Boston. Pop. 6970.

Wakefield, Edward Gibbon, born in London 20th March 1796, was in 1826 imprisoned for abducting a young lady and marrying her at Gretna Green. During his imprisonment he studied colonial questions with zeal, and after his liberation assisted in the colonisation of South Australia. He was private secretary to Lord Durham in Canada in 1838, but is best known for his services as manager of the New Zealand Association. He was a founder of the High Church colony of Canterbury, where he died, 16th May 1862. See his Life by N. Garnett (1898).

Wakefield, Gilbert, divine, was born at Nottingham, 22d February 1756, and had his education at Jesus College, Cambridge, of which he became fellow. He took orders, but renounced the Anglican communion, laboured as classical tutor in dissenting academies at Warrington and Hackney, lay two years in Dorchester gaol for a so-called seditious libel in answer to Bishop Watson, for which his political friends consoled him with a gift of £5000, and died in London, 9th September 1801. He published editions of Bion and Moschus, Virgil, Horace, and Lucretius; *Christian writers of the three first centuries on the Person of Christ* (1784), left unfinished; *Inquiry into the expediency and propriety of social worship* (1791), the necessity for which he denied; *An Examination of Paine's Age of Reason* (1794); and *Silva Critica*, a collection intended to illustrate the Scriptures from the stores of profane learning (1789–95). His learning was wide, if nowhere profound or exact; but his warmth of temper proved a great source of weakness to him as a controversialist. After leaving the Church of England he never attached himself to any other religious society, although practically a Unitarian. In his *Diary*, H. C. Robinson says of him: 'He had the pale complexion and mild features of a saint, was a most gentle creature in domestic life, and a very amiable man; but when he took part in political or religious controversy his pen was dipped in gall.' His own *Memoirs* (1792) are uninteresting; not so his Correspondence with Fox (1813).

Wakhan. See Badakhshan, Afghanistan.

Walch, Christian Wilhelm Franz, was born at Jena in 1726, in 1754 became extra-ordinary, in 1757 ordinary, professor of Theology at Göttingen, and died 10th March 1784. His name survives in the durable worth of his contributions to church history: *Gedanken von der Geschichte der Glaubenslehre* (1756), *Entwurf einer Historie der Ketzereien, bis auf die Reformation* (11 vols. 1762–85), and *Neueste Religionsgeschichte* (9 vols. 1771–83).—His father, Johann Georg Walch (1693–1775), was

long professor of Theology at Jena, edited Luther's works (24 vols. Halle, 1740–52), and wrote a work of great value on the history of the religious controversies within the Evangelical-Lutheran Church (5 vols. 1730–39), and its complement, on those without that church (5 vols. 1733–36).

Walcheren, an island in the Dutch province of Zeeland, at the mouth of the Scheldt, containing 52,000 acres and 45,000 inhabitants. The chief places are Middelburg, Flushing, and Campvere. One-half is meadow, the other rich arable land, well wooded to the north. Where it is not protected by natural dunes, strong dykes have been formed, that at West Kappelle being a magnificent work. The drainage-water is carried off by large sea-sluices at Middelburg and Vere. Agriculture is the principal employment. The people are chiefly Protestants. Several large artificial mounds are supposed to have been erected by the early inhabitants as places of refuge from high tides.

The *Walcheren Expedition*, one of the most disastrous failures in the history of modern warfare, was planned in 1807, when Britain, Prussia, Russia, and Austria were all in arms against France; but it was not till early in the summer of 1809 (when Napoleon, who had meantime overwhelmed Prussia, and reduced Russia to neutrality, was gradually forcing Austria to succumb) that the British ministry resolved to carry it out. The plan was to send a fleet and army up the Scheldt, and attack Antwerp (the principal naval station and arsenal of the French), whose fortifications, though formidable, were much in need of repair, and whose garrison at the time only numbered about 2000 Invalides and coast-guards; while there were not more than 10,000 French soldiers in Holland. The expedition, after numberless needless delays, at last sailed on July 28, and, to the number of 37 men-of-war, 23 frigates, 115 sloops and gunboats, accompanied by transports carrying about 41,000 soldiers, reached the Dutch coast on the following day. But, instead of obeying the orders of the minister of war, Lord Castlereagh (q.v.), to advance at once in force against Antwerp, the commander-in-chief, Lord Chatham (1756–1835), Pitt's elder brother, frittered away his time in the reduction of Flushing, which was not effected till August 16, by which time the garrison of Antwerp had been reinforced by King Louis Bonaparte with the troops at his command (about 6000), and by detachments sent from France, which swelled the garrison, by August 20, to 15,000 men. About the end of August Chatham, who, as a general, was a methodical incapable, 'found himself prepared' to march upon Antwerp, but by this time 30,000 men, under Bernadotte, were gathered to its defence, and the English army was decimated by marsh-fever, so that success was not to be hoped for. However, it was judged right to hold possession of Walcheren, in order to compel the French to keep a strong force on the watch in Belgium, and, accordingly, 15,000 remained to garrison the island, the rest returning to England; but the malaria proved fatal in its ravages, and, peace having been concluded between Austria and France, this force was also recalled. Thus an excellently devised scheme, through the utter stupidity of the agent chosen by George III. to carry it out, failed in every point of consequence, and ended in a loss of 7000 men dead, and the permanent disablement of half the remainder.

Waldeck, or WALDECK-PYRMONT, a small principality of Germany now controlled by Prussia, consists of two parts, Waldeck, between Westphalia and Hesse-Nassau, and Pyrmont, a small patch between Lippe, Westphalia, Brunswick, and Hanover. The country is high-lying and poor, with a total area of 438 sq. m. and a population of (1890) 57,283, of which 8104 belong to Pyrmont. The capital is Arolsen (q.v.). Pyrmont, 15 miles E. of Detmold (pop. 1500), lies in the valley of the Emmer, and has famous mineral springs. The arrangement by which Prussia took over all essentials of government except formal ones was made in 1867, and renewed in 1877 and 1887. Daughters of the princely house were married to the king of the Netherlands in 1879 and to the Duke of Albany in 1882.

Waldenses, a famous Christian community which originally grew out of an anti-sacerdotal movement originated by Peter Waldo of Lyons in the second half of the 12th century. A rich merchant, pious and unlearned, he caused the New Testament and a collection of extracts from the Fathers to be translated into Romaunt, and, naturally failing to find the apostolic simplicity in the ecclesiastical condition of the time, sold his moyable goods for the support of the poor, and devoted himself to preaching the truth to the people by the wayside. Everywhere he found eager listeners, and was followed by groups of simple and earnest persons of both sexes who did their best, even to their dress, to carry out the apostolic ideal, loving to bear the name of the Poor Men of Lyons. The tenets ascribed to them in the earliest accounts are chiefly that oaths even in a court of justice are not allowable, that homicide is under no circumstances justifiable, that every lie is a mortal sin, that all believers are capable of priestly functions, and that the sacraments are invalidated by uncleanness of life in the officiating priest. We find at first no special doctrines that could be condemned as heretical, and even in later days, as Mr Lea points out, the documents of the Inquisition constantly refer to 'heresy and Waldensianism,' the former meaning Catharism. The Archbishop of Lyons forbade them to preach, but in vain; Pope Alexander III. gave them a modified approval, but Lucius III. anathematised them at Verona in 1184, and Innocent III. at the fourth council of the Lateran in 1215. But it was impossible to compel silence, for the missionary zeal of these sincere enthusiasts was boundless, and their influence quickly grew. Alonso II. of Aragon ordered them to quit his dominions in 1194, and in southern France they became involved in the common destruction of the Albigenses, although their quarrel with the church differed from that of the latter in relating to matters of practice rather than of doctrine. But under persecution their divergences from the church naturally grew ever the greater, and we find that gradually, though never uniformly, they came to repudiate the invocation of the Virgin and saints, transubstantiation, and purgatory with all its consequences. Thus the Waldensian martyrs at Strasburg in 1212 made no distinction between laity and priesthood, while at the same time both the French and Lombardian Waldenses held that the Eucharist could be celebrated only by an ordained priest, and it was at that time still the latter only who believed it invalid if the priest was living in sin. Yet they themselves maintained a kind of order of preachers (*perfecti*), living in voluntary poverty and celibacy, in contradistinction to the ordinary *credentes*. And by some accounts there was a kind of hierarchy among the *perfecti*, a theory which gains some support from the frequent use of such terms as *majoralis*, *magnus magister*, *major*, and *minor*. Their morality was austere, and we find the very inquisitors acknowledging their chastity, sobriety, truthfulness, and industry. Their crowning offences were their paramount regard for Scripture and the unresting proselytism of their preachers, who went abroad two by two, ostensibly practising some

calling, as pedlars or tinkers, but ceaselessly exhorting the faithful in sequestered places, hearing confessions, and administering absolution. Their principal seats were the slopes and fastnesses of the Cottian Alps, east in Piedmont, west in Provence and Dauphiné. After the Cathari were finally crushed they supplied the chief work that remained to the Inquisition in France. They had grown strong among the poorer class in Languedoc, with schools, a good organisation, and missionaries reputed to have skill in medicine. They next spread into Lorraine, Burgundy, Franche Comté, Narbonne, and the mountains of Auvergne. We find Bernard Gui burning them at Toulouse in 1316, and by this time persecution had done its perfect work as well in refining their piety as in completing their estrangement from Rome. Their doctrine of non-resistance made it easy to harry and confiscate their property, yet we find the victims often too poor to pay for the wood that burned them. During the years 1336–46 especially they were severely harassed; twelve were burned in front of the cathedral at Embrun in 1348. Popes Clement VI. and Urban V. stimulated the zeal of the Inquisition, and we read how the fierce inquisitor, François Borel, burned 150 at Grenoble in one day in 1393. Gregory XI. urged on the unholy work in Provence, Dauphiné, and the Lyonnais, and in 1375 the prisons were crowded with far more prisoners than could be fed, and charity was actually asked for them by the church. During the Great Schism they contrived to escape, and after the Council of Constance the Hussites engaged for a time all the energies of the church. We hear, however, of the persecutions again in 1432 and later years, and by this time, says Mr Lea, so completely had the Waldenses monopolised the field of misbelief in the public mind of France that sorcery became popularly known as *vauderie*, and witches as *vaudoises*. Sixtus IV. tried to stir up Louis XI. in vain; but Charles VIII. was more docile, and Pope Innocent VIII. was able in 1488 to organise a crusade against them in both Dauphiné and Savoy. The valley of Pragelato, Val Cluson, and Freyssinières were ravaged pitilessly with fire and sword and wholesale confiscations, many *barbes* (pastors) were burned, and in Val Louise the poor fugitives were smoked to death in their caves. Louis XII. stopped the proceedings, with consent of Pope Alexander VI., whose son Cæsar Borgia had just received the duchy of Valentinois. Their remnants continued to cherish their own faith, more or less under disguise of Catholicism, until they finally merged with the Calvinists after the Reformation.

In Italy the Waldenses had found the ground prepared by the Arnaldistæ, or followers of Arnold of Brescia (q.v.), and Umiliati, and spread rapidly even in Milan, but especially in the valleys of the Cottian Alps, Luserna, Angrogna, San Martino, Perosa. Poor, hard-working labourers as they were, they showed throughout their history examples of constancy and quiet heroism such as the world has seldom seen. The Inquisition destroyed Catharism in Italy; Waldensianism it could not destroy. About 1312 in Luserna and Perosa, we are told, as many as 500 attended their assemblies. Popes John XXII., Urban V., and Gregory XI. urged on the persecution, yet all the terrors of fire and sword and torture could not tear them from their faith. In 1375 many of the wretched fugitives from Pragelato perished in the snow, among them as many as fifty mothers with children at the breast. Again in 1475 a bitter war of extermination began under the Duchess Yolande, regent of Savoy, and another, as has been seen, in 1488 at the instigation of Pope Innocent VIII. During the persecutions in Savoy many had found refuge in Calabria and Apulia, and about 1400 there was a larger emigration, as during the 15th century the Inquisition was virtually extinct in Naples. These outlying settlements were visited every two years by *barbes* journeying under some pretext, the distance between Pignerol and Calabria being counted twenty-five days' journey by the western coast.

The Cathari never made much way in Germany, but on the other hand the Waldenses became strong. Some were burned at Strasburg in 1212, and especially in the diocese of Passau in the second half of the same century there was much persecution. Yet by the close of the century they had become very numerous, often succeeding in escaping notice by their quietness and outward conformity. In 1392 the Archbishop of Mainz persecuted them vigorously, burning thirty-six at Bingen together. At Steyer in Pomerania, in 1397, over a hundred of either sex were burned. Yet they were not extirpated, and remained strong, especially on the confines between Austria and Moravia. In 1467 they united themselves with the famous Bohemian Brethren. The Waldensians on the French side of the Cottian Alps in 1530 opened negotiations with the Swiss and German reformers, and in 1532 a five days' synod at Chanforans in the valley of Angrogne drew up articles of agreement. The Provence congregations were persecuted pitilessly under Francis I. in 1545, twenty-two villages being burned, and 4000 persons massacred, while as many were driven into flight. In Piedmont they defended their rights with such heroism that Emanuel Philibert in 1561 was forced to grant them freedom of worship in the valleys of St Martin, Perosa, and Luserna. In 1571 they formed the 'Union of Valleys' to guard their rights against a government that could not be trusted. From May 1630 to July 1631 plague raged in these valleys and carried off over 10,000—one-half of the whole population. But still more cruel was the persecution, which seldom indeed gave a long respite, and burst out in 1655 with a ferocious brutality that called forth a significant protest from Oliver Cromwell and from Milton one noble sonnet. In 1601 the Duke of Savoy had driven as many as 500 families into exile; again in 1686 Amadeus II. with the help of French troops coerced many through terror into conversion, and drove the recusants into exile, as many as 2000 to Geneva alone, others to the Palatinate, Hesse, and Nassau. In August 1689 more than 800 of these exiles returned to their native valleys, suffering incredible sufferings on their way. Under their pastor Henri Arnaud they made a valiant struggle against the French, and were finally added to Savoy by the peace of Utrecht. The 18th century was not a favourable age for persecution, yet even at its close the Waldenses could hold no office nor real estate, nor have physicians of their own faith. Napoleon allowed their church a constitution, but this Victor Emmanuel abolished in 1814, although two years later, urged by England and Prussia, he issued a milder edict. Meantime they prospered—Colonel John C. Beckwith (1789–1862), who had lost a leg at Waterloo, through reading Dr Gilly's *Visit to the Valleys of Piedmont* (1823), settled amongst the people for the last thirty-five years of his life, marrying a peasant girl, and succeeded in establishing as many as 120 schools. At last in 1848 Charles Albert gave the Waldenses equal political and religious rights, and since that time their progress has been constant if not rapid. In 1889–90 they had in Italy 44 churches and 53 stations, 58 pastors and evangelists, and a theological school at Florence.

Morland, Cromwell's emissary to Piedmont in 1658, brought back many Waldensian MSS. in Romaunt, which

were lost and only rediscovered in the Cambridge University Library in 1862. (See H. Bradshaw in the *Memoirs* of Camb. Antiq. Soc., 1862, and Archdeacon Groome in *Christian Advocate and Review* for January 1863). The prose consists of translations from Scripture and the Fathers, and sermons; the finest thing in the poetry is the *Nobla Leyczon*, an exhortation to good works. Gradually the Waldenses conceived a kind of mythical idea of the continuity from primitive times of their scheme of doctrine, and naturally this compelled them to push back the origin of their community until actually they came to regard theirs as the real mother of the Reformed Churches. The origin of their name was no longer found in Peter Waldo, but in the Lat. *valles*, the valleys which had sheltered the true faith from the Apostolic age. Their historical documents were interpolated and falsified to suit the requirements of this historical theory, which indeed was long accepted by the Protestant world, and only disproved by Dieckhoff, *Die Waldenser im Mittelalter* (1851); Herzog, *Die Romanischen Waldenser* (1853); Todd, *Discourses on the Prophecies relating to Antichrist* (1840); and Maitland, *Facts and Documents of the Waldenses* (1862). See the *Bulletin de la Société d'Histoire Vaudoise* appearing yearly in Torre Pellice; and of more modern books, especially Émile Comba, *Histoire des Vaudois d'Italie* (vol. i. 1887; Eng. trans. 1889); Édouard Montet, *Histoire Littéraire des Vaudois du Piémont* (1883); K. Müller, *Die Waldenser bis zum Anfang des 14 Jahrhunderts* (Gotha, 1886); Henry C. Lea's *History of the Inquisition of the Middle Ages* (3 vols. New York, 1887); and A. Bérard, *Les Vaudois, leur Historie du IV^e^ au XVIII^e^ Siècle* (1892). See the bibliographies appended to the articles in Herzog and in Holtzmann-Zöpffel.

Waldo. See WALDENSES.

Wales, a great peninsula in the west of the island of Britain, bounded by the Irish Sea, St George's Channel, and the Bristol Channel, and touching the (now English) counties of Cheshire, Shropshire, Hereford, and Monmouth. The area is 7363 sq. m., about a fifth larger than Yorkshire. The principality of Wales, administratively a part of England, though differing more or less widely in blood, language, national character, and religious temper, is a mountainous land, and contains Snowdon (q.v.), the highest point in South Britain; North Wales is especially picturesque. The minerals are extremely valuable, and South Wales contains some of the most important coal and iron industries in the United Kingdom. Copper, zinc, lead, tin, and gold are also found. The physical geography, geology, climate, &c. have been already discussed at GREAT BRITAIN, where physical and geological maps of Wales will be found. For the political map, see that of England; the representation is shown at PARLIAMENT, p. 778. The established church is a part of the Church of England, with four episcopal sees; Nonconformists, especially Calvinistic Methodists, Congregationalists, Baptists, and Wesleyans, are very numerous, and claim to be a large majority of the total population. There are university colleges at Aberystwith, Bangor, and Cardiff, incorporated as the University of Wales in 1893, and theological colleges at Lampeter, &c. See the articles on the several Welsh counties, and on the towns such as Cardiff, Swansea, &c. In 1891, 508,036 persons spoke Welsh only, 402,253 both Welsh and English.

County.	Area in acres.	1881.	1891.

History.—The population of Wales contains Brythonic elements mixed with Goidelic and Ivernian or pre-Celtic, probably pre-Aryan (see CELTS). The Silures of Glamorgan and Brecknockshire and east to the Severn were probably Goidelic; so were the Demetæ of Dyfed or west South Wales, but more strongly Ivernian; the Gangani and Decanti of North Wales were mainly Ivernian. Between these were the Ordovices (Orddwy), Brythonic, in the Upper Severn valley. During the Roman occupation Brythonic tribes seem to have encroached on the Goidels and Ivernians; and the Brythons appear to have become largely Latinised. Christianity had been introduced before the end of the 2d century, and extended beyond Roman territory. During the Roman occupation invaders from beyond the North Sea had already given trouble; the south-east of the present England was administered by the 'Count of the Saxon Shore;' the remaining territory, where Goidels and Ivernians had to be dealt with, was under the 'Duke of the Britains,' from southern Scotland to Land's End. When the Romans had gone, the *Dux Britanniarum* was succeeded by a Gwledig, who ruled over the tribes in the whole of his district, both Brythonic, Goidelic, and Ivernian, the ruling race being Brythonic. A common name for the people of this district was introduced, meaning 'fellow-countrymen,' *Combroges*, or, in modern form, *Cymry*, which survives in the names *Cumberland* and *Cambria*. *Wales* is from *Wealas*, 'foreigners,' the name given by the Anglo-Saxon invaders to the natives of Britain (compare the German *Wälsch*, used of things Italian and French). Saxon invasions did not for some time much affect this western district; but at length disturbances in the north drove Cunedda Wledig, the ruler of the district, away from the Forth valley where his seat was. He migrated to North Wales, waged war with the Goidelic tribes and expelled them from the Dee to the Teifi, Brythonising the country, except in the north-west corner. This resisted the process for some time, but at length, before 500 A.D., became Brythonic or Welsh in language, though Goidelic and Ivernian legends and traditions long lingered there. In South Wales the Demetæ were hard pressed by the same influence, and squeezed into the modern Pembrokeshire by about 600. The Demetæ of Dyfed and the Silures of Morganwg do not appear to have been conquered, but they were Brythonised; and the Gaelic language thus disappeared from Wales. At the same time Christianity was energetically spread by Cunedda's descendants, of whom many are found in the lists of Welsh saints—e.g. St David Christianised the Ivernian (or Pictish) Menavia (now St Davids), and founded a see there. The Gwledigship, more or less reduced to a shadowy claim of over-lordship over all the tribal chiefs, remained with the descendants of Cunedda, who were princes or kings of Gwynedd, Venedotia, or North-west Wales.

In 577 Ceawlin took Bath, Cirencester, and Gloucester, and thus separated the Britons of Cornwall from those of Wales. In 655 Cadwaladr, in alliance with Penda of Mercia, was defeated, and Penda slain, by Oswiu at Winwædfield. Strathclyde and Cumberland were separated by this battle from Wales. About 720 we find Cadwaladr's grandson, Rhodri (Roderick) Maelwynawg ab Tudwal, leading the Welsh chiefs; and he kept Saxondom at bay until 754, when he died. After his death his two sons quarrelled about Anglesey, while the Welsh chieftaincies fell asunder. From 757 to 795 Offa of Mercia scourged the Welsh; in 795 was the still-remembered battle of Rhuddlan marsh; Shrewsbury and Hereford became English centres; and Offa's Dyke was built from Flintshire to the

Wye. In 768 the church in Gwynedd conformed to the Roman time of keeping Easter, but remained heterodox as regards the celibacy of the clergy. During the 9th century Wales was sorely troubled with Danish invasions. It was for Wales a century of misery, in which, however, Rhodri Fawr (Roderick the Great) succeeded in bringing all the chiefs under one head for some time. Towards the end of the century the Welsh chiefs all came successively under the protection of King Alfred, and the 10th century began quietly. Hywel Dda of Dyfed (Pembrokeshire), and probably of Powys (Upper Severn and Dee), codified the Welsh laws, based on the tribal system. The end of the 10th century was miserable; internecine strife aggravated and encouraged the attacks of the English and of the Danish sea-rovers. In 1039 Gruffydd ap Llywelyn became king of Gwynedd, and after very varying fortune became in 1055 king of all Wales, except perhaps Morganwg (Glamorganshire). When he destroyed the settlements of Edward the Confessor's Norman friends in Herefordshire, there were no reprisals, but Gruffydd submitted to King Edward. He afterwards broke the peace, and was defeated in 1063 by Harold and Tostig at Rhuddlan; Wales was vehemently attacked, and Gruffydd was murdered by his own people. Wales then submitted from sheer exhaustion.

After 1066 Welsh and English co-operated against William, but in vain; in 1070 William seized Chester; in 1071 Chester was made the centre of a palatine earldom under Hugo de Avranches, and Shrewsbury of one under Roger de Montgomery; in 1072 we find a vassal of Earl Hugh's in Rhuddlan, building Rhuddlan Castle, and Hugh de Montgomery across the Plynlimmon range, harrying north Cardiganshire, while Montgomery Castle was being built. Rival claimants to Welsh princedoms call in Norman aid, while the Black Danes are still, in 1080, invading Dyfed and Anglesey, and attacking Bangor. In 1081, by the battle of Carno (Montgomery) the rightful heirs of Gwynedd and South Wales, Gruffydd ap Cynan ap Iago and Rhys ap Tewdwr, a descendant of Roderick the Great, rescued their provinces from a usurping Trahaiarn, prince of Powys. Between 1081 and 1084 the Norman Conquest extended over Monmouthshire, Cardiff and Radnor castles were built, and William entered Wales. Under William Rufus the boundary line was pushed as far back as the Neath River in Glamorganshire, Brecknockshire (Brycheiniawg) was seized, and Earl Hugh of Chester gained a footing in Anglesey. In 1093 Rhys ab Tewdwr was killed by the Brecknock Normans, and so Pembroke and Cardigan were laid open; nothing was left but the mountain country of North-west Wales.

In 1094 a general rising took place; the castles in Gwynedd were seized; the Normans were expelled from Anglesey, and they lost Montgomery Castle; and in 1095 William Rufus marched in person as far as Snowdon, but with no success. In 1096 Monmouthshire and Brecknockshire were retaken, and the Normans by this time held only Glamorganshire and Pembroke Castle. In 1097 William led two more unsuccessful expeditions into Wales. After 1097 the tide turned; in a short time the Normans had their castles again in their hands. From 1100 onwards, under the politic Henry I., districts of country were allotted to the Welsh leaders under conditions of homage and service. Gruffydd ap Cynan growing too strong in Gwynedd among his mountains, Henry led an expedition against him in 1114, and Gruffydd was obliged to agree to a peace; Gwynedd thereafter began to prosper in agriculture, building, and wealth generally, though Gwynedd and Powys (under Cadwgan) were at strife. In South Wales, where in 1111 Henry had planted colonies of Flemings in Pembrokeshire and Gower to strengthen the Norman stations, Gruffydd ap Rhys ap Tewdwr asserted his heirship to the princedom; but though he gained some considerable successes, Wales was reduced to quietness by an expedition under Henry in 1121.

After the death of Henry I. in 1135, there was a wide-spread revolt, and the men of Gwynedd took Carmarthen. Even such districts as Radnorshire were lost by the Normans; under Stephen the royal power had ceased, and the lords marchers or border barons had become simply rival robbers. The Welsh leaders are found operating as far east as Flintshire, in Chester territory, and building a castle at Oswestry. By 1157 we find Gwynedd, under Owain, extending from Flintshire to Towyn (Merioneth); Powys, under Madoc ap Maredudd, extending far down towards Shropshire; and South Wales, under Rhys, from Aberdovey to Kidwelly; but internecine strife still continues. In 1157 Henry II. leads an expedition into Wales; Madoc of Powys assists him; Owain of Gwynedd is victorious by sea, but defeated by land, and submits; Rhys of South Wales then submits, and suffers loss of lands. Much land was distributed among Norman chiefs, and many diplomatic Norman-Welsh marriages made. Rhys ere long, deprived of sundry lands by force, rose in revolt; he maintained himself till 1162; then submitted to a strong expedition sent against him, aided by the men of Gwynedd; but in 1163 all Wales was in unanimous revolt. Henry's struggle with Becket had begun, and the Welsh expectation of the return of Arthur had become general. In 1165 an extraordinary but unsuccessful effort was made by Henry; and afterwards, being engrossed in his struggle with Becket, he treated the Welsh chiefs as ordinary feudal barons, and allowed them to fight out their own disputes. On this footing the Welsh chiefs swore homage and fealty to Henry, and Rhys of South Wales assisted him against his sons' revolt.

In ecclesiastical matters, the Welsh bishops repudiated the claims of the see of Canterbury, the see of St Davids being considered an archbishopric; but in 1203 the Welsh bishops were enjoined to obey the see of Canterbury. In 1194 Llywelyn ab Iorwerth, the rightful heir, became prince of Gwynedd, upsetting Henry's arrangements of 1170; in 1212 he, in alliance with other princes, attacked the Normans in Powys and Gwynedd, and rapidly extended his conquest during John's struggle with his barons; in 1217 he did homage to Henry III.; in 1219 he had become 'Prince of all Wales,' holding his own, and helping the barons against Henry III.; in 1238 he exacted an oath of fealty to his son Dafydd from the leaders of Wales; and he died in 1240. Dafydd was beleaguered (1245) in Snowdonia by Henry. In 1246 Dafydd was succeeded by Owain and Llywelyn ap Gruffydd, his nephews, who at first surrendered their lordships to Henry; Edward, Henry's young son, cruelly ruled over them, and a successful revolt resulted; in 1258 there was a Welsh-Scottish alliance against Henry III.: Llywelyn, who helped Simon de Montfort against Henry, obtained from Simon the fullest acknowledgment of his entire independence as 'Prince of Wales' saving the homage to the English crown, and this was confirmed by Henry even after the battle of Evesham. But Edward I., after bearing with seizures of certain lands by Llywelyn, delays in reference to homage and certain money payments, appeals to Rome and Canterbury, and an offer of homage to France, declared Llywelyn a rebel in 1276; excommunication followed; and Llywelyn was forced to submission in 1277. In 1281 he broke out again, but was killed near Builth in 1282. In 1283 his brother

Dafydd was executed as a traitor. In 1283 the Statutes of Rhuddlan were passed, retaining Welsh law, modified, organising the government of Wales, and diminishing the too independent power of the Norman barons.

In 1284 Edward II. was born in Carnarvon town, and made Prince of Wales in 1300–1. For several years there were various brief insurrections, some with French assistance. In 1400 Owain ab Gruffydd Fychan, or Owain Glyndyfrdwy, Owain of the Glen of Dee or Owen Glendower, incensed by an encroachment on the part of Lord Grey de Ruthyn, took arms. Henry IV. took the field against him in vain; in 1401 unconscionably severe proscriptive laws ('Ordinances of Wales') were passed against Welshmen: Sir Henry Percy (Hotspur), Justiciary of Chester, was put in command; Owain raided the Severn valley in 1402 as far as Leominster; Henry IV. invaded Wales, but was driven back by extraordinary storms: Owain was recognised as 'Prince of Wales' at Machynlleth in 1402. Thereafter he sided against Henry IV., and allied himself with Hotspur and others for a partition of the kingdom. Henry IV. marching against the Scots, turned aside and intercepted Hotspur marching south, defeating him near Shrewsbury, 1403. Owain, who was in South Wales at the time, was left in possession during 1404, and made an alliance with Charles VI. of France in 1405. He suffered two defeats, in Monmouth and Brecknoekshire, in 1405; when French assistance arrived, it could be of little use, and retired. The English entered Wales, but were again driven back by bad weather. Owain fell back in power, and in 1415 he died in obscurity, still holding out; Rhys ab Tewdwr, his associate in the rebellion, and Rhys's brother Meredydd having been executed for treason in 1412. Meredydd's son Owain married Catherine, the widow of Henry V.; their grandson, Henry Tudor, became Henry VII., to the great delight of Wales, which now believed it saw all Myrddin's (Merlin's) prophecies fulfilled, and the British race again ruling in Britain.

By 27 Henry VIII. chap. 26 (A.D. 1536) Wales was incorporated with England, with English laws and liberties; in 1689 the lords marchers' surviving anomalous jurisdiction (with a Lord President and Council at Ludlow) was abolished; in 1831 the Welsh judiciary (Court of Great Sessions) was incorporated in the judicial system of England. During the Cromwellian struggle Wales was strongly Royalist, and at a later period Jacobite in sympathy. The most striking features of its subsequent history have been the rise of Nonconformity and its recent intellectual awakening.

See Prof. Rhys's *Celtic Britain;* Woodward's *History of Wales* for the mediæval history; a sketch by Prof. Lloyd in the *Eisteddfod Transactions*, 1884 (Liverpool: I. Foulkes), of which we have made free use; Mr Tout's article on Wales in the *Dictionary of English History;* the Marquis of Bute's Presidential Address at Rhyl Eisteddfod, 1892; Henry Owen's *Gerald the Welshman* (London: Cymmrodorion Society); Rees's *Nonconformity in Wales;* and also the references in J. R. Green's works; Hubert Lewis's *Ancient Welsh Laws;* Stephens' *Literature of the Kymry;* John E. Southall's *Wales and her Language;* E. J. Newall, *A History of the Welsh Church* (1895). For Welsh topography may be consulted works by Pennant (ed. by Rhys, 1883), Borrow (1862), and Wirt Sykes (South Wales, 1882).
See also Eisteddfod, Madoc, Rebecca Riots.

Language and Literature.—For the relations of the various Celtic tongues, see Celts. Of the surviving Celtic languages, Welsh shows by far the most vigorous signs of life. It is spoken generally throughout Wales and Monmouthshire, and by thousands of Welshmen in the large towns of England, and in America and the colonies; and as it is written phonetically, there are very few of its speakers who cannot also read it. About twenty weekly newspapers are published entirely in Welsh, as well as fifteen or twenty monthly magazines, two bi-monthly reviews, and one quarterly. Two Welsh weekly papers and several monthlies appear in America. Abstracts of acts of parliament and other parliamentary papers having reference to Wales are regularly published in Welsh by government, and of late whole acts have been translated and published, including the Local Government Act, 1888. Welsh is taught in Oxford and at the university colleges of Wales; and now, after a long trial of the policy of ignoring it, it is being introduced into Welsh elementary schools.

The Welsh alphabet consists of twenty-seven letters—*a, b, c, ch, d, dd, e, f, ff, g, ng, h, i, l, ll, m, n, o, p, ph, r, s, t, th, u, w, y.* The consonants *b, d, h, l, m, n, p, ph, s, t, th* are pronounced as in English; *c* and *g* are always hard; *r* is trilled; *ch* is the German *ch* in *nacht; dd* is the soft *th* in *breathe; f* is the English *v, ff* the English *f; ng* is pronounced as in *sing; ll* bears the same relation to *l* that hard *th* does to soft *th; a, e, i, o* are pronounced as in Italian; *w* is the *w* in *wind*, or the *oo* in *book; u* is a peculiar sound approaching the English *e* in *pretty; y* has a sound approaching *i* in *fir*, except in the final syllable and in monosyllables, where it is pronounced as the Welsh *u*.

Zeuss, in his *Grammatica Celtica*, published in 1853, first proved that the Celtic group of languages belongs to the great Aryan or Indo-European family; and from that time it has become increasingly evident that it is closely connected with the Italian group. An idea of the relation between them may best be formed by a comparison with the Latin declensions of the Proto-Celtic declensions as restored by Dr Whitley Stokes. It is certain that when Cæsar landed in Britain the Brythonic language was highly inflected; and probably the Goidelic differed but little from it.

The importance of Welsh to the Celtic philologist is due to the fact that in the Roman period it borrowed a very considerable number of words from the Latin. Knowing the forms of these words at that period, and in mediæval and modern Welsh, we are able to deduce from them the laws of phonetic change, by which the Brythonic of that period has been transformed into modern Welsh. So that, given a pure Welsh word in its modern form, it is generally possible with some degree of confidence to restore it into the form which it had in old Brythonic.

The oldest forms of Welsh are preserved in inscriptions written in Roman characters and in Ogam (q.v.). The inscriptions, however, contain little beyond a few proper names. A number of glosses and some scraps of writing are preserved in manuscripts of the 9th century; and in these the final syllable of the Roman period has completely disappeared, but vowel-flanked consonants are still written hard. The oldest connected piece of Welsh writing of any length still existing is the Black Book of Carmarthen, a manuscript of the end of the 12th century. But several poems, whose composition must be referred to a much earlier date, are found in manuscripts of the 13th and 14th centuries. Phonetically the language of these poems is that of the date of the manuscripts; but this is only what is to be expected, for in existing manuscripts it is seen that everything is modernised at every successive transcription.

The most important of these ancient works is the *Gododin* of Aneurin, a poem of considerable literary merit, commemorative of the heroes who fell at the battle of Cattraeth, and written in the 6th century,

probably not long after the date of that battle. It is preserved in a manuscript of the later part of the 13th century, and is about 1000 lines in length. Next in importance perhaps are the works of Llywarch Hên, who wrote *The Hall of Cynddylan*, and an elegy on Urien, one of the heroes of Cattraeth. The other poets of that period are Taliesin and Myrddin (Merlin, q.v.); but most of the poems attributed to these are spurious.

This early period of literary activity was followed by a long period of decline. But with the 12th century there came a great literary revival. The Mabinogion and the romances of Arthur, which had long hovered formlessly in the air as folklore, now crystallised and took literary shape. 'It was in the year 1145,' writes Mr Alfred Nutt (*Studies in the Legend of the Holy Grail*, p. 229), 'that Geoffrey of Monmouth first made the legendary history of Britain accessible to the lettered class of England and Continent. . . . Twenty years had not passed before the British heroes were household names throughout Europe, and by the close of the century nearly every existing literature had assimilated and reproduced the story of Arthur and his Knights.' In England the early English literature was forgotten, and exercised practically no influence on the English literature of the middle ages, which derived its inspiration and the greater part of its materials from the Arthurian sagas (*The Arthurian Legend*, by Prof. Rhys, p. 289).

The poetry of this period of revival is chiefly heroic. In the early part of the 12th century Meilir composed his ode in memory of Gruffudd ap Cynan; then came Gwalchmai, one of whose odes has been done into English verse by Gray; and then, about the end of the century, Cynddelw, the richness of whose vocabulary makes him difficult to understand now, on account of the number of words that have become obsolete. We must not omit to mention Llywarch ap Llywelyn, the bard of Llywelyn the Great, and Gruffudd ap Maredudd, whose lament on the death of Gwenhwyvar of Anglesey is one of the finest things of its kind in the language. This period, which may be called the period of the Princes, came to an end with the death in 1282 of Llywelyn ap Gruffudd, the last Prince of Wales.

In the early years of the 14th century a new period was ushered in by Rhys Goch ap Rhiccert, who wrote a number of sweetly musical love-songs. He was immediately followed by Davydd ap Gwilym, and the bards of the three Eisteddfods called those of the renascence ('y tair eisteddfod ddadeni'). In the poetry of the new revival love takes the place occupied by war in the older poetry; and the 'cywydd' metre of seven syllables takes the place of the longer heroic metre. Dafydd ap Gwilym, the greatest poet of this period, which has been called the golden age of Welsh literature, was born of noble parents in 1300. A welcome guest at every mansion in Wales, he travelled much throughout the length and breadth of the land. He met Morfudd, the daughter of Madawg Lawgam, at Newborough in Anglesey; and she became his Laura, to whom he inscribed seven score and seven songs. As a poet of nature he has perhaps no equal in English literature; he is certainly not approached by any one before Wordsworth. He knows every bird and every flower, and they all reveal to him their secrets. His descriptions of natural objects are not the mere conventional formulas of Chaucer, but the spontaneous expression of a profound first-hand knowledge of the things themselves. He died in 1368. Iolo Goch, one of the younger bards of the 'tair eisteddfod,' lived to write fiery odes to Owen Glendower. In 1451 Dafydd ab Edmwnd rearranged the metres, and perfected the rules of alliterative versification; and from that time Welsh poetry became artificial and mechanically correct, and eulogy and elegy took the place of love. Lewis Glyn Cothi wrote his historical odes from 1440–1480; he was followed by Tudur Aled, who died about 1530; and William Llŷn, who flourished about 1550. The last poet of this period may be said to be Edmwnd Prys, who in the later half of the 16th century composed a metric version of the Psalms, which is still used in the churches and chapels of Wales.

During the golden age of Welsh poetry no prose was written that deserves mention. A new period dawns with the publication of the New Testament in 1567. The translator, William Salesbury, had a craze for restoring every Latin word into its original form; so that his Testament was unintelligible to the mass of the people. But the whole Bible, translated into good, vigorous Welsh by Dr W. Morgan, was published in 1588. In those years many grammars and dictionaries were published; and in 1620 a new and much improved edition of the Bible was issued, and is, with few alterations, the Bible now in use. In 1630 Dr J. Davies published his Welsh-Latin dictionary, which remained the standard work for more than 150 years. During the 17th century one poet, Hugh Morris, is perhaps worthy of mention. The two most important prose writers were Morgan Llwyd o Wynedd, who wrote about the middle of the century eight books in defence of the Puritans; and Charles Edwards, who published in 1671 an excellent 'History of the Faith.' With these exceptions the Welsh literature of this century consisted chiefly of poor translations of English second-rate theological books.

But the 18th century witnessed a third revival of Welsh literature. Lewis Morris, born in 1702, became a proficient in most of the natural sciences then known, a skilled mathematician, and mineralogist. He devoted his leisure hours to the study of Welsh antiquities and literature. He instructed Goronwy Owen and other young bards in the rules of Welsh poetry, and by his direction and guidance brought about the last revival of Welsh literature. Goronwy Owen, the greatest bard of this period, was born of poor parents in 1722, was educated at the Bangor grammar-school and Jesus College, Oxford, and failed to get a curacy in Wales. Goronwy's poetry is the lament of an exile. His odes to his native Anglesey are perhaps the finest things written in Welsh.

About this time a religious movement, known afterwards as the Welsh Methodist revival, took place through the instrumentality of a few earnest clergymen. Griffith Jones of Llanddowror founded 3000 schools in all parts of the country to teach the people to read the Bible in the only language they could understand. The work of these schools has since been carried on by the Sunday-schools. Modern Welsh literature is the joint product of the literary and religious movements of the 18th century. The literary movement gave it purity of language; the religious movement gave it most of its subjects, and taught the people to read.

The bards of the 19th century are exceedingly numerous; the best are Robert ap Gwilym Ddu, Dewi Wyn, Caledfryn, Eben Fardd, Ieuan Glan Geirionnyd, Emrys, Nicander, Islwyn, and Ceiriog. The prose of this century is mostly theological; of purely literary works we may mention the historical works of the Rev. P. Price, of Gweirydd ap Rhys, and of Meudwy Môn, the essays of the brothers Roberts of Llanbrynmair, the works of Dr William Rees, the literary essays of Dr L. Edwards, and the novels of Mr Daniel Owen.

The early grammars and the dictionary of Dr Davies have been mentioned. In 1707 Edward Lhuyd of Jesus College published his *Archæologia Britannica*, which Dr Schrader calls 'an extremely

remarkable work for its time.' It contains grammars and comparative dictionaries of the Celtic dialects; even sounds are compared and phonetic laws deduced; and it has been said of Lhuyd that he lived 150 years before his time. But the native philologists did not in the least understand him; and in 1803 W. Owen, afterwards Dr W. O. Pughe, published his dictionary, based philologically upon the theory that every Welsh word was an agglutination of monosyllabic roots invented by the Druids. Owen's method is still the popular one in Wales. Prichard (q.v.), in *The Eastern Origin of the Celtic Nations* (1831), first attempted to apply to the Celtic languages the canons of comparative philology; but Zeuss (q.v.), in his *Grammatica Celtica* (1853), was the first to succeed in this. After Zeuss many names might be mentioned; but perhaps Prof. Rhys (q.v.) has done more, in a direct way, for Welsh philology and grammar than any other scholar.

One of the best results of the last revival was the interest which it awoke in Welshmen in their old literature. In the first years of the 19th century the *Myvyrian Archaiology*, under the editorship of Owen Jones, William Owen, and Edward Williams, was published at Owen Jones's expense. It contained the works of the early bards and historical and other works of the middle ages. A second edition was issued by Mr Gee of Denbigh in 1870. In 1838 Lady Guest published the *Mabinogion*, with translations. Subsequently the Welsh MSS. Society was formed, and the *Liber Landavensis*, the *Lives of the Saints*, the *Iolo MSS.*, and other ancient documents were published by it. In 1868 Mr W. F. Skene published his *Four Ancient Books of Wales*, containing the Book of Aneurin, the Book of Taliesin, the Black Book of Carmarthen, and the poetry of the Red Book of Hergest (q.v.), with translations and notes. In 1887 the first volume was published of the *Welsh Texts*, under the editorship of Prof. Rhys and Mr Gwenogvryn Evans. It consists of a diplomatic reproduction of the Mabinogion from the Red Book of Hergest. A fac-simile of the Black Book of Carmarthen, and the Bruts from the Red Book have since been issued.

PRINCE OF WALES is the title borne by the eldest son of the sovereign of England. After the fall of the last native princes of Wales, Llewelyn in 1282 and David in 1283, Wales came fully under the dominion of Edward I., who in 1284 is fabled to have presented the Welsh with a prince in his infant son, Edward, really born at Carnarvon Castle. Edward, by the death of his elder brother four months later, became heir-apparent; but it was not till 1301 that he was created Prince of Wales. Edward III. in 1343 invested his son Edward the Black Prince with the principality, and from that time the title of Prince of Wales has been borne by the eldest son of the reigning king. Till the time of Charles II. the Welsh connection was oddly maintained by the arrangement that the Prince of Wales always had a Welsh wet-nurse. The title is not inherited, and has usually been bestowed by patent and investiture, though in a few instances the heir to the throne has become Prince of Wales simply by being so declared. The eldest son of the sovereign is by inheritance Duke of Cornwall, a title first conferred in 1337 on Edward the Black Prince. The title of Earl of Chester, borne by Edward III. before his accession to the throne, has since been given along with the principality of Wales. On the death of a Prince of Wales in his father's lifetime the title has been conferred on the sovereign's grandson, or next younger son, being heir-apparent, though not upon Charles I. till four years after the death of Prince Henry. As heir of the crown of Scotland the eldest son of the sovereign is Great Steward of Scotland, Duke of Rothesay, Earl of Carrick, Baron of Renfrew, and Lord of the Isles. The Prince of Wales was created Earl of Dublin in 1849, a title that descended with the other hereditary honours to his eldest (surviving) son, till 1901 known as Duke of York. George Frederick Ernest Albert, second son of Albert Edward, Prince of Wales (see EDWARD VII.), was born 3d June 1865, was created Duke of York in 1892, and the same year by the death of his elder brother, the Duke of Clarence, became his father's heir. He married in 1893 the Princess Victoria Mary of Teck, and when his father became king had three sons and a daughter.

The revenues of the Duchy of Cornwall were in 1901 nearly £120,000; of this more than half goes to the Prince of Wales. The annuities of the Prince (from 1863 to 1901, £40,000) and Princess of Wales (in 1901, £10,000) are charged on the Consolidated Fund. The Prince of Wales has a separate household. The statute of treasons, 25 Edw. III., makes it treason to compass the death of the Prince of Wales or violate the chastity of his consort. By a statute of the Order of the Garter, of date 1805, the Prince of Wales as soon as he receives that title becomes a Knight of the Garter. The arms of the Prince of Wales are those of the sovereign, differenced by a label of three points argent, as described in the article HERALDRY, Vol. V. page 666. The supporters and crest are the same as those of royalty. For the crown, see CORONET. The Prince of Wales has further a distinguishing badge, composed of a plume of three white ostrich feathers, encircled by an ancient coronet of a Prince of Wales, and accompanied by the motto 'Ich Dien' ('I serve'). See BADGE, ICH DIEN, ALBERT-EDWARD, REGENT, SANDRINGHAM.

Walfish. See WALVISCH.

Walhalla (the German form of the Icelandic *Valhöll* or *Valhal*, 'the Hall of the Slain'—i.e. 'heroes'), the name of the place of residence for the fallen in battle in Scandinavian Mythology (q.v.).—The name WALHALLA was given to a magnificent marble structure of nearly the same proportions as the Parthenon (q.v.), erected by Ludwig I. of Bavaria (1830–41) as a temple of fame for all Germany, on an eminence 250 feet above the Danube, near Ratisbon. By means of statues, busts, reliefs, and tablets the mythology and history of Germany are illustrated, and her greatest names commemorated.

Walker, CLEMENT, was a native of Cliffe in Dorsetshire, sat for Wells in 1640, was imprisoned in the Tower by Cromwell in 1649 for writing his *History of Independency* (complete 1646–60), and died there in 1651. The work is rambling and bitter, but is worth attention.

Walker, FREDERICK, artist, was born in Marylebone, 26th May 1840, studied at the British Museum, the Royal Academy, and elsewhere, and became a wood-engraver. He made drawings for the *Cornhill*, *Good Words*, *Once a Week*, and other periodicals, and contributed to the exhibitions of the Society of Painters in Water-colours. An A.R.A. since 1871, he died at St Fillans, Perthshire, 4th June 1875. Amongst his best-known pictures are the water-colours 'The Wayfarers,' 'The Rainbow,' and 'The Fishmonger's Shop;' and the oil-paintings 'The Bathers,' 'The Vagrants,' 'The Old Gate,' 'The Plough,' and 'The Harbour of Refuge.' See Claude Phillips in a special number of the *Portfolio* for 1894, and the Life by J. G. Marks (1896).

Walker, GEORGE, the heroic defender of Londonderry, was born of English parents in County Tyrone in the early part of the 17th century, had his education at the university of

Glasgow, took orders, and became rector of Donoughmore. When the Irish army of James II. approached Londonderry, the walls of which were untrustworthy, while the governor (Lundy) was a traitor, and the bishop (Hopkins) a timid advocate of passive obedience, the famous thirteen prentice-boys closed the city gates (18th December 1688), and the aged Walker by his fiery harangues stirred up the townspeople to make a desperate defence, the most memorable in British history. The actual siege began in April, and lasted till the 12th August 1689 (o.s.), a period of 105 days. The starving citizens were sustained to the last by the rousing sermons preached by Walker in the cathedral, and his heroic example at the head of sallies against the enemy. When the siege was raised Walker went to London, was warmly received at court, thanked by the House of Commons, created D.D. by Oxford, and Bishop of Derry by the king. But Walker was too impatient to settle quietly in his bishopric; he headed the men of Derry at the battle of the Boyne, and there perished. A lofty Doric column bearing a colossal statue of Walker stands on the walls at Londonderry.

Walker, JOHN (1674–1747), author of the *Sufferings of the Clergy*, was a native of Exeter, of which his father was mayor, and had his education at Exeter College, Oxford, where he became fellow, graduating M.A. in 1699. He became rector of St Mary-the-More, Exeter. His famous work is entitled *An Account of the Sufferings of the Clergy who were Sequestered in the Grand Rebellion* (folio, 1714). The work itself was called forth by Calamy's *Abridgment of the Life of Mr Baxter*, nearly half of which is the famous *Particular Account of the Ministers who were ejected by the Act of Uniformity*, and Calamy himself replied to it in *The Church and Dissenters compared as to Persecution* (1719). Withers, a dissenting minister of Exeter, also made a reply, and still more Neal in his *History of the Puritans*. Walker estimates at from seven to eight thousand the number of clergy 'imprisoned, banished, and sent a-starving.'

Walker, JOHN, dictionary-maker, was born at Colney Hatch in Middlesex, 18th March 1732, was by turns actor, schoolmaster, and peripatetic teacher of elocution, passed from Presbyterianism to the Roman Catholic communion, and died in London, 1st August 1807. His well-known *Rhyming Dictionary* first appeared in 1775, and has since relieved the poetic pains of countless poetasters, and even of Lord Byron. His *Critical Pronouncing Dictionary* was published in 1791, and had not lost its vogue, or the value of a traditional name, after nearly forty editions and sixty years.

Walker, JOHN, an Oxford antiquary, was born in 1770, became fellow of New College, Oxford, and was vicar of Hornechurch in Essex from 1819 till his death in 1831. His works were *Curia Oxoniensis; Oxoniana* (4 vols.); *Selection of Curious Articles from the Gentleman's Magazine* (3 vols. 1809); and *Letters Written by Eminent Persons* (2 vols. 1813).

Walker, THOMAS, was born at Manchester in 1784, son of a Liberal manufacturer, whom Erskine defended successfully on a charge of high-treason at Lancaster. He was educated privately, then went to Trinity College, Cambridge, where he graduated in 1808. He took to law, was called to the bar by the Society of the Inner Temple in 1812, became a Lambeth police-magistrate in 1829, and died at Brussels, 20th January 1836. He gave much thought to the problem of pauperism, and published a book on the subject in 1826; but his chief reputation was as a conversationalist of rare humour. His famous weekly periodical, *The Original*, ran only for twenty-six numbers, from May to 11th November 1835. His characteristic quality is seen here in the touch of humour which adds interest to themes the most ordinary.

Walker, WILLIAM, filibuster, was born 8th May 1824, at Nashville, Tennessee, the son of an emigrant Dundee banker. He graduated at the university there in 1838, studied medicine at Edinburgh and Heidelberg, but soon gave this up for law and afterwards journalism at New Orleans and in California. In 1853 he failed in an attempt to conquer Sonora and to found a new republic there and in Lower California; with forty-four companions he did capture La Paz, but the native Mexicans refused to be 'liberated,' and on 8th May 1854—his thirtieth birthday—'President' Walker fought his way across the frontier into California and surrendered with the gaunt, starved, wounded survivors of his expedition to the United States commander. A trial for breaking the neutrality laws ended in his acquittal, and a year later he was on his way to Nicaragua, with fifty-five followers, invited to help the Democrats against the Legitimist party. The strange story of Walker's adventures in Central America cannot be more than outlined here. In June 1855 he was repulsed at Rivas with a loss of twenty; but in September, at the head of 110 men, he took the capital, Granada, with the loss of only a drummer. A new government was constituted, with Walker as generalissimo, and in four months he raised an American force of 1400 men, whom he kept under an iron discipline. In February 1856 Costa Rica declared war for the express purpose of driving out the foreigners; but battle and cholera thinned the ranks of the invaders, and of 3000 men only 500 escaped to carry the pestilence back with them across the border. In June Walker was elected president of Nicaragua, and his government was recognised by the United States. Walker's support came chiefly from the southern states, and his aim was to extend the area of slavery southward; accordingly almost the first act of the new administration was to restore slavery, which had been abolished in 1824. Meanwhile his enemies had gathered a force of allies from the surrounding republics, and, though he destroyed nearly 800 of them, he was compelled before the end of the year to burn and abandon Granada. Gradually the allies closed in upon him at Rivas, and on May 1, 1857, he was forced to capitulate to a United States sloop-of-war sent out for the purpose. But in November he landed again at S. Juan del Norte, with a force of 150 men—only to be compelled to surrender, in December, to a United States frigate and carried prisoner to New York, where, as his arrest on foreign soil was illegal, he was soon liberated. In 1860 he published *The War in Nicaragua*, and turned Catholic. In August he sailed from Mobile for Honduras, with a force of 100 men. He took Trujillo in half an hour, but had to evacuate it on the order of a British man-of-war, by whose commander he was given up to the Honduras authorities. By them he was tried by court-martial, and shot at Trujillo on 12th September 1860. Personally pure, temperate, honest, and fearlessly brave, Walker appears to have been led away by an unquestioning belief in his 'destiny.' See C. W. Doubleday's *Reminiscences* (1886), and J. F. Roche's *Story of the Filibusters* ('Adventure' series, 1891).

Walker, WILLIAM SIDNEY, Shakespearian scholar, was born at Pembroke in 1795, had his education at Eton and Trinity College, Cambridge, became fellow thereof, and died, after a life far from fortunate, in 1846. His name survives through the remarkable value of his *Shakespeare's Versification* (1852), and *Critical Examination of*

the Text of Shakespeare (3 vols. 1859), both edited anonymously by W. N. Lettsom. His *Poetical Remains* appeared in 1852, with a memoir by the Rev. J. Moultrie the poet.

Walking. See ATHLETICS.

Walking-leaf. See LEAF-INSECT.

Walking-stick, the popular name of many Orthopterous insects of the family Phasmidæ, which strikingly resemble the twigs of plants. The body is long and slender, the legs are also twig-like, the wings are sometimes absent, sometimes rudimentary, sometimes leaf-like. Sluggish in their habits, herbivorous in diet, the walking-sticks are very effectively concealed by their resemblance to the plants on which they rest and feed. Rossi's Stick-insect (*Bacillus rossii*) in southern Europe, the American *Diapheromera femorata*, whose colour changes with that of the foliage, and large species of Phasma, sometimes measuring 10 inches in length, may be cited as representative. The Leaf-insects (Phyllium) are nearly related. See MIMICRY.

Walking-stick (*Diapheromera femorata*).

Walking-sticks have been in use from the remotest antiquity, not merely for helping to support the weight of the person, but for the appearance of dignity and elegance they lend. Developments from the walking-stick are the Pastoral Staff (q.v., and see FILLAN, ST), the sceptre, the constable's baton or staff, and the rod or wand of office generally (but cf. MACE). The pilgrim's staff in the middle ages was a stout stick four feet long and made hollow at the top, presumably for containing relics; but the hollow was sometimes convenient for conveying secretly valuable plants, seeds, or eggs (such as saffron and silkworm eggs), of which Chinese, Turks, and Greeks forbade the export. At a later date the tall sticks of doctors had a smaller receptacle to contain snuff or other supposed disinfectants. Magnificent and costly sticks were part of the equipment of fops in the 18th century. For the making of walking-sticks almost every kind of wood is used. Thus in England oak, ash, crab, hazel, sloe or blackthorn, broom, and juniper are favourite woods. Small stems or canes of some palms—as Malacca canes and Penang lawyers—are imported into London in large numbers; the midribs of some palm-leaves are serviceable, as are shoots of bamboo, of orange, myrtle, cinnamon, and sweet-cherry. The heads—flat, round, crooked—may be of the same piece of wood, or may be fixed on, carved or plain, made of deer's or other horn, or of ivory, silver, &c.

Walkyries (more correctly *Valkyrjur*), in Northern Mythology, either nine or three times nine divine maidens who cleave their way through air and water to lead to Odin those who have fallen in battle and who are worthy of Valhalla.

Wall. See the relevant section under BUILDING, and other articles there referred to; BUTTRESS; the articles on the various styles of architecture; and for military building, FORTIFICATION. For ancient lines of defence, see ANTONINUS (WALL OF), HADRIAN'S WALL, CATRAIL, and OFFA'S DYKE. Of old walled towns, retaining more or less completely their ancient walls of fortification, may be named in the British Isles Berwick, Alnwick, York, Chester, Conway, Tenby, Dover, Wareham, Limerick, and Derry.

Wallaby. See KANGAROO.

Wallace, ALFRED RUSSEL, traveller and naturalist, was born at Usk in Monmouthshire, 8th January 1822, and was educated for the profession of land-surveyer and architect, a calling he exercised until 1845, when he devoted himself exclusively to studies and researches in natural history. He spent four years on the Amazon with Mr Bates, and eight amongst the Malay Islands, making extensive zoological collections. It was while living in the East that, unaware of Mr Darwin's cognate researches and speculations, Wallace formed and committed to writing a theory of development by natural selection, though not using the term. Valuable contributions to zoology, botany, and cognate subjects are to be found in his *Travels on the Amazon and Rio Negro* (1853); *Palm Trees of the Amazon* (1853); *The Malay Archipelago* (1869; 10th ed. 1892); *Contributions to the Theory of Natural Selection* (1870). In a work *On Miracles and Modern Spiritualism* (1875) he vindicates views seldom entertained by men of science; the article SPIRITUALISM in the present work is from his pen. *The Geographical Distribution of Animals* (1876) practically founded a new science; for 'Wallace's Line,' see the article GEOGRAPHICAL DISTRIBUTION. *Tropical Nature* appeared in 1878, *Australasia* in 1879 (new ed.; 2 vols. 1893–94), *Island Life* in 1880, *Land Nationalisation* in 1882, and *Darwinism* in 1889. He opposed compulsory vaccination in *Forty-five Years of Registration Statistics* (1885). He is F.R.S., LL.D., and D.C.L., and since 1881 has had a pension.

Wallace, SIR RICHARD, K.C.B. (1818–90), made a baronet in 1871, inherited from his putative father the Marquis of Hertford, a very valuable collection of paintings and other art objects, which in 1897 his widow bequeathed to the nation.

Wallace, SIR WILLIAM, the Scottish patriot, was born about 1274, the second of the three sons of Sir Malcolm Wallace of Elderslie, near Paisley, by Margaret, daughter of Sir Reginald Crawford, sheriff of Ayr. The name Wallace—otherwise Valeys, Walensis, le Waleys, &c.—means simply 'Welshman;' and the Wallaces may have come north with the Stewarts (q.v.), of whom they seem to have been feudal dependents. Blind Harry associates the hero's boyhood with Dundee, his youthful manhood with Ayrshire; whilst, according to Fordun, he got part of his education from an uncle, the priest of Dunipace, who instilled into him the maxim, 'Libertas optima rerum.' But his true history, even in the next generation, was so obscure that it now is next to impossible to separate truth from falsehood or exaggeration. He first stands out clearly in the spring of 1297 as the chief of a patriotic force, arrayed against Edward I. (q.v.) of England. To avenge, says Wyntoun, the murder of his young wife, he attacked the English garrison at Lanark and slew William de Hazelrig; he attempted to surprise the English justiciar at Scone; and with a large company he lay in the Forest of Selkirk. This last fact (the first that is absolutely certain) appears from a letter written by Cressingham to Edward on 23d July, a fortnight before which

date the Scottish nobles, with the exception of Sir Andrew Moray, had submitted at Irvine to Edward. Edward himself was at the time in Flanders, but his general in Scotland was Warenne Earl of Surrey; and him on 11th September Wallace utterly defeated in the battle of Stirling Bridge, as he was trying to pass beyond the Forth. The whole kingdom submitted to Wallace, whom we find the next month making friendly overtures to the Hanse towns of Lübeck and Hamburg, and who, crossing the Border, harried all the north of England as far south as Newcastle. (Blind Harry absurdly takes him as far as St Albans, and makes him have a meeting with the English queen, when English queen there was none.) On his return from this expedition he was appointed 'Governor of Scotland, in name of King John [Baliol], and by consent of the Scottish nation.' In 1298 Edward in person invaded Scotland at the head of 88,000 men. Wallace adopted a Fabian policy, but was forced to give battle at Falkirk (22d July), where, deserted by the cavalry, his 'schiltrouns' or circular formations of infantry were shot down by the English archers and totally routed. The Scottish loss is variously estimated by the English chroniclers at from 22,000 to 100,000, but according to Scottish writers the whole army did not exceed the former number. With this defeat Wallace's brief but glorious career terminated. We know that he visited France, whose king, Philip, came near surrendering him to Edward; we know also that he at least contemplated a visit to Rome; and then, on 3d August 1305, seven years after the battle of Falkirk, we have his capture near Glasgow by Sir John Menteith, Edward's Scottish governor of Dumbarton. He was brought to London, and, crowned with laurel in mockery, was tried for treason in the great hall of Westminster. He pleaded, and truly, that he had never been King Edward's vassal or subject; but he was condemned and executed that very same day at West Smithfield—hanged, disembowelled, beheaded, and quartered, the quarters being sent to Newcastle, Berwick, Stirling, and Perth.

See the article HARRY (BLIND) for an account of the epic which moulded, whilst embodying, the popular conception of Wallace; and for authentic materials refer in the first place to the Rev. Joseph Stevenson's *Documents illustrative of Sir William Wallace* (Maitland Club, 1841), which may be supplemented by vol. ii. of Hill Burton's *History of Scotland;* the Marquis of Bute's *Early Days of Sir William Wallace* (Paisley, 1876), his *Burning of the Barns of Ayr* (*ib.* 1878); A. Brunton's *Sir William Wallace* (Glasgow, 1881); Henry Gough's *Scotland in 1298* (Paisley, 1888); James Moir's *Sir William Wallace* (Aberdeen, 1888); the Rev. C. Rogers' *The Book of Wallace* (2 vols. Grampian Club, 1889—to be used with caution); A. F. Murison's *Sir William Wallace* ('Famous Scots,' 1898).

Wallace, WILLIAM VINCENT, born at Waterford, of Scotch parents, 1st June 1814, early attained proficiency as a performer on the pianoforte and violin—his performances on the latter instrument bringing him under the notice of Paganini. After being for some years leader of an orchestra in Dublin, he emigrated for health's sake to Australia in 1832. By-and-by he appeared in Sydney as a musician, and gave concerts in Australia, New Zealand, India, and America. In 1845 he came to England and wrote his first opera, *Maritana*, which was an immediate success both in London and Vienna, and still holds the stage as one of the most popular of English operas. *Matilda of Hungary* followed it in 1847. During a sojourn of some years in Germany Wallace added further to his musical culture; and after again visiting America he composed *Lurline*, which was brought out in London in 1860, with even greater success than *Maritana*. In 1861 he produced *The Amber Witch;* in 1862, *Love's Triumph;* and in 1863, *The Desert Flower*. He died October 12, 1865, leaving another opera, *Estrella*, nearly completed. Wallace was a highly cultivated musician; the fresh motives and the brilliant orchestration of his operas stamped their author as one of the chief English composers of the century.

Wallachia. See ROUMANIA.

Walla Walla, capital of a county of that name in Washington, on the Walla Walla River, 204 miles by rail SSW. of Spokane Falls. Pop. (1880) 3588; (1890) 7239.

Wallenstein, or more correctly WALDSTEIN, ALBRECHT WENZEL EUSEBIUS VON, Duke of Friedland, Sagan, and Mecklenburg, the most remarkable of the imperial generals in the Thirty Years' War, was born at Hermanic in Bohemia on 14th September 1583. His parents were of Czech blood, of noble rank, and Protestants, and took their name from the castle of Waldstein near Turnau. After their death the education of the boy, then fourteen, was entrusted by a Catholic uncle to the Jesuits at Olmütz. Thence he passed to the university of Altdorf; and whilst making the grand tour he spent some time studying at Padua and Bologna. Having tried his sword in battle against the Turks, he took the first step on the ladder of ambition by marrying a Bohemian widow of vast expectations. At her death (1614) he added her estates to those he had inherited from his uncle. This enabled him to raise troops to assist the Archduke Ferdinand against Venice; and he still further ingratiated himself with his future emperor through his marriage with a daughter of Count Harrach, Ferdinand's favourite. When in 1618 the Bohemians took up arms against the emperor, Count von Waldstein (to which dignity he had meanwhile been advanced) raised troops at his own cost, and led them against his countrymen. The Bohemians humiliated, Waldstein contrived to possess himself, by means the reverse of honourable, of huge slices of their confiscated estates, and in 1623 gratified another of his ambitions by inducing Ferdinand to make him ruler of the new principality of Friedland in Mecklenburg. Two years later, the emperor being hard pressed by the Protestant princes, and having no army save the troops of the Catholic League, which he could not direct as he chose, Wallenstein offered to raise and equip for his imperial master's service 20,000 men at his own expense on condition that he was given a free hand in the hostile provinces. Ferdinand jumped at the offer, and on 25th July 1625 named the wealthy Bohemian magnate general-in-chief of all the imperial armies and conferred upon him absolute authority in the field. Wallenstein at once marched for the Elbe, and in the following spring defeated the emperor's bitter foe, Count von Mansfeld, at Dessau; in the autumn he chased him through Silesia and Hungary, and held him and his ally, Bethlen Gabor of Transylvania, in check, until Mansfeld's death and a truce with Bethlen freed Ferdinand from both these enemies. In the following year (1627) Wallenstein, co-operating with Tilly, won the Jutland peninsula and the Mecklenburg duchies from the Danes and the Protestant princes. At this time and during the next few months the emperor not only sold Wallenstein the dukedom of Sagan (in Silesia), but created Friedland a hereditary duchy, invested him with the duchy of Mecklenburg, and appointed him general of the Baltic and the North Sea.

Two objects which hovered before Wallenstein's mind at this period indicate the grandiose and wide-reaching character of his ideas: (1) the emperor should be made a despotic sovereign and head of a

resuscitated empire of Byzantium, his power resting on strong and well-disciplined armies levied entirely in his own interest; (2) the power of the maritime Protestant nations of the north—Sweden, the Netherlands, England—should be broken, and the imperial sway be supreme at sea as well as on land. The latter of these ambitious dreams, which he attempted to realise by subduing Pomerania, was thwarted by the Swedish fleet and the heroic resistance of Stralsund, which, defying all Wallenstein's desperate efforts, had the honour of being the first to withstand successfully the man who believed that the stars were guiding his destiny to the loftiest heights of earthly glory. To his insatiable and unscrupulous ambition, and his greed of power, Wallenstein added an arrogance of manner, an overweening self-assurance, an arbitrary and wilful tone of behaviour, that gave the bitterest offence to Ferdinand's allies, the old princes of the empire. They, when Gustavus Adolphus invaded northern Germany, and the emperor was compelled to seek their aid against him, seized upon the opportunity to insist upon the dismissal of the 'upstart' Friedland. Contrary to Ferdinand's fears, Wallenstein quietly resigned (1630) his command and retired to Gitschin, the capital of his principality. But the inability of the Duke of Bavaria and his colleagues to check the progress of the invincible 'Snow-king' and his sheepskin-clad legions soon convinced the emperor that nothing could save him except the military genius of the man whom he had affronted. The Swedes, the Saxons, the Brandenburgers were closing in upon him; his allies were powerless to stand against them; and in the end of 1631 Ferdinand restored Wallenstein to the supreme command. But the proud and haughty duke only consented to resume action on his own terms, which practically made him absolute disposer of the military resources of the empire and supreme arbiter of peace and war. Having driven the Saxons out of Bohemia, he marched against the Swedes in Bavaria; he repulsed the desperate attempt of Gustavus Adolphus to storm his entrenched camp near Nuremberg (3d September 1632), but failed to get the better of the Swedish king at Lützen (q.v.), though his loss of the victory was more than outbalanced by the death of the mainstay of the Protestant cause.

Wallenstein's relations to the emperor, and his policy and aims, during this second investment with the supreme command were entirely different from those which had characterised his first tenure of the office. When Gustavus fell he knew perfectly well that his influence was paramount to decide the destinies not only of Ferdinand, but of the princes of the empire; he seems, therefore, to have resolved upon dictating peace to all the combatants alike, in the hope both of preserving his position as a prince of the empire and of founding a ruling (ducal or royal) dynasty. But circumstances and his own character were too strong for him. His innate love of intrigue, the ineradicable suspicion and irresolution of his nature, his impatience, his scornful pride, his instinctive predilection for mystery and crooked dealing, combined with the sudden fluctuations of circumstance, entangled him in such a complicated web of intrigue that the snarer was taken in his own toils. He sought to sow disunion amongst the Protestant princes as well as amongst the chiefs of the Catholic League; he negotiated at one and the same time with Arnim, the Saxon general, with the Swedes, with the French, with the Bohemian exiles, and hoodwinked them all and the emperor to boot; he coquetted with such bribes as the duchy of Franconia, the royal crown of Bohemia; he pretended a sincere desire to restore peace to distracted Germany; but over and above all these objects, real and professed, he aimed at keeping always a secure retreat open for himself, whatever might be the outcome of events. At length his enemies at court, pointing to his culpable inactivity after Lützen, and his open and secret negotiations with Swedes and Saxons, convinced Ferdinand that the all too powerful general was meditating treachery; and indeed in a conference with Arnim, near Schweidnitz on 16th August 1633, Wallenstein had proposed to join the Saxons and Swedes in assailing the empire, though owing to the mistrust of Arnim and of Oxenstjerna nothing came of the proposal. A month after Christmas the emperor, who had secretly won over certain of Wallenstein's officers, deposed the duke from his command and named General Gallas his successor, and in less than another month proclaimed Wallenstein a traitor, and released his officers from their oath of obedience to him. Wallenstein, thinking to find support in Bernhard of Saxe-Weimar (then on the Upper Danube), hastened to Eger in the mountains of western Bohemia. But some amongst his train were traitors, notably the Irishmen Butler and Devereux, and the Scotchmen Gordon and Lesley. These men, after killing his most faithful adherents, slew Wallenstein himself as he was retiring to rest on the evening of 25th February 1634.

Tall, spare but muscular, with a yellow skin, a thin beard, and glittering eyes that made men tremble, Wallenstein was stern of countenance and cold in demeanour, of untiring activity and a lover of order, moderation, and thrift. Such were the contradictions of his strangely complex character that he was both avaricious of wealth and lavish in expenditure, obstinate yet irresolute, in general sparing of words, though on occasion rash and bold of speech, yet always cautious to a degree against committing himself in writing, unusually tolerant of religious opinions, yet a firm believer in the quackeries of astrology, impatient of control, jealous of his authority, proud and domineering, yet a far-reaching and sagacious statesman, a man consumed by the most insatiable ambition, but capable at the same time of dreaming the grandest and remotest of ideals. As a recruiter and organiser of armies, a general who could not only maintain the strictest discipline, but make himself beloved of his soldiers, and lead them to certain victory, he stands almost unrivalled. Too great for a subject, he was not great enough, or at least, consistently bold enough, to usurp the throne of a ruler; his ambition and untiring energy came to naught because he lacked resolution to fit them together for controlling the circumstances over which destiny made him master.

Waller. EDMUND, poet, was born of an ancient and wealthy family at Coleshill near Amersham in a detached portion of Hertfordshire, 3d March 1606. A maternal uncle was the father of John Hampden, and married Elizabeth Cromwell, aunt of the great Oliver, but a devoted royalist throughout. Waller had his education at Eton and King's College, Cambridge, and is usually said to have been returned member for the borough of Agmondesham (Amersham) in the short-lived parliament of 1621–22. A likelier date is 1624; certainly he was returned for Chipping-Wycombe in 1625, for Agmondesham in 1627. At five-and-twenty he cut out Ann Banks, a wealthy London heiress, from the fortune-hunters about court, but

she soon afterwards died, leaving him free to sing the praises of his famous Saccharissa—the beautiful Lady Dorothy Sidney, eldest daughter of the Earl of Leicester. His suit was spurned, and not more successful was his wooing of Amoret, supposed to be the Lady Sophia Murray. Long afterwards, in her old age, Saccharissa, meeting the poet one day, asked him when he would again write verses upon her: 'When you are as young, madam, and as handsome as you were then,' he replied. Waller was again returned for Amersham to the famous Long Parliament, and he seems in the great constitutional struggle to have tried the difficult task of sitting on both sides. He spoke well, and was chosen by the house to conduct the impeachment of Crawley for his judgment in the ship-money case. But his heart was with the king, and it is probable that he was gained over even before his visit as one of the commissioners to Charles at Oxford in 1643. He now plunged into a dubious plot on the king's behalf, and as soon as it was discovered was arrested and expelled the House. He showed himself an abject coward, eager to confess not only all he knew but all he suspected, and his sentence of death was commuted into a fine of £10,000 and banishment for life. He lived at Rouen, in Switzerland, and in Paris, travelled six months in company with Evelyn, and was as popular among the impoverished exiles for his hospitality as his wit. He was permitted to return in 1652. Cromwell appears to have liked to talk with him, and certainly Waller's famous panegyric is his sincerest and almost his best poem. In 1661 he sat for Hastings, and in later parliaments for Chipping-Wycombe and Saltash in Cornwall. He was ready with his congratulation, 'Upon His Majesty's Happy Return,' and, when the king complained that it was inferior to the panegyric on the Protector, replied with matchless readiness and wit, 'Poets, sir, succeed better in fiction than in truth.' Waller continued to the end a favourite at court, where his water-drinking was forgiven for his wit. He was anxious to become Provost of Eton, but as laymen were excluded by statute was hindered by Clarendon. He tried to revenge himself upon the minister in the moment of his fall, but had his reward in the elaborate character limned by the historian, in which his cowardice and meanness are gibbeted to all posterity. He died at his house at Beaconsfield, 21st October 1687, and was buried there. He left by his second wife a large family of sons and daughters.

Waller's poems, which are mostly of the *occasional* character, were widely circulated, but not published till 1645—again in 1664. His feeble character, out of place in that resolute age, is reflected in his poetry, which is easy, flowing, felicitous, but lacking in sincerity and strength. Pope has eulogised his *sweetness*, which word we may allow if we limit its meaning to elegance, ease, and grace, without passion, energy, or creative force. His importance in English poetry is that he revived the heroic couplet, and used it easily in that form which it retained for over a hundred years. Denham felt his influence most strongly, and forms the link between him and the great Dryden.

Editions of Waller are those of Fenton (1729), and Mr G. Thorn Drury in 'Muses Library' (1893). See Mr Gosse's Cambridge lectures, *From Shakespeare to Pope* (1885); but the extravagant importance given to the influence of Waller is a paradox not to be admitted. See also Julia Cartwright's *Sacharissa* (1893).

Wallflower (*Cheiranthus*), a genus of plants of the natural order Cruciferæ, having the siliques quadrangular from the prominence of the nerves on the back of the valves, the seeds in a single row in each cell, the stigma deeply two-lobed, the lobes bent back. The flowers are in racemes. The species are annual, biennial, or perennial herbaceous plants, some of them almost shrubs. The Common Wallflower (*C. cheiri*) is found in rocky places and on old walls in the south of Europe, and also, but less abundantly, in the middle of Europe and in Britain. In its wild state its flowers are always yellow; but in cultivation they exhibit a considerable diversity of colours, chiefly brown, purple, and variegated, and they attain a larger size. It is a universal favourite on account of the delicious odour of its flowers. The varieties in cultivation are very numerous, but there are among them no marked distinctions. Double and semi-double flowers are not uncommon. The plant is perennial, but in gardens is generally treated as a biennial, although fine kinds are propagated by cuttings, which soon strike root under a hand-glass. The ordinary mode of cultivation is to sow the seed of an approved kind, and to plant out the seedlings. The flowers have a bitter and cress-like taste, and were formerly used as a medicine.

Wall-fruit. See GARDENING, FRUIT, PEACH, APRICOT, &c.

Wallingford, a town of Berkshire, 15 miles NW. of Reading and 13 SSE. of Oxford, on the right bank of the Thames, which is crossed here by a bridge 300 yards long, built in 1809 at a cost of £14,000. It has Roman earthworks, a fragment of a Norman castle, which figured prominently in King Stephen's wars, and was taken by Fairfax, and dismantled (1646); three—formerly thirteen—churches, in one of which Blackstone is buried; a grammar-school; a short branch-line; and a great July wool sale. A borough since Edward the Confessor's time, it returned two members till 1832, and then one till 1885. Pop. 2989.

See Crofts' *Chronicles of Wallingford Castle* (1870), and J. H. Hedges' *History of Wallingford* (2 vols. 1882).

Wallingford, a borough of Connecticut, on the Quinepiac River, 13 miles by rail NNE. of New Haven, with manufactories of buttons and Britannia and silver ware. Pop. 6538.

Wallis, JOHN, mathematician, was born at Ashford, Kent, 23d November 1616, was trained at Cambridge, and took orders, but in 1648 became Savilian professor of Geometry at Oxford. He sided with the parliament, was secretary to the Westminster Assembly, but strenuously favoured the Restoration. His principal work is his *Arithmetica Infinitorum*, but he wrote on proportion, mechanics, the quadrature of the circle (against Hobbes), grammar, logic, theology, and the teaching of the deaf and dumb, and edited some of the Greek mathematicians. He was one of the founders of the Royal Society. He died 28th October 1703. A collected edition of his works appeared in 1791.

Walloons (Fr. *Wallon*), the name given to a population of mixed Celtic and Romanic stock akin to the French, occupying the tract along the frontiers of the Teutonic-speaking territory in the South Netherlands, from Dunkirk to Malmedy. They are located more particularly in the Ardennes, in parts of Pas-de-Calais, Nord, Aisne, and Ardennes in France, but chiefly in South Brabant, Hainault, Namur, Liége, and Luxemburg, and in the neighbourhood of Malmedy in Rhenish Prussia. The Walloons, whose numbers in Belgium are stated at 2¼ millions, are the descendants of the old Gallic Belgæ, who held their ground among the Ardennes Mountains when the rest of Gaul was overrun by the German conquerors, but became eventually Romanised, especially in their language, which is now a patois or popular dialect of northern French, with a considerable infusion both of old Celtic and Low German elements. The name Walloon (in Dutch *Walen*) is akin to Galli, Gaels, Welsh,

Welsch, Wallachians, &c. The Walloons of the present day resemble their French more than they do their Flemish neighbours. They are middle-sized, with dark hair, and are adroit, active, impulsive, and in every way more like the French than the Flemings. They make good soldiers, and were famous as ruthless mercenaries in the Thirty Years' War (Tilly was a Walloon); and it is worthy of notice that the Belgian revolution was pre-eminently the work of the Walloon districts. It was against the Walloon spirit and tendencies that the Flemish movement (see HOLLAND) was chiefly directed. During the persecutions by the Inquisition in the Low Countries bodies of Walloons fled to England, and many of the French-speaking Protestant congregations (often called 'Walloon congregations') were wholly or partly composed of Walloons (as at Canterbury, Norwich, and elsewhere).

See works on the people and dialect by Grandgagnage and Scheler (1845–80), Dejardin (1863), Forix (1866–74), Simonon (1845), and Van der Kindere (1872).

Wall-paper. For ordinary purposes this consists of a tough, but not a thick paper, printed with a pattern in size colours. For expensive wall-papers a rather stout paper is used, and for very cheap kinds a paper of such poor quality that it can only be pasted on walls without tearing by great care. The printing of the commoner kinds is done with a roller printing-machine something like that used in Calico-printing (q.v.), but the better class of wall-papers are block-printed by hand. The printing rollers or blocks are either entirely of wood, in which case the pattern is cut on their surface, or they are of wood faced with a pattern formed of felt, and outlined with thin brass fixed edgewise into the wood. Flock-paper, sometimes called velvet-paper, is made by printing the pattern in strong size, and then dusting this over with ground wool dyed various colours, and called 'flock.' The superfluous flock which does not adhere to the size is then shaken off. Flock-papers so made have a rich effect, but for some time past most of them have been prepared in one colour, and painted over after being put on the walls. In the latter case they in some degree imitate embossed leather. Such parts of a pattern as are to be finished in bronze or gold leaf are first printed in gold size. Embossed Japanese wall-papers entirely coated with bronze, but with the sunk portion of the pattern printed in colour over the bronze, are now much used in Great Britain. These are varnished, and therefore admit of being washed. The Japanese use powdered mica or talc to give paper a silvery appearance.

The modern system of paper-hanging, which is so far an imitation of the older manner of decorating walls with figured textile fabrics or embossed leather, came into use in Europe after the paper-making machine was brought into practical shape in the beginning of the 19th century. Before that paper could only be obtained in sheets of limited size, which were, however, to some extent used for covering walls after a pattern had been put on them. The Chinese appear to have used wall-papers for centuries.

In the later decades of the 19th century the patterns on wall-papers have, as a rule, been greatly improved, some of the best decorative artists in England and France having been frequently employed in designing them. It is hardly necessary to say that no plastered wall should be papered, except with plain cartridge paper, until it is thoroughly dry. See EMBOSSING.

Wallsend, a town of Northumberland noted for its collieries, 4 miles NE. of Newcastle. It is named from its being at the end of the Roman wall (see HADRIAN'S WALL); and many Roman relics have been found here. Pop. (1881) 6351; (1891) 11,620.

Wall Trees. See GARDENING, ESPALIER, FRUIT.

Walmer Castle, in Kent, 2 miles S. of Deal, is the official residence of the Lord Warden of the Cinque Ports (q.v.), and is a round-towered castle, built by Henry VIII. It was the favourite residence and the death-place of the Duke of Wellington; and its relics of him, of Pitt, and of other Lord Wardens were in 1892 secured to the nation by the son of the late Right Hon. W. H. Smith. The adjoining town of Walmer is a favourite watering-place, has barracks, and is a member of the Cinque Port of Sandwich. Pop. (1891) 4565. See Rev. C. Elvin's *Records of Walmer* (1891).

Walnut (*Juglans*), a genus comprising seven or eight species of beautiful trees of the natural order Juglandaceæ. All are trees with alternate pinnated leaves, monœcious flowers, and a drupe-like fruit, with a deciduous fleshy husk, which bursts irregularly, and a deeply wrinkled shell (*putamen*) of two valves, within which is the seed, curiously lobed and wrinkled, with a membranaceous *testa* and partial dissepiments. The Common Walnut (*J. regia*) is a native of Persia and the Himalayas, but has long been cultivated in all parts of the south of Europe. The date of its introduction is unknown, but it was certainly cultivated by the Romans in the reign of Tiberius. It is a lofty tree of 60 to 90 feet, with large spreading branches. The leaves have two to four pairs of leaflets, and a terminal one. They have a fine balsamic odour when bruised; this quality, however, being much more marked in some trees than in others. An infusion of them has been found useful in scrofula; when bruised and rubbed on the skin they are efficacious in curing itch; and placed in wardrobes they prevent the ravages of moths. The sap is limpid like water, but contains much sugar, so that the tree is sometimes tapped for it, like the sugar-maple, and the sugar is procured by evaporation; a pleasant kind of wine is also made from it. An excellent pickle and a kind of ketchup are made of the unripe fruit. The ripe fruit is one of the best of nuts, and is an important article of export from many parts of the south of Europe. Walnuts are also exported in large quantities from Cashmere and other Himalayan regions to supply the markets of India. In the south of Europe walnuts are a very considerable article of food, and when perfectly fresh they are wholesome and nutritious, although in the state in which they are imported into Britain they are not easily digestible. Just before they are ripe they are much used in France with vinegar, salt, pepper, and shallots. Among the varieties of walnut in cultivation is one with a very thin shell, which is much esteemed. Walnuts yield by

Walnut (*Juglans regia*).
a, nut; *b*, seed.

expression a bland fixed oil, which, under the names of *Walnut Oil* and *Nut Oil*, is much used by painters as a drying oil, and in the countries in which it is produced is a common article of food. The *cake* left after the expression of the oil is sometimes used as an article of food, and is also used for feeding cattle and poultry. The timber of the walnut is of great value, and is much used by cabinet-makers. It is light, although hard and fine-grained; and gun-stocks are made of it. The wood of young trees is white, and little esteemed; that of old trees is brown, veined and shaded with darker brown and black. Aged trees of fine quality have been sold for £600 each. The wood of the roots is beautifully veined. Both the root and the husks of the walnut yield a dye, which is used for staining light-coloured woods brown. The walnut, when meant to become a timber-tree, is best sown where it is to remain, as the roots are much injured by transplanting. The best kinds of walnut for fruit are generally grafted. The walnut succeeds well in Britain as an ornamental tree, even in the north of Scotland, although it seldom quite ripens its fruit except in the warmest parts of England. The names in Teutonic lands (A.S. *wealh-hnutu*; cf. Ger. *walnuss*) indicate that it came into north Europe from Italy and France. Very similar to the common walnut is the Black Walnut (*J. nigra*) of North America, found in most parts of the United States, except the most northern. It is a very large and beautiful tree, the trunk sometimes 6 or 7 feet in diameter; its leaves have more numerous leaflets than those of the common walnut. The timber is even more valuable than that of the common walnut; the fruit is very inferior. The Butternut (*J. cinerea*) is abundant in the northern and north-western states of North America, and in Canada. It is a tree only about 50 feet high, with trunk about a foot in diameter; leaves with fifteen to seventeen leaflets; the fruit elongated, and externally covered with a viscid substance. The nut is hard and rough, with prominent ridges, and of good quality. The wood is not apt to split or warp, and is useful for many purposes. Sugar is obtained from the sap, as from that of the maple, but is of inferior quality. The inner bark is a mild cathartic, resembling rhubarb in its properties. The leaves, reduced to powder, are used for blistering, like cantharides.

Walpole, Horace, fourth Earl of Orford, author and virtuoso, was born 24th September 1717 (o.s.) in Arlington Street, London. He was the third son of Sir Robert Walpole, afterwards first Lord Orford, by his wife Catharine Shorter. In April 1727 he went to Eton, where he had for schoolfellows the future poets Thomas Gray and Richard West. In 1735 he passed to King's College, Cambridge, Gray being already established there as a fellow-commoner of Peterhouse. In 1737 his mother died, and while he was still at the university he was appointed by his provident father to one or two patent places. Quitting college in 1739, he shortly afterwards, with Gray for companion, started on the orthodox grand tour. They visited France and Italy, making a prolonged stay at Florence. At Reggio a growing incompatibility of tastes ripened into a quarrel (of which Walpole in later years accepted the blame), and the companions separated. Then Walpole fell seriously ill at Reggio, and had it not been for the prompt intervention of Joseph Spence, professor of Poetry at Oxford, might have died. He however recovered, and returned to England to take his seat for Callington in Cornwall, to which, in his absence, he had been elected. At this time (1741) his father was tottering to his fall. But there is no reason for supposing that, had Sir Robert continued in power, his son would ever have become an ardent politician. As it was, he spoke but rarely, and only respectably; and although he seems occasionally to have interested himself genuinely in cases like the Byng trial of 1757, his function in politics is that of the chronicling spectator rather than the earnest actor. With the record that he exchanged his Cornish seat in 1744 for the family borough of Castle Rising, which he vacated in turn for the other family borough of King's Lynn, the account of his public life may be closed. In 1745 his father died, leaving him a house in Arlington Street (No. 5), with sufficient, if not excessive means. He continued to live the life he had already commenced as a collector and connoisseur, dabbling lightly in familiar verse and *jeux d'esprit*, trifling with history and art criticism, and corresponding voluminously with his friends, especially with Horace (afterwards Sir Horace) Mann, the British minister plenipotentiary at Florence, whose acquaintance he had made when on the grand tour. In 1747, after temporary trial of a summer residence at Windsor, he purchased, near Twickenham, the cottage which he gradually, by alterations and additions, elaborated into the well-known 'Gothic Castle' and 'curiosity shop' of Strawberry Hill. The transformation thus slowly effected, alternating with authorship, visits to Paris, the establishment of a private press at Twickenham, and the maintenance of an ever-growing correspondence, constituted the chief remaining occupations of his life, which was prolonged until March 1797, when he died in the house in Berkeley Square (the present No. 11) to which he had moved in 1779 from Arlington Street. In 1791, by the death of his eldest brother's son, he had become fourth Earl of Orford, but he was never married. He was buried at the family seat of Houghton in Norfolk.

Walpole's literary efforts are more various than distinguished. His essays in Moore's *World* exhibit a light hand, and he had gifts as a verse-writer. In such squibs as the *Letter from Xo Ho to his friend Lien Chi at Pekin* (1757), in which he anticipates Goldsmith's *Citizen of the World* by three years, he is at his best. In the romance of the *Castle of Otranto* (1764), which may be said to be the offspring of Gothic Strawberry, he not only had a happy idea, but was fortunate enough to inaugurate a new era of supernatural romance. His tragedy of *The Mysterious Mother* (1768), though in capable verse and extremely powerful, is too horrible in its subject for any but the strongest stomachs, and it is a curious contradiction of literature that a work so sombre and impassioned should have proceeded from the pen of so fastidious a personage as its author. Of his remaining books the *Anecdotes of Painting in England* (1761–71) [1780] and *Catalogue of Engravers* (1763), in which he systematised and made intelligible the voluminous data collected by George Vertue the engraver, are perhaps the most valuable, as they contain much which would not otherwise have been preserved. His memoirs of parts of the reigns of George II. and III., published posthumously in 1822 and 1845 respectively, although warped by personal and political prejudice, contain many facts and particulars which the writer's special opportunities of obtaining information render unusually interesting. He also compiled a *Catalogue of Royal and Noble Authors* (1758), *Fugitive Pieces in Verse and Prose* (1758), *Historic Doubts on Richard III.* (1768), an *Essay on Modern Gardening* (1785), &c. Some of the above were printed at his private press at Twickenham, from which, among other and very miscellaneous issues, he put forth editions of Grammont's *Memoirs* (1772); of the *Life of Lord Herbert of Cherbury* (1764); of

Lucan's *Pharsalia*, with Bentley's notes (1760); and (for the Dodsleys) of the *Pindarie Odes* of Gray (1757), to whom at this date he had become reconciled. The books printed at the Strawberry Hill Press are the favourite toys of the collector.

Walpole's literary reputation, however, now rests chiefly upon his letters, of which those to Mann, continued assiduously for forty years—a correspondence not to be paralleled in the annals of the post-office—form the staple. His letters in the Cunningham edition extend to 2665; and it is known that there are others still unprinted. Yet, notwithstanding their voluminous character, their interest never flags. Croker, Walpole's persistent critic, reiterating Byron's opinion that they are incomparable, goes on to say that they are 'a perfect encyclopædia of information from the very best sources—politics from the fountain-head of parties, debates by the best of reporters, foreign affairs from an *habitué* of diplomatic society, sketches of public characters by their intimate acquaintance or associate, the gossip of fashionable life from a man of fashion, literature from a man of letters, the arts from a man of taste, the news of the town from a member of every club in St James's Street; and all this retailed, day by day, and hour by hour, to a variety of correspondents—*reddendo singula singulis*—according to their various stations, characters, and tastes, by a pen whose vivacity and graphic power is equalled by nothing but the wonderful industry and perseverance with which it was plied through so long a series of years.' To this may be added the verdict of another writer by no means favourable to Walpole personally: 'We expect,' says Lord Macaulay, 'to see fresh Humes and fresh Burkes before we again fall in with that peculiar combination of moral and intellectual qualities to which the writings of Walpole owe their extraordinary popularity.'

Walpole's life was that of a man of the world with a leaning to letters; and it has no great occurrences. In politics he was an aristocrat by instinct, and a republican by caprice. The former feeling was probably more genuine than the latter, but he was a wit and virtuoso above all. His truest sympathies were with his own class and circle; outside this they were imperfect. To those he liked he was a firm friend; but with many men of his age he reserved his closest confidence for the other sex (Madame du Deffand, Lady Ossory, the Misses Berry). Lord Macaulay made it the fashion to despise him as frivolous and selfish; but he has left us such a legacy of unfailing amusement that at this date the defects of his character need not greatly occupy us.

The *Letters* of Horace Walpole were collected into nine volumes in 1857–59 by Mr Peter Cunningham (Bentley). See also *Memoirs* of Horace Walpole, edited by Eliot Warburton (1852); and *Horace Walpole*, a memoir, by the author of this paper (1890).

Walpole, Sir Robert, afterwards Lord Orford, statesman, was the third son of Robert Walpole, M.P., and was born 26th August 1676 at Houghton in Norfolk, the seat of his ancestors since Stephen's reign. He received his education at Eton and at King's College, Cambridge. Through the death of his brothers he succeeded to the family estates on the death of his father, and in 1701 was returned to parliament for Castle Rising. In 1702 he was elected member of parliament for King's Lynn, which he continued to represent; and in 1705 he was nominated one of the council to Prince George of Denmark. In this latter capacity he appears to have won the esteem of Godolphin, Marlborough, and other Whig leaders. In 1708 he was appointed Secretary at War, and in 1710 Treasurer of the Navy. Shortly after this, however, his fortunes suffered a temporary eclipse; he was found guilty by the House of Commons of 'breach of trust and notorious corruption,' and on 17th January 1712 was expelled the House, and sent to the Tower; but it is certain the charge was due solely to party animosity. He had all along been a strong Hanoverian, and on the accession of George I. he was restored to fortune; he was made a privy-councillor, and had various other high offices conferred upon him. On the impeachment of Bolingbroke and others by his means, he became in 1715 Chancellor of the Exchequer and First Lord of the Treasury. A disunion in the cabinet having arisen in 1717, he resigned office, bringing in a Sinking-fund Bill on the day of his resignation. Out of office he has been charged with somewhat unscrupulous opposition. The Peerage Bill of the government (headed by Sunderland and Stanhope) having been defeated mainly by Walpole's resistance, Sunderland gave Walpole (1720) the post of Paymaster-general, and after the collapse of the South Sea Scheme the public looked to Walpole to restore order in public affairs; in 1721 he became First Lord of the Treasury and Chancellor of the Exchequer, and from this time to his final retirement in 1742 the life of Walpole may be said to be the history of England. His chief contribution to the development of the constitution was that, whereas heretofore ministers were regarded as equals amongst themselves, in his person and henceforward there was a prime-minister who gave to cabinet government the necessary unity. By systematic bribery (less in money amount than has been supposed) he secured a Whig House of Commons, and in the House of Commons secured majorities by the bribes both of money and of office. He it was who trained the Whig lords to rely not on their peers but on the Commons. His first successful trial of strength (1724) was with Carteret; later he held his own against the attacks of Bolingbroke and Pulteney; forced on the breach with his brother-in-law Townshend, who retired (1730) into private life; and quarrelled with Chesterfield (q.v.). He crushed Atterbury's plot; withdrew the grant for 'Wood's Halfpence' on the storm raised by Swift's *Drapier's Letters* (1723); failed to pass a famous Excise Bill (1733); and lost credit by his peaceful foreign policy, which Pitt and Newcastle attacked, the Prince of Wales also joining the opposition for other reasons. In 1740 a motion was made in the House to petition the king to remove Sir Robert Walpole 'from his Majesty's presence and counsels for ever.' This motion was negatived by a large majority; but the power of the great minister was seriously shaken. He resigned on 2d February 1742, when he was created Earl of Orford, with a pension of £4000 a year. His son had been created Baron Walpole in 1723. Charges of bribery were now brought against him, and a committee of investigation was ultimately appointed by the House of Commons; it consisted of twenty-one members, of whom only two were of his own party. The Report was against him, but it was unsupported by evidence, and proceedings were ultimately dropped. The rest of Walpole's life was spent in tranquillity and retirement. He died 18th March 1745. In private life he was amiable and good-tempered, but was essentially coarse-minded, as well as jealous; love of power appears to have been his ruling motive of action. He had strong common sense, with clearness of political vision, and seems to have understood the true interests of his country beyond any of his contemporaries; it was he who secured the permanence of the Revolution Settlement, and in his time peace was much needed by the country.

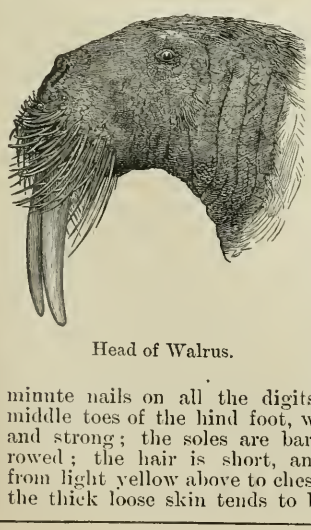
See the articles GEORGE I., GEORGE II., ATTERBURY, CARTERET, TOWNSHEND, SOUTH SEA SCHEME, SINKING FUND; Coxe's *Memoirs of Sir Robert Walpole* (3 vols. 1798); monographs on him by Ewald (1877) and John Morley (1889); the Histories of Ralph, Stanhope, M'Carthy, and Lecky; works cited at HORACE WALPOLE; Jessopp's *One Generation of a Norfolk House* (1878), which includes the Jesuit, Henry Walpole, hanged in 1595.

Walpole, SIR SPENCER, secretary to the Post-office 1893–99, and since 1898 K.C.B., is son of the Right Hon. Spencer Horatio Walpole, Home Secretary under Lord Derby (died 1898), and was born 6th February 1839, and educated at Eton. He had a post in the War Office, was made inspector of fisheries in 1867, and in 1882 lieutenant-governor of the Isle of Man. He has written lives of the Right Hon. Spencer Perceval (his grandfather, 1873) and Lord John Russell (1889); two volumes in the 'English Citizen' series; and the valuable *History of England from the Conclusion of the Great War in 1815* (5 vols. 1878–86). He is LL.D. of Edinburgh.

Walpurga, ST, sister of St Wilibald, came with him from England to Germany, was abbess of Heidenheim, and died about 778. Her day is the 1st of May. Hence she has been accidentally associated with some strange popular superstitions connected with the 1st of May. During 'Walpurgis Night,' between 30th April and 1st May, the witches rode on broom-sticks and he-goats to the ancient places of sacrifice, to hold revel there with their master the devil. The best known of these witch-hills was the highest point of the Harz, the Brocken (q.v.), famous as the scene of the witches' Sabbath in Goethe's *Faust*.

Walrus, or MORSE (*Trichechus*), a genus of aquatic, web-footed (pinniped) Carnivores, sole living representative of a family (Trichechidæ) in many ways intermediate between the sea-lions and the seals. Two genera of huge extinct forms—Trichechodon and Alactherium—are also referred to the same family. The walrus resembles the seal in the absence of external ears, and the sea-lion in the way in which the hind feet are turned forward and used in hobbling along, but is at once distinguishable by the development of the upper canines into enormous tusks. Two species are distinguished—*T. rosmarus* in the Arctic seas, *T. obesus* in the North Pacific—but the two are closely alike.

A full-grown animal measures from 10 to 12 feet in length, and there is force in the old description which pictured the huge creature as 'large as an ox and thick as a hogshead.' The head is relatively small; the eyes, fierce to look at, are small; external ears are absent; the muzzle, with swollen upper lips, bears stiff whiskers, each hair as thick as a crow quill; the shoulder region is strong and massive; the short tail is hidden by a flap of skin which unites the hind legs; the limbs are webbed flippers with minute nails on all the digits except the three middle toes of the hind foot, where they are large and strong; the soles are bare and roughly furrowed; the hair is short, and varies in colour from light yellow above to chestnut brown below; the thick loose skin tends to become bare as the animal grows older, and is often much wrinkled and scarred. The dentition of the young is expressed in the formula $\frac{2}{3}$, $\frac{1}{1}$, $\frac{4}{4}$, but many of the teeth are lost or remain rudimentary, and the adult has only $\frac{1}{0}$, $\frac{1}{1}$, $\frac{3}{3}$. The tusks or upper canines are sometimes 2 feet long; they do not become conspicuous until the animal is about two years of age.



Head of Walrus.

Walruses live near the coasts among the Arctic ice, often on floating packs. They are gregarious in habit, posting sentinels, and aiding one another with all their strength against the attacks of men or polar bears—practically their only enemies. Apart from the fierce contests between rival males at pairing time, they are peaceful animals, but when molested or robbed of their young display much ferocity. In their sexual relations they are said to be monogamous; the young are born, after a gestation of about a twelvemonth, between the months of April and June, and normally there is but one at each birth. As the pathetic tales of the walrus-hunters amply testify, the females tend their offspring with solicitude, and will fight for them to the death, while the young during the prolonged period of suckling—lasting for one or two years—are tenaciously affectionate to their mothers. Walruses feed chiefly on bivalves, especially *Mya truncata* and *Saxicava rugosa*, which they dig up with their tusks, crush with their tongue and back teeth, and so sift that only the soft parts are swallowed. Besides bivalves, they also eat crustaceans, star-fishes, sea-urchins, worms, and the like, and have a strange habit of swallowing pebbles. Seaweeds have also been found in their stomachs, but this is probably the result of accident, and not indicative of a partially vegetarian diet. The young walrus kept for a time at the Zoo in London was not particularly discriminating in its diet, but showed no inclination for Algæ. The tusks are chiefly used in grubbing for food, but they are also formidable weapons, and according to the majority of observers they also serve to break breathing-holes in the ice, and to help the animals, which are as awkward out of water as they are agile in it, to climb among the rocks and ice. In the autumn the walruses have a period of fasting, the precise nature of which is not clearly known. The voice of the walrus is a roaring bark, 'between the mooing of a cow and the deep baying of a mastiff.'

Mainly as the result of ruthless destruction, the range of the walrus has been greatly narrowed, for they are no longer found so far south as they once were, and in many parts of the Arctic regions where they were once abundant they are now scarce. This is not to be wondered at, as there are records of hunts during which as many as a thousand walruses were captured. Sometimes they are surprised on land, and then they fall easy victims to the hunter; usually, however, they are attacked in the water by harpooning-boats, and this is often full of hazard. The oil of the walrus is used like that of seals; the hide is made into harness, ropes, and fishing-lines; the ivory tusks form weapons, utensils, and ornaments, and the flesh is eaten by the Eskimos and Tchuktchis. The word walrus is Norwegian (*hval-ros*, whale-horse), and another Norwegian name, *rosmar*, has been translated into one of the common English titles, sea-horse. The name *morse* is from the Russian *morss* or Lapp *morsk*. The Eskimos and Greenlanders call the creature Awŭk from its cry.

Walsall, a municipal, parliamentary, and county borough of Staffordshire, is situated on an eminence above a small feeder of the Tame, 8 miles NNW. of Birmingham, 6 E. of Wolverhampton, and 123 NW. of London. An ancient place, but of modern development, it stands on the edge of the South Staffordshire coalfield, and manufactures

saddlers' ironmongery and all kinds of saddlery, carriages, iron and brass, leather, &c., whilst in the vicinity are coal-pits, limestone-quarries, and brickyards. The public buildings include an Italian Renaissance guildhall (1867), county court-house (1869), post-office (1879), public library (1859), grammar-school (1554; rebuilt 1850), and cottage hospital (1878); and in 1886 a statue was erected of 'Sister Dora' (Miss Pattison, q.v.). Walsall was the scene in 1891–92 of an Anarchist conspiracy, for which four dynamiters were convicted. It became a municipal borough in Henry IV.'s reign; a parliamentary borough, returning one member, in 1832; and a county borough in 1888. Pop. (1851) 25,680; (1881) 54,402; (1891) 71,791. See F. W. Willmore's *History of Walsall* (1887).

Walsham, North, a market-town of Norfolk, 14 miles N. by E. of Norwich. It has a large Perpendicular church with a ruined tower, and a market-cross (rebuilt 1600). Pop. 3612.

Walsingham, a small town of one long street and 1016 inhabitants in the north of Norfolk, 31 miles NE. of King's Lynn by rail. The Augustinian Priory, of which some ruins are left, was founded according to tradition in 1016. It contained a famous image of the Virgin, known as 'Our Lady of Walsingham,' to which many pilgrimages were made. Henry VIII. made the pilgrimage barefoot, and Erasmus' *Peregrinatio religionis ergo* (Eng. trans. by Gough Nichols, 2d ed. 1875) records a visit of the great humanist. At Old Walsingham, a small village 1 mile NE., Roman remains have been found.

Walsingham, Sir Francis, born at Chiselhurst, Kent, about 1536, studied at King's College, Cambridge, and afterwards travelled on the Continent, where he remained until the accession of Queen Elizabeth. Burghley, with his usual discernment, discovered his abilities, brought him into office, and sent him on an embassy to France in August 1570. He remained in Paris until May 1573, and discharged diplomatic duties with such consummate skill that he was, on the recommendation of his great patron, appointed one of the principal secretaries of state to Elizabeth. He was also sworn of the Privy-council, and knighted. In 1578 he was sent on an important embassy to the Netherlands, in 1581 to France, and in 1583 to Scotland. He was, with some reason, regarded by the adherents of Mary, Queen of Scots, as the most insidious of her enemies in the English council. He contrived to intercept most of her letters, and after deciphering them sent them to their destination, in order to obtain fresh intelligence from their answers. He soon held her safe in the toils. Up to Babington's (or, as some have called it, Walsingham's) conspiracy there was no evidence for charging her with being accessory to any of the plots formed against the life of Elizabeth. The real fountain-head of this conspiracy, and the chief confederates, were spies in the pay of Walsingham, and all the correspondence of Mary and her friends passed through the hands of Elizabeth's dexterous minister. After the discovery and execution of Babington and his confederates Walsingham went to Fotheringhay as one of the commission to try Queen Mary. She charged him with having forged the correspondence produced against her, when Walsingham rose in his place and solemnly called God to witness that he had not done anything unbecoming an honest man, and that he was wholly free from malice. Elizabeth signed her death-warrant with a jest on Walsingham's hatred of the Queen of Scots. She had ordered Davison to bring her the warrant, and when she had signed it she said: 'Go; tell all this to Walsingham, who is now sick; though I fear he will die for sorrow when he hears it.' Walsingham was distinguished even among the ministers of Elizabeth for acuteness of penetration, extensive knowledge of public affairs, and profound acquaintance with human nature. His administration of foreign affairs was founded on the system of bribery, espionage, and deception. He is said to have had in his pay fifty-three agents and eighteen spies in various countries; and no minister was better informed of the intrigues of foreign courts. Notwithstanding this diplomatic duplicity, which was then universal among public men, Walsingham's personal integrity and disinterested patriotism are undoubted. He was of strict morals, favoured the Puritan party, and in his later days gave himself up to religious meditation. He retired from public affairs some time before his death, and resided at his house in Barn Elms. He died in Seething Lane, London, April 6, 1590. Elizabeth was ready enough to acknowledge his diligence, genius, and important services, yet she kept him poor. There remain in the British Museum (Harleian MSS.) various letters from Walsingham complaining of his being wholly unable, on his scanty appointments, to support his establishment, though very inadequate to his dignity of ambassador in France. Camden says he died so far in debt that he was buried privately by night in St Paul's Church, without any funeral solemnity. The queen was chary even in conferring honours upon him, for he received nothing but his knighthood, and held no offices when he resigned the charge of foreign affairs. His daughter Frances became successively the wife of Sir Philip Sidney, of the brilliant and unfortunate Earl of Essex, and of the brave soldier, Richard de Burgh, fourth Earl of Clanricarde.

Walsingham, Thomas, precentor of the abbey of St Albans under Richard II., and afterwards prior of the cell of Wymundham, one of the most eminent of the famous historians of St Albans. His *Historia Anglicana* forms vols. i. and ii. of the *Chronica Monast. S. Albani* (Rolls series, 1863–64). For the first fifteen years of Richard II. (1377–92) it is an authority of the highest value; the earlier period is grounded chiefly on the *Annals* of St Albans; the concluding portion, from 1393 to 1492, contains many inaccuracies, so much so that its editor in the Rolls series thought it the work of another hand. But Mr Gairdner holds that the writer of both is one and the same.

Walter, John. See Times.

Walters, Lucy. See Charles II.

Waltham, a market-town of Essex, on the Lea, 13 miles N. by E. of London. Called also Waltham Abbey and Waltham Holy Cross, it retains the nave of a stately Norman church, which, rebuilt by Harold in 1060 for a collegiate chapter, served from 1177 for an Augustinian abbey. A miraculous cross had been brought here from Montacute in Somerset; and here probably Harold was buried. Both the nave and a Decorated lady chapel have been restored; they serve for the parish church, of which Bishop Hall and Thomas Fuller were incumbents. Waltham has memories also of Cranmer and Henry VIII. Waltham Cross (see Vol. III. p. 583) is 1¼ mile W., in Hertfordshire; and 1 mile farther W. is Theobalds (q.v.). The Lea's many channels form a network of islands, on which are vast gunpowder-mills belonging to government. Enfield (q.v.), in Middlesex, is also near; and market-gardening is largely carried on. Pop. (1851) 2329; (1891) 6066. See works by Fuller (1655; ed. by Nichols, 1837) and Bishop Stubbs (1860).

Waltham, a town of Massachusetts, on the Charles River, 10 miles by rail WNW. of Boston,

with manufactories of cottons and watches. Pop. (1880) 11,712; (1890) 18,707.

Walthamstow, an Essex parish, 6 miles NE. of St Paul's. Pop. (1851) 4959; (1891) 46,346.

Walther von der Vogelweide, best of the Minnesinger and greatest German poet of the middle ages, was born about 1160, probably in Tyrol; but the place of his birth is unknown, nor has it been proved where the Vogelweide was from which he took his name. In 1180–98 he was at Vienna, at the court of the Dukes of Austria, and in high favour there; later we find him at Mainz and Magdeburg; in 1204 he outshone his rivals in the great poetical contest at the Wartburg (see MINNESINGER). He sided with the Guelph emperor Otto IV. till his cause was utterly lost, but afterwards made friends with the victorious Hohenstaufen, Frederick II., who gave the poet a small estate. Here he died about 1230, and was buried in the cathedral of Würzburg. Love was his main theme, as that of the other Minnesinger, and he sang both sweetly and with warm human feelings in varied and artistic forms of verse. But he could also stir the hearts of his contemporaries by his patriotic pride in the Fatherland, by his praise of justice, and his support of national duty. He was even regarded by some as having exercised by his verse a too great influence on public feeling in political matters. He was also famous as an inditer of weighty proverbs and maxims.

There are editions of his works by Lachmann (1827), Wackernagel and Rieger (1862), Pfeiffer (1864), Wilmanns (1883), and Paul (1882); translations by Simrock, Weiske, Schröter, Wenzel, and others; and monographs on Walther by Uhland (1822), Pfeiffer (1860), Rieger (1863), Menzel (1865), and Wilmanns (1882), as well as a full bibliography by Leo (1880).

Waltner, CHARLES, etcher, was born at Paris, 24th March 1846, and studied painting under Gérôme, but, after working as a copperplate engraver, found his true vocation in etching. He became famous by etchings after Rembrandt, Rubens, Van Dyck, and Velazquez; amongst his best-known etchings are those of Millet's 'Angelus,' and Munkacsy's 'Christ before Pilate.'

Walton, BRIAN, editor of the great London Polyglott Bible, was born at Seymour in Yorkshire in 1600, was educated at Magdalene College and Peterhouse, Cambridge, and became in 1626 rector of St Martin's Orgar in London, to which was added the rectory of Sandon in Essex in 1636. In 1641 he was sequestered, and he thereupon found refuge in Oxford, afterwards in his second father-in-law's house in London, where he devoted himself to his great work, which came out by a subscription of ten pounds a set in six folio volumes (1654–57). He had been aided by Usher, Lightfoot, Pocock, and many other scholars, and Cromwell himself favoured the scheme, as acknowledged in the original preface. Walton was consecrated Bishop of Chester in December 1660, and died in London, 29th November 1661. Some portions of Walton's Polyglott are printed in seven languages, all open at one view. No one book is given in nine languages, but nine are used in the course of the work, Hebrew, Chaldee, Samaritan, Syriac, Arabic, Persian, Ethiopic, Greek, and Latin. Dr Edmund Castell's *Lexicon Heptaglotton* (2 vols. folio, 1669), giving lexicons and grammars of the languages contained, is its necessary complement. Other works were his *Introductio ad Lect. Orient.* (1654) and *Considerator Considered* (1660), an answer to Owen, who found things prejudicial to the faith in the *Prolegomena* to the Polyglott and in the large number of various readings admitted.

See the Life by H. J. Todd (2 vols. 1821), the second volume containing a reprint of the answer to Owen.

Walton, IZAAK, the 'Father of Angling,' was born at Stafford, 9th August 1593. Of his early years we know nothing save that his father died early; but in 1624 we find him settled in Fleet Street, near Chancery Lane, London, carrying on business as a linen-draper. Later he removed into Chancery Lane itself, and is described in the lease as a sempster or milliner. In the end of 1626 he married Rachel Floud, a great-grand-niece of Cranmer, and it is not improbable that from her uncle George Cranmer, who had been a pupil and friend of Hooker, he may have derived the materials for his life of the great divine. His wife died in August 1640 after giving birth to an infant daughter—the two sons she had borne him were already dead. About 1644 he retired from business with such a modest competence as sufficed for his simple wants, and in 1647 he married Ann Ken, half-sister of the future bishop, then a boy ten years old. She bore him a daughter, Anne, who married Dr Hawkins, a prebendary of Winchester, and died in 1715, and two sons, of whom the younger survived him, became a canon of Salisbury, contributed largely to Walker's *Sufferings*, and died in 1719. Walton lost his second wife in 1662, and buried her in Worcester Cathedral. Wood tells us he spent most of his time 'in the families of the eminent clergymen of England, of whom he was much beloved.' He had been a close friend of Dr Donne, vicar of St Dunstan's, the parish he lived in, and was urged by Sir Henry Wotton to collect materials for the life of the poet-dean. Donne's sermons being about to be reprinted without a life, Walton himself took up the task, left untouched by Sir Henry at his death in 1639, and so produced under the spur of necessity one of the most delightful biographies in miniature within English literature. Already in 1631 he had mourned Donne's death in an *Elegy*, in which he calls himself his convert. Others among his intimate friends were Morley and Sanderson, after the Restoration bishops of Worcester (then Winchester) and Lincoln, while yet another friend, Dr King, was reinstated in the see of Chichester. In his later years he lived much at Winchester, closed his blameless life there in the house of his son-in-law, 15th December 1683, and was buried in Prior Silkstede's chapel in the south transept of the cathedral.

The first edition of *The Compleat Angler, or the Contemplative Man's Recreation*, appeared in 1653; the fourth, grown from thirteen chapters to twenty-one, in 1676. The latter contained also Charles Cotton's 'Second Part of the Complete Angler, being Instructions how to Angle for Trout or Grayling in a Clear Stream.' To the two original interlocutors, 'Piscator' and 'Viator,' Walton had already added in the second rewritten and greatly enlarged edition (1655) the falconer ('Auceps'), and changed 'Viator' into 'Venator.' A fishing expedition to the Hertfordshire streams between Ware and Waltham furnishes a slight narrative framework for the book, and after each of the three, the bird-catcher, the hunter, and the fisher, has commended in turn his own recreation, Piscator adopts Viator as his pupil in the art of angling, and discourses to him on the otter and chub, the trout, the artificial minnow and flies, the umber or grayling, the salmon, the luce or pike, the carp, the bream, the tench, the perch, the eel, the barbel, the gudgeon, ruffe, and bleak, the roach, dace, and caddis, the minnow or penk, loach, and bull-head or miller's thumb, of the various English rivers, of fish-ponds, and of rods and lines. The discourse is interspersed with scraps of dialogue, moral reflections, quaint old verses, songs, and sayings, and idyllic glimpses of country-life, and the whole breathes such cheerful piety and contentment, such sweet freshness and simplicity as

to give the book a perennial charm altogether its own. Walton loved God and man with an unaffected simplicity of mind which cast a radiant atmosphere of happiness around all the idyllic pictures that he saw, for the charm of the book is not so much in the matter, or even the manner, as the unconscious picture of the writer's own disposition. The book was the delight of Charles Lamb's childhood. Writing to Coleridge, he says 'it breathes the very spirit of innocence, purity, and simplicity of heart. . . . It would sweeten a man's temper at any time to read it; it would Christianise every discordant angry passion.'

Not less exquisite and indeed unique are his *Lives*—of Donne (1640), Wotton (1651), Hooker (1652), Herbert (1670, when the four were collected), and Sanderson (1678)—'Satellites burning in a lucid ring Around meek Walton's heavenly memory.' This was one of Dr Johnson's favourite books, and Boswell tells us he counted the Life of Donne as the most perfect of the five.

In the edition of Mr Thomas Westwood's *Chronicle of 'The Compleat Angler,'* published on the two hundredth anniversary of Walton's death, there are enumerated as many as 97 editions, as compared with 117 in 1897—including editions by Andrew Lang (1897) and R. Le Gallienne (1897); by [Sir] John Hawkins (1760); Major (1824, 1835, 1844); Sir Harris Nicolas, with a good Life of Walton (1836); Dr G. W. Bethune (New York, 1847); Ed. Jesse and H. G. Bohn (1856); Dowling (1857); and a fac-simile of the original ed. (1876). Of the *Lives* there are editions by Dr Thomas Zouch, with a poor Life (York, 1796), Major (1825), and A. H. Bullen, with W. Dowling's Life (1884).

Walton-on-Thames, a Surrey village, 17 miles (by water 28) SW. of London. Its church has some interesting monuments, and Lilly is buried here. Pop. of parish, 7000.

Waltz (Ger. *walzer*, Fr. *valse*), a German dance, which first became a fashionable dance in other countries in the early part of the 19th century, being introduced into England in 1813. The *Valse à Deux Temps* is a form of the waltz not so graceful as the older one, because not so correspondent to the rhythm of the music. Strauss, Gungl, and Godfrey are well-known waltz-composers; and there are idealised concert-waltzes, not suited for dancing, by Chopin, Liszt, Brahms, &c.

Walvisch Bay (Dutch, 'Bay of Whales'), anglicised as Walfish Bay, or, more completely, Walwich Bay, a territory of 480 sq. m. on the west coast of Africa, 420 miles N. of the mouth of the Orange River. Declared British in 1878, it is surrounded by the German territory of Damaraland, and annexed to Cape Colony in 1884. The bay affords a secure anchorage. Pop. 800.

Wampum, a name given to shells, about an inch long and twice the thickness of a knitting-needle, used as money by the American Indians.

Wandering Jew. The legend of a Jew who cannot die but must wander till the day of judgment, for an insult offered to Christ on the way to the Crucifixion, is not ancient nor wide-spread. There is no trace of it in the early middle ages either in the East or West, and the popularity of the story is mainly confined to some countries of north-western Europe—Germany, Scandinavia, the Netherlands, and France. The first Wandering Jew, as Schoebel points out, was Cain, whose curse offers a striking analogy. Among the Arabs Samiri, the maker of the Golden Calf, is a similar homeless wanderer. Still there is no direct link between these and the modern story. The early imagination, not content with the Gospel narrative, amplified both the antecedent and the subsequent incidents, and invented many new episodes, which clustered round the names of Judas, Pilate, Mary, Joseph, and Jesus himself. An Italian legend, which M. Paris thinks of great antiquity, tells how a Jew named Malchus gave Jesus a blow with an iron glove, and how ever since he has lived underground, endlessly turning round and round a pillar till the day of judgment. This story, which has given rise to proverbs, and appears in Sicilian folk-song, may be essentially the same legend which first took historical form in the version of Matthew Paris. He tells us in his *Historia Major* (completed 1259) that an Armenian bishop visited England in 1228, and among other wonders of his country told of one Cartaphilus who had been present at the Passion being then alive and well known to himself. He was a door-keeper in the palace of Pilate, and as Jesus was being led past to His crucifixion he struck Him with the words 'Go, Jesus: go on faster.' To which Jesus answered, 'I go, but thou shalt wait till I return.' Cartaphilus was baptised by Ananias with the name of Joseph, and settled in Armenia, where he had often sat at the archbishop's table. Thirty years old when he insulted Christ, whenever he reaches a hundred he falls into a faint, and on recovery finds himself at the age he was when his doom was pronounced. Some years later we are told that the archbishop's brother visited England, and some of his attendant monks confirmed the story. We next find it repeated in the *Chronique* by Philippe Mouskets, written at Tournai about 1243. Schoebel suggests that the name Cartaphilus (Gr., 'very dear') must have had its origin in the disciple 'whom Jesus loved,' of whom it will be remembered Jesus said to Peter, 'If I will that he tarry till I come, what is that to thee?' (John, xxi. 22). An analogous saying of Jesus, which seems to have strongly impressed the early imagination, is that recorded in Matthew, xvi. 28. When facts had belied the natural meaning of this saying, the popular belief sought to justify it notwithstanding, by assuming that certain witnesses of the Passion of Christ had been miraculously saved from death, whether as a reward or as a punishment. The one suspicious fact against the good archbishop on whom this story is fathered is that there is no trace of it in the East, even in the vast compilation of Jean d'Outremeuse.

Three hundred years later we find the next development of the legend in the story that the Wandering Jew was seen at Hamburg in 1547 by Paul von Eitzen, Bishop of Sleswick, listening to the sermon, tall, ragged, gaunt, bare-footed, his long hair falling over his shoulders. He had been a shoemaker at the death of Jesus, his name was Ahasuerus. He spoke the languages of all countries, was never seen to laugh, and rebuked blasphemies against the name of Christ with awe-struck severity. This story was widely current about the beginning of the 17th century, and a form of it is extant, with full details, vouched for by a letter signed Chrysostomus Dudulæus Westphalus, and dated Refel [Reval], 1st August 1613. From this time forward we meet with many precise versions and variations. One of the most celebrated appearances was that to two grave citizens together at Brussels in 1640. Here the name given to him is Isaac Laquedom, which Böttcher thought likely to be a corruption by some half-learned man from the Hebrew (*la-kĕdem* = the former world). The German *Volksbuch* versions had been early translated into French, Dutch, Danish, Swedish; in English at least they inspired a ballad in Percy's *Reliques*. There is a beautiful French *complainte* on the subject, apparently of Belgian origin, which gives him again the name of Laquedom. Yet another name given him is Buttadeus—the Bedeus of the Transylvanian Saxons, the Italian Buttadio, the Boudedeo of the beautiful Breton *gwerz* translated by M. Luzel.

Further appearances are recorded at Beauvais, Leipzig, Lübeck, Moscow, Madrid, and even Hull—a tract of 1769 'authenticated by four ministers of Hull in Yorkshire,' tells how 'some time since' he visited Hull and was locked up, but the prison doors flew open to him whom the Almighty had denied a resting-place. The *Turkish Spy*, writing from Paris in 1644, gives an account of a conversation with him as Michob Ader in several languages, five or six hours together in Arabic. The 'Younger Brother of Time' said there was scarce a true history to be found, and unhappily he could give no satisfactory account of the whereabouts of the lost Ten Tribes.

It is of the essence of popular tradition to confound analogies, and so we find the Wandering Jew confounded with figures of mythology, converted Prometheus-like into an emblem of humanity, a personification of the Jewish race itself. Stories of deathless saints and heroes are to be found in the early history of every people—Enoch, Elijah, Arthur, Charlemagne, Barbarossa. And in such conceptions as Cain fleeing from the face of man with the brand of murder on his brow, the Wild Huntsman on land, and the Flying Dutchman on sea we may see how readily the imagination lends itself to the fundamental horror in the fate of the Wandering Jew.

The theme touched the imagination of Goethe, but he abandoned it for Faust. The greatest man who has treated it artistically is Edgar Quinet (*Ahasuerus*, 1833). Others are A. W. Schlegel, Chamisso, Lenau, H. C. Andersen, Klingemann, and Ed. Grenier. The introduction of the Wandering Jew in Sue's romance is the crowning absurdity of that absurd book—his death is an outrage to dramatic consistency which makes his whole history ridiculous. George Croly's novel, *Salathiel*, is named only because it is English. See Dr Grässe, *Die Sage vom Ewigen Juden* (1844), F. Helbig, *Die Sage vom 'Ewigen Juden,' ihre poetische Wandlung und Fortbildung* (1874); C. Schoebel, *Le Légende du Juif-Errant* (1877); Professor D'Ancona in *Nuova Antologia* (Oct. 1880); but especially the admirable brochure by Gaston Paris, *Le Juif-Errant* (1880). The fullest English account (made fuller by plentiful irrelevances) is in Moncure D. Conway's *Wandering Jew* (1881). There is a slight paper in Baring-Gould's *Popular Myths*. See also Champfleury, *Histoire de l'Imagerie Populaire* (1869).

Wanderoo (*Macacus silenus*), a catarrhine monkey, a native of the Malabar coast of India.

Wanderoo (*Macacus silenus*).

It is 3 feet long to the tip of the tail, has a slim body, pink buttocks, dark hair, and a great mane of long whitish hair round the face. Fabulous stories are current of its cunning and mischievousness; others are exceptionally intelligent. The Rhesus Monkey (q.v.) is another Macacus.

Wandiwash, a town of North Arcot, Madras, scene of the victory by Sir Eyre Coote (q.v.).

Wandsbeck, a NE. suburb of Hamburg.

Wanganui, a New Zealand port, 4 miles from the mouth of the Wanganui river, and 135 miles north-west of Wellington by rail. Pop. 5011.

Wanks. See HONDURAS.

Wansbeck. See MORPETH.

Wantage, a market-town of Berkshire, in the Vale of the White Horse, 26 miles W. of Reading. It has a good 14th-century church, a corn exchange (1865), a grammar-school (1597; rebuilt 1850), an Anglican home for penitents, and a marble statue (1877, by Count Gleichen) of King Alfred, who was born here. Bishop Butler was also a native. Wantage manufactures agricultural implements. Pop. (1851) 3056; (1891) 3669.

Wantley. A mock heroic ballad, printed in Percy's *Reliques*, celebrates a fight in which the dragon of Wantley was worsted and slain. The ballad itself (early 17th century) is a vulgar but justifiable satire on such extravagant fictions, and Percy prints a dubious story of its origin being a lawsuit concerning a claim of tithes made by the Wortley family, whose seat, Warncliff Lodge (locally Wantley), is 6 miles from Rotherham in Yorkshire. The ballad is poor at best.

Wantsome. See THANET.

Wapenshaw, in ancient Scottish usage, a periodical gathering of the people within various areas for the purpose of seeing that each man was armed in accordance with his rank, and ready to take the field when required. Numerous statutes regulate the wapenshaws, and under the later Stuarts attendance was rigorously enforced. Sports, archery, &c. were indulged in at such meetings. The name has been in some places revived for volunteer meetings and shooting competitions.

Wapentake (Sax. *wæpen*, 'arms,' and *tae*, 'touch'), a name given in Yorkshire (q.v.) to the territorial divisions of the county, similar to what in most other English counties are called *hundreds*, and in the more northern counties *wards*.

Wapiti (*Cervus canadensis*), a species of deer of large size, being 4½ feet in height at the shoulder.

Wapiti (*Cervus canadensis*).

It is a native of North America, found as far south as Carolina, and as far north as 56° or 57° N. lat.

It is yellowish brown on the upper parts; the sides gray; a pale yellowish patch on each buttock, bounded by a black line on the thigh; the neck a mixture of red and black, with long, coarse, black hair falling down from it in front like a dewlap; a black mark at each angle of the mouth. The hair is crisp and hard, but there is a soft down beneath it. The antlers are large, much like those of the stag, but the first branch bends down almost over the face. The wapiti is called *elk* and *gray moose* in some parts of America, although very different from the true elk or moose deer. It is found chiefly in low grounds, or in parts of the forest adjacent to savannahs and marshes. Its flesh is coarse and dry. The hide makes excellent leather.

War, a struggle by force of arms carried on between different states (international war) or tribes, or between different parties in the same state (civil war). The laws of war are treated of in this work in a long series of articles, such as those on International Law, Articles of War, Blockade, Contraband, Enemy (where the declaration of war is dealt with), Martial Law, Neutrality, &c. The means of conducting warfare come under such heads as those of Army, Navy, Fortification, Siege, Strategy, Tactics. Many of the great wars of history have separate articles—Crimean War, Peninsular War, Seven Years' War, Thirty Years' War, War of the Spanish Succession, Wars of the Roses, &c.—or are discussed in the histories of the countries they affect (Carthage, Rome, France, Germany, Turkey, United States, &c.) and of the commanders who waged them (Alexander, Cæsar, Hannibal, Frederick the Great, Napoleon, Wellington); see, too, the articles on great battles, Waterloo, &c.

It is difficult to estimate even approximately the cost, directly and indirectly, of great wars, apart from the loss of life. But some notion of the war expenditure of Great Britain may be gathered from the table at National Debt, showing the amount of the debt at successive dates. The cost of the Russian war to Britain is set down at close on £70,000,000; the loss in men was 20,526, of whom 12 per cent. died in battle, the rest in hospital. The American civil war was estimated to have cost the nation 600,000 lives and $10,000,000,000. Besides the fearful loss in men (290,000) and cost in money (£316,000,000) to France of the Franco-German war, there was added the war indemnity of 5000 millions of francs. In the one bloody battle of Gravelotte alone the victorious Germans lost 328 officers and 4900 men dead, and 571 officers and 14,000 men wounded; the French loss was 13,000 men. See also Ambassador (for Declaration of War), Battle, Geneva, and the lists appended to Army and to International Law; and works on the Art of War by Clausewitz (trans. 1873), Jomini (trans. Phila. 1875), Hamley (1878), Wheeler (New York, 1880), Derrécagaix (trans. Washington, 1889), Maurice and Fitzgerald (1889), Douglas Owen (1890), and Köhler (3 vols. 1888–90).

The War Department has charge of everything connected with the army. In Great Britain it is a department of the state under a cabinet minister, the Secretary of State for War (abroad, war minister), assisted by a permanent and a parliamentary under-secretary. The War Office, the manufacturing departments, the Ordnance Survey, all forts, barracks, stores, government land used for military purposes, and vessels employed in carrying ordnance stores, &c. are under the War Department as well as the army itself. The letters W D with a broad arrow between them is the mark by which the War Department property is distinguished.

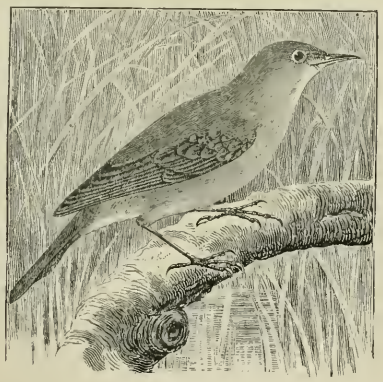
The War Office is the immediate office of the Secretary of State for War, who, under the sovereign, is the head of the army, and responsible for everything connected with it. Before the Crimean war the administration of the army was divided amongst the War Office, Horse Guards, Ordnance Office, Treasury, Colonial Office, and Foreign Office. In 1856 it was concentrated in the War Office, which was divided into three great branches representing roughly men, money, and *matériél* under the Officer Commanding in Chief, the Financial Secretary, and the Surveyor-general of the Ordnance respectively. By an order in council of 21st February 1888 the War Office was reorganised, the Surveyor-general of the Ordnance abolished, and his duties divided between the Finance and Military departments—the first, under the Financial Secretary, to include the divisions of the Accountant-general and Directors of Contracts, Clothing, and Ordnance Factories; the second, under the Commander-in-Chief, those of the Adjutant-general, or Chief Staff Officer (discipline, enlistment, military education, &c.), the Military Secretary (appointments, honours, &c.), Quartermaster-general (supplies, quarters, transport, &c.), Inspector-general of Fortifications (forts, lands, submarine mines, &c.), Director of Artillery (warlike stores, inventions, &c.), Director of Military Intelligence, Directors-general of the Army Medical Department and of Military Education, Chaplain-general (Church of England only, other denominations are under the permanent Under-secretary of State for War), and Principal Veterinary Surgeon. By a reorganisation in 1895, the Secretary of State controls administration of the Army Service, the heads of departments being responsible to him; whereas formerly the Commander-in-chief was supreme head of the Military departments, with the Adjutant-general as his staff-officer.

Warasdin (*Varasdin*), a Croatian town on the Drave, 35 miles NE. of Agram, with a cathedral; pop. 10,371. Seven miles south-west is the warm sulphurous spring of Varasdin-Töplitza.

Warbeck, Perkin, a pretender to the crown of England, acknowledged in his own confession that he was a native of Tournay, son of one John Osbeck. In 1490 he appeared at the court of the Duchess of Burgundy, sister of Edward IV. of England, and here professed to be Richard Duke of York, the younger of the two sons of Edward IV. murdered in the Tower. This prince was born in 1472, and the claimant would no doubt be about the same age. In 1491 he landed at Cork, where he was welcomed. Next year he was received at the court of Charles VIII. of France as Duke of York; and from the court of Burgundy, where he was treated as nephew of the duchess, he made an ineffectual landing in Kent (July 1495). He next went to Ireland, then to Scotland, where James IV. gave him his kinswoman, Catherine Gordon, the daughter of the Earl of Huntly, in marriage. In 1498 he sailed by Ireland to Cornwall in order to profit by the disaffection there, attempted to besiege Exeter, then went on to Taunton, but ran away with un-Plantagenet poltroonery by night to the sanctuary at Beaulieu in Hampshire. He surrendered on promise of pardon, and was subjected to an easy imprisonment. Next year he managed to escape, but was caught at Sheen. He was thrown into the Tower, and it was more than probable an opportunity was purposely afforded him to plot an escape with the imprisoned Earl of Warwick. He was executed in November 1499, as was also the ill-fated Warwick. Thus, says Bacon, did 'this winding ivy of a Plantagenet kill the true tree itself.' See James Gairdner's appendix to his *History of Richard III.* (1878).

Warble-fly. See Bot.

Warbler, a popular name often applied to all the birds of the family Sylviidæ (q.v.; sometimes called by the French name of Fauvettes), many of which, however, commonly receive other popular names, as the Blackcap, Nightingale, Hedge-sparrow, Redbreast, Redstart, Stonechat, Wheat-ear, Whitethroat, &c. (q.v.), while many receive the name Warbler with some adjunct—Reed-warbler, &c. The more typical genera comprise birds of small size and plain plumage, usually alike in both sexes; most of them are migratory, going a long way south of their breeding-haunts to winter; for instance, the Siberian Chiff-chaff (*Phylloscopus tristis*) winters in India. Such genera are Sylvia, to which the Blackcap and Garden-warbler belong; Locustella, of which is the Grasshopper-warbler (*L. nævia*), not unfrequent in many parts of England, and found also in the south of Scotland and in Ireland. It is found in most parts of the centre and south of Europe, at least during summer, being a bird of passage. It is of a greenish-brown colour, the centres of the feathers dark brown, producing a spotted appearance; the lower parts pale brown. It is a shy bird, hiding itself in hedges and bushes, but very active, often darting out like a mouse from the bottom of the hedge, and receives its name from its chirping, grasshopper like note. The genus Acrocephalus has, like the foregoing, a rounded tail; the species frequent watery places, and are known as Reed-warblers. Some of them nearly equal a thrush in size. The Sedge-warbler (*A. schœnobœnus*) is the most common British species, and is generally found in thick patches of reeds or willows in marshes, or in other situations close to water, and where the aquatic herbage is thick and strong. It abounds on the marshy



Reed-warbler (*Acrocephalus strepcrus*).

banks of the Thames. The Reed-warbler (*A. streperus*) is found in summer in marshy situations in the south of England; it abounds in Holland and in many parts of Europe, and its range extends to the north of India. It is of a uniform pale brown, with a tinge of chestnut; the chin and throat white; the under parts pale buff colour. Its nest is remarkable; it is attached to the stems of three or four reeds, and formed by winding grass or the branches of reed panicles together with a little wool, and is conical and deep, so that the eggs or young may not be thrown out when the reeds are shaken by the wind. The Phylloscopi feed chiefly on small insects and larvæ which infest the foliage of trees; they are small species, and in colour vary above from olive-green to brown, and below from yellow or greenish yellow to white. They build semi-domed nests. The Chiff-chaff (*P. collybita*), so named from its two-noted cry, is a familiar early migrant to Britain. The Wood-warbler, also known as Wood-wren (*P. sibilatrix*), is common in the wooded districts of England in summer, particularly in old plantations of oak and beech. The Willow-warbler (*P. trochilus*) is very common in the south of England in summer, but more rare in northern parts of Britain. It frequents woods, shrubberies, thick hedgerows, and bushes, but builds its nest on the ground. Numerous species of warblers are found in North America, but these belong to a quite distinct family (Mniotiltidæ) which appear to graduate into the Tanagers (q.v.). They are birds of brighter plumage than the Old-World warblers, but resemble them in their habits, and are also migrants. Not a few of the species are therefore reckoned among the birds of the West Indies, just as some of the European species are found in Africa. Asia has many species of warblers, among which some of the European species are included. Australia has many species of warblers, some of which (Malurus) are of very beautiful plumage, but these are sometimes made a distinct family (Maluridæ). See Howard Saunders, *Manual of British Birds.*

Nest of Reed-warbler.

Warburton, Eliot, was born in 1810 at Aughrim, County Galway, the eldest son of the inspector-general of constabulary in Ireland. He studied at Cambridge, and was called to the bar, but soon devoted himself to literature, travel, and the improvement of his Irish estates. His eight works include *The Crescent and the Cross* (1844), a spirited description of eastern lands; *Memoirs of Prince Rupert* (1849); and *Darien, or the Merchant Prince* (1851). He was sailing for Panamá, as an agent of the Atlantic and Pacific Company, when he was lost in the steamship *Amazon*, burnt off Land's End on 4th January 1852.

Warburton, William, a famous but not a great English divine, was born at Newark, the son of its town-clerk, December 24, 1698. He received his education at Oakham and Newark grammar-schools, and at sixteen was articled to an attorney. He seems to have practised his profession for some years at Newark, while diligently keeping up his studies, and he was ordained deacon in 1723, priest in 1727. Presented by Sir Robert Sutton to the rectory of Brant-Broughton in Lincolnshire, he gave himself here for eighteen years to severe and unbroken study. His *Alliance between Church and State* (1736) first called attention to his powers, but it was *The Divine Legation of Moses* (books i.–iii. 1738; iv.–vi. 1740) which formed the sure foundation of his fame, although Gibbon could describe it in his autobiography as 'a monument, already crumbling in the dust, of the vigour and weakness of the human mind.' His object was to prove the divine authority of Moses, but he wanders discursively into all manner of subsidiary inquiries, and fortifies defects of argument with vulgar abuse of all manner of adversaries, especially in his foot-notes—his 'places of execution.' A characteristic excursion was the explanation of Virgil's descent of Æneas into the shades as an allegorical version of initiation

as a law-giver into the Eleusinian mysteries, which called forth the anonymous *Critical Observations on the Sixth Book of the Æneid* (1770) of the yet untried historian Gibbon. The Deists had made much of the absence from the Old Testament of any distinct reference to a future life, but Warburton makes bold to take this itself as a proof of divine authenticity, for no mere human legislator would have omitted such a sanction, and therefore the motive of Moses in leaving out so necessary a condition of morality must needs have been that he expected a further revelation. Of this preposterous work books vii. and viii. never appeared; book ix. was only published posthumously in 1788. It displays no speculative power or profundity of thought, but merely a vigour in verbal logic, and a reading multifarious and vast indeed, but inaccurate. This man has 'monstrous appetite and bad digestion' said Bentley. Insolent, dogmatic, arrogant beyond belief, prone to paradox, devoid of any spiritual insight, intolerant of any difference of opinion, he brings to theological controversy the habits of mind of the attorney's office, brow-beating his opponents with abuse and imputation, reading, says Mr Leslie Stephen, the Bible precisely like an act of parliament. In a series of letters in the *Works of the Learned* for 1739 he voluntarily defended the orthodoxy of Pope's *Essay on Man* in answer to Crousaz, and the poet was so grateful at being proved to be not a fatalist that he rewarded his boisterous apologist with a close and unbroken friendship, leaving him at his death in 1744 his literary executor—a bequest which Johnson estimated at £4000. This friendship also gave him an introduction to the wealthy owner of Prior Park, Ralph Allen, whose favourite niece, Gertrude Tucker, he married in 1745. Warburton's preferment was now rapid: he became successively Preacher of Lincoln's Inn (1746), Prebendary of Gloucester (1753), King's Chaplain (1754), Prebendary of Durham (1755), Dean of Bristol (1757), finally, through the nomination of Allen's warm friend, William Pitt, Bishop of Gloucester (1759). He was remiss in his episcopal duties, but the standard of that age was not high, and Hurd, who had the honesty to be as obsequious in his flattery to him dead as living, counts the loss to his diocese gain to the church. The grace of apostolical succession did not drive out his fighting spirit, and he wore out his days in endless warfare with Hume, Jortin, the Deists wholesale, Voltaire, Lowth, and Wesley. The most famous of these struggles was that with Lowth, who was as much his superior in scholarship as in courtesy. Lowth's famous *Letter* (1765) remains scarce rivalled to this day in polite raillery and point, and Warburton for once had the prudence to offer no retort. His *Doctrine of Grace* (1762) was a weak attack on Wesley, to which both Whitefield and Wesley made a satisfactory reply. Warburton's mental powers did not last out his life, and the loss of his only son in 1755 was a trial from which he never recovered. He died June 11, 1779, and was buried in his cathedral. His widow in 1781 married a former chaplain, John Smith.

Warburton in his early years had aided Theobald in his Shakespeare, and in 1747 he himself issued an edition which brought him no credit, for Douce was within the truth when he called him of all Shakespeare commentators 'surely the worst.' His chief remaining works were the credulous enough *Julian* (1750), on the renegade emperor's attempt to rebuild the temple at Jerusalem, *à propos* of Middleton's *Inquiry concerning the Miraculous Powers of the Early Church*; his edition of Pope (1751); *The Principles of Natural and Revealed Religion*, sermons (3 vols. 1753-54-67). A sumptuous edition of his works was published in 1788 by his jackal, Bishop Hurd, in seven quarto volumes, at the expense of his widow; a more recent edition is in 12 vols. (1811).

—His name survives in the Lecture he founded at Lincoln's Inn with £500 in 1768.—See the Lives by F. Kilvert (1860) and J. S. Watson (1863), also Leslie Stephen in *Fortnightly Review* for February 1872, and in his *History of English Thought in the Eighteenth Century* (1876), Mark Pattison's *Essays* (vol. ii. 1889), and Sir J. F. Stephen's *Horæ Sabbaticæ* (vol. ii. 1892).

Ward. See GUARDIAN, CHANCERY.

Ward, ADOLPHUS WILLIAM, was born at Hampstead, December 2, 1837, and had his education in Germany, at Bury St Edmunds, and St Peter's College, Cambridge, becoming a fellow in 1860. In 1866 he became Professor of History and English Literature at Owens College, Manchester, its Principal in 1888, and in 1896 Master of Peterhouse. He received the degrees of LL.D. from Glasgow in 1879 and Litt.D. from Cambridge in 1883. He translated Curtius' *History of Greece* (5 vols. 1868–73), and wrote a profoundly learned and invaluable *History of English Dramatic Literature* (2 vols. 1875). Other works are *Chaucer* (1880) and *Dickens* (1882) in 'English Men of Letters,' the Globe edition of Pope's poetry (1869), and Marlowe's *Faustus*, together with Greene's *Friar Bacon* (1878), for the Clarendon Press.

Ward, ARTEMUS. See BROWNE (C. F.).

Ward, EDWARD MATTHEW, painter, was born in 1816 in London. In 1834 he was sent to study at the Royal Academy, and two years after he went to Rome. He returned to England in 1839 by Munich, where he had lessons in fresco-painting from Cornelius. In 1843 he competed unsuccessfully for the decoration of the Houses of Parliament. In the same year, however, he made a very 'palpable hit' by his 'Dr Johnson perusing the Manuscript of the *Vicar of Wakefield*.' In 1853 he was solicited by the Fine Arts Commissioners to aid in the work at Westminster. Of the eight pictures which he engaged to furnish two were done in oils and two in water-glass—one of them 'The Last Sleep of Argyll.' He became A.R.A. in 1847, and R.A. in 1855. A few of his more notable pictures are—'The Fall of Clarendon,' 'Interview between Charles II. and Nell Gwynn,' 'The Royal Family of France in the Prison of the Temple,' 'Charlotte Corday led to Execution,' 'Jeanie Deans,' 'The Earl of Leicester and Amy Robsart,' 'Luther's First Study of the Bible,' 'Baxter and Jeffreys,' 'Doctor Goldsmith,' and 'James II. receiving the News of the Landing of William of Orange.' He died from a wound inflicted by his own hand, 15th January 1879. See his *Life and Works*, by J. Dafforne (1879).

Ward, MRS HUMPHRY. Mary Augusta Arnold was born in 1851 at Hobart in Tasmania, eldest daughter of Thomas Arnold (b. 1823), second son of the great Dr Arnold of Rugby. Her father, becoming a Roman Catholic, resigned his place as inspector of schools, and returned to England in 1856 to become professor in the Roman Catholic university at Dublin. Afterwards in the Oratory School at Birmingham and at Oxford, he wrote a serviceable *Manual of English Literature* (1862), and edited *Select English Works of Wyclif* (3 vols. 1869), *Beowulf* (1876), and for the Rolls series Henry of Huntingdon (1879) and Symeon of Durham (1882–85). Together with the Rev. William E. Addis he edited the well-known *Catholic Dictionary* (1883). In 1872 Miss Arnold married Thomas Humphry Ward (b. 1845), the editor of *The English Poets* (4 vols. 1880–81), *Men of the Reign* (1885), *Men of the Time* (12th ed. 1887), and *The Reign of Queen Victoria* (1887). She began early to contribute to *Macmillan's Magazine*, and gave the fruits of her Spanish studies to Smith and Wace's *Dictionary of Christian Biography*. A child's story, *Milly and Olly* (1881), *Miss Bretherton* (1884), a slight

but promising novel, and the translation of Amiel's *Journal Intime* (1885) prepared the way for the widely read spiritual romance of *Robert Elsmere* (1888). The book was an attempt to represent the struggle of a soul in its voyage towards newer theistic aspirations after losing the landmarks of the old faith. Profound spiritual insight, broad human sympathy, and strong thinking are manifest throughout, but as a work of art it is marred by diffuseness, its didactic persistency of purpose, and a fatal want of mastery over the fundamental secret of the novelist—the power to make his puppets live rather than preach. Its successor, *David Grieve* (1892), showed all its faults but hardly all its merits, and yet is said to have brought its author in the first two months no less than £18,000. Later works, variously judged, were *Marcella* (1894), *Bessie Costrell* (1895), *Sir George Tressady* (1896), *Helbeck of Bannisdale* (1898—on the conflict of thought between a devout Catholic husband and an agnostic wife), and *Eleanor* (1900). Mrs Ward was a founder (1890) of University Hall, Gordon Square, as a centre of liberal religious thought.

Ward, NATHANIEL BAGSHAW (1791–1868), botanist and inventor of the 'Wardian Case' for the transport of delicate ferns and other such plants, or for keeping them indoors—a close glass case fitted accurately on a tray containing soil.

Warden, an officer appointed for the naval or military protection of some particular district of country. To keep the districts of England adjoining Scotland and Wales in a state of defence, Lords Wardens of the Marches were appointed. See BORDERS; also CINQUE PORTS, STANNARIES.

Wardlaw, ELIZABETH, LADY, Scottish poetess, was born in 1677, the second daughter of Sir Charles Halkett, Bart. of Pitfirrane. She married in 1696 Sir Henry Wardlaw, Bart. of Pitreavie, also near Dunfermline, and died in 1727. Her pseudo-archaic ballad, *Hardyknute, a Fragment,* was first published in 1719 as a genuine antique, and, expanded from 216 to 336 lines, had been two or three times reprinted, when Percy in the second edition of his *Reliques* revealed the secret of its authorship. To Lady Wardlaw also Dr Robert Chambers in 1859 ascribed 'Sir Patrick Spens,' 'The Douglas Tragedy,' and many more of our finest traditional ballads. Endorsed though it be by Professor Masson in his *Edinburgh Sketches* (1892), the theory is untenable; still our debt to Lady Wardlaw is a heavy one, for '*Hardyknute,*' says Scott, was 'the first poem I ever learnt, the last I shall ever forget.'

Wardlaw, RALPH, a great Scottish divine, was born at Dalkeith, 22d December 1779. A great-grandson of Ebenezer Erskine, he studied at the Selkirk theological hall of the Secession Church after his university course at Glasgow, but embraced Congregationalist views, and settled as pastor in Glasgow. In 1811 he was appointed professor of Theology to the Congregational body in Scotland, an office he retained along with his pastorate to his death, 17th December 1853. Wardlaw was a powerful preacher, a sound theologian, able and vigorous controversialist, and a voluminous writer. He took an active part in the anti-slavery agitation, and in the formation of the Evangelical Alliance (1846).

The most important of his works are *Discourses on the Socinian Controversy* (1814); *Lectures on Ecclesiastes* (1821); *Discourses on the Sabbath* (1832); *Christian Ethics* (1833); *National Church Established Examined* (1839); *Lectures on Female Prostitution in Glasgow* (1842); *Discourses on the Nature and Extent of the Atonement of Christ* (1843); *Congregational Independency* (1848); *On Miracles* (1852).—See the Memoir by Dr W. L. Alexander (1856).

Wardship, in English feudal law, was the guardianship which the feudal lord had of the land of his vassal while the latter was an infant or minor. Until the majority of the infant the lord, out of the profits, provided a fit person to render the services incumbent on the vassal. In the case of a female ward, he could dispose of her hand in marriage. See TENURE, FEUDALISM.

Ware, a market-town of Herts, on the Lea, 2½ miles ENE. of Hertford. It has a fine cruciform church, remains of a priory (1233), great malting establishments, and memories of Godwin and 'John Gilpin.' St Edmund's Catholic College (1769), with a chapel of 1850 by Pugin, is at Old Hall Green, 5 miles NNE.; and the great Bed (q.v.) of Ware was in 1869 removed to Rye House. Pop. (1851) 4882; (1891) 5121.

Ware, a town of Massachusetts, on Ware River, 74 miles by rail W. of Boston, with cotton and woollen factories, and a pop. of 7329.

Wareham, a small but very ancient market-town of Dorsetshire, stands between the rivers Piddle and Frome, 15 miles E. of Dorchester. It was a British town, and afterwards a Roman station, and is surrounded by a vallum or grassy earth-wall, which is still about 30 feet high, and is perfect on three sides. A fire destroyed two-thirds of it in 1762, and a Norman castle and a priory have disappeared; but St Mary's church retains an interesting chapel, that marks the resting-place for two years of Edward the Martyr. Superseded by Poole as a port, Wareham now depends chiefly on extensive clay-works. It is a municipal borough, and till 1832 returned two members, then till 1885 one (with Corfe Castle, Arne, &c.). Horace Walpole is claimed falsely as a native. Pop. 2141.

Warehousing. See BONDED WAREHOUSE.

Warham, WILLIAM, Archbishop of Canterbury from 1503 to 1532, was born about 1450 at Church Oakley in Hampshire, and was educated at Winchester and New College, Oxford. He took holy orders, but also practised law, and became advocate in the Court of Arches and moderator of the Civil Law School in St Edmund's parish, Oxford. He became known to Henry VII., and was attached to an embassy to the court of Burgundy. His services in connection with Perkin Warbeck's pretensions to the crown obtained for him rapid preferment in church and state, and he was soon Master of the Rolls (1494), Lord Chancellor (1503), Bishop of London (1503), and Primate (1503). He fell into disfavour with Henry VIII., and in 1515 resigned the great seal to Wolsey. He was a close friend and favourer of the New Learning and of its apostles in England—Erasmus, Dean Colet, Grocyn, and Linacre—but had no stomach for fundamental reform. He listened to the ravings of the Maid of Kent, but had no pity for heretics and translators of the Scriptures. With regard to the divorce he passively supported the king, and he agreed to recognise the king's supremacy. He died 22d August 1532. See vol. vi. of Hook's *Lives of the Archbishops* (1868).

Warkworth, a small seaport (pop. 700) in Northumberland, near the mouth of the Coquet, 7 miles SE. of Alnwick by rail. The castle, mostly ruinous, dates from the 12th century, and is often named in the history of the Percies (as in Shakespeare's *Henry IV.*). The Norman church has been restored. The Benedictine priory was founded in 1256, and the hermitage 'deep hewn within a craggy cliff,' and known from Bishop Percy's ballad, is about a mile above the castle. The place gives the Duke of Northumberland a baronial title, his eldest son's son being known as Lord Warkworth. The trade, chiefly in exporting coal, is mainly carried on at Amble, 1 mile SE. on the coast.

Warming. Warm-blooded animals require for health a certain temperature of the body, variable only within certain limits. If the external temperature become too high, the temperature of the body is regulated by perspiration and respiration; if it become low the bodily activity is increased, and the temperature thus kept up. Under ordinary circumstances, however, man needs to protect himself against excessive cooling, in order that he may lead the comparatively quiescent life of civilisation; he needs houses and clothing. If this precaution be neglected his vitality sinks; and as the external temperature falls the death-rate rises, which shows that there is a certain amount either of neglect or inability, or both, to take the measures necessary to avoid undue cooling of the body. This undue cooling may be avoided in two ways—by extra clothing or by artificial heating of apartments. In southern Europe and in China the former is the plan resorted to; in countries where fuel is not scarce the latter plan, which is preferable, is adopted.

The objects of artificial heating are the temperature most congenial to the human constitution, pure air to breathe, and air not too warm or dry. If the body be kept sufficiently warm the air which we breathe may be fairly cool; and an ideal system of warming would warm the body and leave the air cool and pure. The actual methods of warming are, to a greater or less extent, compromises, and they depend mainly either upon radiation of heat or upon convection of heat, or both. The former method is that of the open fire; the latter is, in the main, that of stoves, gas, steam, and hot water. In the former the walls and furniture of the room are warmed, while the air is not warmed directly by the fire, for the radiant heat streams through it without warming it; in the latter the air itself is warmed directly. In the former the walls are, so far as the fire is concerned, warmer than the air; in the latter the reverse is the case. In the former (the open fire) there is no tendency to deposition of moisture from the air upon the walls, unless the air becomes laden with excess of moisture from extraneous causes, such as the presence of a numerous assemblage, or unless the air becomes chilled and deposits its moisture even upon somewhat warmer walls; in the latter case, the walls being cooler than the air, there is a continuous tendency to the deposition of moisture on the walls, unless the air is at some distance from its saturation point. Heating by radiation is best exemplified by the open fire with a chimney or in the open air. The drawbacks of the open fire burning in a grate are the waste of fuel through imperfect combustion, the production of smoke, the comparatively small radiative power of flame (a blazing fire having less effect than a glowing one), the warming of surrounding objects on one side only, the want of an equably maintained temperature, and the waste of heat, which escapes with the smoke and chimney-gases. Its advantages are the satisfaction of the eye, cool air to breathe, and the ventilation produced. Smoke may be diminished and radiation increased by an extended use of coke; but coke does not do well if the fire burns low, and a blower should be used to make the fire draw quickly and become bright. A forced draught should always be used for a few minutes while lighting a fire; the amount of smoke produced is very materially diminished by this means. The forced draught is secured by narrowing the front aperture so that all the air which reaches the chimney must have passed through the fuel. If the aperture in front of the fire be large, air passes up to the chimney in front of the fire-gases, and the combustion is relatively slow. Dr Arnott (q.v.) developed the principle of limiting the access of air to the fuel by enclosing a store of fuel in an iron box beneath the grate, and bringing this gradually to the top by pushing up a false bottom; the air got access to the fire only at and near the top, and if the fire were left to itself it smouldered for many hours, ready to brighten up when it was pushed up so that air might gain freer access to it. In tending a fire it ought to be borne in mind that when the fire cannot radiate light it cannot radiate heat, and that it is therefore absurd to hide the fire under opaque masses of coal; and secondly, that the products of distillation of coal ought not to be allowed to escape as black smoke, but should pass up through a bright portion of the fire, and be perfectly burned. In special hearths it is possible, by means of false bottoms, to introduce fresh charges of coal underneath the existing fire so that the outer surface of the fire is always clear and bright. Even in ordinary grates it is possible to do a good deal towards minimising smoke and confining the active portion of the fire to the top and front; if, for example, a tile be fitted in the bottom of the grate; if a substantial amount of fuel be put in the grate and lit at the top; if this fuel contain some broken coke or cinder; if fresh fuel be added, not by throwing it on the top, but by raking the fire forward, throwing the fresh fuel into the hollow thus produced at the back of the fire, and then pushing the bright fire back upon it; if these things be done the fire is obviously brighter and more continuously cheerful and more nearly smokeless. The fire should always be bounded by fire-brick behind and on each side, for iron chills and blackens it. The fire-gases should not be allowed to escape at once into the chimney up a sloping iron back; but the back of the grate should be fire-brick all the way up, and should overhang the fire so that the ascending fire-gases impinge on it; by this means the 'throat' of the chimney is prevented from being excessively wide, the back-brick absorbs heat from the fire-gases and radiates it towards the floor, and the back-brick also reflects towards the room the heat radiated upwards from the top of the fire. For similar reasons the regulator or register should slope forwards. In every case, however, where there is flame there is great loss of heat, which escapes up the chimney, and even where the fire is smokeless this loss is considerable. The heat which is radiated into the apartment is never more than a fraction of the total heat of combustion of the fuel; and plans have been devised (see VENTILATION) for recovering some of this heat by causing it to warm the air which is supplied to the apartment.

In the more primitive plans in which there is no ventilation—an open fire in a cave, a tent, a wigwam, or a cabin, or a charcoal brazier in a room with a chimney, or a gas or petroleum stove isolated in a room—the whole heat of combustion of the fuel may be utilised in warming the walls and air of the room; but the products of combustion vitiate the air. Warming of this kind is effected by gas-burners and petroleum-lamps, which raise the temperature very considerably in non-ventilated rooms, but seriously vitiate the air at the same time.

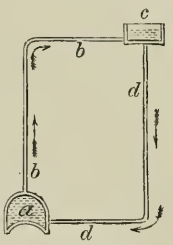
By the use of close stoves the actual vitiation of the air by products of combustion is in great part avoided. The Dutch stove, for example, is a hollow cylinder or other form of iron, standing on a stone slab on the floor, close at the top, and having bars at the bottom on which the fire rests. The door by which the coals are put in being kept shut, the air for combustion enters below the grate; and a pipe issuing from near the top carries the smoke into a flue in the wall. If this pipe be made long enough the fire-gases traversing it may be very materially cooled down before they enter

the chimney, and thus the bulk of the heat of combustion remains in the room. As far as mere temperature is concerned, this is a most effective and economical warming arrangement; but it has serious faults. The iron often becomes red-hot or even hotter; any carbonic oxide existing inside as the result of an inadequate draught passes through hot iron and acts as a slow poison, causing anæmia; the dust in the air is charred when it approaches the hot metal, and gives rise to offensive and unwholesome odours; the air is rendered very 'dry' by being strongly heated. These faults are more or less obviated by increasing the mass and the cooling surface of the stove so that it cannot become too hot externally when a moderate fire is kept up within; by regulating the fire; by adjusting the fire-capacity of the stove itself; by allowing the access of sufficient air to ensure complete combustion; by surrounding the fire with brick instead of iron, or building the whole stove of brick or earthenware; and by placing a vessel of water upon the stove, the water evaporated from which may supply the moisture necessary to bring the air to a congenial degree of saturation, appropriate to its new temperature. If this vessel of water be placed upon the stove the air takes up moisture from the evaporating pan, and does not then parch the skin and lungs; but when the room cools down again the air may readily prove supersaturated, and deposit moisture on the walls, a condition favourable to mould.

In most continental stoves the fire is surrounded by a mass of brick, lined externally with porcelain. The smoke goes along a winding passage in the structure and issues nearly cold. The brickwork becomes warmed, and keeps up a moderate heat for a long time after the fuel has burned out. Open-fire stoves have also been devised; and an open fire-grate might be built out into a room at a distance from the wall, and the flue might go at once into the chimney, or go up an ornamental column through the room above. By such means the waste heat of the chimney would be utilised in warming the air of the apartments.

Gas-stoves have come into considerable vogue of late years. They depend either upon radiation from luminous flames or from asbestos heated by Bunsen Burners (q.v.), or upon heating of a metal casing by Bunsen burners with or without direct contact between flame and casing. Bunsen flames are in themselves of no use for pure radiation, and bare flames without ventilation simply heat the air by pouring hot water-vapour and carbonic acid into it, as any other fuel would do. In gas-stoves as much as in open fires the products of combustion, though they are invisible, must be taken out of the room, and the means of access of these products to the chimney must be ample. The air of apartments is also frequently warmed by steam or hot-water pipes: these are iron pipes containing hot steam or hot water, and warm externally by reason of the heat-conductivity of the metal. Air coming in contact with them is warmed and ascends, its place being taken by cooler and heavier air, which in its turn ascends. The whole air thus becomes warmed. Radiation from the pipes is also favoured by a coat of paint, not by a smooth metallic surface. These systems lend themselves readily to distribution of heat throughout a building from one central fireplace. The pipes can be so arranged that the steam or water can be shut off from any part at will; and the tubes may, by being connected with or attached to plates or wings of metal, have their heating surface and their heating efficiency increased. Steam heating is useful where there is waste steam available, as in factories and railway trains. As long as steam goes on condensing it remains at 212° F. (100° C.) until it is wholly converted into water at 212° F.; overheating is thus not possible unless the steam is itself superheated at a high pressure. The pipes must be so laid, in the case of a building, that all condensed water may flow back into the boiler, and allowance must be made for expansion of the pipes by heat. When hot water is employed it may be made to circulate either at low pressure or at high pressure.

In low-pressure systems the arrangement may be illustrated by the figure, in which *a* is a boiler; *b* is a tube which circulates through the building; *c* is a small tank at the top of the circuit and open to the air, by which the tubes and boiler are kept full; *d* is the return tube. When the boiler is heated the heaviest portion of the water within the system, the cool water in *d*, tends to sink by gravity to the lowest level, and thus circulation is immediately set up, and kept up as long as the boiler maintains a difference of temperature. The portion of the pipe which contains the coldest water should be vertical, and the comparative coolness of the water in the return pipes is maintained by the loss of heat experienced by the water on its way round the building. In high-pressure systems the pipe is narrower and very strong (wrought-iron of special make and thickness), and it forms a closed endless coil throughout the building. It is completely filled with water, except at the top, where there is a strong closed cylinder (the 'expansion-pipe') containing air to provide for the expansion of the water by heat. The pipe is led in a 'boiler coil' round a fire at the basement. The water circulates for the same reason as in the low-pressure system, but it travels very rapidly, since the water can be heated in the boiler coil to temperatures far exceeding 212° F. This is because the whole apparatus is equivalent to a closed vessel, capable of standing great pressures, and in such a vessel water may be highly heated without attaining a boiling-point. The apparatus is tested for pressures of 2000 to 3000 lb. per square inch, and at 750 lb. pressure it would be possible to heat the water to 510° F. The usual heat employed is from 300° to 350° F., which corresponds to a pressure of from five to nine atmospheres.



The advantages of the high-pressure system are the use of smaller pipes, which are more convenient and more seemly; the possibility of making them dip without risk of the bends being blocked by air (the removal of which must, on the low-pressure system, be provided for and attended to); the ease of application of radiating surfaces to the smaller tubes; the yielding of the system by alternate compression and release of the air in the expansion-tube, which acts as an elastic cushion and tends to prevent fracture; the small quantity of water used, the rapidity of circulation and the consequent promptness of action; the freedom from any access of dirt to clog the tubes; and the advantageous form of the boiler-coil as a rapid heater. The disadvantages are the quick cooling down when the fire goes down and the want of uniformity of temperature when the fire fluctuates, the uncomfortable heat of the pipes when touched, the fact that the pipes must be kept at a greater distance from plants, the slight charring of dust in the air, the slight charring of some kinds of wood laid too near the pipes, and the greater chance of freezing if the fire goes out. For the last reason the pipes should be charged not with water but with a non-freezing solution. In a modification of the system

specially applicable to cases in which portions of the system are to be shut off from time to time, there are outlet and inlet safety valves to let hot water out or cold water in when the pressures are greater or less than certain limiting values. In that case the expansion-pipe is often dispensed with. In these cases the air which is in the room is heated. The heating of air to be brought into a room will be found under VENTILATION.

Small spaces may sometimes be warmed by the introduction of hot water, as railway carriages by hot-water tins. Better than hot water is a tin case filled with crystallised acetate of soda; this is exposed to heat until it becomes warm; the heat absorbed is partly expended in melting the acetate, which then dissolves in its own water of crystallisation; the mass therefore absorbs much heat; and as it cools down it keeps on liberating its latent heat for a protracted period.

As to conserving the warmth of a room by preventing heat from escaping, the leading methods are to make the walls, doors, &c. bad conductors and air-tight. Air-tightness is incompatible with ventilation, but bad conduction is desirable both in winter and summer. The best material for a badly-conducting wall is one of a porous or spongy texture, such as porous stone or brick, which contains air in its interstices; but the best structural form is that which contains a film or jacket of air. Even iron houses may be made warm in winter by this means, if plaster-lined. Windows, again, if made double—double panes or, better, double sashes—allow very much less heat to escape than single ones, and even window-blinds and curtains have to a smaller extent the same action. The intervening air-film or layer is prevented from flowing away, and it is a very bad conductor.

See Edwards on *Ventilation and Heat* (Longmans, 1881), and Dye's edition of C. Hood's *Warming Buildings* (1891), and literature there cited. See also FUEL.

Warminster, an ancient market-town of Wiltshire, on the west border of Salisbury Plain, and 19½ miles NW. of Salisbury. It has a town-hall (1831); a free school (1707), at which Bishop Hampden and Dr Arnold were pupils; and a theological college (1860). The Marquis of Bath's seat, Longleat, 4½ miles SW., is one of the noblest Elizabethan mansions in the kingdom, with a fine collection of portraits, memories of Bishop Ken, and a magnificent park. Pop. (1851) 6285; (1891) 5562. See J. T. Daniell's *History of Warminster* (1879).

Warneck, GUSTAV, theologian, was born at Naumburg in Germany, March 6, 1834, studied at Halle, and became pastor at Rothenschirmbach near Eisleben (1874). Editor of a *Missions-Zeitschrift*, he has written many books and papers on missions, those translated into English being *Modern Missions and Culture* (1883) and *Outline of the History of Protestant Missions* (1884).

Warner, CHARLES DUDLEY, American author, was born at Plainfield, Massachusetts, 12th September 1829, graduated in 1851 at Hamilton, and in law at the University of Pennsylvania in 1856, practised in Chicago till 1860, and then settled as an editor at Hartford. In 1884 he became co-editor of *Harper's Magazine*, to which his papers on the South, on Mexico, and the Great West were contributed. In 1873 he wrote with 'Mark Twain' *The Gilded Age;* he had then published *My Summer in a Garden* (1870) and *Back-log Studies* (1872). Other works are *Being a Boy* (1877), *Washington Irving* (1881), *Captain John Smith* (1881), *In the Levant* (1893), &c. He died suddenly at Hartford, 20th October 1900.

Warner, SUSAN, authoress, born at New York, 11th July 1819, published under the pen-name of Elizabeth Wetherell her first novel, *The Wide, Wide World*, in 1851. It proved, next to *Uncle Tom's Cabin*, the most successful of American stories, and owes nothing to either its subject or its incidents. *Queechy* followed the year after, *The Hills of Shatemuc* in 1856, *The Old Helmet* in 1863, *Melbourne House* in 1864, *Daisy* in 1868, and *A Story of Small Beginnings* in 1872. Her other works were mostly religious. She died at Highland Falls, New York, 17th March 1885.

War Office. See WAR.

Warping, a method of improving land by distributing on it, by embankments, canals, flood-gates, &c., the alluvial mud brought down by rivers.

Warrant, an authorisation from the proper authority to a person to do something which he has not otherwise a right to do. The more formal warrants are under the hand and seal of the person granting them. The kinds of warrants are innumerable—informal instruments authorising a person to receive money or goods, such as dock-warrants, dividend-warrants, share-warrants, and formal legal warrants used in civil and criminal cases. Warrant of attorney is dealt with at ATTORNEY. The more important judicial warrants are the bailiff's-warrant, the sheriff's authorisation to a bailiff to execute a writ; the warrant to answer, issued by a justice of the peace, for the apprehension of a person accused of an indictable offence; the bench-warrant, issued by the court before which an indictment has been found, to arrest the accused; and the warrant of deliverance, for discharging from prison a person who has been bailed. General warrants, issued against no one person named, but against all persons suspected, were formerly in use, and proved an instrument of oppression; in the case of Wilkes, such a general warrant issued by a secretary of state to search for and seize the papers of the author (not named) of a seditious libel was decided to be illegal. In Scotland, after the declaration of an accused person has been made, if there be reasonable grounds of suspicion against him, the magistrate grants a warrant, the warrant of commitment, sending him to prison to abide the result of his trial. By statute 1701, chap. 6, this warrant must be in writing and duly signed; it must specify the particular offence charged, and must proceed on a signed information. There are, further, the distress-warrant, issued for raising a sum of money upon the goods of a party specified in the warrant; and the search-warrant, granted by a justice of the peace to a constable to enter the premises of a person suspected of secreting stolen goods, or of keeping gunpowder, nitro-glycerine, liquors, &c. contrary to law. Contrary to a common impression, no special warrant is required for capital punishment, the so-called death-warrant being simply the calendar of the prisoners' names, with their punishments on the margin, signed by the judge. In the United States warrants must not issue save on probable cause, supported by oath or affirmation, describing the person to be arrested or place to be searched. See ARREST, CRIMINAL LAW.

Warrant-officers. The highest ranks to which seamen under ordinary circumstances can attain are those of warrant-officers and chief warrant-officers. They are divided into three classes—gunners, boatswains, and carpenters, the gunners taking precedence of the other two. Of late years their pay and position have been greatly improved, while their sphere of duties has been much enlarged. They now rise from 5s. 6d. per diem, when they first receive their warrant, to 7s. 6d. per diem, and to 9s. on promotion to chief warrant-officer, exclusive of any extra allowances to which they may be entitled for performing special duties. Formerly, before ironclads superseded wooden ships, there was only one officer of this rank of each

class carried on board even the largest ships. Now, in addition to the officer of each class appointed to carry out the special duties of gunner, boatswain, and carpenter on board every ship, there are usually three or four junior gunners or boatswains appointed to battle-ships and some of the larger of other classes of ships to perform what are called quarter-deck duties, in addition to which in many of the larger ships an extra gunner or boatswain is appointed for torpedo-duties. A certain proportion of these officers who have duly qualified in navigation are now appointed to command torpedo boats, and in war-time they will unquestionably be largely employed on that service. The warrant-officers of the present day are for their station a most highly educated and most efficient body of men. On the occasion of the Queen's jubilee in 1887 two of this rank were promoted to lieutenants for distinguished service before the enemy during the Egyptian war of 1882-85; and a limited number of the chief warrant-officers who have a specially good record of service are also allowed on retirement to assume that rank. Warrant-officers rank with, but before, midshipmen and with second-lieutenants in the army; chief warrant-officers with, but after, sub-lieutenants in the navy and lieutenants in the army; they can rise to a maximum pension of £150 a year, and their widows are also entitled to a small pension. For Warrant officers in the army, see NON-COMMISSIONED OFFICERS.

Warranty, in English law, is a promise to secure a person in the enjoyment of a right transferred to him. According to ancient rules of procedure, a person whose title was questioned might vouch another to warranty—i.e. call upon him to make good the guarantee he had given; the vouchee on his appearance stepped into the place of the original defendant. As applied to land the term is now obsolete, but in the mercantile law warranties are still of great importance. On a contract of sale, e.g., the general rule is *eaveat emptor*—let the buyer look to himself: a person who sells a thing in its natural state, having no better means of information than the purchaser, is not taken to warrant the quality of the article; he is not liable to make good any defects unless he has been guilty of fraud or dishonest concealment. But where the purchaser has to rely on the vendor the law will generally imply a warranty. Thus, a person selling goods for a particular purpose is usually taken to warrant that they are suitable for that purpose; a dealer in provisions, for instance, warrants them to be wholesome and fit for food. If the goods are unsuitable, it sometimes happens that the purchaser has two courses open to him: he may reject the goods as not corresponding to the contract, or he may accept the goods and sue the vendor for damages for breach of warranty. On a sale by a manufacturer, he is taken to warrant that the goods are of his own manufacture, unless the usage of trade is to the contrary; on a sale by sample there is an implied warranty that the bulk corresponds to the sample in quality and condition. A seller is held to warrant his right to sell; if he is not in fact the owner of what he sells he may have to pay damages if the true owner claims the property from the purchaser; but a seller with a doubtful title may protect himself by agreeing to transfer such rights as he has. The rule of law is sometimes expressed by saying that a seller is not liable in respect of patent defects (i.e. such as the buyer might discover by the exercise of his own judgment), but only for latent defects (i.e. defects known to the vendor which the purchaser has no means of discovering). A warranty must of course be carefully distinguished from a mere expression of opinion about the thing sold. An agent or servant has no right to give a warranty unless he is authorised to do so. On the sale of a horse, the purchaser must make proper inquiry and investigation; if the horse turns out restive or unmanageable, he cannot recover damages unless the seller has given him an express warranty to the contrary.

Unsoundness in horses is a relative term, and difficult to define; but the rule is that, if at the time of sale the horse has any disease which either actually does diminish its natural usefulness so as to make it less capable of performing the work it is intended for, or which in an ordinary course may hereafter diminish its usefulness, or if either from disease or accident it has undergone any alteration of structure that either actually at the time does, or may in its ordinary course, diminish the animal's usefulness, such a horse is unsound. Veterinarians of experience recognise two conditions under the term *sound*, and two converse ones under that of *unsoundness*. The first is recognised under the appellation of 'legally sound,' and is thus defined by Baron Parke. 'I think the word sound means what it expresses—viz. that the animal is *sound* and free from disease at the time he is warranted.' Now experience is opposed to this, as many, perhaps the majority, of horses have evidence of disease or of the results or products of disease or accident in some part or parts of the body; or they may have some infirmity, such as being slight 'roarers' or whistlers, or have slight stringhalt, which renders them legally unsound. Such horses if warranted sound are returnable; but they may nevertheless be what is termed serviceably sound—that is to say, fit to perform the work for which they are bought. Or again, a horse may have a bone spavin; now a bone spavin is looked upon as a disease, and a spavined horse is considered unsound. But if he is free from lameness and have good hock action, in the opinion of many veterinarians he is serviceably sound. And pathological investigation has confirmed this view, for it has discovered that the enlargement—the bone spavin or exostosis—is composed of reparative material, by which the actual disease has been cured. Then again there are what are denominated 'hereditary unsoundnesses,' and the following are officially recognised by the R.A.S.E.: roaring and whistling, bone and bog spavins, side-bones and ring-bones, stringhalt, cataract, and navicular disease.

See Anson, *Law of Contract;* Chalmers, *Sale of Goods;* Oliphant, *Law of Horses;* and Ross Stewart, *Law of Horses* (1892). Guaranty (q.v.), etymologically the same word as warranty, has a different sense in law.

Warren is a place kept for the purpose of breeding game or rabbits. In its strict legal sense a right of free warren (extending to hares, rabbits, partridges, pheasants, and sometimes quails, woodcocks, and water-fowl) can only be derived by grant from the crown, and gives certain privileges to the warrener as to recovering game and destroying dogs which infest it.

Warren, (1) capital of Trumbull county, Ohio, 52 miles by rail SE. of Cleveland, with rolling and flour mills, and manufactories of linseed-oil, cottons, &c. Pop. 5973.—(2) Capital of Warren county, Pennsylvania, on the Alleghany River, 66 miles by rail SE. of Erie. It manufactures engines and boilers, wooden wares, and leather, and has a trade in lumber and petroleum. Pop. 5288.

Warren, SAMUEL, novelist, was born in Denbighshire, 23d May 1807. He studied medicine at Edinburgh and law at the Inner Temple, and was called to the bar in 1837. He was made a Queen's Counsel (1851), was Recorder of Hull (1854–74), represented Midhurst in the Conservative interest

(1856–59), and then he was appointed one of the two Masters of Lunacy. His *Passages from the Diary of a Late Physician* (1832) had been contributed to *Blackwood's Magazine*, as also was *Ten Thousand a Year* (1841), the amusing story of 'Tittlebat Titmouse.' By these he is chiefly remembered; but he published a dozen more works, including *Now and Then* (1847), *The Lily and the Bee* (1851), and several law-books. He died in London, 29th July 1877.

Warrington, a municipal and parliamentary borough and manufacturing town of Lancashire, on the right bank of the Mersey, 18 miles E. of Liverpool, 16 WSW. of Manchester, and 182 NW. of London. Though of recent development, it is an ancient place, the *Wallintun* of Domesday; and, acquiring strategic importance through its bridge (1496) over the Mersey, it was the scene of defeats of the Scots (1648), the royalists (1651), and a portion of Prince Charles Edward's forces (1745). To a dissenting academy, founded in 1757, it owes its memories of Drs Aikin, Priestley, Taylor, &c.; and Lucy Aikin was a native. There are still some old timbered houses; and the parish church, St Elphin's, with a spire 300 feet high, is a fine cruciform Decorated structure, restored in 1859–67 at a cost of over £15,000. The town-hall was the former seat (1750) of Col. Wilson Patten, purchased in 1872 for £20,000; and other buildings are the Royal Court Theatre (1862), post-office (1876), hospital (1876), museum and library (1857), school of art (1882), public baths (1866), grammar-school (1526; rebuilt 1857), &c. There are also public gardens and a park. The manufactures include iron, wire, pins, files, cottons, glass, leather, and soap. Warrington was constituted a parliamentary borough, returning one member, in 1832, and a municipal borough in 1847. Pop. (1851) 22,894; (1881) 45,253; (1891) 55,349, of whom 52,742 were within the municipal boundary.

See a monograph on the worthies of Warrington by James Kendrick (1853), and others by William Beamont (Chetham Society, 1872–73) on an Augustinian friary founded in 1379, on the lords of Warrington, &c.

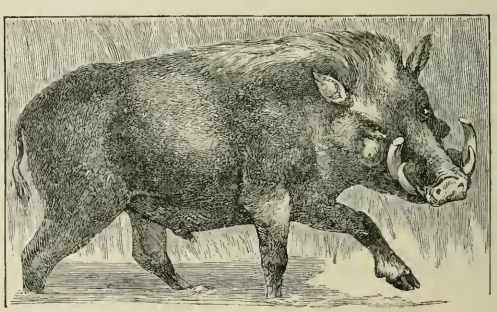
Warsaw (Polish *Warszawa*), long the capital of Poland and now capital of a government of Russian Poland, stands on the left bank of the Vistula, 330 miles E. of Berlin by rail and 700 SW. of St Petersburg. It stands partly on a high plain, partly on the terraces sloping upwards from the left bank of the river, extends over a wide area, and consists of the city proper and a number of suburbs. Two iron bridges connect Warsaw with the suburb of Praga, on the right bank of the Vistula. Standing on a navigable river, with great railway lines to Moscow, St Petersburg, Vienna, Danzig, and Berlin, Warsaw is one of the most important towns in eastern Europe, being, next after Moscow and St Petersburg, the largest city in the empire. There is much trade in corn and flax exported, and in coal and manufactured goods imported. Warsaw has among its own manufactures those of electroplate, machinery, boots and leather goods, woollens, pianos, carriages, tobacco, sugar, chemicals, beer, and spirits. Of over one hundred Catholic churches the cathedral of St John is the most notable; there are also some half-dozen Greek churches, two Lutheran ones, and many synagogues. The castle is an imposing building, and contains many pictures and sculptures. There are innumerable private palaces or mansions, many of them fine. The university, suppressed in 1832, was reopened in 1864, and has seventy-five professors (who teach in Russian) and about 1000 students. There are various academies and museums, a school of arts, several theatres, and some fine public gardens. Pop. (1872) 276,000; (1891) 465,272. Area of government, 5623 sq. m.; pop. 1,465,131. The city of Warsaw has been closely identified historically with Poland, the insurrections against Russia having generally had their headquarters here. See Poland, Russia.

Wart. See Warts.

Wartburg. See Eisenach.

Warthe, the Oder's chief affluent, rises on the south-west frontier of Poland, flows north and west into Prussia, then north (past Posen) and west again, and enters the Oder at Küstrin. Length, 445 miles (230 in Prussia, and 265 navigable).

Wart-hog (*Phacochœrus*), a genus of Suidæ, closely resembling the true hogs in most of their characters, and particularly in their feet, but remarkably differing from them in their dentition: the number of teeth is much reduced; the canines become the large tusks, and in the adult the last molar only is found in each jaw, which grows to an enormous size as in the elephant. The head is very large, and the muzzle very broad; the cheeks are furnished with large wart-like excrescences, so that the appearance is altogether very remarkable and uncouth. The species are all natives of Africa. They feed very much on the roots of plants, which they dig up by means of their enormous tusks. The African Wart-hog, or Haruja (*P. æliani*), a native of Abyssinia and of the central regions of Africa, from the coast of Guinea to that of Mozambique, is nearly 4 feet long, with a naked slender tail of 1 foot, is scantily covered with long bristles of a light-brown colour, and has a mane sometimes 10 inches long, extending from between the ears



Wart-hog (*Phacochœrus æthiopicus*).

along the neck and back. Another species is found in the south of Africa (*P. æthiopicus*), the *Valke Vark* of the Dutch colonists at the Cape of Good Hope. The incisors of the latter fall out at an early age, those of the former are persistent. A closely allied genus is Potamochœrus, of which there are several species, as the *Bosch Vark* of Cape Colony (*P. africanus*), which is nearly black, with whitish cheeks having a central black spot, and the Painted Pig of West Africa (*P. penicillatus*), which is reddish, with black face, forehead, and ears; another and less known species is *P. edwardsi* from Madagascar. The species of Potamochœrus frequent swampy grounds, and sometimes receive the name of Water-hog. They have longer ears than the true wart-hogs, tapering and ending in a pencil of hairs; the face is elongated, and has a huge protuberance on each side. The flesh of all the wart-hogs and water-hogs is in high esteem. They are hunted by dogs, which are often killed in the encounter with them. They are much addicted to fighting among themselves. This genus differs from Sus in that there are only four young in a litter, and that one molar tooth in each jaw has disappeared.

Warton, Joseph, was born at Dunsfold, Surrey, in 1722, son of the Rev. Thomas Warton (1688–1745), vicar of Basingstoke in Hampshire, and sometime professor of Poetry at Oxford. At fourteen he was sent to Winchester, whence in 1740 he passed to Oriel College, Oxford. In 1748 he was presented to the rectory of Winslade near Basingstoke, was appointed second master of Winchester in 1755, and was its head-master from 1766 till his retirement in 1793. His preferments were a prebend of St Paul's, the living of Thorley, Hertfordshire, a prebend of Winchester, and the rectory of Easton, which he soon after exchanged for that of Upham. His *Odes* (1746) marked a reaction against the dominant school of Pope. An edition of Virgil (1753), with translation of the *Eclogues* and *Georgics*, gained him a high reputation. He was much esteemed by Dr Johnson, and, like his brother Thomas, was one of the members of the famous Literary Club. In 1756 appeared the first volume of his *Essay on the Writings and Genius of Pope*, the second and concluding volume following only in 1782. The distinction it drew between the poetry of reason and the poetry of fancy marked an important point in English criticism. His latest works were an annotated edition of Pope (9 vols. 1797) and a similar edition of Dryden, of which he had published two volumes at his death, in London, 23d February 1800. See the *Memoir* by the Rev. John Wooll, a ridiculously stilted panegyric (1806).—Thomas Warton, his brother, was born in 1728 at his father's vicarage of Basingstoke. In 1743 he was entered at Trinity College, Oxford, where he obtained a fellowship in 1751. He remained at the university as a tutor, and in 1757 was appointed professor of Poetry. In 1767 he took his B.D. degree, and was soon after presented to the living of Kiddington, to which he added in 1782 the college living of Hill Farrance in Somersetshire. But he had more taste for the pipe and tankard than clerical duty, and we are told how he mostly confined himself in preaching to two sermons—one his father's, the other a printed one, and even that abridged. His *Observations on the Faerie Queene of Spenser* (1754; 2d ed. expanded to 2 vols. 1762) established his reputation as a critic. But the work by which Thomas Warton will be ever remembered is his *History of English Poetry* (1774–78–81; ed. in 4 vols. by W. C. Hazlitt, 1871), which, in the width of its learning, remains to this day unrivalled. As a poet Warton takes distinct if hardly high rank. In 1777 he published a collection, and on the death of Whitehead, the poet-laureate, he had the honour, such as it was, of succeeding him in the office. That same year he was elected Camden professor of History at Oxford. His last work was an elaborately annotated edition of the Minor Poems of Milton (1785). He died suddenly, 21st May 1790. His miscellaneous writings included humorous and burlesque poetry and prose, genial satires on Oxford, an edition of Theocritus, lives of Thomas Pope and Bathurst, two Trinity College benefactors, *Inquiry into the authenticity of the Rowley Poems*, &c. See the Life in Mant's edition of his poems (1802); and John Dennis, *Studies in English Literature* (1876).

Warts (sometimes known in Surgery by their Latin name *Verrucæ*) are collections of lengthened papillæ of the Skin (q.v.), closely adherent and ensheathed by a thick covering of hard dry cuticle. From friction and exposure to the air their surface presents a horny texture, and is rounded off into a small button-like shape. Such is the description of the simple wart, which is so commonly seen on the hands and fingers (and rarely on the face or elsewhere) of persons of all ages, but especially of children. Amongst other varieties of warts are (1) one to which the term *Verruca digitata* has been applied. It is more elongated in shape, and less protected by cuticle than the preceding. It is said to occur nowhere but on the scalp of women of adult age, and sometimes to occasion great annoyance in brushing and combing the hair. (2) *Subungual warts*, growing, as their specific name implies, beneath or at the side of the finger or toe nails. They originate beneath the nail, and as they increase they crop out either at the free extremity or the side of the nail, and are usually troublesome, and often very painful. They are generally of syphilitic origin. (3) *Venereal warts*, caused by the direct irritation of the discharges of gonorrhœa or syphilis, and occurring about the parts which are liable to be polluted with such discharges. They attain a larger size, and are more fleshy and vascular than other warts.

Nothing is known of the causes of warts further than that the third variety is induced by an irritating discharge, that the malignant form of wart which is the beginning of chimney-sweepers' cancer is caused by the irritation of soot, and that persons engaged in dissection and *post-mortem* researches are especially liable to them; hence we may infer that they are always due to some local irritation. Venereal warts are certainly contagious; with regard to others, we cannot speak positively. According to popular belief, blood from a wart is capable of producing similar warts when applied to the skin, and occasionally, but rarely, this has been the case in the experience of surgeons. In consequence of the capricious way in which warts often undergo spontaneous cure, there are numerous popular charms for their removal, several of which may be found recorded in the pages of *Notes and Queries*. Common warts are so apt to disappear that they may be often left to themselves. If it is desired to remove them, glacial acetic acid may be applied with a camel-hair pencil till the wart is pretty well sodden, care being taken not to blister the neighbouring skin. One or at most two applications are usually sufficient. Nitrate of silver and tincture of iron are popular and general applications. Salicylic acid in collodion (see Corns) is also very effective. Small warts hanging by a neck may often be very simply removed by the tight application of an elastic ligature (e.g. a small broken elastic ring) to the base. The wart usually shrivels up and falls off within a week. The other varieties of warts must be left to the surgeon.

Warwick, the county town of Warwickshire, on the Avon, 21 miles SE. of Birmingham, 45 NNW. of Oxford, and 107 NW. of London. In spite of a great fire in 1694, it has preserved much of its mediæval character, and, besides a good deal of antique domestic architecture, retains two of the old gates with chapels above their archways. St Mary's church is a large cruciform Perpendicular structure, partly rebuilt after that great fire, with a Norman crypt, the superb Beauchamp chapel (1464), and a wealth of interesting monuments. But Warwick's chief glory is its stately castle, on a rocky elevation, 40 feet high, overhanging the river. Ethelfleda, King Alfred's daughter, built a fortress here about 915; but the present edifice, which extends over 3 acres, is all of post-Conquest erection, its oldest portion the huge Cæsar's Tower (147 feet high), whilst Guy's Tower (128 feet) was built in 1394. Having passed ere then, with the earldom of Warwick, to the Beauchamps, Nevilles, Plantagenets, Dudleys, and Riches, it had long been ruinous when in 1605 it was granted to Sir Fulke Greville (q.v.), whose descendant, Lord Brooke, was in 1759 created Earl of Warwick, and who spent at least £20,000 in repairing and beautifying it. It stood a memorable siege by the royalists during the Great Rebellion, and its great

hall was gutted by fire on 3d December 1871; but by 1876 the damage had been repaired at a cost of £18,000, and Warwick Castle is one of the few feudal residences still tenanted. Besides relics of Guy of Warwick (q.v.), the 'King-maker,' and Cromwell, it has paintings by Van Dyck, Rubens, Holbein, and other masters, the 'Grimani table,' valued at £10,000, and the Greek 'Warwick vase,' 7 feet in diameter, from Hadrian's Villa at Tivoli. It has welcomed many royal visitors, as Queen Elizabeth, James I., William III., and (in 1892) the Prince of Wales and the Duke of York. The Leycester Hospital was founded in 1571 by Robert Dudley, Queen Elizabeth's favourite, for twelve poor brethren; the king's school (1546), which has a yearly endowment of £800, occupies fine modern buildings erected at a cost of over £13,000. The industries include the making of art furniture, gelatine, and agricultural implements; and there is a considerable trade in agricultural produce. Warwick, which was chartered by Henry VIII. as a municipal borough, lost one of its two members in 1885, when the parliamentary boundary was extended so as to take in Leamington (q.v.). Walter Savage Landor was a native. Pop. of mun. borough (1851) 10,973; (1891) 11,905; of parl. borough (1891) 39,102.

Warwick, a township of Rhode Island, on Narragansett Bay, 10 miles SW. of Providence, the birthplace of General N. Greene. Pop. 17,761.

Warwick, Richard Neville, Earl of, the King-maker, eldest son of Richard, Earl of Salisbury and Alice Montacute, was born November 22, 1428. The house of Neville had been built up by a series of wealthy marriages, and Richard was no exception to the rule. While yet a boy he was married to Anne, daughter of the Earl of Warwick, and through her, after the death of her brother and niece, he took his place at the age of twenty-one among the chief earls of the realm. By this time the English rule in France had broken down, bringing the reigning house of Lancaster into great unpopularity, and throwing a correspondingly greater influence into the hands of the leader of the opposition, the Duke of York. He was brother-in-law to the Earl of Salisbury, and so attached to his party the powerful influence of the Nevilles. The Duke of York at first made no claim to the throne, demanding only that he should have his place in the councils of the king, and even when swords were drawn the Yorkists swore their allegiance to the king while fighting against his advisers. The Wars of the Roses (q.v.) began with the battle of St Albans (1455), which was gained to the Yorkists chiefly by the help of Warwick. By a sudden sally into the streets of the town he routed the royal forces, and gained for himself that character of daring and courage which he maintained to the end. He was rewarded with the post of captain of Calais, which he retained throughout the changes of the parties. In this position he was practically independent, and scoured the Channel at his pleasure. In 1458 he attacked some vessels which were under a treaty of peace with England, and being summoned to London to answer before the king, was violently attacked by the followers of Somerset and barely escaped with his life. In 1459 the civil war finally broke out. In the first campaign the Yorkists failed owing to their inactivity. The leaders fled to the coast of Devon, where they hired five men to carry them to Bristol. As soon as they left land, Warwick stripped to the doublet and took the helm, and steered straight for Calais, where he arrived in a few days. And when Somerset came to claim the keys of the stronghold, he had the mortification to find Warwick there before him.
